Whence it follows that under universal suffrage the rabble is politically dangerous only so long as we have an arrogant, insolent privileged class to influence the rabble vote.

When the people have improved the morals of the anti-social arrogant by taking away their privileges, they will be able to some extent to improve the manners of the non-social rabble. For there are ways of persuading the rude, notwithstanding their lack of ideas, to imitate, if only mechanically, the behavior of the considerate.

This is why "democracy" will ultimately be "triumphant." Mr. Carnegie was right as to the adjective, but wrong as to the reasons.

The Congregationalists and Church Union

The Congregationalists of the United States held their Triennial National Council in Cleveland, Ohio, last week, utterly undisturbed by the hot mayoralty campaign, which was also of national interest. There were papers read, as al-

ways, by the bale, and speeches before the missionary bodies; but only one question was before the Council of absorbing interest, and that the question of corporate union between the Congregationalists, the United Brethren and the Methodist Protestants. A plan for union was officially before the Council, which involved one National Council for the three, which would thus become one; the consolidation of their benevolent boards, and the liberty of their local and State conferences to unite or remain apart as long as they pleased. The question of union came before the Congregationalists first, as the quadrennial National Conferences of the two other bodies meet one in 1908 and the other in 1909.

And the Congregational National Council was not quite ready to consummate the union yet. They wanted more time to consider it. They wanted union, were sure they did, and by a very large —an almost unanimous vote; but they did not all understand the conditions.

Of course, there were a very few who did not want union anyhow or on any conditions, unless it were by absorption in the Congregational body. There always are such selfish ecclesiastics who can endure no terms but submission. They made some noise at first, but that kind of ecclesiastical conceit which thinks that only those of their cold temperament are fit to be admitted into fellowship is so narrow and unchristian that even those who held to it were soon ashamed to utter it. Then there were some others who are rigidly denominational, and are desperately careful that in the case of union none of the Congregational shibboleths shall be disturbed. They saw that the definite statement of the "autonomy" of the individual church had been omitted, and they did not have confidence that they would be able to maintain it. They thought they saw indications in the proposed Act of Union that authority was going down from the top, instead of going up from the bottom, which is a very serious thing in theoretic Congregationalism; at least, it squinted that way, and, notwithstanding the juristic adage, "*De minimis lex non obstat*," they remembered the camel's nose, and were not "strong in faith."

Nevertheless, a great majority would have been willing to trust and go ahead, but for their tenderness toward the minority. They thought or hoped that, with a generous allowance of time, the minority would be won over, or that it would be easy to revise the Act of Union so as to relieve their fears and not offend the other parties. Especially did this consideration affect the committee of twenty-eight, which had been constituted to represent the strongest opponents of union as well as those who warmly favored it and wanted it now. The opponents pressed the evil of a division or split in the body, said that the opponents "never would consent," and this seemed to mean that they would leave the denomination, and it was declared that there would thus be four denominations instead of three, and that those who stayed behind would hold the money. To be sure, the sub-committee on Legal Relations, of which Chief Justice Baldwin, of Connecticut, was chairman, had covered and guarded that in their long report, but few had read it or even known of it.

The fear of those who "would never consent" is not a valid one. In a democracy we expect people to refuse their consent, but they know how to submit to the will of the majority. It is the right of the minority to refuse consent, but it is their duty also, as Christians and gentlemen, to yield unless some high moral question is involved. The opponents are such gentlemen, and there is no danger that Broadway Tabernacle would withdraw from the Manhattan Conference, or the Manhattan Conference from the State Conference. The Congregational denomination could not be split with a battle-ax, any more than one can split a cup of water with a knife.

But to the Committee of Twenty-eight, comprising not a few of the very best of men, the necessity of coming to a unanimous conclusion which should carry the minority seemed essential. Perhaps it was; for the minority might have made noise enough to frighten the two other denominations from giving their assent to the union. At any rate, the necessity of unanimity, by a miracle which confirms the possibility of biblical miracles, burdened their judgments. But how could there be unanimity with Rossiter Raymond and Dr. Jefferson on one side

and Washington Gladden and President Mackenzie on the other? Only by great yielding.

But what is this fetish of unanimity? Freedom fights unanimity. A unanimous Church is a dead Church; witness the Greek Church. "*Semper idem et ubique*" is poor fodder for thought and life. To require action on any important matter to be unanimous is to forbid progress. It gives us only an outward linen decency of conformity. To accomplish anything then was impossible, and so the opponents were pleased with delay, and those who favored union yielded for the present. But they yielded with the determination that, with three years more allowed for those that had been asleep to wake up, there would be no excuse for further waiting, and an overwhelming majority would then insist on action.

Of course, delay is dangerous. But we trust that the United Brethren and the Methodist Protestants, who have not been asleep, and who will find it harder for them than for the Congregationalists to maintain the distracting situation, will yet have patience with the slower moving body, and will not imagine that they have been deceived by those who had assured them that Congregationalists would welcome union, or by the action of the previous National Council, which invited negotiations. And, after all, for so great a cause patience is worth while, but not the patience that threatens failure. It is a great, an unusual effort for the union of these denominations which had not learned close intimacy, and the union, when accomplished, will be a fruitful example to the other dichotomies and subdichotomies of schism.

The Philippine Assembly

AMERICA has kept its word with the Philippines, as it kept it with Cuba. We said we would give back *Cuba Libre* to her own people, and we did it; and now that we have been called back there we shall do it again. President McKinley and Congress and President Roosevelt all promised the people of the Philippines that they should have self-government just as fast as possible, that they should take part in making their own laws, and what was promised has been done. First we told them to elect their own mayors of towns and other more local officers: now we have given them a co-ordinate part in legislation by their election of one of the two houses of their Congress Secretary Taft has inaugurated this new and worthy *régime*, unexampled in the history of colonies in the East, and he leaves it to the people themselves to say whether this experiment is a safe one.

Where now are the croakers, the ill-omened ravens of suspicion, who declared that our Government was wholly selfish in its taking and keeping of the Philippines? Shall we hear them confess that our Government was honest—and benevolent even—in its purpose? Not at all. They will still see only ill where good is meant.

But the good work has gone on, and with the natural suspicion of the Filipinos themselves and the ill will and opposition of not a few Americans in the Islands whose only purpose has been to fill their own purses. Most of them despise the dark-skinned natives, and would keep them as vassals of the American control. Fortunately, our Government, and Governor Taft, its official representative, have held firm to the theory of self-government, to their faith in liberty for all people, and to their plighted word.

For be it remembered to the credit of Congress, that in our government of those islands we have contradicted all the precedents of Great Britain, France, Spain and Holland. Their examples have been studiously set before us by scholars and by foreign critics. It is not safe, they said; it is only safe to follow the steps of our predecessors who have for centuries ruled Eastern people, people who can never learn the duties and privileges of liberty. But we said, No We would not deny for other men that faith in freedom which we hold for ourselves. This one act is itself a precedent for other nations. Great Britain is bound to follow it in India, or she will lose India. Wherever education becomes general there must be self-government. It is only by keeping a people ignorant that they can be content to be servile.

So Secretary Taft will return having accomplished what no man in history has ever done before, and he will deserve the eternal gratitude of the Filipinos, as him-

self the voice of the will, the good will, of the American people.

Railroad Officers' Opinions

PROMINENT officers of the railroads are giving to the public their opinions about the causes of the difficulties encountered when their companies seek to borrow money or to market new securities. These opinions do not always agree. Mr. E. H. Harriman, president of the Union Pacific, Southern Pacific, and other companies, said last week:

"There is no lack of money in the country. There is plenty of it, but the people will not let it circulate because of false sentiment engendered by antagonism to those conducting big business enterprises.

"I am sick, and most other men are also sick, of the continued attacks made upon the railroads. When charges are made against a railroad, the proper thing to do is to refrain from publishing them until the party bringing the charges and the representatives of the railroad have had a conference, with representatives of the press present."

These remarks were made two or three days after the delivery of an interesting address before the Chicago Association of Commerce by Mr. Robert Mather, president of the Rock Island Railroad Company, who was for years chief counsel for the Rock Island interests. Mr. Mather said:

"Three theories are commonly advanced in explanation of the unsalability of our railroad securities. One is that a world-wide money stringency, due to great and general commercial activity, restricts investments in all kinds of securities. I am not a banker, and should not presume to have an opinion upon this proposition, but it does not strongly impress me.

"I count as first among the causes that have made their securities unsalable, the misdeeds of the railroads themselves."

He would not deny, he continued, the perniciousness of the practice of paying rebates, or decry efforts of the Government to terminate it, but the misdeeds he had in mind were acts by which the securities were more directly affected:

"There is a prevailing public belief, based on facts publicly shown, that railroad corporations have issued corporate obligations and applied the proceeds to purposes other than those for which such obligations may lawfully be issued. Directors are understood to have purchased the securities of corporations of which they are trustees, and to have sold property of their own to the corporations, making personal profit thru their dealings with the trust estate."

Is it not probable that Mr. Mather was thinking of what has been called the "looting of the Alton company," and of those remarkable transactions in securities by Union Pacific officers which were revealed some months ago during an official investigation? Mr. Harriman appears to give those disclosures no weight in his estimate of the forces which affect public opinion as to the value of railroad securities, and impair public confidence in responsible railway officers. It will be noticed that Mr. Harriman would have charges against a railroad investigated in conference, with representatives of the press present. But we have not heard that reporters were invited by him to be present at the conferences in which the Alton campaign was carried on, in order that they might afterward assure the public that nothing unjust or improper had been done. Nor were representatives of the press taken into the confidence of Mr. Harriman and his associates concerning the sales of securities to the Union Pacific. Indeed, Mr. Harriman is so averse to publicity concerning the history of those sales that he has refused to testify about it, and the Government has found it necessary to ask the courts for an order directing him to answer many questions to which he had declined to give any response.

Again, there are those rebates paid to favored shippers on the Pacific Coast by the Southern Pacific, the record of which was found in the company's books two weeks ago by Commissioner Lane. These rebates were allowed up to the end of last month, altho Mr. Harriman asserted some months ago that rebating had ceased on all the roads with which he was connected. We do not understand that representatives of the press were consulted as to the fairness and legality of these practices. On the other hand, the record of the rebates was kept, it is stated, in a separate and secret set of books. It is not an attack, sickening or otherwise, upon railroads for the press to publish the testimony now and to express the opinion that there ought not to have been such favoritism, but the publication does not fill the people with a consuming desire to buy the securities of a road which

is controlled by men who permit such injustice and violation of law.

One or two other railway presidents have recently ascribed the popular distaste for railway securities to hysteria in high places, meaning, we suppose, Mr. Roosevelt's speeches and the prosecution of rebaters by the Government. For some reason—we do not undertake to trace the connection—this reminds us of the complaint of George H. Brouwer, who was arrested last week for embezzling about $100,000 from a New York brokerage firm which employed him as manager of its business. He had taken the money and lost it in stock speculation, and he explained that Mr. Roosevelt was the cause of all his woes. But for the President's speeches and for the Government's prosecution of offending corporations, he argued, his thefts would not have come to light, because his speculations would have been profitable.

We ought not to overlook the fact that Mr. Harriman and the directors associated with him in the financial transactions which were the subject of the Interstate Commerce Commission's memorable inquiry in New York appear to retain the confidence of the stockholders of the Union Pacific. At the annual meeting, on the 8th inst., the directors were re-elected, and the old officers keep their places. No hostile votes were cast, but what the officers and directors had done was approved by the ballots of 685,256 of the 995,693 holders of preferred stock and those of 1,524,497 of the 1,954,899 owners of common shares. Some of the acts of the men who control the Union Pacific may be classed by the public with the misdeeds of which President Mather spoke, but it appears that they have been approved by a large majority of the many shareholders of that great company.

A Brave Bishop

Bishop Potter has the courage of his convictions, and has never hesitated to express them, whatever they might be. But he has never, in word or deed, done a braver thing than when last Friday, in the city of Richmond, the Rebel Capital of the Confederacy, he invited the negro, Bishop Ferguson, to sit down at dinner with himself and his wife.

When President Roosevelt asked Dr. Booker T. Washington to stop and lunch with him, it was no brave act. It probably never occurred to him that anybody would know or care about it. It was an act of common civility extended from one gentleman to another. Doubtless the stir it made both amused and surprised the President. But this is a different thing. Bishop Potter had definitely in mind what had been the uproar raised in certain sections by the President's act of courtesy. He knew it would be criticised. He knew that he was defying the social conventions of the city and commonwealth in which he was sojourning. And yet he knew that such a courteous recognition was due to a brother bishop otherwise socially ignored. So he did the decent and right thing, to its full measure, and yet not indifferent to the criticisms and contemptuous attacks that would surely follow his action.

Another clergyman of Bishop Potter's own church, but a native Southerner, the Rev. Quincy Ewing, of Louisiana, has taken more than one occasion publicly to put himself on the side of appreciative justice toward the colored people. We recall his really remarkable address to the colored students of Atlanta University, at its last commencement, the last at which President Bumsted presided before his successor, President Ware, was installed. Mr. Ewing said:

"Perhaps it is pardonable to add that in a special sense I rejoice in your achievement, because you are not identified with my race: because you are identified with a race which has been charged, again and again, with elemental unfitness to scale the hights and breathe the atmosphere of the higher learning. In a special sense I congratulate you, because of your refutation of the old superstition, that the Lord God created one race of people with just enough intellect to guide their hands in the service of other people, to whom were vouchsafed all the rare treasures of knowledge and wisdom for themselves alone. It is gratifying to me beyond measure the witness you bear, that there is no such God at the helm of things as some people have imagined—no God capable of creating a race of men responsible to other men and Him for their attitude toward the Moral Law, but by Him denied those faculties and emotions, and perceptions, and ambitions, and appreciations, which make obedience to the Moral Law a thing humanly worth while. The saying that the negro can not take a higher education, is equivalent to saying that the negro is only to a certain degree human—not human enough for God's

truth of the uplands to win entrance to his brain, to find lodgment in his soul. You have shown that the negro can take a higher education by yourselves taking it: you have shown that the negro can understand and love what other men understand and love by yourselves understanding and loving it: you have borne witness by your self-consecration to an ideal, which is human, not racial; by your achievement this day which is human, not racial; which declares that despite all the wild ravings of this or that human mind, and all the mad hatreds of this or that human heart, there is after all, elementally, but *one human mind,* but *one human heart*—but *one human race.*

"We members of a dominant race have been praying a long time, 'Our Father, Who art in Heaven.' Achievements like yours should help us to pray that prayer better—with an 'our' more inclusive; and urge us on to that far hight of vision where we shall see and confess at last that *human brotherhood has no limits which exclude humanity.*"

The Northern bishop and the slaveholder's son stand side by side in the recognition of the brotherhood of man.

Electricity to the Farmer

The service rendered by electricity to the farm began with the trolley and the telephone. These, together with free mail delivery, constituted the first chapter in a great revolution. The automobile, whether electrical or run by gasolene, has so far been rather a menace to the farmer's every-day use of the roads. A few, however, have foreseen the day when the automobile itself would be the farmer's special friend and property. In 1905 several manufacturing firms turned their attention to the construction of a motor, which should be serviceable and cheap enough for the farmer's pleasure and for his marketing. We are not able to decide as to the present value of some of these vehicles, only they are built at a price which brings them within the reach of a man of moderate means. One or two of them are sold for from four to seven hundred dollars. One takes the form of a common buggy, while others are more specifically built for hauling. However, so far, the most manifest assistance given to the remote farmer is along the trolley line—where his wagons, built for the track, are picked up by a trolley engine and hauled into town.

In the field itself it did not seem possible to use the gasolene or electrically-propelled automobile. A Kansas man has, however, been working quietly on the problem, and it is said that he is successfully running a gang plow with an automobile. With this he is able to do about three times the work done by four horses. He is able to plow thirty acres a day with fifty gallons of gasolene. The car now in use weighs a little over four thousand pounds, and is of thirty horsepower. It moves across a common country sod, pulling gang plows that turn six furrows at a time, and without noticeable display of power. The same auto or machine is used for hauling wheat, or a train of wheat-loaded wagons to market—at a rate of six miles an hour. The same engine will run any other machine or set of machines on the farm. The owner will have the equivalent of fifty horses and twenty-five drivers stored away, able to work night and day without rest when wanted, and without the cost of feed when resting. Efforts have been heretofore made, and the results have been exhibited at State fairs, but up to the present time not anything has been turned out satisfactory. The present invention has been tested, and will be placed on the market by another year.

Another application of electricity to farm work turns up in Maryland. It is in the form of a milking machine. It is asserted that by the use of this electrical appliance absolutely pure milk can be supplied city consumers or others. Rubber tubes lead directly from the cow's udder into closed cans, eliminating danger of contamination of any sort. Of course, the same electric plant can be used for other farm work. It can run the threshing machine, or saw wood, or grind fodder. It can be used for filling the silo, for operating the separator and churn, for pumping water, and turning grindstones. In the house it can be used to operate the washing machine, the clothes wringer, the sewing machine, and even to wash the dishes. Some one must apply it to sweeping, and the work is done. In other words, electricity has entered the barn and the house; and as we have seen above, it has entered the field, and is going very far toward the settlement of the help problem. We are pretty sure that we are going to be able soon to hold an Emancipation Day from the terrors of inferior help, and little of that.

In France the use of electricity in domestic service is greatly facilitated by the loaning and leasing of power from the waterways and trolly plants. Something of this sort has already been inaugurated in this country, and we believe is making considerable headway in some of the Western States. It has been tried to some extent in New York State. The movement could be advanced greatly by associating such service with franchises. The town that grants the use of its highways might properly increase its own income by stipulating for the use of surplus power at low prices, both for public enterprises and for domestic service. It is believed by some economists that we are to look along this line for the solution of the fuel problem, which is beginning to crowd upon us. Notwithstanding the protest of a few experts, we find Orton's estimate is now approved by best authorities, that coal will be practically exhausted before 1950. This, of course, does not mean that we shall have used up all the storages in our mines, but that coal can no longer be furnished in sufficient quantities to meet the growing demands of mechanical work, transportation, fuel and light. Dr. McGee, of Chicago, addressing the City Club, and speaking of the deep waterway system, now being urged upon Congress for action, said that in addition to the benefits to be expected in the way of cheap transit, he looked for the development of a great power available for distribution among the people. He would have lock dams constructed that would distribute the power, all along the route, in such a way as to create a revenue, and at the same time wonderfully develop millions of acres now either unusable or burdened with the dearth of help.

It is difficult to forecast the uses of electricity and its possible applications without losing ourselves in enthusiasm. We have wholly outlived the area for making sport of prophets. We are inclined to anticipate too much rather than too little. At any rate, the farmer will do well, for the present at least, who plants a wood lot. The readjustment of all our industrial life to electricity will be neither sudden nor speedy. We are not going to get rid of some of the more severe phases of labor. The great Northwest is threatened by fuel famine from car shortage—and we have in sight, neither from electricity nor otherwise, any certain relief. We are told that it will take at least three years for our railroads to equip themselves in such a way that the farmers' surplus can be transmitted to market, and coal supply be insured in return. We must be content at present with makeshifts and be cheered by anticipation.

A Newspaper Outbreak

Again there is the attempt to make the public believe that the sending of the fleet to the Pacific was with the conscious intention of stirring up the Japanese people to angry protest and war. Of course the noisy repetition of such assertions is itself calculated quite as much as the despatch of the fleet to excite the Japanese by telling them they ought to get angry with us. It is reckless fighting with fire to spread such notions, and is most reprehensible. Even more reprehensible is it if the reason for it is in no degree patriotic, but, as is evident in some cases, is a simple expression of malice toward the President, and of a desire to discredit him at any risk. It is quite possible that the President thought it would be safer, in view of imaginable contingencies, to have a strong fleet in the Pacific, while at the same time expecting nothing but the most amicable relations with Japan. That is conceivable and not to his discredit, just as the war departments of all nations try to have in their bureaus plans of the forts of nations with which they are in the firmest concord. The sending of the fleet is not in itself as provocative as is this mischievous newspaper talk, nor as is the anti-Japanese attitude of San Francisco. We are good friends with Japan, always have been, and the Japanese have the right to believe that Secretary Taft was genuine in his desire and faith for permanent peace, and that is the kindly sentiment of the American people.

A Hero

Andrew J. Hedger is a Superintendent of Schools of Finney County, Kan. He has a wife, who is an invalid, and four children. On November 27th, 1906, he heard that Joseph H. King and William H. Munn

were caught in a cave-in two miles away. Running all the way to the spot he found 200 people already present. He offered to draw lots with any of them to see who should enter the well. All refusing he wrote a letter to his family with final instructions regarding his insurance policies and property, and having given it to one of the bystanders descended seventy-two feet into the well to almost certain death. For two hours he worked with a shovel before he uncovered King, whom he sent to the surface, and still he kept shoveling until he found the dead body of Munn. He then had only enough strength left to tie the rope around his body and was drawn to the surface. Last week the Carnegie Hero Fund Commission awarded him a gold medal and $3,600 in cash. The commission considers this the most extraordinary act of heroism ever brought to their notice. "Peace hath her victories no less renowned than war."

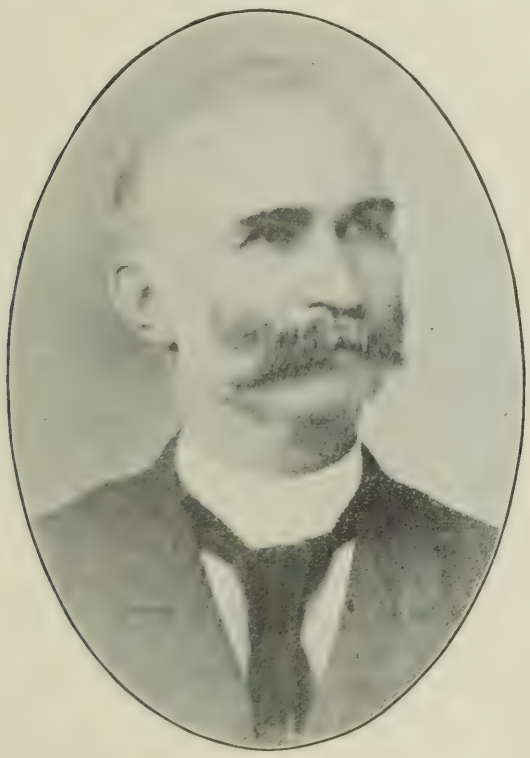
Our Correspondent in Prison

Mr. William English Walling, one of THE INDEPENDENT'S most valuable contributors, and for two years our special correspondent in Russia, has been arrested in St. Petersburg, together with his wife and sister-in-law, on what precise charge is not clear, but apparently because he has been associating with revolutionists. As Mr. Walling proposes to find out whatever he can about actual conditions in Russia, there is little doubt that he consorts with revolutionists just as he does with bureaucrats. Tho a rich man, who could spend his time in idleness, he devotes his whole life to investigating social conditions here and abroad. We advise the Russian Government to let him go as quickly as possible. They will find it a far different matter to jail an honest and intelligent American citizen than some poor subject of their own. If the bureaucracy only had the sense to translate into Russian and scatter broadcast among the people Mr. Walling's INDEPENDENT articles, what a good thing it would be for Russia. But tyranny takes no advice. Here are some of the titles of Mr. Walling's articles that have appeared in our columns. Perhaps this imprisonment will be the theme of another: November 2, 1905, "The Revolution in Poland"; January 25, 1906, "The Social Revolution in Russia"; March 15, "Moscow"; October 18, "The Peasants' Revolution"; December 6, "Will the Peasants Act?"; March 7, 1907, "The Village Against the Czar"; April 4, "Civil War in Russia"; July 4, "The Real Russian People at Church"; September 26, "The Real Russian People at Home."

The "Lusitania" and the "Mauritania" are to be beaten in size by the next Hamburg-American Line steamship, the "Europa," which is now building at Belfast, and will displace 48,000 tons, as against the 32,500 of the "Lusitania." We shall soon conquer seasickness, for the big ship will ride the waves indeed. Now we wait for the newly promised other craft, which is to slide over the water, instead of plowing thru it.

From the pastorate of the famous and historical Church of the Pilgrims, in Brooklyn, Dr. H. P. Dewey leaves this week to go to one of the very strongest Congregational churches in the country, the Plymouth Church in Minneapolis. He has done admirable service as successor to Dr. R. S. Storrs, and is yet a young man.

Where are our poets? Is not the instantaneous transmission of messages between the severed branches of the Anglo-Saxon race by means of an invisible, intangible medium as inspiring a topic as a royal marriage or a bloody battle? But we are not asking the poems sent *us*.



Last week Henry M. Whitney, a most honored member of President Roosevelt's Ananias Club, was declared the regular nominee of the Democratic party for Governor of Massachusetts. The Ananias Club is not in bad odor thruout the land.

Sarah Bernhardt teaches a good lesson from the stage. She says she is an old woman, but she has no intention of giving up work, but means to stand on the stage as long as she lives.

Financial

Banks and Speculation

LAST week's events in Wall Street give fresh emphasis to the sound doctrine that banks should not be used for the support of speculators and promoters. Whenever a bank falls under the control of a capitalist engaged in speculation, or in the promotion of large projects upon inadequate foundations, it eventually comes to pass that he makes an improper use of the institution's resources. Then there is imminent danger of great loss,

SETH M. MILLIKEN,
President of the Mercantile National Bank.

to be suffered not only by the bank's depositors and stockholders, but also by the general public, owing to depression of the securities market and to a loss of confidence in other banking institutions that are truly conservative in policy. In this instance, certain speculators, unrestrained by a shrinkage of more than $400,000,000 in the market value of copper securities since the beginning of the year, or by the great decline in the price of the metal, sought to operate a corner in the shares of a copper mining company whose president recently bought control of a New York bank. The attempt failed promptly and miserably, owing in part, it is believed, to the treachery of one of the operators. This collapse was followed by the failure of two brokerage firms. Suspicion concerning the bank controlled by the speculators was naturally excited. Fortunately, an examination by the Clearing House committee showed that it was solvent. Its capital was not impaired, altho its deposits had fallen from $19,000,000 to $11,000,000, and it still possessed a comfortable surplus, altho nearly half of it was tied up in loans upon securities at present unmarketable. These loans are supposed to have been made in the interest of the venturesome persons who have owned the institution. The Clearing House authorities have very properly caused the retirement of the bank's president (who is also president of the copper mining company) and of all its directors, one of whom has also withdrawn from the vice-presidencies of three other banks and the boards of several other financial institutions. Thus the Clearing House Association has once more proved its great value as a conservative force in times of danger. The way has been cleared for a rehabilitation of the Mercantile National Bank and for a complete restoration of confidence in the other institutions in some measure affliated with it.

Seth M. Milliken, senior member of the well-known firm of Deering, Milliken & Co., cotton factors, at a meeting of the directors of this bank, was elected president to succeed F. Augustus Heinze, resigned. Mr. Milliken is a trustee of the Bowery Savings Bank, a director in the Fidelity Bank, of the bank of which he now assumes the executive management, of the Trust Company of America, and of the Van Norden Trust Company, besides having very close relations as director or trustee with numerous manufacturing and industrial concerns of the best class. Following the retirement of Charles W. Morse as a vice-president and director of the National Bank of North America, and the resig-

nation of the president, Alfred H. Curtis, at a meeting of the directors of this bank, held at the home of John H. Flagler, William F. Havemeyer was elected to fill the presidential vacancy. Mr. Havemeyer is related to Henry O. Havemeyer, president of the American Sugar Refining Company, and is a director in the following corporations: Corn Exchange Bank, National Bank of North America, Nineteenth Ward Bank, Van Norden Trust Company, Colorado Eastern Railway, Queens County Safe Deposit Company, Union Ferry Company, Title Insurance Company of New York, Van Norden Safe Deposit Company, Century Realty Company, Chelsea Realty Company and New York Mortgage and Security Company.

Saturday's weekly statement showed that the Association banks are in an exceptionally strong position. This should inspire confidence. It is unfortunate that this affair should have caused a considerable decline of stocks, but this is usually the result of such a violation of sound banking policy. The conservative banking interests of New York should not be satisfied with intervening at a crisis to prevent disaster; they should strive earnestly to discourage at an earlier date the acquisition and use of banks by speculators and the promoters of doubtful projects.

Fifty Years of Banking in Chicago

In commemoration of its fiftieth anniversary and half century of public service, the Merchants' Loan and Trust Company, the oldest existing bank in Chicago, has just issued a very attractive book entitled "Fifty Years of Banking in Chicago," with text by William Hudson Harper and Charles H. Ravell. The volume, which is an excellent example of modern bookmaking, is first concerned with a description of the Merchants' Loan and Trust Company as it is today. The organization of the bank is modern in every particular, and its directors, according to the book, actually direct, which shows that banking in Chicago has certainly progressed much more than it has in some places further East. Well executed half-tone cuts of the bank's directors, former directors, its officers and long-time employees adorn the book's pages. Its various departments are tabulated, and the plan and scope of each are clearly set forth. The origin and early history of the Merchants' Loan and Trust Company is given a conspicuous, but very appropriate, place in the volume, which must be particularly interesting to the patrons of the bank. The book closes with a survey of early banking in Illinois, when banking consisted in barter. A number of well-executed etchings find places in this volume.

....The United States Trust Company, of which Edward W. Sheldon is president and William M. Kingsley second vice-president, has elected as first vice-president John Crosby Brown, head of the banking house of Brown Brothers & Co., in place of D. Willis James, deceased. The capital of the United States Trust Company is $2,000,000; the surplus and undivided profits are $13,557,815, and the total resources are $75,683,473.

WILLIAM F. HAVEMEYER,
President of the National Bank of North America.

The Pinkertons and the American Bankers' Association

THE annual report of Pinkerton's National Detective Agency for 1907 to the American Bankers' Association is an interesting document. Notwithstanding the fact that the membership of the association has increased about 900 members since the preceding report, there have been fewer crimes in proportion perpetrated against members than for any year since the protective work was inaugurated. The efforts of the association to which the Pinkerton's report, are exclusively directed against professional thieves, forgers, burglars and swindlers. The following table shows something of the work done by the Pinkertons and the American Bankers' Association working together:

		Arrested since Sept. 1, 1906.	Arrested prior to Sept. 1, 1906.	Convicted.	Sentenced.	Specific terms.	Indeterminate term.	Total year.	Months.	Escaped.	Recaptured.	Released.	Awaiting trial.
Burglars	Special	13	1	12	12	10	2	64	8	0	0	0	2
Burglars	General	18	10	17	17	13	4	125	8	1	0	7	3
Hold-ups	Special	4	0	4	4	0	4	0	0	0	0	0	0
Sneak thieves	Special	1	0	1	1	1	0	5	0	0	0	0	0
Forgers	Special	30	11	19	19	14	5	63	1	1	1	11	11
Forgers	General	31	2	22	20	12	8	42	1	2	0	4	7

The following law, previously recommended for enactment in the several States, has received considerable attention, viz.:

"Burglary with Explosives—A person who, with intent to commit burglary, breaks and enters, in the night time, a building, and commits a burglary by the use of nitro-glycerine, dynamite, gunpowder, or any other high explosive, is guilt of burglary with explosives.

"Burglary with Exposives—How Punished—Burglary with explosives is punishable by imprisonment in State Prison for not less than twenty-five years and not more than forty years."

The efforts put forth in favor of this law have now resulted in the taking of favorable action along the line of the proposed legislation, and five States have enacted this law, with the penalty as follows:

Colorado..	Law passed..	Punishment 25 to 40 years.
Kansas....	" ..	" Not less than 25 years.
Maryland..	" ..	" 25 to 40 years.
Missouri...	" ..	" Not less than 25 years.
Nebraska..	" ..	" 20 years to life imprisonment.

THE Illinois Insurance Department in a recent ruling holds that the use of special agency contracts and board schemes, as well as the sale of stock in agency or insurance companies as inducements to the taking out of life insurance, is against the law. A number of companies operating in Chicago are affected by the ruling. An effort will be made to have this ruling changed, but in the meantime the offering of company or agency stock to prospective insurers as an inducement to take out policies of insurance will be regarded by the department as a violation of the anti-rebate law. The above ruling would, however, not prevent an insurance company from selling its stock to a policy-holder as an independent proposition, disassociated from the sale of insurance. The action taken by the State of Illinois is in line with similar action previously taken by twenty-two out of thirty States in which the anti-rebate law is in force.

(*Continued from page* 1019.)

Edward L. Andrews counsel, that arrangements for the enforcement and consequent refunding of these securities have been made, and that the bonds, under the agreement of March 29th, 1905, should be deposited, on or before November 1st, with the United States Trust Company, at 45 Wall street.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

The Financial Panic in New York

Banks and trust companies in New York were subjected to a severe strain thruout last week. Banking institutions in three other Eastern cities were affected. On the Stock Exchange, at times, panic conditions prevailed. At the end of the week there were signs that the crisis had been past. The original cause of disturbance was the collapse, in the preceding week, of a corner in the shares of a copper company. Several banks at once fell under suspicion. By prompt and drastic action, the Clearing House Association intervened for the protection of all. F. Augustus Heinze, Charles W. Morse, E. R. Thomas and O. F. Thomas retired from the banking business, and, as a result of this movement, new presidents of four banks (beginning with the Mercantile National) were elected. We referred to these events last week in our financial department. It was ascertained that the banks under criticism were solvent, and the Associated Banks decided to support them. For this purpose $10,000,000 was pledged. Owing to the elimination of speculative interests, prices on the Exchange advanced on Monday, the 21st. That night, however, a new cause of disturbance appeared in the resignation of Charles T. Barney, president of the Knickerbocker Trust Company, an institution having $62,000,000 of deposits and housed in a costly new building on Fifth avenue. Mr. Barney had been associated with Mr. Morse in various projects. The great Bank of Commerce, of which he was a director, refused to act longer as the Knickerbocker's agent with the Clearing House. It was reported that $15,000,000 had been pledged to meet the foreseen run on the suspected trust company. The latter had $8,000,000 in its vaults and was said to have a surplus of $5,707,000 Mr. Barney, who resigned at the suggestion of the directors, is a brother-in-law of the late William C. Whitney, whose son and other capitalists were in the board. He was a director in more than thirty companies. On Tuesday there was a great run upon the Knickerbocker and its branch offices. After $8,000,000 had been paid out, the doors were closed, at 12:30 p. m. It appears that the report about $15,000,000 for support was not well founded. The institution is now in the hands of temporary receivers, appointed in response to the application of Attorney-General Jackson. Its loans and investments leave something to be desired, but some think the depositors will eventually get all, or nearly all, of their money. There are investments in and loans upon the securities in which Mr. Morse is prominently interested. The latter has been influential in the Ice Trust, and he consolidated many of the steamship companies doing business on the Atlantic Coast. Last week the common stock of the holding company of these steamship interests was selling at $1 a share, and its 4 per cent. bonds at less than one-tenth of their par value. About two hours before the closing of the doors, a notice had been posted, in which Mr. Skinner, Acting Superintendent of Banks, said that the company was solvent, with a large surplus. During the run, Fourth Vice-President William Turnbull said to the press:

"This is the inevitable end of what has been in progress for months. There is a man

high in authority in this country who does not know the meaning of credit and who has consistently done all that he could to destroy this delicate constituent of legitimate business methods. When a snowball starts it seems a small thing, but when it rolls down hill and somebody behind pushes it faster, it gathers and gathers until its size increases enormously. The attack upon business which was inaugurated by this man has now grown like a snowball. The nerve of the public is strained nearly to the breaking point as the result of these attacks by this man who does not know the meaning of credit. If disaster follows this initial break, and any one wants to learn the fundamental cause of the trouble, let him go back over the last six months and read the speeches of this man."

Mr. Turnbull's remarks were not commended by the press, whose news columns have shown the nature of the credit operations which were the original cause of disturbance, as well as the character of the Knickerbocker's investments and loans. On the same day, in a speech at Nashville, President Roosevelt said:

"There has been trouble in the stock market, in the high financial world, during the past few months. The statement has frequently been made that the policies for which I stand, legislative and executive, are responsible for that trouble. Now, gentlemen, these policies of mine can be summed up in one brief sentence. They represent the effort to punish successful dishonesty. I doubt if these policies have had any material effect in bringing about the present trouble, but if they have, it will not alter in the slightest degree my determination that, for the remaining sixteen months of my term, these policies shall be persevered in unswervingly.

"If to arouse that type of civic manhood in our nation it were necessary to suffer any temporary commercial depression, I should consider the cost but small. All we have done has been to unearth the wrongdoing. It was not the fact that it was unearthed that did the damage. All I did was to turn on the light. I am responsible for turning on the light, but I am not responsible for what the light showed. It is impossible to cut out a cancer without making the patient feel for a few days rather sicker than he felt before."

He would protect honest property in every way in his power, he added, and would protect the honest man of wealth to the extent of his ability; but in no other way could he protect the honest man of wealth so effectively as by bringing his "dishonest brother of wealth" to justice. On the following day, at Binghamton, N. Y., Mr. Bryan said:

"I notice that one of the officers of the bank that closed its doors yesterday attributed it to President Roosevelt. That is not the reason. Don't blame the sheriff, but the horse thief. Don't blame the officials who make and enforce the laws, but blame the criminals who make such laws necessary. Blame the unscrupulous financiers who have piled up predatory wealth and who exploit a whole nation as 'high finance.'"

Other Events of the Week

After the closing of the Knickerbocker, it became known that the Trust Company of America, another large institution, was under suspicion, altho solvent and having $12,000,000 in cash on hand. The leading financial interests decided to support this company. There was a continued run upon its resources. It paid out nearly $11,000,000 on Wednesday, about $9,000,000 on Thursday, and $2,000,000 on Friday. Then the tide turned, and on Saturday the new deposits are said to have exceeded the payments. Secretary Cortelyou came to New York and was associated with J. Pierpont Morgan and others in projects for relief and protection. There was still (on Wednesday) no serious trouble in other cities, except in Pittsburg, where the Westinghouse Electric Company and two or three corporations associated with it were placed in the hands of receivers. The Westinghouse business was larger than ever before, but there was difficulty about renewing loans. Arrangements have since been made for extensions covering three years. The Pittsburg Stock Exchange was closed during the greater part of the week. Banks there were said to be in good condition. On Wednesday, in New York, the oldest and largest trust companies united in giving support. They formed a committee of five, headed by Edward King, and representing five companies whose total resources are about $350,000,000. This committee worked in concert with Mr. Morgan, who had become the leading conservative figure in the crisis. With John D. Rockefeller and others he raised a relief fund exceeding $50,000,000, and Mr. Cortelyou deposited $25,000,000 of Government money in the banks. Thursday afternoon, when stocks were falling and brokers could obtain no money, even at 100 per cent., Mr. Morgan loaned $27,000,000 on the floor of the Stock Exchange, thus preventing utter demoralization. On the following day he loaned $10,000,000 more. These

funds had been raised by the great banks and capitalists. The limits of our space will not permit a complete narrative of the week's events. There were sharp runs on the savings banks, all of which finally decided to require sixty days' notice except for small payments to needy depositors. Several small banks, a majority of them in Brooklyn, suspended payment because of lack of ready cash. It is not clear, however, that any one of them is insolvent. There was evidence, in the statement of Comptroller Ridgely and in other testimony, that the national banks were sound, but it was difficult to obtain cash for payments to anxious and unreasoning depositors. In one day, $10,000,000 in small bills was sent over from Washington. Among the institutions on which there was a run was the Lincoln Trust Company, which paid out more than $4,000,000. In Providence, in the latter part of the week, a run on the Union Trust Company caused it to close its doors. Two other trust companies there resorted to the requirement of ninety days' notice. The Southern Steel Company, of Alabama, was embarrassed by lack of accommodation, and creditors asked for receivers. Savings banks in Baltimore required sixty days' notice. No trouble was reported in Philadelphia, Boston or Chicago. One of the suspended Brooklyn banks is the oldest in that borough, having been founded in 1832. At the end of the week the Clearing House Association decided to use loan certificates for the relief of the banks. They were last used in 1893. Similar certificates will be issued in Philadelphia and Pittsburg. On Saturday there were signs of a re-establishment of confidence, and $7,000,000 in gold was engaged abroad. It is thought that several of the New York trust companies will join the Clearing House Association, consenting to a requirement of 15 per cent. reserve against their deposits. Stocks at the end of the week showed a considerable net decline, but there had been only one brokerage house failure, that of Mayer & Co., for about $6,000,000. Good reports concerning manufactures and retail business thruout the country were received, together with evidence of a continued increase of railroad earnings. On Sunday there was published the following letter, sent on the 24th to Secretary Cortelyou by President Roosevelt:

"I congratulate you upon the admirable way in which you have handled the present crisis. I congratulate also those conservative and substantial business men who in this crisis have acted with such wisdom and public spirit. By their action they did invaluable service in checking the panic which, beginning as a matter of speculation, was threatening to destroy the confidence and credit necessary to the conduct of legitimate business. No one who considers calmly can question that the underlying conditions which make up our financial and industrial well-being are essentially sound and honest. Dishonest dealing and speculative enterprise are merely the occasional incidents of our real prosperity. The action taken by you and by the business men in question has been of the utmost consequence and has secured opportunity for the calm consideration which must inevitably produce entire confidence in our business conditions."

The Battleship Fleet

Speaking of the coming transfer of the battleships to the Pacific, the President said, on the 24th, that his intention was that they should remain there three or four months and should then return. This statement appears to have been suggested by comments upon his remark, in a speech at Vicksburg, that there was money enough on hand to pay for the coal and other supplies required for the outward voyage, and that if the appropriation should then be exhausted, "the question of coming back" would "depend upon another appropriation being made." The battleships have been ordered to assemble at Hampton Roads on December 9th, and to start for the Pacific on December 16th. Reports to the Government show, it is stated, that Japan is not making large purchases of war material, but "is diligently pursuing the ways of peace and striving to recuperate from the exhausting effect of the recent war." Dr. Louis L. Seaman says that, in a letter to himself, dated on September 17th, Count Okuma remarked that "the sending of a fleet at this time is not good diplomacy." ——On the 26th, Secretary Root said, after a conference with the Japanese Ambassador at Washington:

"No such relations exist between the United States and Japan as would make it improper to send the American battleship fleet into the Pacific. If there were, then the relations between the United States and Great Britain and the relations between the United States

and France, which are the same, would forbid the maintenance of the battleship fleet in the Atlantic Ocean."

It is said by authority that there have been no negotiations with Japan for a treaty to enforce our legislation of last February concerning the immigration of Japanese laborers. Japan is unwilling to embody the restrictions in a treaty, but will co-operate with our Government in enforcing them, because her laborers are needed in Corea and Manchuria.——Canada's Government asks the Government at London to take all possible steps for limiting or discouraging the emigration of Hindus to British Columbia. Canada's special envoy to Japan, Mr. Lemieux, will say to the Japanese Government that when the existing treaty was made there was an understanding that immigration from Japan should be limited; that assurances to that effect were given in the Canadian Parliament; and that if the understanding be not carried out, notice for abrogation of the treaty may be given.

Railroad Questions

Reports from Washington say it did not appear during the investigation made in San Francisco by Commissioner Lane that President Harriman had any knowledge of the rebates paid by the Southern Pacific since the Hepburn act went into effect. It is asserted, therefore, that he will not be prosecuted. The hearing in the case of the Commission's application to the court for an order directing him to answer the questions which he refused to answer during the Union Pacific investigation was adjourned on the 21st to November 13th. It is said in Washington that Attorney-General Bonaparte has decided to sue the Southern Pacific for the recovery of 2,000,000 acres of land alleged to have been acquired illegally in Oregon, and has employed Tracy G. Becker to conduct the prosecution.——What is called the "little Alton" rebate case against the Standard Oil Company will be tried in Chicago before Judge Bethea, beginning on January 6th. This is like the case in which Judge Landis imposed a fine of $29,240,000, and it involves a possible fine of $2,680,000. Counsel for the Standard will base their appeal from Judge Landis's sentence in part upon the allegation that the Elkins law is unconstitutional, and will contend that the Government ought to have informed the defendant of the agreement by which the Alton road gained immunity.——In accordance with an agreement between Governor Comer, of Alabama, and the president of the Southern Railroad Company, the rate of $2\frac{3}{4}$ cents a mile will be adopted by the Southern and its subsidiary lines in that State, and pending legislation on the subject will be dropped.——During the examination of Otto Kelsey, the New York Superintendent of Insurance, by a special commissioner appointed by Governor Hughes to investigate his department (from which the Governor sought unsuccessfully, some months ago, to remove him for incompetence), it was shown, last week, that recently, and since the enactment of the new insurance laws, the Mutual Life Insurance Company had loaned $3,000,000 to the Illinois Central Railroad Company, $2,000,000 to the Southern Pacific, and $4,000,000 to the Delaware & Hudson and one of its subsidiary corporations. In answer to the commissioner's questions, Mr. Kelsey said he had not inquired whether any members of the Mutual's finance committee were directors of the companies which obtained loans. It appeared that this question was suggested by the fact that President Peabody is a member of the finance committee and is also a director of the Illinois Central, the Delaware & Hudson, and the Union Pacific, which controls the Southern Pacific. These are called Harriman roads. The commissioner's questions appeared to warrant the inference that in his opinion the making of loans under such conditions was not in accord with the new law, altho the record does not show that he said so.

Secretary Taft's Visit to Manila

Secretary Taft was entertained last week at several banquets, and he laid the cornerstone of the first permanent schoolhouse to be erected in Manila under American rule. At one of the banquets he said that the future prosperity of the islands would depend upon the Filipinos themselves. He believed that the investment of foreign capital would be welcomed by the new Assembly, to which those who sought

concessions and franchises must make application. At another banquet, given in his honor by the Assembly, he was introduced as the next President of the United States, to which, in a toast, all pledged loyalty. To the Secretary was given a fine silver loving cup of native manufacture. He urged the importance of education, and again expressed his hope for a reduction of the tariff on Philippine products. [Such a reduction is now to be sought in connection with a limit upon the quantities of Philippine sugar and tobacco exported to the States.] He was glad, he said, to hear Speaker Osmena say that the United States had kept in letter and spirit all its promises to the islanders. Señor Regidor, who was deported for taking part in an insurrection, and was afterward accustomed to demand independence for the islands, said at this banquet that it would now be wicked to agitate for independence, because "undreamed-of measures of self-government had been so generously granted by the United States." The Secretary went to Subig Bay, desiring, if possible, to reconcile the differing opinions of the army and the navy as to the fortification of the naval station there. Admiral Dewey prefers Subig Bay to Manila Bay, but the army engineers say that 100,000 soldiers would be required to defend Subig against an attack by land. Even more would be needed for Manila. The police of Manila are so zealously enforcing the new law against gambling that they gave warning at the house of Judge Smith, during a session of the Bridge Whist Club, held in honor of Mrs. Taft, that there should be no stakes or prizes.

Land Fraud Cases

Indictments have been found by a Federal grand jury at Santa Fé, N. M., against Phelps, Dodge & Co., of New York, as owners of the El Paso & Southwestern Railroad, of smelting works and of coal lands, together with Charles S. Spiess, their attorney; Professor Douglass, formerly territorial engineer; David M. White, and sixteen other persons. The charge is conspiracy to defraud the Government of coal lands. ——At a preliminary hearing in Denver with respect to land fraud indictments found there some months ago, Guy D. Goff, Charles F. Hunter, T. J. Pereles, J. M. Pereles, Chauncey L. Jones and Elias Arnold, all well-known citizens of Milwaukee, and connected with the Wisconsin Coal Mining Company or the Federal Coal and Iron Company, have been held for trial.——James L. Bradford, a wealthy resident of New Orleans, was recently pardoned after serving four months of a term of two years in prison, for defrauding the Government of public land. He has paid his fine of $5,000, and on the 19th 2,000 acres of the land in question was restored to the Government.——In the case of the Rev. George G. Ware, convicted in Omaha of obtaining public lands by fraud, and sentenced to be imprisoned for one year, the Supreme Court at Washington has declined to grant him a new trial.

The Mohonk Conference

This conference has rounded out a quarter of a century. It is no longer exclusively for the good of the Indians. All the races that have come under the oversight of the United States are now considered by this body. The next twenty-five years is to be devoted to accomplish for the Porto Ricans, the Filipinos and the people of Hawaii what has been secured for the Indians, as a result of the influence of the Mohonk Conference. The pressing need of the Indians is no longer legislation, but the wise carrying out of the laws already on the books. With the other peoples it is different. The platform which was unanimously adopted at the recent Mohonk Conference calls upon Congress to be up and doing in their behalf. First of all, these people must have a lift in education. Federal help is urged as absolutely necessary that all the children, instead of a small proportion, shall have primary education at least. There were several Congressmen at Mohonk, and they heard that the Filipinos are looking to them for justice in tariff affairs and to securing an indefinite postponement of the application of the coastwise shipping act, which would bear more heavily on them than it does even on

the American in Hawaii, who must pay a fine of $200 if he ventures to cross the ocean from there in any but an American vessel. Another demand is for methods by which the residents of these various islands may become American citizens. The absurd anomaly which forbade the only real native of this country, the red man, to become a citizen of the United States has been removed, but instead it is now transferred to the resident of Porto Rico, who cannot renounce his allegiance to any other sovereign, because he has no such allegiance. He is neither native nor foreigner—neither fish nor fowl, and there seems no way of even making of him good red herring. The Mohonk Conference begs Congress to attend to these and various other reforms and pledges itself—and that "itself" is made up of hundreds of wise and public-spirited people—to aid in every effort for the happy development of these many new cousins over the seas. We give passages from the platform:

"We record our high appreciation of the executive ability, unselfish devotion and sympathetic spirit toward the Filipinos which have distinguished the administration of Secrtary Taft.

"In spite of the great magnitude of the responsibilities assumed, gratifying and encouraging results have been obtained in the last eight years. The currency of the islands has been placed upon a stable basis without commercial friction a general educational system especially adapted to the needs of the Islanders has been established under American and native teachers, and 430,000 pupils enrolled. Great sanitary reforms have been effected. The harbor of Manila has been permanently improved. Insular and telegraphic communication has been established and important railway enterprises undertaken. Postal savings banks have been created with beneficient results and an agricultural bank has been authorized by Act of Congress. Land titles guaranteed by law have given a new stability to business enterprises. Local self-government has been firmly established in every civilized community, and the Philippines National Assembly has lately been elected and organized. We are grateful that insular administration has not been an issue between political parties in the United States, and that, the insular service has been placed upon a basis of principle and merit, rather than upon one of politics. . . .

"By legislation which we regard as directly at variance with the moral duties we owe to the Philippine Islands, Congress has imposed upon them great and unmerited burdens. While all commodities coming to the United States from Porto Rico and Hawaii are admitted free of duty and those from Cuba at twenty per cent. of the existing tariff, a tax of seventy-five per cent. of said tariff continues to be imposed upon two of the principal products of the Islands, while a third product produced there alone and therefore not in competition with products of the United States is admitted free. This glaring inequality does not, we believe, reflect the prevailing spirit of the American people. . . .

"We urge that Congress shall without delay legislate so as to effect a radical reduction of the duties now collected on products of the Philippine Islands.

"We advise that the greatest educational emphasis be put upon the primary schools and the preparation of teachers therefor, and that such instruction shall have special reference to industrial training. The utmost effort should be made to secure the enrollment and attendance of all children. We maintain that it is the duty of Congress to provide adequately for such education even if the necessary money were to come from direct appropriation, but additional funds to those now raised in the Islands would become available there for educational purposes by the increased amount of taxable property which would be accumulated as a result of the reduction of existing duties.

"We recommend Congressional enactment to enable a large number of persons in the Philippine Islands to be naturalized as citizens of said Islands. We believe that provision should be made by Congress whereby educated and duly qualified Porto Ricans may become citizens of the United States.

"We recommend that the application of the Coastwise Shipping Act be permanently suspended with reference to the Philippines, and that Congress give serious attention to legislation necessary to relieve Hawaii from the disadvantages which this law imposes, and encourage the industrial development of Porto Rico.

"With clear recognition of the ability shown in the administration of affairs in the Philippines and the conviction that we have a body of competent men trained in colonial administration, it still seems to us that the Bureau of Insular Affairs, whose functions are essentially civil, should be ultimately committed to some other department than the Department of War.

Porto Rico

According to reports published in the *Porto Rico Review*, which is edited by ex-Attorney-General Sweet, remarks made on September 16th by Governor Regis H. Post at a conference of school superintendents in San Juan are sharply resented by those to whom they were addressed and by others. It is asserted that fifteen superintendents at once resigned, and were induced to withdraw their resignations only by what was virtually an apology from the Governor on the following day. Among those present were

Dr. Dexter, the new Commissioner of Education, and Dr. Lord, his assistant, who has been in the service for some years. The newspaper report says that the Governor bitterly attacked the Department and the superintendents, declaring that the Department's influence in the island was worse than any other, except that of the missionaries; that he called the superintendents pharisees, and that he sought to emphasize his criticism by profanity. The Governor, who is now in this country, explains that his criticism was suggested by the fact that the attitude of some of the superintendents and teachers toward the people had been unsatisfactory, being marked by an assumption of national or racial superiority which excited anti-American feeling. Those so offending, however, were a minority. The school officers generally, he adds, as well as the missionaries, have accomplished much good.

The Pillage of Churches

In both France and Italy there is no little scandal over the stealing or sale of old church treasures. A French dealer has been guilty of actual robbery, and has transferred not a few valuable ecclesiastical objects to England and elsewhere. The result is the introduction into the Chamber of Deputies of a more stringent bill, which will safeguard such objects of historical value, at present insufficiently guarded, by putting them in public collections. There are already general laws in France, as also in Italy, against taking any art treasures of value out of the country without authorization by the authorities, and a similar bill has been introduced in the Spanish Cortes. But in Italy the scandal comes nearer to the Church itself, for three ecclesiastics, two canons and an abbot have been guilty of selling the finest objects belonging to the Cathedral of Aosto. These three priests secured keys to the treasure room of the Cathedral, in which many objects of value were stored, and also money, as it was used as a safety deposit vault by the wealthy people. They succeeded in disposing of many objects belonging to the churches of the diocese of Aosta, replacing them by counterfeits. Among the objects stolen and sold were twenty-five fine high-relief statues that adorned the thirteenth century choir of Aosta Cathedral, substituting for them copies made by a wood carver. One magnificent medieval cope is among the treasures, and in this case a village priest was the intermediary.

Various European News

The Emperor of Austria, after an illness which, tho not in itself severe, yet gave much anxiety on account of his age, has very nearly recovered from his attack of infectious bronchitis.——The Italian Government, in reply to relatives of Italians in Mississippi, says that it has not the slightest fear that any difficulty will follow the reported refusal of one or more towns in Mississippi to allow the Italian children to attend the public schools. The answer declares perfect confidence in the loyal friendship of the American Government and in the ability of the Italian Minister at Washington to prevent any dispute of the kind. It is added that no difficulty is expected in settling any trouble that may arise, and that no serious elements, such as entered into the recent racial trouble in San Francisco, can figure in the present discussion. ——The French Chamber met October 27th and found M. Clemenceau in command of the Government forces, and with a pliable Chamber. There is no present likelihood that he will be driven to resign. His action against the anti-militarists has been supported by the nation, and his action will be drastic against those who are distributing pamphlets against the army and crying "Down with the Fatherland." A very important proposition will be to reform the Councils of War, so as to eliminate the strong Monarchist influences in them. The attempt of M. Bourgeois to carry an income tax wrecked his administration, but will be renewed with much courage by M. Clemenceau. He will be interpellated as to Morocco, and has set a day when he will reply, but that question is a delicate one diplomatically rather than politically.——The terrible court scandal in Berlin, involving unnatural crimes, has been made public by the action for slander of Count Kuno von Moltke, former military governor of Berlin, against Maximilian Harden, editor of the Socialist paper *Zukunft*. Harden, in a series of articles, had

charged von Moltke with belonging to a court circle which was trying to influence the Kaiser in political matters, but which were themselves guilty of gross immoralities. Von Moltke challenged Harden to a duel, which was declined, as that would close the incident. Men and women of distinguished rank are among the witnesses summoned by the defense, and Harden declares that he will justify the charges made. The Kaiser is furious that such revelations are made in public as to doings in his court.——We reported last week the arrest in Russia of our correspondent, William E. Walling, his wife and her sister, Miss Strunsky. At the intervention of the American Ambassador they have been set at liberty, and will be compelled to leave Russia, where they have been accused of consorting with Finnish and other conspirators against the Government.——The Russian Minister of Foreign Affairs, M. Tvolsky, has been visiting Paris, and has uttered himself in the most assuring way as to permanent peace. He says that Russia's foreign policy rests on the French alliance, which must be maintained firm and permanent. As to relations with other nations, he says:

"We have concluded with our friends, the English, an agreement removing conflicts of interest in Asia. We have made a treaty with our former adversaries, the Japanese, who are now our friends. This treaty, with the Anglo-Japanese alliance and the Franco-Japanese treaty, is the gauge of peace in that part of the world.

"Russia needs rest, and will pursue a pacific policy everywhere. I am happy to say I found in all my recent interviews with heads of States and with statesmen that the same wish reigned everywhere to live as good friends and carry out the policy of bringing happiness and prosperity to the peoples."

——A daring and ingenious plot to kill the Czar was frustrated simply by accident a few days ago, tho it is also explained as merely an attempt to rob a train. General Kristi was hunting in the forest close to the Czar's palace at Tsarskoe-Selo, when his dogs stopped and began scraping the earth at a spot 400 yards from the Pavlowsk Railway, connecting St. Petersburg and Tsarskoe-Selo. General Kristi's curiosity was aroused and he had his huntsmen remove the soil from the spot, which showed signs of having been recently disturbed. They found beneath the soil a quantity of straw which covered planks. These were removed and the entrance to a tunnel was disclosed. The huntsmen descended into the tunnel and found two men engaged in driving a shaft toward the railway. They were arrested and handed over to the gendarmes at Tsarskoe-Selo.

A Korean Comedy

Japanese papers report the amusing and, to the Japanese, provoking *opera bouffe* movement in the Korean Court. It will be remembered that the Korean Emperor was deposed by Prince Ito, or, rather, compelled to resign in favor of his son. But it became necessary to separate the son from his father, and so the son was provided with a separate palace, where he should be withdrawn from the anti-Japanese influence of his intriguing father. But when the son moved to his new palace the father and the ex-Empress Om thought it only courtesy to accompany him to his new home. To be sure, they went back to the old palace the next day, and the Japanese were relieved. But parental affection would not allow them to be thus separated permanently, and so the ex-Emperor finds that out of pure love for his offspring in his new duties he must make him a visit every day and give him, doubtless, the advice which his inexperience requires. Meanwhile there is telephone connection between the two palaces, and the Japanese are saying that the conditions are not improved beyond what they were under the old Emperor. They would have him removed to another palace twenty-five miles distant, and they wait to see what the wise Prince Ito will do. But all this is doubtless settled by the visit of the Crown Prince of Japan to Korea, accompanied by Marquis Katsura, whose purpose it was to put an end to the various rebellious movements in Korea, in which almost invariably a number of Koreans are killed and no casualties among the Japanese. This discrepancy is due to the fact that the Korean ammunition is pretty much exhausted. The Korean Crown Prince, it will be remembered, is taken back to Japan for education.

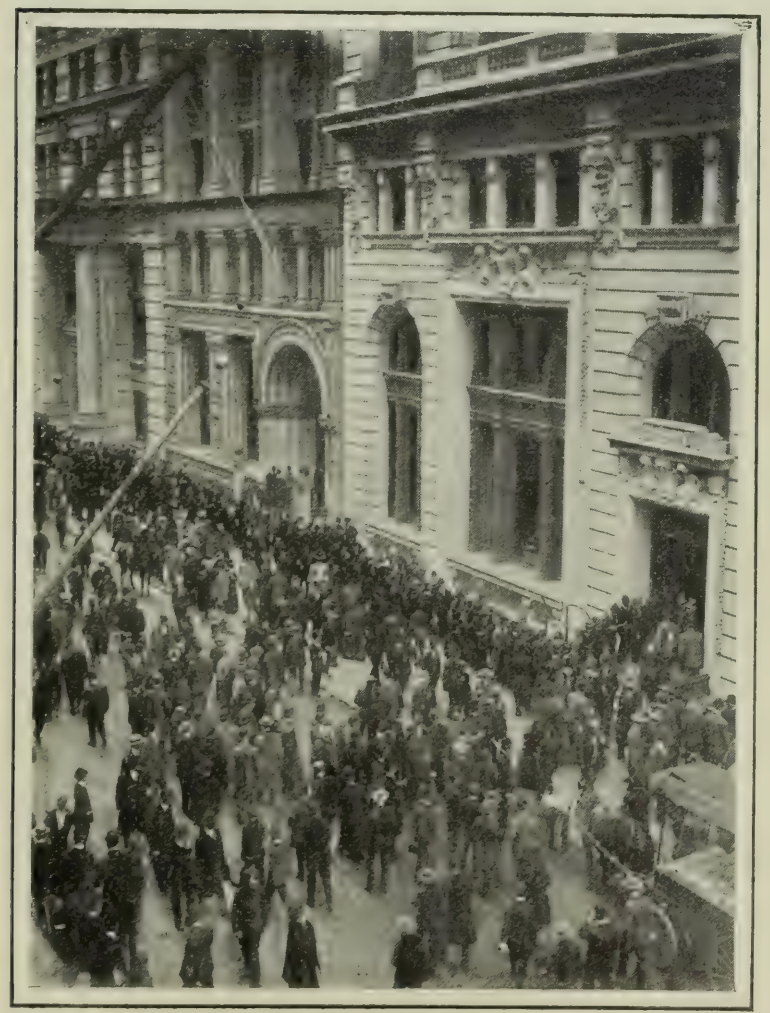
The Clearing House Committee

BY ALEXANDER D. NOYES



AUTHOR OF "THIRTY YEARS OF AMERICAN FINANCE," ETC.

FOR several days during this past week, the attention of the entire financial community was converged on a committee of five men, in whose hands lay decision as to the continued solvency of an important banking institution. These five men made up what is commonly called the "Clearing House Committee"; they are elected by the banks of the Clearing House, an institution where the New York banks exchange and redeem each day the checks turned in to them the day before as deposits. All of the larger New York City banks are members of the Clearing House Association, which, therefore, embodies much of the bank capital and resources of the community. Early last week the Mercantile National Bank, itself a member of the Clearing House, reached a situation where it did not see its way clear to meet its obligations and pay the cash balances debited to it after the daily clearings. It applied to the Associated Banks for assistance, believing the crisis to be but temporary. Its request was placed at once in the hands of this committee of five, who thereupon proceeded to examine the books and accounts of the Mercantile, to investigate its loans, and to see what collateral stood behind them.

In the end their decision was that the bank was solvent, in the sense that it was able to meet its obligations if it could surmount the momentary diffi-

culty. The Clearing House Committee thereupon agreed that the requisite assistance should be extended, and for that purpose assessed a certain number of banks in the Clearing House membership amounts sufficient to meet the daily balances against the Mercantile so long as such aid should be imperative. But before granting this assistance in behalf of the Associated Banks, the committee of five stipulated that the entire board of directors, not only of the Mercantile, but of several affiliated institutions, should resign, that its president should retire, and that certain officers prominently identified with its management should virtually withdraw from the banking field in New York City. These were drastic requirements; they were approved by the banking community as a whole, which was well aware that the difficulties had been caused by improper use at the hands of directors of bank resources. To the stipulation thus laid down the Mercantile and the other institutions were compelled to give assent; that was the manifest price of solvency. It may therefore be said that five men in New York City assumed dictatorial powers over an institution, with $12,000,000 deposits, with which none of them was connected, and compelled its owners to surrender their offices and to remodel radically their bank practices.

Such an event makes it interesting to ask who these five committeemen are and how their committee came to enjoy any such broad powers. The members of the present Clearing House Committee are: James T. Woodward, president of the Hanover National Bank; William A. Nash, president of the Corn Exchange Bank; Dumont Clarke, president of the American Exchange; Edward Townsend, president of the Importers and Traders; A. B. Hepburn, president of the Chase National; and with them has acted Alexander Gilbert, president of the Market and Fulton Bank, who is president of the Clearing House and member of the committee *ex officio*. These men are all veterans in New York bank finance; their experience has covered other periods when bank conditions were even more seriously disturbed than they are today. They inspire confidence in the future of banking in this city in spite of the present stress. None of them ever gave way to the delusions which afflicted Wall Street, and with it a large part of the banking community, at the time of the great boom of 1901, when the saying was prevalent on all financial markets that we had reached a "new era in American finance." Bankers of this class, representing largely an older generation, were very generally mentioned with something like indifference by the financiers and captains of industry who came to the front of the stage in those brilliant times. A somewhat pitying reference to "old-fogy

ideas in banking" was frequently the most that one could get from the leading actors of the day, in the way of comment on the ideas and attitude of such men as these. There were people even then, however, who ventured the hint that the time would come when our captains of industry and so-called "progressive bankers" would be glad to knock at the doors of the old-fogy bankers for practical advice and for even more practical assistance, when the new order of financiers encountered their inevitable troubles. That time arrived last week.

The powers of the Clearing House Committee are peculiar. On the face of things, the Clearing House is simply an institution designed, as the Association's constitution declares, for "the effecting at one place of the daily exchanges between the several associated banks, and the payment at the same place of the balances resulting from such exchanges." This would appear to be a perfunctory operation, involving no dictatorial powers, and such, in fact, is the nature of the Clearing House in most important financial capitals of the world. Early in New York banking history, however, it was discovered that some regulating and controlling influence must be exerted, even on responsible financial institutions; that, in particular, the constant recurrence of occasions when some banks would have to go to the assistance of others required the constant presence of a committee with power to act immediately in the circumstances.

In London the Bank of England, a central institution holding the reserve balances of the great joint stock banks of that city, itself performs precisely this office. It was the Bank of England, through its Governor, Mr. Lidderdale, which intervened in November, 1890, to compel the banks of London to unite in guaranteeing the assets of Baring Brothers, who, without such help, must have gone down in complete insolvency. To come down to more recent times, it was the Bank of England which, in August of last year, interfered peremptorily with the rash advances of capital by the London banks to the Wall Street market, and which, by fixing its own discount rate at 6 per cent. and forcing the general money rate close to that figure, rendered the American borrowing operations too costly to be continued. It was again the Bank of England which last August, under circumstances even now not widely understood, stepped in the breach to stop incipient panic and compel certain London banks to accept the drafts of a banking house with American connections which, in a moment of nervous fright, had been refused accommodation. Somewhat the same function is performed by the great State banks of Continental capitals; the fact that no such institution exists in the United States is no doubt the explanation of the peculiar powers enjoyed by the New York Clearing House Committee.

In the original constitution of the Clearing House, this committee of five had laid upon it only such routine duties as the caring for the Clearing House building, the establishment of rules and regulations regarding check exchanges, and the appointment of a manager. They were also empowered, however, "generally to supervise Clearing House affairs," and from this authority rather broad powers were drawn, as long ago as the panic of 1873. In the stress of that episode, numerous important institutions, solvent on their books, were brought to the verge of bankruptcy through a run of depositors or through absolute inability to procure cash. They could not meet their daily balances at the Clearing House, and failure to meet those balances would have meant necessarily declaration of their insolvency and the closing of their doors. Under such circumstances the Clearing House Committee devised the plan of what were then called "Clearing House loan certificates" — which meant that any bank, solvent but lacking cash to meet its balances, should place its assets in the hands of the Clearing House Committee, and that, in proportion to the sound assets thus deposited, such bank should be allotted certificates that so much credit had been loaned to it by the Associated Banks as a whole. These certificates they were allowed to employ in lieu of cash in making daily exchanges at the Clearing House. In effect, this ex-

1. James T. Woodward, President of the Hanover National Bank, Chairman. 2. Dumont Clarke, President of the American Exchange National Bank. 3. Edward Townsend, President of the Importers and Traders National Bank. 4. William A. Nash, President of the Corn Exchange Bank. 5. A. B. Hepburn, President of the Chase National Bank. 6. Alexander Gilbert, President of the Market and Fulton National Bank, who is also President of the Clearing House and a member of the committee ex-officio. Photographs by Gressford.

pedient meant the lending of cash resources by banks in an easy position to other institutions which happened to be hard pressed. In 1873, $26,565,000 in such certificates were issued. In the May panic of 1884, an episode which in many respects recembled that of the present month, $24,915,000 were issued. During the Baring panic of November, 1890, the Clearing House Committee authorized $15,205,000, and in the very severe financial strain of 1893 the amount thus granted rose to $38,280,000, thus surpassing all other records. Precautions were naturally taken to ensure the redemption of these certificates in cash as soon as the situation returned to equilibrium, this being done thru imposition of a high rate of interest charged against the bank on all such certificates outstanding on its charge.

So far the powers of the Clearing House Committee regarding united action by the banks are manifest; it is only within a comparatively recent period, however, that the committee has had the right to do exactly what it did in the case of the Mercantile Bank—namely, to enter the suspected institution, examine its books and decide on its future fate. This interesting power was conferred by the Associated Banks as a result of certain experiences in the panic of May, 1884, when it was clearly manifest that disasters which became unavoidable would have been averted had the committee possessed the right to investigate what was going on. An amendment, adopted in the ensuing month, authorized the Clearing House Committee to examine any bank in the association whenever it considered such examination to be for the interest of the Associated Banks in general, and to require from such bank the surrender of its securities for purposes of protection. It will be observed that this authority was conferred by the vote of all the banks in the Clearing House membership; therefore each of these institutions voluntarily submitted itself to a possible examination of the sort. On occasions since that time small banks under suspicion by depositors or by the Banking Department have been taken in hand in exactly this way by the Clearing House Committee. How the authority was applied in the case of the Mercantile National Bank has already been shown. It will be observed that the stipulations made regarding the officers and directors of the banks examined went apparently beyond the letter of the powers conferred on the Clearing House Committee. As a matter of fact, however, they were a necessary incident to such powers; for in any case the committee of five retained the right to refuse to take the bank's affairs in hand for protective purposes and the demands made on the directors were the simple price of such action by the committee.

In short, it may be said that while the actions of this committee during the past week were in their nature dictatorial, they represented a perfectly sound and correct adjustment of the machinery of the Associated Banks to the urgent needs of the occasion. There can be little doubt that in a possible emergency those powers would be carried even further. During the panic of 1893, the committee named by the Clearing House practically held in its hands, under the expert leadership of the late Frederick D. Tappen, the fortunes of half the New York banks. The brilliant manner in which the committee then acquitted itself of the heavy responsibilities placed upon it left the banking community ready to trust its fortunes in all future exigencies to such hands.

It need only be said, in concluding, that membership on this committee, while greatly esteemed by all officers in the New York banks, is conferred only on those whose experience and conservatism warrant the entrusting to them of such weighty duties. In this, the banks as a whole have shown that none of them seriously shared in the financial delusions of the past six years. They were well aware that old principles of conservative banking had not been overturned by the luck which followed the speculative excesses of 1901 and 1906. The episode of this month is certain to put an end forever to the notion that the American financial community had grown six years ago, or ever hereafter can grow, beyond the need for close supervision at the hands of old-fashioned bankers.

New York City.

The Second Peace Conference at The Hague

BY HAYNE DAVIS

Copyright, 1907, by Hayne Davis

[Mr. Hayne Davis, with whose writings on Peace and that movement which would substitute law for war our readers are familiar, is the only American, with the exception of the official delegates, who was at the Hague Conference during the whole session. We are therefore glad to be able to present to our readers his complete and luminous account of the results of the Conference which have been so misunderstood and misrepresented thruout the world. It will be remembered that Mr. Davis is the author of "Among the World's Peace Makers," the Secretary of the American Branch of "Conciliation Internationale" and the Secretary of the American Delegation at the last Interparliamentary Conferences. This article will be followed in succeeding issues by two others.—EDITOR.]

THE announcement made in 1898 that the Emperor of Russia had invited the Powers to assemble in a general conference came like a flash of lightning. It arrested for a moment the step of every one. It shed light on the path ahead for very few. Some suspected an ulterior motive, and to them the darkness seemed even denser than before. A tone of skepticism, or even worse, prevailed in the press of the whole world. Nevertheless, the Conference convened, and by doing so inaugurated a new era—an era to be characterized by discussion in conference of questions of common concern, by representatives of all interested parties. But this was not apparent to the members of the Conference, nor is it yet perfectly clear to the general public. And yet it is the chief fruit of both the First Conference and the one that has just ended.

Few of the delegates to the First Conference arrived at The Hague with firm faith in the possibility to achieve definite results. Consequently, the few who did go having faith in the outcome completely captured the Conference. Before it was two months old the first Conference had improved the laws of war, constituted a permanent Tribunal of Arbitration, provided for mediation during hostilities and for investigation of disputed questions of fact prior to the opening of hostilities.

The Second Conference was very different from this. The call for it was made by the Interparliamentary Union, at its St. Louis session, the resolution for such a Conference being coupled with a request that President Roosevelt issue the invitations to all the Powers. This fact was spread broadcast thruout the world, during the two weeks which intervened before the President received the parliamentarians and promised to comply with their request. Russia's unwillingness to participate in such a Conference during the war necessitated its postponement for over two years. The interval was used by public officials, peace societies and private persons to study the subject and to stimulate public opinion in favor of what seemed to them the points of greatest value and least resistance.

So that when the delegates arrived at The Hague last June a large number of its members were avowed advocates of definite ideas, and in some countries, notably our own, public expectation was at a high point. The circumstances under which the Conference was called precluded all possibility of an ulterior motive, and the general sentiment at The Hague was one of hope, instead of skepticism. The free and confident air of the delegates was a mutual inspiration and increased the expectations of all concerned.

The Launching of the Conference.

For some days after my arrival at The Hague I had a feeling that the place was familiar. Finally I recalled the pictures of "Spotless Town" in our illustrated papers. Then I understood. The streets of "Spotless Town" are the streets of The Hague. In this beautiful city, evidencing even in its public high-

ways a scrupulous and unexcelled cleanliness, the representatives of forty-four nations took their places in the Hall of the Knights on the 14th day of June, 1907. It was the first time in the annals of history that all the governments of the earth had assembled together. Only a few more than half the Powers (twenty-six) were represented at the First Conference, a fact due to the absence of South American representation at St. Petersburg. The number of sovereign States entitled to a seat in such a Conference is certainly less than fifty, and only forty-six have an undisputed right of representation in such a body. Costa Rica and Honduras have such a right, but did not exercise it. Korea claims to have the right and Japan disputes this; nevertheless, a delegation from Korea appeared at The Hague and asked to be admitted, but the Conference considered that the question was outside of its competence.

The Second Conference was, therefore, a conference of practically all the States that are universally acknowledged as sovereign over some section of the world, and therefore entitled to be present in conference when questions of common concern to the sovereigns are under discussion. This fact alone made the opening of the Conference an historic event, and not the least of the many far-reaching consequences of this event was the fact that it awoke the sovereigns of some parts of the world to the fact that there are other sovereigns whose existence and importance must not be overlooked. Indeed, all Europe was treated to an awakening at this Conference—an awakening which forced upon it the fact that not North America only, but South America also must be recognized as having a part in world politics, and that in Asia there is one sovereign, at least, whom they must all respect as their equal in intelligence and in power to use intelligence according to their own methods.

This, however, was not apparent at the opening of the Conference. Indeed, the disposition to ignore non-European Powers was clearly seen at the outset. The official invitations to the Conference were issued by the Russian Government, as a consequence of Mr. Roosevelt's courtesy in yielding the privilege to the Emperor. Perhaps Mr. Roosevelt did not fully realize that this carried with it the privilege of naming the President of the Conference, still it was proper that Nelidoff, the head of the Russian delegation, should be President of the Conference, and Beaufort, the head of the Dutch delegation, Vice-President. But there was no apparent reason why the presidency of all the committees into which the Conference was divided should be parceled out among European Powers, except the ignorance of Europe in regard to non-European peoples.

Even if there were no American, either North or South, who was considered worthy of the presidency of a commission, how is it possible to explain the failure of the Conference at its first session to acknowledge President Roosevelt's initiative except on the assumption that non-European people and things were still regarded as, after all, not of the greatest importance?

Doubtless every member of the Conference knew beforehand that the Conference owed its existence to President Roosevelt's act. But the Prime Minister of Holland, in his address of welcome, and Nelidoff, in his inaugural address, alluded to the President's act, and thus the Conference was effected with official notice of the fact. Nevertheless, its first session was adjourned without any appreciation of the initiative of Mr. Roosevelt. The Europeans who had taken charge of the Conference were content with "laying at the feet" of His Majesty the Emperor of Russia the homage of the Conference and its promise faithfully to accomplish, as far as possible, the task which His Majesty had entrusted to it; and "at the feet" of Her Majesty the Queen of The Netherlands its high appreciation of her goodness in permitting it to make this attempt within the borders of her kingdom and in the place graciously provided by her.

When the first session was over, I asked myself, "Would they have so treated the king of some ninety hundred thousand people in Europe? Is the President of some ninety million people in America entitled to less consideration?" The Conference was sure to hear from

our President later, and it was still possible to hope that he would hear from the Conference in the best way, namely, by its acceptance of the progressive ideas proposed by our delegates, and also, in the second best way, by proper acknowledgment of his part in its existence and in the success of its labors. Nor was this reasonable hope unrewarded. The Conference heard from our President in the progressive proposals made by our delegates and Mr. Roosevelt heard from the Conference, both by its acceptance of the most important of these proposals and by a cablegram before its adjournment, expressing gratitude for his initiative.

The Principal Proposals.

Soon after the opening of the Conference, proposals began to pour in. They divided themselves into several classes:

1. Regulation of war.
2. International courts.
3. Treaties of arbitration.
4. Future conferences.
5. Miscellaneous.

It is the work of the specialist to write and to read about this vast network of Lilliputian threads, which the delegates to the Second Conference proposed to weave around the sleeping figure of war. Only the chief proposals can here be mentioned. It also seems desirable to omit the discussion of all proposals designed to decrease the inevitable injustices which result from a state of war, tho some important proposals of this kind were approved and many more were made and pressed with vigor upon the Conference.

The idea to which the American delegation was primarily devoted was a High Court of International Justice. The delegation unofficially presented this idea to persons in and out of the Conference from the very outset. I had the honor of an interview with Dr. David Jayne Hill, the American Minister at The Hague, soon after the Conference convened. He drew a picture of such a Court, composed of jurists of such eminent and known qualification as to command the confidence of the people of all nations and of the governments, and able to administer justice among nations with an impartiality similar to that now exhibited by the highest national tribunals in the various countries represented in the Conference. He spoke of a tenure of office of such length and a compensation sufficient to place these judges above the reach of national influence. Mr. Hill declared that it was *possible* to think of the governments as rising to the hight of an agreement to respect each other's territory and sovereignty and each other's just rights in the international realm, that it was *reasonable* to hope that some steps could now be taken in the direction of these things; and that the creation of such a Court would seem to be the easiest long step in this necessary way to a more enduring peace and a better establishment of justice.

It must be remembered that Mr. Hill, as Assistant Secretary of State in 1899, served as the connecting link between the American Government and the First Conference. This fact constituted him almost a member of the First Conference and a very valuable member of the Second.

In addition to drawing this picture of a High Court of International Justice, Mr. Hill alluded to the convening of subsequent Conferences, similar to that which was then launching itself, and declared his personal conviction that the face of the world is now turned toward these things and that the command of "forward march" must be given and obeyed in due time. Hence the relative unimportance of the present situation, whether it be the moment of marking time or marching forward.

This gives a glimpse into the state of the mind of the American delegation at the opening of the Conference. The greater stress laid by Mr. Hill on the High Court justified the opinion that this was the leading American proposition and the subsequent action of the delega tion proved this to be true. The plan for such a Court was in due time presented to the Conference.

Technical and legal books will discuss the details of this proposal. The essence of it seemed to lie in its empowering such a Court, once constituted, to act as an integral part of the world's judicial machinery, within such area as might be marked out by the nations for its jurisdiction. The constitution of such a Court and the use of it for the settlement of international disputes would soon

necessitate and provide a body of international law, recognized by the nations as binding upon them and their citizens. The recognition of this fact is indispensable to a just appreciation of the presentation of such a proposition by any government, and its favorable consideration by so many.

Having put forward the main ideas involved in such a proposal, the Americans found themselves supported by both the British and German delegates, and when the proposal was actually made in open Conference, it was recognized as the joint proposal of America, England and Germany.

Clearly, a Court composed of nine, or twice nine, judges could not contain a representative from every country. Some method of selection would have to be agreed upon. What was the proper method?

Meanwhile the Russians had come with a proposal regarding a Court. Martens, of the Russian delegation, was a member of the First Conference and is now a member for Russia of the Arbitration Tribunal created by that Conference, and which was called the "Tribunal of 1899." Each Power has the right to appoint four of its members on this Tribunal, but the Tribunal has no power to do anything. When any of its members are selected by particular Powers to decide a controversy, these members can do what is permitted by the joint agreement of the disputant Powers.

Martens proposed on behalf of Russia that this existing Court be given an inherent power of action, so that its members could assemble at The Hague once each year, to express their opinion on international questions raised during the preceding year; to overlook the work of the International office at The Hague (composed of the Ministers of all countries at The Hague and some designated officers, in accordance with the recommendations of the First Conference); to discuss the general march of the movement for International Arbitration, and to elect three of their own number to act during the succeeding year, as a special Court of Justice in such matters as the Powers might submit to them, rather than to judges of their own choosing.

Then came Dr. Ruy Barbosa, of Brazil, with a proposition that the Court proposed by the Americans, English and Germans should be composed of one judge appointed by each Power, the judges to sit in sections of the agreed number, according to the alphabetical list of countries represented, and that this Court should take the place of the Tribunal of 1899, which would be abolished instead of co-existing with the new Court.

In addition to these proposals for a High Court of International Justice, whose action would cover the whole field of international relations, a special International Prize Court was proposed by both England and Germany. This Court was to concern itself solely with prizes taken in war and claimed by the captors in accordance with rules of war recognized by the belligerents.

Proposed Treaties of Arbitration.

Among proposed treaties of arbitration must be mentioned that which the American delegation submitted. This treaty was almost identical with that negotiated between France and England some years ago, and upon which a number of other treaties now in force were modeled. The one important difference between the treaty proposed by the Americans and the Anglo-French model was that it was expressly stated in the treaty proposed at The Hague that the ratification by *each* contracting power should be *in accordance with its own Constitution.* The insertion of this clause may seem insignificant, but it was very significant, because it indicated that the State Department at Washington (including the President) had receded from the position taken by the President in the controversy with the Senate in regard to the treaties negotiated by John Hay in 1903, between the United States and nine other Powers.

The concluding clause of these Hay treaties provided that no question could be referred to arbitration under them until a subsequent agreement should be concluded by the parties, specifying the particular question at issue, the arbitral procedure, etc. As the treaty had nowhere clearly defined the classes of questions supposed to be included in it, judgment had to be exercised in the making of the subsequent agreement, more than

at the time of ratifying the treaty. There was a question whether this "subsequent agreement" would need the assent of the Senate in order to become legal. The Senators were determined to have a voice in deciding what questions should be arbitrated under the treaty. So they substituted the word *treaty* for the word *agreement.* This made it necessary for the Executive to submit all these subsequent special treaties for each case to the Senate. The President refused to accept this amendment and thus the treaties never became operative.

The proposal made by our delegates at The Hague was very important, therefore, proving, as it did, that the way is open for agreement between the Senate and President. This removed a great obstacle in the further progress of arbitration.

In other respects the American proposal was a disappointment to those who looked for progress in obligatory arbitration. The proposed treaty merely adopted the form acceptable to England and France some years ago, and which even these "ancient enemies" have outgrown during the interval since its conclusion. Furthermore, the form was objectionable for several reasons. It was so vague in its definition of the questions included in it that either contracting Power could say that a particular question at issue was not covered by the treaty, and therefore not a matter for obligatory arbitration. Second, it granted no inherent jurisdiction to any court to act in questions of the kind covered by it, but necessitated the *positive* act of both parties to the dispute after the question became acute, assenting to its settlement by arbitration, before the matter could pass into the hands of the court.

The Interparliamentary Conferences at Brussels in 1905 and at London in 1906 had formulated a treaty drawn on the Anglo-French model, but designating certain classes of questions as not falling within the reservation of the Anglo-French form, and therefore as being proper for settlement by arbitration without any agreement between the contracting Powers, subsequent to their ratification of the treaty.

Apparently the American State Department had neglected to consider or had rejected this model treaty proposed by the Interparliamentary Union, altho the St. Louis resolution of that Union had given Mr. Roosevelt the opportunity to convene this Conference.

Portugal, however, came forward with a treaty of arbitration containing the Interparliamentary proposals, and this gave as a basis for discussion a treaty whose adoption would empower the existing Tribunal of 1899 or the newly created International Court to come into action *in clearly defined area,* however limited, as national courts do within their jurisdiction, thus making the International Court an integral, self-acting part of our machinery for the administration of justice.

England also came forward with some amendments to the Portuguese proposition which placed the influence of the British Empire behind the essential idea contained in the Interparliamentary treaty as adopted by Portugal.

The only part of this treaty not found in the Portuguese proposal was the clause adopted on Mr. Bryan's motion, namely, that in all questions reserved for settlement by force, either mediation by a friendly power or investigation by an International Commission of Inquiry should be resorted to *before* the appeal to arms.

The substance of this clause was proposed in three parts; one part by France, in the form of delay for a definite period between the rupture of diplomatic negotiations and the commencement of hostilities. Still other parts by General Porter for the United States and by Dr. Barbosa for Brazil.

The Porter proposition (so called from its champion, General Horace Porter) provided that armed forces should not be used hereafter in the collection of contractual debts from a government without first offering to submit the claims to the judgment of an international tribunal.

The Barbosa proposition bound the governments not to acquire territory at the expense of each other without previously offering to submit their claim to arbitration, and declared that the title to territory acquired contrary to this agreement would have no legal force or value.

Uruguay proposed a League of Peace between ten or more Powers, half of whom should have twenty-five million or more inhabitants each, for the judicial determination of all questions between the members of the League, and for intervening between Powers not in the League where the League considered this desirable for the securing of a just settlement.

Finally, when the Conference was nearly over, came the proposal of the American delegation that "self-governed" international conferences shall occur at convenient intervals hereafter.

While the members of the Conference were formulating and arriving at a proper solution for these and innumerable other questions, persons both at The Hague and elsewhere were lashing it with accusations that it was a "war" and not a "peace" Conference.

General Porter said to me one day that he wished some of the friends of peace who think lightly of the Conference could have an opportunity to handle its members a little. They were picked men. Indeed, the governments were afraid to send inferior men to the Conference. It would have jeopardized their vital interests. Why should the Powers concern themselves with the reservation of "vital interests" from treaties of arbitration and then neglect those very interests by sending incompetent persons to the Conference? Few, if any, nations fell into such an error.

The Delegates.

There were 244 representatives at the Conference. Forty-two of these are so highly esteemed by their governments that they are now entrusted with the highest diplomatic positions—twelve of them being ambassadors and thirty ministers, this being the highest diplomatic office known to some countries.

Fifteen or more members of the existing Hague Court were sent to the Second Conference, and, of course, all the ministers at The Hague were members of the Conference. The delegation from France was notable in that its three leading delegates were members of the First Conference also; that they are now members of the Hague Court, and that they were empowered to use their judgment instead of being bound to secure instructions from the French Foreign Office. I think no other delegation was trusted to this extent by its own home Government.

The delegation from Uruguay contained an ex-president, the only ex-president in the Conference. Is not such a body the place for all ex-presidents of republics?

The Secretary of the Japanese Council of State was the chief Japanese delegate. All proposals made by the Emperor pass thru this official to the other officials of the Island Empire before they can become law.

The Vice-President of the Brazilian Senate was the first delegate of Brazil, and he has the honor of having been a member of the Constitutional Convention of Brazil, and of having proposed that clause of Brazil's Constitution which forbids the nation to engage in war without first offering to submit the question at issue to arbitration.

The second delegate of Argentina was another of the conspicuous members, Louis M. Drago, whose name has become a household word at the capitals of the world, in consequence of the note that he sent to the various foreign offices while he was Foreign Minister of Argentina. In this note he declared himself against the use of armed forces for collection of money claims from a sovereign State, and this doctrine now bears his name.

The members of the American delegation are well known as men of the highest character and ability, and they became the motive power of the Conference.

France and South America supplied the captain and the helmsman of this international "ship of state." The "hereditary claim" became the barnacles to impede its progress. But it was well officered, and the crew did their duty, and on her trial passage this "ship of state" came into port with colors flying and every prospect of a record voyage on her next venture, which will occur in 1915, the centennial of the Battle of Waterloo.

The Constitution of the Conference.

The machinery of this Conference was unique. Besides the president of the Conference there were presidents of the four commissions (or committees) into

which the Conference was divided. Upon these four men devolved the chief directive duties of the body. Every proposition was argued out in the committees, until the position of every nation upon it was well understood. These committees reported to the Conference in full session when they had finished with any question of importance.

The Conference met in full session only ten times. The committees met almost daily. The plenary sessions of the Conference were merely for voting and for recording reservations or explanations, which seemed important to the Powers making them.

The members were not free to use their own judgment, but were under the necessity of receiving instructions from their respective governments. So that a Foreign Minister, not at The Hague, had to be converted by the delegation, even after the delegation had accepted a proposal, before the vote of the nation could be cast in favor of it.

Hampered in this way, and by the multiplicity of languages, and by lack of previous experience of such assemblies, the wonder is not that the Conference accomplished so little, as is constantly reiterated, but that it accomplished so much.

Disarmament and National Disgrace.

In presenting the principal proposals made at the Second Peace Conference, no allusion was made to the question of armaments, because, in my opinion, that was not an important question at this Conference. Allusion was made, however, to the fact that Koreans appeared at The Hague, bearing letters from the Emperor of Korea, and protesting that Japan has no right to represent Korea in international councils, because the treaty under which Japan claims this right was not signed by the Emperor of Korea, and because the signature of the Korean Minister who did sign the treaty was affixed to it under duress. This incident, properly understood, would settle the question of armament. The Koreans claimed at The Hague that their country is mountainous and could offer great resistance to an armed attack, and that the population of Korea is several millions. The few thousand Boers well armed made such resistance to England's forces that one of the Boer generals has now risen to the Primacy in that promising country. What could the Koreans have done to protect themselves, if they had been equally well armed, when Japan's fifty million people were arrayed against Russia's one hundred and fifty million? Being practically unarmed, the Koreans simply had to accept the terms dictated by Japan, however distasteful their consequent exclusion from international councils may be.

The visit of the would-be delegates from Korea to the Second Conference would hardly deserve a place in this account of the Conference, if Korea was not such an object lesson on the question of armaments. Korea acted under existing conditions as it would be proper for a government to act after the nations shall have agreed to respect each other's sovereignty at home and just rights abroad. Result, Korea is subjected to a sort of suzerainty by Japan, and is excluded from the international councils with so little difficulty that the world was not aware that Korea objected to Japan's protectorate until the Koreans appeared at The Hague.

Some better provision for national security must precede a wise decrease in the power of national defense. And, taken together, the Koreans and the Boers are a complete proof of this. Nevertheless, many of the advocates of peace lay great stress on the decrease of armaments. Some even regard this as the paramount question. It was regarded by the press and the public as the leading idea in the Czar's call for the first Conference. The insistent demand by Great Britain that the question be placed on the program of the Second Conference necessitated its consideration, tho the heavily armed Powers made it plain during the tour of Europe by M. de Martens last spring that they regarded the discussion of the question as useless.

The delegates of Great Britain found, upon their arrival at The Hague and by friendly interchange of opinion with other delegates, that a fruitful discussion of this question was impossible. They were wise enough not to press upon the Conference a subject which

could only serve to divide the Conference into factions and to weaken their own influence in matters upon which there was a chance of securing general consent.

Accordingly, they introduced a resolution merely reaffirming the resolution of 1899, calling for the consideration of the question of a limitation of armaments, and giving as an additional reason for such consideration the fact that armaments have been greatly increased during the interval between the First and Second Conferences.

This resolution leaves the question of a limitation of armaments on the international program to all appearances. In fact, the general opinion was that the resolution was adopted in this form to save the British delegates from a humiliation, due to the fact that the British Premier had made such a point of placing this question on the program, and to the further fact that not only the British press generally, but also *The Courier* of the Conference, published by W. T. Stead at The Hague, never ceased to berate the British Government and representatives at The Hague, and even the Conference itself, on this question, until it was thus disposed of. Indeed, echoes of this continued to appear afterward in *The Courier,* which rendered, on all other subjects, a service which can hardly be overestimated. This paper appeared every day during the Conference, except Mondays, and was the only accurate and timely medium for knowing what was transpiring at The Hague. It was a necessity even for the members of the Conference. During the very period when *The Courier* was lashing the British delegates for not compelling the Conference to consider limitation of armaments, it introduced into its own columns irrefutable arguments against a reduction of armaments prior to a general agreement by the Powers to respect the rights of nations whose defensive power is thus decreased.

It was during this time that the estimable Koreans appeared at The Hague and asked for admission to the Conference. *The Courier* manifested a great interest in the Korean delegates, supplementing their own statement of their case with the inimitable illustrations which flow so freely from the pen of the noted journalist who had assumed the editorship of this valuable paper. When the Barbosa proposition not to acquire land by armed force without offering to submit the claim to arbitration, and the Porter proposition not to use armed force for collection of money without first securing the judgment of an impartial tribunal, and the Uruguay proposition to form a League of Peace, for judicial settlement of all controversies between the members and for seeing that justice is administered in questions arising between Powers not in the League—when these proposed and other unproposed and still more progressive propositions are actually accepted and in full operation, then the limitation of its power of self-preservation may properly be made by a nation, protected by these guarantees, in accordance with what other nations regard as its proportionate power of defense.

What, then, must be done in the meantime with the intolerable burden of armaments? The people must carry this burden until those in authority see that *the* way to lay it down forever is to provide a system for the administration of justice among nations, as justice is now administered among the States of the various well-organized federal governments.

The Porter Proposition.

General Horace Porter campaigned with Grant during the Civil War, and when only twenty-six years he had taken part in twenty-one battles. He made a vow during these awful times that he would do everything in his power to prevent the recurrence of such calamities. When the President appointed him a delegate to the Second Peace Conference his opportunity had come. Indeed his service in the Civil War had prepared him for service in the Peace Conference. The qualities developed in the face of the enemy came to his aid in the successful campaign which he conducted at The Hague for removing money claims from the war area to the precincts of courts of justice. At the very outset he presented his proposition that armed forces should not be used for collection of contractual debts, without first submitting the claim

to an International Tribunal and securing a decision that it is just. When he made the proposal the general opinion in the Conference was adverse to it. Furthermore, it was not mentioned in the program. Some delegations were so instructed that they were compelled to oppose it regardless of their individual opinion, for instance, the Japanese. But this delegation secured such a modification of its instructions that it could cast Japanese influence for the proposal, and Tsudzuki, the first delegate of Japan, early in the day, created a precedent and produced a profound impression upon the Conference, by rising in the commission which had this proposal under consideration and declaring that his Government would unreservedly support it. No other great Power had previously done this. General Porter rested neither day nor night till he carried this proposition.

The importance of the proposition seems to have been overlooked by the public generally, and the difficulties encountered in carrying it can be appreciated only by those who endeavored to secure for some favorite idea the unanimous approval of representatives from all countries, speaking all languages and standing in a position of such responsibility that the vital interests of their nation and people may depend upon their action. We, the unofficial public, are like one walking on a plank lying on the ground. This is done without difficulty. Indeed, it takes an effort to step off rather than on the plank. Elevate the plank ten feet from the ground and it takes a well governed mind to walk on it at all. Elevate it 1,000 feet and who can walk on it with a steady tread? Only those whose eye remains open and clear in the face of danger. Membership in a Conference such as this at The Hague is like walking the plank at the 1,000 foot elevation. Men unburdened with the responsibility of membership in the Conference can arrive easily at a decision on every question proposed. The same men placed in the Conference instantly become conscious of responsibility and correspondingly cautious in their decisions. The controlling individuals in such assemblies are those who decide and proceed with the ease and carelessness, at such hights of responsibility, as characterize the man walking safely on the level ground of private opinion.

In order to understand the importance of the Porter proposition, it is necessary to realize that money claims constitute the greatest danger of war between any European and any American State, during the period that now lies just ahead of us. The removal of these claims from the war area to the law area of our international domain is therefore of very great importance. Indeed, the significance of the acceptance of the Porter proposition is almost incalculable. It gives good hope that the one danger most likely to involve our country, as well as other American States, in a war with European Powers has been reduced to a minimum, if not entirely destroyed.

The Porter proposition is generally confounded with the Drago Doctrine. Indeed, they are quite different. The Porter proposition does not venture to say that force shall not be used to collect money that is *justly* due, in the judgment of an International Tribunal. It simply forbids the use of force for collection of claims that have not been adjudged just by an impartial tribunal; on the other hand, the Drago Doctrine goes the length of forbidding the use of armed forces in the collection of money claims from sovereign States, whether the claims be just or not.

While justice is the basis of the Porter proposition, "respect for sovereignty" is the foundation of the Drago Doctrine.

Strangely enough, the essence of the Drago Doctrine is actually in force among the States of our Union. One clause of our Constitution forbids the courts of the United States to entertain a claim against any State in the Union at the suit of a citizen of another State or of a foreign country. On the other hand, the States which compose the Argentine Republic can be sued in such cases, and can be compelled, by judicial decision backed by the power of the Republic, to pay money claims proven to be justly due, in accordance with legal methods authorized by the Republic.

The acceptance of the Porter proposition and the rejection of the Barbosa proposition call for a word in regard to the relation of these two ideas. Together they constitute one complete proposition,

and the acceptance of both must be placed in the cornerstone of the International House of Justice when it is built.

As the Porter proposition forbids the use of armed forces for collection of unadjudicated money claims, so the Barbosa proposition forbids the use of these forces for the acquisition of land, without previously submitting the claim to the judgment of arbitration. The acceptance of one removes unjust money claims from settlement on the field of battle; the acceptance of the other would remove unjust land claims from this antiquated method of trial.

After making this proposal, Dr. Barbosa, the first delegate of Brazil, did not press it upon the Conference. Perhaps all his energies were needed to prevent the acceptance of proposals which would have introduced into international councils the doctrine of inferior and superior States. Certain it is that Dr. Barbosa became the champion of "State Rights" in the First General Assembly of the Sovereign States.

(*Continued next week.*)

THE HAGUE, HOLLAND.

The Woman of the Future

BY ELLEN KEY

[Foremost among the leaders of the "New Woman Movement" now agitating the sociological waters of Europe is Ellen Key, the Swedish writer. In all of her works she proclaims herself as a champion of the divine rights of women, but in quite a different way from the usually accepted interpretation of this feminine shibboleth. It is from a purely ethical standpoint of soul development that she preaches this new doctrine of woman's rights. She believes that only through spiritual and intellectual development can these rights be obtained. As she herself has it: "No woman ever stepped out of a perfectly happy life of domestic contentment to grasp the banner of emancipation in her hands and cry out thru the streets for woman's rights." Her works, which are few, deal with every phase of modern life, and are broadly humanitarian, deeply philosophical. The three classes which appeal most strongly to this altruistic philosopher and thinker are women, wage earners and children, and to them, and their cause, she dedicates the greater part of her works.—EDITOR.]

THERE are certain words which are as alluring to us as are the strains of a beautiful melody. Among these are "The Woman of the Future."

Such a melody sounds for me in the rhythm of a poet, a poet and at the same time a teacher, whose name now glows with the radiance of a day star, but who, during his life, heard invectives heaped upon himself as an atheist and iconoclast, the brilliancy of his thoughts appearing to his contemporaries as destructive lightnings. His poetic intuition revealed to him an era in which the woman should be

" . . . frank, beautiful and kind as the free heaven, which rains fresh, light and clear on the wide earths . . .
From custom's evil taint exempt and pure;
Speaking the wisdom once they could not think,
Looking emotions, once they feared to feel,
And changed to all, which once they dared not be,
Yet being now, made earth like heaven. . . ."

This silhouet of Shelley's "Woman of the Future" floats before my mind as I try to draw a picture of my own, which shall give her somewhat more definite features.

The "storm and stress" period of women and the higher culture along social and psychological lines with which it is intimately connected, will probably reach far into the new century. This period, full of conflict and unrest, will only cease when woman, both married and unmarried, has attained unto a full legal equality with man; when such transformations have taken place in our social fabric that the present competition between the sexes shall have been mutually and satisfactorily adjusted; and when the means by which a woman earns her living, as well as the serious problem of domestic conditions, shall have reached such a state as to relieve her from the burden of oppression under which she now suffers. Probably not until the close of the twentieth century will the feminine type of the nine-

teenth century have reached the zenith of its development and a new type will begin to appear.

My ideal woman of the future—and when one paints ideal pictures one does not have to deny one's self anything—is a being of sharp contrasts which have been attuned into perfect harmony; she is a creature of diverse traits, in which one is, however, able to trace a clearly defined unity; her nature is richly exuberant and, at the same time, the essence of simplicity; she is a thru and thru product of the highest culture, and still retains possession of her primeval, elemental impulses.

This woman will understand the seriousness of scientific work, will be a strict searcher after the truths of free thought and artistic creation. She will be able to grasp the necessity of natural laws and the lines of development. Society at large will claim her interest and responsibility. She will be juster than the woman of the present, because she knows more and thinks more clearly; she will be better because she is stronger; milder because she is wiser. She will be able to take a broader view of life and its meaning, and in this way she will lose certain prejudices which are now known as virtues. She will always remain a molder of morals, not seeking support in social conventions, but rather in the laws of her own nature; she will have courage to think her own thoughts and to sift the new thoughts of her age. She will dare to feel and to avow those feelings which she now hides and suppresses. Her freedom of action and her all-round personal development will make possible a bolder and energetic striving after an existence which rests on the same plane with her own ego; and such an existence she will be enabled to find by a surer instinct than she now possesses.

She will understand how to work more intensely, to rest more intensely and to rejoice more intensely in all simple, contiguous sources of joy than the woman of the present. In this way her life will become fuller; her experiences will be deepened; her soul-life will be more highly developed and her sense of the beautiful will be hightened and refined.

She will be very sensitive, highly responsive, and will therefore possess in a higher degree the faculty of enjoyment and be able to suffer and endure more than the present generation of women.

By all this the woman of the twentieth century will give new values to social life, to art and literature. But her greatest significance as a culture force will be the protection of mankind from overculture, and this she will be able to do by the enigmatical, the presaging and impulsive qualities in her nature. To knowledge she opposes the unknowable; to logic she opposes feeling; over against reality she places possibilities, and for analysis she substitutes intuition. The woman will, above all, promote the growth of the soul—man that of the intelligence; she will extend the province of presentiment—he that of reason; she will exemplify the power of love—he that of justice; she will conquer thru pride—he thru courage. The woman of the twentieth century will not only have learned much, but she will also have forgotten much, especially many of the feminine and anti-feminine follies of the present. The happiness of being loved she will desire with the intensity of her entire being. She will be pure, not out of indifference, but out of passion; aristocratic, not because she is anemic, but because she is full-blooded. She is moral, because she is soulful, and true because she is proud. She demands much love, and is herself capable of giving much more. Out of her hyper-refined idealism she will construct an erotic problem, the solution of which will not always be an easy one.

On the other hand, the happiness which she feels and gives will be richer, deeper and more lasting than anything which up to this time has been called happiness. Many trials which now belong to the present wife and mother will in all probability be lacking in the woman of the twentieth century.

She will dedicate her deepest and strongest powers to the difficult but beautiful task of being the beloved and at the same time the mother; her religious creed will be to create life's happiness and bliss.

For the reason that she knows and values the psychical and physical hypo-

theses of health and beauty, she will choose the father of her children with a clearer insight and a deeper feeling of responsibility than she does now. She will bear and nurture healthy and beautiful children, and she herself will possess greater charm and more enduring youth than the woman of the present—a charm, which will be perennial because she will constantly employ herself in beautifying her nature. Her *greatest* charm will lie in her ability to be true to her own self at all times and in every phase of her life, and her imperishable youth, her ultimate beauty she will reveal solely to the one whom she loves. She will realize that the magic of the soul is the most potent force, and out of the depths of her being she will draw inexhaustible supplies of this soul fluid, giving expression to her individuality, in infinite and unexpected nuances. Her simple presence will abolish the restraints of mere form and custom, and by virtue of her own nobility of purpose she will create new and ennobled forms of domestic, public and social relations.

She will, in all probability, speak less than the woman of today, but her silence and her smile will be more eloquent.

Her nature streams out effervescingly free and fresh like the celebrated falls of the Giessbach, and yet, like these, is held within bounds by a firm, innate rhythm. However far she lets herself go in the delirium of joy, in the passion of tenderness, in the transports of happiness, or in the fury of pain, she never loses herself. She is a plurality of women and yet only one, whether she *plays* and smiles, or *suffers* and still smiles; whether she glows with health and vigor, or bleeds her life away from a deadly wound; whether she is ruled by a great calm, or by highly strung nerves, by joy or by tears, by sunlight or shadow. The woman of the future is already here in the dreams of the men, and it is after the dreams of men that women always model themselves. The modern masculine ideal is not the masculine woman, but the all-round development of the eternal feminine.

This new type has already made its appearance, not only in the present, but in past centuries as well. In the Middle Ages she wrote the letters of Héloise; during the Renaissance, Leonardo painted her as Mona Lisa, and in the eighteenth century she conducted a French salon as Mlle. Lespinasse. In our century she wrote the love poems of Elizabeth Barrett Browning, she has appeared upon the stage as Eleonora Duse, and the keynote of her nature is sounded by the poet when he sums up her characteristics in the beautifully significant lives:

"Wie der Sternenhimmel
Still und bewegt."

STOCKHOLM, SWEDEN.

After-Fulfillment

BY EDITH M. THOMAS

I

I HUNGERED. They gave not. I hunger no more.
Now how they hasten to lavish their store—
Apples of gold, the Hesperides gave,
And mellow Falernian, brought from the cave!

II

I was night-bound and homeless. They cried, "Hence, away!"
I have found the blind road into ambient day—
And they build me a dwelling and deck it with theft
Of marble and splendor, from palaces reft!

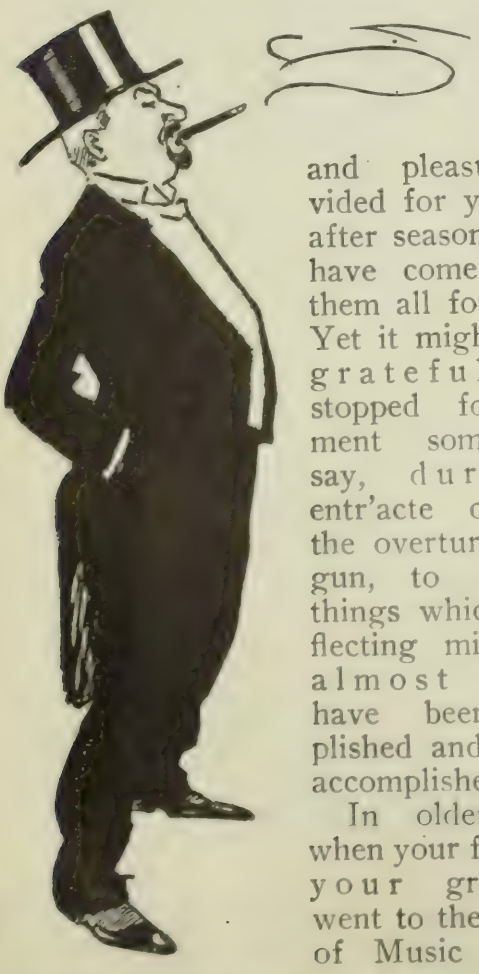
III

I entreated them, "Hear me!" They turned with a jest.
Now, when the dove-silence broods in my breast,
They would make me dispenser of laughter and tears,
With words that are magic, enchaining all ears!

WEST NEW BRIGHTON, STATEN ISLAND, N. Y.

Grand Opera in the Making

BY CHARLES HENRY MELTZER



HERTZ,
Conductor.

[Mr. Meltzer, as our readers know, is one of our best playwrights and dramatic critics. His position as assistant to Mr. Conried at the Metropolitan Opera House during the past two seasons makes the following article authoritative. All the illustrations except that of Mr. Hammerstein are from cartoons made by Caruso, the famous tenor of the Metropolitan Opera House, as printed in Caruso's book, published at $50.00 and copyrighted by Robert Grier Cooke, Inc., N. Y., 1906.—EDITOR.]

VIGNA.
Conductor.

AS you sit at ease in your armchairs at the Metropolitan or the Manhattan, listening to the strains of "Faust," "Carmen" or "Tristan und Isolde," staring at the multi-millionaire box-holders, and reveling generally in your surroundings, have you ever asked yourself what it costs—what thought and work, what time and money must be spent—for your enjoyment? You have, perhaps, grown so used to having art, ease and pleasure provided for you season after season that you have come to take them all for granted. Yet it might be only grateful if you stopped for a moment some night, say, during an entr'acte or before the overture has begun, to ask how things which, to reflecting minds, seem almost miracles, have been accomplished and who has accomplished them.

OSCAR HAMMERSTEIN.

In olden days, when your fathers and your grandfathers went to the Academy of Music for their opera, everything was simpler. Theatergoers were less exacting as to their comfort, and as to such matters as stage scenery and costumes, than they have since become. Great singing, beautiful (which then meant easily singable and melodious) operas, with decent but not necessarily sumptuous or accurate settings, were all they expected on the stage. As to the boxes, why, tho our forerunners were properly critical as to the standing, character and antecedents of their occupants, they cared little for the way in which they were upholstered, or how many millions they might shelter.

Opera was comparatively cheap. Colonel Mapleson and Mr. Strakosch, we may be sure, spent scarcely one-third of what it now costs Mr. Conried and Mr. Hammerstein to give grand opera. Mr. Abbey and Mr. Grau had not, by their calculated extravagance, yet sent the terms of the great singers skyward. Nor did the patrons of the Academy take the impresarios to task unfeelingly if backgrounds which had done duty in "Norma" or "Semiramide" appeared a week after as accessories of "Il Flauto Magico."

And, for all the millions that have recently been poured into the laps of our Carusos, Melbas and Mary Gardens, the singing of those days has not been beaten. There may be equals now of Patti, Nilsson, Gerster, Grisi, Tietjens, Scalchi and Trebelli (to name only women) or of Rubini, Nicolini, Galassi, Campanini and Tamberlik (of the men), but who has excelled them?

With the opening of the new, garish Metropolitan twenty-four years ago, un-

der the management of Mr. Abbey, there came a revolution. For the first time in the history of American grand opera, the power of gold, mere gold, was tested to the uttermost. In a determined effort to beat Colonel Mapleson at the Academy, and to enable a new aristocracy of wealth to outdo the older fashionables, Mr. Abbey spent money without stint, and, as some thought, without judgment. Colonel Mapleson either could or would not follow the example set so recklessly. At the end of his first season Mr. Abbey found himself a quarter of a million dollars in debt and confessed bankruptcy. From that day to this, however, the salaries of the great stars of opera have risen, nor is it at all probable that, for a decade or so more at all events, they will come down again.

Roughly, it may be said, for the benefit of all who are curious on the subject, that Mr. Conried spends one million dollars annually on behalf of the company over which he presides at the Metropolitan Opera House. Mr. Hammerstein's next season at the Manhattan will probably cost him close upon three quarters of a million—irrespective of what rental his house would represent if he leased it to another manager, instead of himself making use of it. That, too, is perhaps the least troublesome part of the complex problem which the two rival managers have to solve. Months before the curtain goes up on the first performances in the big lyric theaters Europe has been scoured for "stars" and operas; Paris, London, Berlin, Vienna, Madrid and a dozen other cities have been visited in search of costumes, scenery and stage "properties"; scores, if not hundreds, of aspirants to the honor of an engagement in America have sung to the heroic Oscar and the tenacious Heinrich; while, earlier still, the theatrical agents whose business it is to "round up" and "get options" on new artists have been busy in England and on the Continent.

Those, and those only, who, like myself, have sat beside an impresario day after day, listening to the singing candidates, know what has to be endured in the process. Heaven have mercy on the rare manager who happens to have brought a heart with him to one of the "auditions" which he has been asked to grant to so many singers. For there is an art tragedy, or at least a drama, connected with most of those poor people. Some have impoverished fond mothers and fathers, or sisters and brothers, in the hope of winning, soon or late, a place among the grand opera stars. Some have, literally, almost starved to pay for the hire of their pianos in Paris, or their lessons in Munich. Others have sunk into the very depths (this is a side of the great struggle on which, from delicacy, little is said here), sacrificing decency, principle, self-respect, just for one gladdening, maddening chance of being listened to for a few minutes by Mr. Conried or Mr. Hammerstein. And what heart-breakings must follow the refusals, the postponements, and the broken prom-

CALVE, as Carmen.

EAMES, as Aida.

ises, which come inevitably to ninety—nay, ninety-nine—out of each hundred applicants! Yet—woe betide the impresario who lets sentiment sway him in the recruiting of his company. His ruin would be sure.

With Mr. Hammerstein in the field, the difficulties of the managerial recruiting officer have increased and multiplied. Time was, only two years ago, when Mr. Conried, like Mr. Grau, his immediate predecessor, had things very much in his own hands. Having no competitors of importance to dread here, he could go about his task in a majestic way. He could treat with the German and Austrian Hof-Intendants, or with the directors of the French opera houses, in an impressive tone, calculated to strike awe into their hearts. In his travels from capital to capital he could halt, when he so wished, to enjoy a few mud baths at this watering place, and to take a cure at that. Between baths and drinks he could listen, affably or less affably, to a tenor, sign a contract with a soprano, and submit to a newspaper interview. Not till Mr. Hammerstein, last year, announced his first season of grand opera at the Manhattan did the Herr Direktor of the Metropolitan find that—in the unfeeling language of the people—he would have to "hustle," to "step lively," or, in other words, to "get a move on him," or see the great singers and the masterworks he needed whisked away from him before his very nose. Now, alas, Mr. Conried has to strain every nerve to protect himself against the activities of his irreverent competitor. He could tell you strange tales of a certain journey in quest of singers, which began in Vienna and ended, I believe, in Hamburg, after a series of wild darts and frenzied dashes as far west as London and as far south as Milan. He is still paying for the emotions of that journey—and a few others. Who would be a grand opera manager?

We will assume that the manager has engaged the singers whom he needs, arranged his repertory, and ordered the new scenery, costumes and "props" which he has thought it inadvisable to have made in America. With a much lighter heart than he had on sailing he lands in Hoboken, and, with the assistance of his "general press representative," gently discourages as many as possible of the reporters who swarm around him on the dock. Later in the day, after he has lunched and conferred with the heads of the various departments in his particular opera house, he invites the gentlemen of the press to meet him in the sanctum (if he affects one) or on the pavement outside his theater (if he uses his doorstep as an office, after the fashion of Mr. Hammerstein) to rejoice with him over the unprecedented brilliancy, the incomparable charm, of the programs which he announces for his next season. He dilates, sometimes grammatically, over the wonderful sopranos whom he has secured abroad, and over the extraordinary tenors (or baritones, or bassos, or contraltos, as the case may be) whom he has ravished from the clutches of his rivals. Next morning the newspapers in a hundred cities duly register his remarkable utterances. Then, for a week or two, so far as the public is concerned, grand opera ceases to exist, and one might fancy

CARUSO.

that there was nothing but stagnation at the Manhattan and the Metropolitan.

Really, however, the preparations for the grand opera season, which have never quite ceased even during the absence of the manager, now enter on a phase of feverish activity. On the return of the Great Man (whether he be Mr. Conried or Mr. Hammerstein) the stage carpenters, who have been building new scenery; the costumers, who have been fashioning new dresses from the designs of foreign artists; the *corps de ballet,* the chorus, and the mechanics go to work as if their lives depended on their efforts. When the season is in full swing an institution like the Metropolitan employs close upon seven hundred persons. At the Manhattan the roll-call may be a trifle shorter. Of these, three-fourths, maybe, are occupied between September and November, by which date everything that has been projected by the manager must be at least roughly shaped, while some of it must be polished, fully rehearsed and ready for the opening. On the supervision of the manager and his trusted henchmen during the months of September and October depends the artistic, and perhaps also the financial, fate of the approaching season. And, as the line which divides failure from success is finely drawn, those months are anxious ones.

The henchmen to whom I have referred include the "technical director," who has general authority over all the mechanical, scenic and sartorial departments; the "property master," who has charge of the stage furniture, spears, armor and other movables used in the different operas; the general business manager (Mr. Hammerstein, by the by, dispenses with one, or, to be quite accurate, officiates as his own business

PLANCON,
in Sonnambula.

manager), who stands at the door of the theater during the performances, attends to the accounts, helps to make out the artists' contracts and relieves the manager of numerous other administrative duties; the assistant business manager; the chief electrician, who looks after the lighting of the stage and auditorium; the general press representative, already referred to, who, if he be literate, assists the manager with his public statements, while he—whether literate or illiterate—stands between him and his friends or enemies in the newspapers, and reveals, *urbi et orbi,* everything of public interest connected with the opera season; the stage managers, whose mission it is to rehearse the operas; the chorus master and ballet master, whose work need not be explained; the librarian, who, despite his title, is kept busy chiefly making out parts and correcting music scores; and those tremendously important persons, the conductors (sometimes including and under the moral or actual leadership of one named general music director). With all these Mr. Conried and Mr. Hammerstein are more or less continuously in touch before another stage of the preparations for the grand opera season is reached with the daily orchestra rehearsals, vocal costume rehearsals, chorus rehearsals and ballet rehearsals. About the 1st of November at the Metropolitan and toward mid-October at the Manhattan, the stars—those of them who do not happen to have past their summer in this country—begin to arrive in "dear America," and are hungrily interviewed. Now is the opportunity of that general press representative. For hours each day he is called upon to interpret the eloquence poured out in many languages by the new celebrities. He is expected to disclose (and on occasion also to invent) their picturesque and romantic life stories. He must lead them to Bangs or Sarony to have their photographs taken. He must serve as a buffer, a friend and discreet counselor, between them and their manager. He must look to it that no one star of them gets more or less than the right share of screeching notoriety in the newspapers. And he has other things to worry him. Soon the manager and the general business manager are even more worried, as the susceptibilities, the temperaments, and at times the tempers, of the stars are gradually made plain to them. "I could a tale unfold whose lightest word——" But,

C. H. MELTZER,

to be just, most artists are infinitely more reasonable than one might infer from the sensational stories which appear in the Sunday supplements.

And now we reach the final and most

interesting chapter in the preliminary history of each season, with the dress rehearsals of the new works, to some of which not only the directors of the opera house (when, as in the instance of the Metropolitan, they exist) are invited, together with the critics and their wives and a hundred or more other specially privileged persons. Some of these rehearsals—notably those of "Parsifal" and "Salome"—will go down in local history. The hour which sees the curtain rise on some new work with which fame has in advance been busy is a great one for the manager of an opera house. Even should he himself have done little, by direct effort, to assure the smoothness of the performance, the beauty of the singing and the excellence of the orchestra, his is the mind which has gathered together all the materials used in the attainment of the results shown at the dress rehearsal, and he it is who will bear the shame or wear the laurels after the public performance of each opera.

And when, some evening in November, that grand opening night does come, is it strange if it is a very proud, tho very weary, manager who looks at the huge gathering in the auditorium and perhaps watches the lights go wrong in the most carefully rehearsed episodes of the opera—knowing, as he does, that every sin of omission or commission will be visited on his head in the press next morning, but knowing, too, that, if all should go well, he will earn great glory?

NEW YORK CITY.

Do Animals Reason?

BY E. P. POWELL

AUTHOR OF "THE COUNTRY HOME," ETC.

MR. BURROUGHS suggests that a bird, if possessed of reasoning faculties, would not peck at a window, hoping to get at his reflection inside. While reading this argument of our distinguished naturalist, a song sparrow was vigorously flying against a window just beside my own. He had been at this occupation off and on for several hours. He evidently saw what he supposed to be a rival. I considered that behind me I have a heredity of glassmaking and of mirrors, of three or four thousand years. I considered farther that I did not have my sparrows heredity as a weaver. Consequently the little fellow has done what I cannot do, in my plum tree—woven an exquisite nest, wonderfully adapted to home keeping, without the loss which my house has cost me in the way of heating, lumber and infection. He will use his house just once, and will build a new one when needed. I considered farther the wonderful reasoning which has gone on to adjust him to the climate. For I find him going South when food is scarce and weather severe. He does not pay Pullman rates for a sleeper, but flies by night, when he cannot see his food, and by day enjoys the berries and seeds that he finds in the beautiful valleys and hillsides of Virginia and the Carolinas.

I do not believe that this happy method of living came about by something that careless people call "instinct." There is a good deal of instinct as a result of my reasoning, and there is a good deal as a result of his reasoning. Instinct is not a gift, but a consequence. Two years ago, in Florida, I found the robins by the millions. Their flocks in the bayheads reminded me of the pigeons of my boyhood. One evening, I think it was the 25th of February, I heard a strange noise overhead, and saw the beginning of the robin flight northward. They went in flocks of five, of ten and of hundreds. The sky was full of them, and the flight lasted for two or three evenings. It was a matter of close reasoning, for they reached their Northern homes about the 5th of March.

Did you ever see the arrival of a big flock of birds? Every year, on the 22d day of April, I watch the arrival of the swifts or chimney swallows. Reaching a certain locality in the night, all the next day is occupied in a voluble discussion, and a gradual elimination of flocks for localities. They go off by groups and families, until the whole great flock is once more located for the summer. When my catbirds, about nine or ten in number, get here, they divide up my nine acres between them. There is no poaching, but each pair has its own limitations. If I wish to talk with a specially fine singer, I must go over behind my barn and whistle for him. But my dearest friend builds in a syringa bush, almost underneath my balcony. These catbirds all know me, and will set up a joyous song whenever I come into their part of the orchard or gardens. I cannot say just what they are reasoning about on all occasions, but I have a feeling that they are conscious of having found a bird paradise at my expense.

My boy was examining a fly-catcher's nest the other day, and he called out: "Here is the snake skin." This bird, for some reason, I use the word carefully, places a snake skin in its nest. Wilson says: "Snake skins, with this bird, appear to be an indispensable article, for I have never yet found one of his nests without this material forming a part of it." Wilson thinks it may be for the purpose of terrifying other birds and animals. At any rate, it is one of the items which enter into the economy of bird life and bird work, and does not fall within the sure range of man's reason. I do not feel qualified to say that it is a mere matter of unreason. Almost at the same time my attention was called to an excitement in the sky over my head. Looking up, I discovered a crow just rising with a young robin in his mouth. All the robins had joined with the bereaved parents in a shout of anger, and at least a dozen were chasing him with objurgations. They could do very little, with their slow flight and incapacity for rising high. But a little king bird darted up from near the bee house, and he made it hot for the crow. Now on one side, and now on the other, he pecked at his eyes and pulled at his feathers, till the crow was out of sight. This, which Kropotkin calls "mutual aid," is a feature of the social side of bird life, which involves quite as much of the co-operative thinking as we human mortals have shown. I notice that in the morning, at daybreak, that wonderful orison of the robins, which moves steadily from the Atlantic to the Pacific, a magnificent burst of halleluia, is joined in by very few other birds. The song sparrow is sometimes heard, but the catbird and the grossbeak and the oriole wait till this great burst of melody is over. Each one has its morning song, but each one has its own thoughts to express.

While I am talking about my birds, my collies have been let loose from their shed, and come bounding to express their morning greeting. Now I should be ashamed to look Togo in the face and tell him that he had not any reasoning power. He may not understand the English language thoroly, but between us we manage to do a lot of talking. Perhaps affection, obedience, courtesy, do not come within the range of qualities denied by Mr. Burroughs to animals. When my father died, in the field, his dog sat down beside him, forbidding any one to touch him. When at last he was removed to his house, the dog took a position opposite his window, where he watched night and day. If a stranger entered the gate, he took him by the hand and led him into the house; holding him firmly, but without injury, until sure that he was reliable. I do not know how instinct could have covered this case, even if instinct be a gift. While addressing the Chicago Philosophical Society, I took the position that dogs had a sense out of range of our own. A friend who had just returned from Australia said to me, "I doubt your position." She then showed me a photograph of an Australian policeman and a little native lad. These lads are able, on all fours, to run speedily along the track of their own kin, who have marauded the sheep ranches. They go with their noses to the ground, precisely like a dog. Reaching home from Florida, while entirely out of sight of my house among the trees, and fifty rods from the doorway, my collies not only heard me but distinguished my steps, coming with a

grand burst of joy down the roadway. They had not only heard but had argued from their senses, for I had been gone four months. Their joy was eloquent, altho not told in our vernacular. It was, however, as easily translated as Greek or Sanskrit. These collies have acquired a power of laughing, and by drawing up their facial muscles express such emotions as sport, shame and desire for companionship. It is often a ridiculous affair, especially when they desire to say they are sorry for having run off to visit Rover. An animal's language is about one-half in the tail, but their facial and tongue speech is growing in capacity—at least with the collie. Talk to your animals as if you expected them to understand, and you will find that they constantly increase their capacity for understanding.

Cows, as a rule, have been bred so closely for milk and nothing else, that their wits have not been wakened. Accidentally, however, we have got the gentle Jersey, and better yet the shrewd Ayrshire. Brought up on the Scottish hillsides, the latter have had to live largely by considerable climbing and calculation. The result is they are as keen as the Jerseys are peaceable. I had one a few years ago who manifested a most marked spirit of fun-making. It was a favorite game, when I entered the barn cellars and stables, for her to look at me as if challenging my attention, when she would start for the hen roost, beginning at one end of the long roost, and with her horns sweeping the whole sixty into a fluttering, squalling rout. When this was accomplished she whirled around to me with a look and said, "Didn't I do that up brown?" Coming home from my Western parish, I found she had come to milk. But my home people told me that I must get rid of her at once, for she would not only kill her calf but everything and everybody on the place. When trying to milk her they had her penned in a fence corner, with pegs before and behind her front legs and her hind legs fastened in the same way. Then one stood with a brush to keep off the flies, while another made cautious attempts to secure the milk. I placed a rope around her horns and led her out into the lawn grass. It was luscious, and she enjoyed it hugely. The next morning I held a rope over the barn gate and told her to come. She understood me thoroly, but declined to submit her horns. I waited patiently, talking to her, until she finally gave up her gallopades, and deliberately offered her horns. I, as deliberately, placed on the rope and led her out. This was repeated for a week; and then I called the hired man to bring his pail and milk her. He protested vigorously; but she stood without attempting to move, until he was well finished, and then went on with her feeding. That was one of the best cows that I ever had, and her behavior was admirable. I do not believe that we have made any decent attempts to make our bovine friends show their capacity for reasoning.

I remember that my INDEPENDENT readers have heard something before about my Morgan mare. That she could reason and reason well I am sure. When in St. Louis I left her one day in my yard, feeding. She had the range of two adjacent lots as well; but they were all fronted with a sharp decline, to a barbed iron fence. Returning home, as I turned from Garrison avenue, half a block from my door, I heard her calling me. Looking, I could see that she had slipped on the sloping sod, and was lying with two feet fastened in the iron fence. Had she struggled she would probably have broken her legs. Instead she had laid quietly and waited for me. Her call was one of confidence in my ability to help her. I talked with her as I would with a rational being, while I released one foot and then the other—she watching intently. "Now," I said, "Lie still, till everything is ready." When I had all four feet braced for a good pressure, I patted her neck and told her what to do. She sprang up with as lively a lot of thank yous as could be put into horse language. That horse never failed me, because I never failed her. Climbing a steep hill, with my wife and baby in the carriage, one corner of the shafts dropped against her legs. She stopped with a brace, looked around and whinnied to me. I said, "Help me all you can, Fanny," and she did. No human being could have done any better. Sending my wife and baby on foot, we managed to get that buggy to the top of the hill,

where it could be made secure. A beast without reason would have hurled me to the bottom of a fifteen-foot declivity. She learned to assist me greatly in harnessing, and expressed vexation when this operation was done without skill. Hearing her call me from my barn, where she occupied a basement stable, and I was twenty rods away, I found her neglecting her food and her head bent to shout up a trap door till I came. The calves had broken loose from their apartment, and were making bedlam in the stables. When she heard me, she greeted me with a most satisfied whinny, and turned to her food. I do not know where precisely to classify such acts except under the head of reason. It certainly is not a crude instinct coming in the way of heredity.

You sometimes find barn wells enclosed by little houses. Going to my neighbor Harding's, one day, I found him watering his horses in such a well house. I said, "Neighbor, why do you have this huge well-house?" "Well, sir," he replied, "if you had fourteen horses to water you would find out why. Horses like to look at that valley just as much as you and I do; and without these boards in front of them, it would take me half the forenoon to water them. I cannot afford the time." I am not sure that all horses enjoy the scenery, but I do know that many of them do. It is silly, or a mark of lack of reason, to put blinders on them. Nor is this the only manifestation of stupidity in our dealing with horses. There are fewer degenerates among the animals than there are among men, and these are made generally by human contact. An animal will not go twice to swallow a poison; man goes until he becomes a sot. Sheridan said. "Shall we drink like men or drink like beasts?" His companions replied, "Like men, of course." "Then," said Sheridan, "we shall get horribly drunk, for an animal never drinks more than it needs."

The cat deserves special consideration, for the very reason that, as generally treated, it becomes a mere beast of prey, destroying more birds than rats, and in that way becoming a nuisance. It certainly brings with it a destroying heredity. But if a cat has half a chance, it will prove its reasoning powers clearly enough to satisfy any one. I always keep two, because there is no animal that develops more fully the art of play—an art which educators are just learning to appreciate, as an adjunct of reason. They soon solve the looking-glass problem, which our sparrow is still working at. They find out the uses of utensils and door knobs. I have owned more than one who could unlatch doors. While visiting my friend Mitchell, of Utica, I heard the door bell repeatedly ringing, and at last ventured to call his attention to it. "Oh," he said, "that is Josh in the cellar. When he wishes to come up stairs he goes to the wires that run thru the cellar, and pulls the one that rings our front door-bell." Josh was a haughty fellow, and showed his contempt for ordinary folk. Some years ago one of my big cats, Blacknose we called him, at milking time went with John to the stables and sat on the cow while the operation went on. He then transferred himself to the boy's shoulder, and with purrings of satisfaction came to the house with the pail. When John was out of time, Blacknose hunted him, and plainly told him it was time for milking. Another man being hired, the cat took his station half way to the barn under a hedge, and as he came by sprang out at the man, indicating his dislike for the change. The same cat took so strong a liking to a young friend who spent a winter with me, that for weeks after he hunted him in every possible room, including the closets. A fine Maltese used to jump to my shoulder and indicate with both head and tail a desire for a walk. When we reached a little pond where there were frogs, she learned to jump for the fellows, and land her own dinner, and sometimes mine. On the whole, I am strongly sympathetic with those maiden ladies who become warmly attached to their feline friends.

This story is long enough, but I have left out the most intelligent of all our farm creatures, the despised hen—and that will never do. I had a pet hen who walked about the fields with me, keeping up a peculiar hen prattle—a case of affection as truly as with a collie. One day her leg was broken by an accident. I picked her up, carried her to the house, splintered her leg; then spread-

ing a canvas over a headless barrel, I cut a slit in the canvas and placed her legs thru. She understood the whole affair as well as I did, and talked with me all the while. She remained there, without undertaking to struggle or flutter, for three weeks. We fed her on the canvas, and talked with her as we would with a lame child. When her leg was sound again, I lifted her out, patted her, praised her, and after that she was once more my devoted field companion. I must tell you one more hen story, for to me it was very remarkable. I found, when taking my vacation, that my mother had borrowed a little hen to set on some eggs, because her Brahmas would not set. The little hen had hatched chickens, and was taking excellent care of them. One day I heard her at the kitchen door, making a loud call, that never before nor since have I heard from a hen. Going to the door, I found her pacing back and forth across the driveway, picking up a bit of food occasionally, and then going on with her speech. In a few minutes she turned from me, went across our lawn, and straight back to the house from which she had been borrowed. I supposed at first that she was either hungry or that a hawk had caught her chickens. Not a bit of it, for I found her chickens in the pieplant garden—evidently understanding that they were weaned. The little lady had come to the door and told me, in hen language, that she had done her duty and was going home. I could tell you much more about these wise and witty fowls, for there is always at least one wise one to every thirty, but the rest you must find out for yourselves.

I have not stepped outside of nor have I at all exhausted my own personal experiences, during a long life, in which I have found very few dumb animals, and almost continuous animal friendship. I have found my inarticulate companions often thoughtful and not seldom eloquent. I am sorry if anybody else fails to find in all the world about him a rational companionship. And yet my little sparrow is pecking at the window, and will not be satisfied that another bird is not challenging him from the inside. There are many more birds and beasts doing what I would not do if I could, and what I could not do if I would. There may be fools among them, but what a lot of practice it must have taken, and what a lot of thinking, before the oriole could swing a basket in the tip of an elm limb and sing rock-a-bye to her babes. I know some basket-weavers among folk, but not one that can begin to do such delicate work as these golden shuttles thru the orchard limbs—weaving rare melody with the winds that come to my ears. I am quite sure that the universe is not dead, but alive; and that it is full of conscious purpose, in which all animate creatures have a part. I have learned not to look upon man as so exceptional in his powers; but as often the wiser, and sometimes the nobler, in the great animal kingdom. Where the lowest animal life manifests only sentience, the higher is evidently possessed of consentience—that is, compared sensations; and these constitute the lower degrees of conscience and consciousness. The higher animals reach even certain degrees of self-consciousness. Possessed of the very highest degrees of self-consciousness, we outreach the rest of the animal kingdom in the power of conceiving and knowing the Self which is not Ourselves, and of worshiping Him in whom we have our being. I am also thoroly satisfied that the best end of country life, and of life altogether, is not wool, eggs, milk, but that honorable association with all living creatures that leaves in our souls a product above all market price. Nor have I ever in my life killed any living thing for the sport of it; and as for exercise and the acquisition of health, the hoe is quite as sure to secure it as the gun.

CLINTON, N. Y.

The Carnegie Foundation for the Advancement of Teaching

BY CHARLES F. THWING, LL.D.,

President of Western Reserve University and Secretary of the Carnegie Foundation for the Advancement of Teaching

IN the administration of the Carnegie Foundation for the Advancement of Teaching, of which the annual meeting is held November 20th, two or three results of some significance are already emerging.

One of these results is the willingness of the college teacher and president to accept the benefits of this Foundation. When the trust was established, intimations were made that college officers would be reluctant to accept of grants. It was suggested that teachers would be unwilling to come into an apparent condition of dependence. They would, it was even declared, be publicly known as "Carnegie Pensioners." Some college presidents and teachers may have in their hearts really feared that they would be accepting the dole of charity.

But be it at once said, the administration of this trust in its first eighteen months has proved the futility of any such prophecy and the groundlessness of any such fears. Grants many and diverse have been made and accepted. College presidents and professors of highest eminence, of great and prolonged usefulness, of absolute independence of manhood, have retired, accepting allowances granted them, in gratitude and without the least intimation of being subjected to annoying suspicions. Happy have they been to receive, as the Board has been also happy to grant.

The happiness of many college teachers, in reflecting upon the meaning of this trust, deserves more than a single sentence. This gift has given a very distinct sense of relief to hundreds and even thousands of college families. Few teachers of the higher or of the lower education are able to save money from their stipends. Many teachers reflect upon the future needs of their families—needs emerging at a time when their own power of earning money will have diminished and when their need of money will not have diminished—with grave and constant solicitude. Some of the ablest and best of American college professors have frankly expressed to me their solicitude. The change which this great gift has wrought in their outlook is as blessed as the cause of this relief is itself munificent.

At least one reason of the happiness of the teaching body in colleges which are placed within the benefits of the Carnegie Foundation, lies in two or three considerations. One consideration is found in the conception of its work which the Board itself has maintained. This conception is that a retiring allowance is not a largess, not a favor; but that it is an attempt to give proper compensation to the college teacher. It is a deferred payment on salary account. This conception is indicated in the very name of the institution. The institution is founded for the advancement of teaching. The name places emphasis where it should be placed—not upon giving to a few or even many men a few hundred dollars a year; but upon the value of the great force and method, known as teaching. To advance this force, to improve this method, for human benefit, a larger income for teachers is created.

This same happiness is also maintained and increased by the method of administration. Except in the case of a few individuals, among whom D. W. T. Harris is conspicuous, the Carnegie Foundation for the Advancement of Teaching deals not with individuals, but with institutions. The individual college makes application for the granting of a retiring allowance for one of its teachers. With this individual teacher, in preparing the application, the individual institution of course deals. In reference to

this applications, the Carnegie Foundation deals only with, or chiefly with, the college making it. When this appli-tion is granted—if granted it be—payments are made by the Treasurer of the Carnegie Foundation directly to the institution concerned, and the institution, in its due course of business, makes remittances to the individual professor to whom the allowance has been granted. In a sense the Carnegie Foundation makes a grant to a college in order that it may give a retiring allowance to a member of its faculty.

The second result which is emerging in the first months of the administration of the Carnegie Foundation is seen in what is easily recognized as the decline in the denominational relationship of certain colleges. In the original gift it was declared by Mr. Carnegie that its benefits should not be given to institutions of a denominational or sectarian character. The definition of what constitutes a sectarian college is difficult. In the case of some colleges it is as easy to determine what is denominational as in the case of other colleges it is hard. But certain institutions which are manifestly sectarian have taken measures to eliminate the denominational condition. I doubt not that hundreds of institutions have considered this question. Most have hesitated under present conditions to cast off the denominational anchorage; but others have seen fit to remove themselves from this lot to an extent sufficient to be included within the benefits of the Foundation. With certain institutions, the changes thus made are of slight, but with others of fundamental, significance.

Upon those colleges which are ceasing to be denominational in order to come within the field of the benefits of this institution serious responsibilities rest. They cannot, as they should not, forget their history. Many of them are the children of churches whose members have planned carefully, sacrificed greatly, labored ardently for their establishment and for their continuance. No college should, no body of trustees can, think of removing themselves to any large extent from such a history without deep emotions. How much, for instance, of solicitude and sacrifice has entered into the history of Bates College, of Maine, for and of the Free Baptist Church. This college has just obtained from the Legislature a charter free of denominational restrictions. But in such a condition it is for a college to seek in every possible way to give to the Church of which it is the child the same essential benefits and advantages which it would have given, altho in more technical form, had there been no severance of the denominational tie. It is also the privilege of the college always to remember that it is ordained less, far less, for the special benefit of any one Church than for the benefit, thru a Church, of the whole community. It also is not unfitting to add that the Church or denomination whose Church may have cast off sectarian affiliation may worthily seek, and confidently expect to find, the same benefits accruing to itself from the college under the new condition which it had received under the old.

A further result of the work of the Foundation lies in the lifting of the standards of admission of students of several colleges and universities. Among them is the University of Virginia, which has for many years been easy in the conditions of admission but hard in the conditions for receiving a degree. Early in its history the Foundation laid down certain standards for admission to the freshman class of institutions which should be eligible to receive its advantages. These suggested standards were in no wise extreme. They represented such knowledge and training as every freshman ought to possess. Many colleges, however, had not seen fit to adopt such terms of admission; but under the rules of the Foundation they have been persuaded to increase these terms to a proper standard. The influence of the Foundation in thus helping to standardize American colleges in one important respect is already great. The Carnegie Foundation for the Advancement of Teaching soon enters upon the third year of its existence. It has already established for itself, under conservative methods and atmospheres, a great place in the American higher education. That a still greater place, and a very great one, awaits it in the forthcoming time is already made evident.

CLEVELAND, OHIO.

Literature

Mam' Linda

At last the South has produced an author who writes with strength and beauty and absolute veracity about living issues. Many have attempted the task, but Will Harben is the first American author to dramatize with sympathy and intelligence every phase of the trouble between the two races in the South.* Such an interpreter has been so long wished for that naturally we expected when he appeared it would be with a sort of national commotion, that he would be a magnificent Moses, with burning bushes to mark his pathway. But nobody thought he would be the gentle story teller who slipped bashfully into the literary world a few years ago as the author of certain North Georgia dialect pastorals.

With a tender wisdom, Mr. Harben has fixed upon the one remaining link between the whites and blacks which has never been broken as the medium for conveying his message. Mam' Linda is an old black Mammy, typical of those slave mothers to the white children of a former generation who are still sacred to them and their descendants by a thousand ties of love. All the passion and helplessness of such a character under the now existing conditions of hatred are admirably portrayed in this story. Her love for the young white woman whom she had nursed as an infant, her wailing anxiety for her own shiftless idling offspring, Pete, are the background of emotions upon which the tragedy rests. When Pete is whipped by the white-caps, and later when his life is in danger from the mob, the almost bestial fury of her outraged love, the noble agony of her despair, and, finally, her desperate dependence upon Young Carson Dwight to deliver her son is the most faithful picture ever made in literature of the black Mammy in her duel relation to the two races.

Those who think they understand negro nature from the merely sentimental interpretations we have from time to time will do well to note Mr. Harben's accurate lines and shades in drawing Pete's character. It is a fact that the idle braggart negro who talks loudest and most threateningly is the most harmless creature alive. Here comes in the possible mistake of the mob. And for naked tragedy in its simplest forms nothing ever written about fugitive negroes surpasses those chapters that tell of Pete's flight from the furious whites with their bloodhounds. Meanwhile, all the ins and outs of the terrible situation are dramatized by the relations of the different persons in the story to Mam' Linda, or to the South politically. Carson Dwight, the brilliant young lawyer who faces the mob and saves Pete, is evidently meant to represent the coming white man, the man upon whom both races must depend for peace and safety. This has been a very difficult character to draw under all the circumstances, but Mr. Harben has had the courage to produce him, without cant and without fear of consequences.

In short, the story is not only an eloquent and truthful explanation of some of the grief and grievances that now exist between the whites and the blacks, but it is a prophecy of peace and good will to come. He shows conclusively that the trouble has arisen from the mutual loss of love, and that the growth of love, of that gentle justice which bears all things and is kind, will restore each race to the other upon those grounds of mutual regard which nature provides and which has often existed. Nature does not solve problems, she outgrows them. There was a time, for all the faults in it, when the whites and blacks of the South really loved and depended upon one another. Harben's story prophesies the same relations to come again under the eternal conditions of love. He has written it all out so simply that few will recognize the worth of this story. But this is one curious thing about the Good

*Mam' Linda. *By Will N. Harben.* New York: Harper Brothers. $1.50.

God, he rarely reveals the truth of truth to the high and mighty. This is how Harben got his revelation. The high and mighty made war. They made amendments to the constitution and still the race problem grew like the red flame of hate. But here is Harben with his message told with such simplicity that few will recognize its great value. In particular it should be read by the Southern negro. It is the first direct, perfectly intelligent message of love he has had from the Southern whites, since Reconstruction days. Writing of it in the Atlanta *Constitution,* ex-Governor Northern says:

"The story will give spirit, hope, courage and purpose to the better element of our people; and in the minds of the thoughtless and impulsive it will start a train of reflections that will, eventually, greatly help to fashion and adjust the future of our social relations."

Life in the Homeric Age

When Professor Seymour had put the last touch to his *Life in the Homeric Age** he might well say to himself *"Exegi monumentum aere perennius."* No one can doubt that it is definitive. We have at last a *μέγα βιβλίον* on Homer that is not a *μέγα κακόν*. Not one of the nineteen chapters fails to contribute materially to the picture of life and action in an age when poets depicted rather than reflected. The persons who pass before us in the "Iliad" and "Odyssey" act and suffer, but they are not introspective. They are:

"Lonely antagonists of destiny,
That went down scornful before many spears,
Who soon as we are born are straight our friends."

It is taken for granted that the "Iliad" and "Odyssey" took definitive shape not so very long before the rise of lyric poetry. But far back of that time short epic lays came gushing out of the hearts of many bards who felt themselves inspired. That was the real golden age when Crete was blooming and the Vaphio cups were made.

Professor Seymour has long studied every phase of the seething life which these nameless poets have depicted. He sets before us the joyous but religious festivals in which the gods take part. "In a sense a sacrifice implies a bargain." "If haply he may please to receive the savor of lambs and goats, and ward off calamity from us."

"In general, men then did not stand in dread of their divinities. They could fulfil their duties to them in simple and easy fashion, and when they had paid their sacrifices they owed them no debt; they were in the position of a debtor who has paid his debt in full." "Homer knows no divine providence in the sense of a definite purpose and guidance for the life of a man or for the development of a city or nation." He "was far from believing in devils, or, at least, he considered them beneath his notice."

Some parts of the book take on an encyclopedic form. Numerous animals, plants, etc., are described and discussed. Each object is carefully considered and references given. Thus we have a convenient, even if bulky, book of reference, many pages containing twenty or thirty references. Particularly fit are comparisons between the simple customs of the Homeric people and those of our own country, when they had not been spoiled by luxury and still knew the well-sweep and the old oaken bucket, the farm hands and the plowing oxen. Many parallels also are drawn from the Old-Testament life.

Another fine feature is character sketches, particularly of a few women. Helen's graceful charm, with no very deep repentance for the wide swath of ruin which she had cut, is contrasted with the sweet and sorrowful Andromache. These two women, so different, are wrapped in an immortal charm.

A peculiar phase of Homeric life is that "in Homeric Greece wine was the ordinary drink of all classes—from beggars and swineherds to kings; of all ages —from children in arms to old Nestor, and of both sexes. In the two poems no one is represented as thirsting for or drinking water." "Polyphemus did not expect the wine to prove so strong, he being like a countryman, who supposes champagne to be only very excellent cider."

Professor Seymour has accepted Dörpfeld's contention that Leukas is the real Ithaca, which can hardly be doubted when it is clearly shown that Leukas is an island. Leukas lies farthest to the

*Life in the Homeric Age. *By Thomas Day Seymour,* Hillhouse Professor of the Greek Language and Literature in Yale University. Pp. xvi, 704. New York: The Macmillan Company. $4.00.

west in the group of four islands, as both ancient and medieval sailors reckoned. The modern Ithaca must have another name. Dörpfeld calls it Same, and finds the long-lost Dulichion in Kephallenia.

The journey of Telemachus from Messenian Pylos to Sparta in two days by chariot, with a night's sleep at Pherae, has been set down as a fable which could ignore Taygetos. But Dörpfeld and Bérard have recently come almost simultaneously to the conviction that Samikon, not far from Olympia, was the Pylos of legend. This removes some mountains, but leaves some obstacles still. Samikon has hardly proved its Homeric existence by walls which should give the evidence, but a chariot might go from Samikon to Sparta in two days, provided that the roads were somewhat better than now.

In spite of all that has been said to prove that the Thessalian legends are late, the beehive tombs near Volo appear to be as old, if not older, than those of Mykenæ.

We can hardly agree with the remark about piling up the Thessalian mountains, that "the poet knows which should form the base, and which the apex of this pile." If Ossa's sharp cone were placed on Olympus, the long ridge of Pelion could not well find a lodgment upon it.

Sinclair as a Prophet

Mr. Sinclair* claims to speak, "not as a dreamer nor as a child, but as a scientist and a prophet." He gives the present social and economic system in this country five more years of life, and brings in the social revolution in 1913, under the presidency of "the untried hope," Mr. William Randolph Hearst. Mr. Hearst is conceded to be anything but a Socialist, but he will be, nevertheless, the agent thru whom irresistible economic forces will bring about the downfall of the present system and the installation of the new.

The author makes much of a more or less apparent analogy between conditions preceding the Civil War and conditions today. He has even drawn up a table of personal analogies, wherein Daniel Webster is set off against Grover Cleveland, James Buchanan against William H. Taft, and, finally, Lincoln against Hearst. History is made to repeat itself with a closer regard for the duplication of details than is usually discovered in historic parallels.

The revolution is to come by reason of the breakdown of the capitalist process. The coming crisis is to be the final one in a long series of commercial disturbances, and is to be so general and so complete that capitalism cannot recover from the shock. Two or three million—perhaps five or ten million men—will be out of work during the summer of 1912. They will be rioting and using violence. President Taft will be wholly unable, just as was President Buchanan, to interpose any bar to the swiftly moving tide of events making for revolution. The Socialist vote will increase by tens and hundreds of thousands. But, after all, it will be insufficient to elect a President, and Mr. Hearst, whether "pledged to put an end to class-government" as foretold on page 205, or merely standing "upon a platform of Americanism," as foretold on page 209, will be elected. The Socialists "will not understand in the least the meaning of events." Nor will Mr. Hearst. Only Mr. Sinclair, and, perhaps, Mr. Wilshire, will fully comprehend exactly what is happening.

But Mr. Hearst will be elected, and just as Lincoln, against his earlier judgment, was forced by the imperious current of events to abolish slavery, so will Mr. Hearst be forced to take over to government ownership the railroads, the mines and the factories. It is a very simple process—Mr. Sinclair confesses that he could do it all himself. He tells how it will be done tho at times he confesses to certain doubts as to particulars.

Mr. Sinclair writes with force and conviction. But his mood is that of a hurried eagerness that carried him unhesitatingly over all the hard places. Even his occasional confessions of doubt or uncertainty impress one more as concessions to a public which demands a seemly show of caution in its prophets, than as positive misgivings of the author. His note is pitched high, his comparisons are generally cast in the superlative, and the singular number of the first per-

*The Industrial Republic. *By Upton Sinclair.* New York: Doubleday, Page & Co. $1.20.

son is insistent everywhere. His syntax is often far from flawless, and an occasional ludicrous carelessness of utterance intrudes itself here and there. For instance (p. 108):

"Two years ago Mr. Rockefeller put up the price of oil one cent, and the Beef Trust has done the same about once a year."

Just how the Beef Trust has been able to put up the price of oil at yearly intervals is not explained. In another place an equally ludicrous effect is given by a confusion of images. Here the need of breaking an iron fetter rivetted on a boy is gravely and almost eloquently likened to the advisability of getting off a railroad track when a train is approaching.

For all that, there is much brilliant writing in Mr. Sinclair's book. There is power, too, tho rarely kept at a sustained level for any length of time. His insight into social causes and conditions is keen, his indignation is fine and spirited. In many respects his work is comparable with Mr. H. G. Wells's "A Modern Utopia." More careless and less methodical with his data than is Mr. Wells, his analysis of social evils is shrewder and clearer. His faults are haste and carelessness, an over-indulgence in his own intellectual caprices, a too unfaltering trust in the infallibility of his own judgment.

The chapters on the founding of Helicon Hall, an experiment in co-operative living, were first published in THE INDEPENDENT.

The Limit of Wealth. By Alfred L. Hutchinson. New York: The Macmillan Company. $1.25.

Mr. Hutchinson describes the political and social state of the nation in 1942, and relates the progress made since the great revolution of March, 1913. Like all Utopians, he finds the solution of social problems a very simple matter. Merely enact a few laws which the Utopian genius has evolved and presto! the thing is done. The idea of social growth as a resultant of a chain of sequences following upon material causes, is an idea alien to the Utopian mind. Let some individual but propose a scheme of social justice, and immediately the people will ordain it, and peace and plenty will reign in place of strife and privation. That no instance of this sort is discoverable in history is no discouragement to the Utopian. The fact means to him merely that the proper genius has not heretofore arisen. Mr. Hutchinson erects his Utopia on the principle that

"Governments should place no limit upon which an individual may accumulate wealth by lawful means, but all governments should fix a limit to the amount of wealth which any subject may accumulate for his own private disposal."

British Colonial Policy, 1754-1765. By George Louis Beer. New York: The Macmillan Company. $2.00.

Little has been written of eighteenth-century colonial history, and that little has frequently been misunderstood. It is thus gratifying to note the appearance of works which have not for their purpose the glorification of revolutionary patriots or motives, but which are content to view the facts of the period as facts. Professor Munro's book on the "Seignorial System of Canada," recently noted, and Mr. Beer's new volume both come within this group. The degree to which the navigation laws of England were effective in America, and their relative popularity at home and in the colonies, are of great importance in understanding the reasons for the breakdown of the first British colonial empire. "Tyranny" and "unconstitutional taxation" are too obvious and simple to account for the catastrophe. Mr. Beer shows clearly the difficulty of the colonial problem in this work. The financing of imperial defense is still a vexed problem in British politics, and Great Britain has purchased comparative peace with her colonies only by paying all the bills herself. It was the attempt to find a more logical solution than this that developed the friction of the seventeen-sixties, as it might well revive it today. The fact that populations of British extraction object to the payment of a tax has never been any evidence that the tax ought not to be collected. We commend this book to persons who desire a fairer view of the ultimate causes of American independence. "If loyalty be conceived as a sentiment implying duties and sacrifices, and not merely utilitarian allegiance, there was in the colonies, broadly speak-

ing; little loyalty to Great Britain." Never were the colonies ready for the judicial decency implied in the removal of their judges and courts from financial dependence upon partial and interested local legislatures.

Literary Notes

....Crowell & Co. have just issued in three volumes an attractive little edition of Jefferies' best known collections of essays, *The Life of the Fields, Nature near London,* and *The Open Air.* Each volume is preceded by an introduction by Thomas Coke Watkins. It is well known that Jefferies' genius was first appreciated in America, and he should still have enough admirers to make these volumes acceptable.

....The volume bearing the title "Thanksgiving," which Robert Haven Schauffler has edited, in view of the near approach of this American holiday with which it is concerned, is very timely. Prose and verse selections, judiciously gathered from many sources, makes the book particularly pertinent just now. The literature of Thanksgiving Day is given in condensed form, and a short history of the institution, its purpose, significance, and accomplishment in our national life, in Mr. Schauffler's introduction, pleasingly rounds out the book. (Moffat, Yard, $1.00.)

....*Microscopy, the Construction, Theory and Use of the Microscope,* by Edmund J. Spitta, is a new and comprehensive volume on the technique of that instrument, its construction and the theory of optics as applied to the microscope. It differs essentially from "Carpenter on the Microscope," which has long been considered as standard, in that Spitta has nothing to say regarding microscopic objects. He concerns himself entirely with the instrument as a medium. The present volume considers for the first time metallurgical microscopes and illustrates the most recent types. The chapter entitled "Hints to Workers," is exceedingly intelligent and valuable. Advanced students in microscopy will find the present volume extremely helpful. (Dutton, $6.00.)

....A book to catch up now and then for a fragment of fresh and vital religious thought is the Rev. Artemas Jean Haynes's *Social and Religious Ideals* (New York: Charles Scribner's Sons. $1.00). Mr. Haynes is pastor of the United Church on the Green, New Haven, Conn., and dedicates his book to Dr. Munger. He writes for those who are unsettled in religious belief, confesses allegiance to the newer views in both science and Biblical criticism, and seeks to contribute an item here and there to a "New Theology," which shall at the same time fearlessly admit all truth and be reverently humble before God. The book is composed of paragraphs, few over a page in length, and some of the headings are especially happy, compelling attention and containing in themselves suggestive thought.

Pebbles

NATHAN PERRY BEERS, of New York, is the kind of husband the women dream about. His wife died a week ago, and he refused to have the body buried. He spends all his time in her room, having his meals sent in, which he eats off the coffin.—*Atchison Globe.*

THE CURSE OF WAR.

SHE (visiting the grave of her first husband)—Ah! If it wasn't for the war you wouldn't now be my husband, Jim.

Jim—What a curse is war!

—*The Sandhurst (England) Regiment.*

HER WILLINGNESS.

"YOU must have been dreaming of some one proposing to you last night, Laura."

"How is that?"

"Why, I heard you for a whole quarter of an hour crying out, 'Yes!' Yes!! Yes!!!'"

—*Fliegende Blaetter.*

FRIEND (to artist)—Well, were you successful at the salon?

Artist—No, they rejected my picture, the wretches.

Friend—Why?

Artist—How should I know? The oil was bad, perhaps.—*Nos Loisirs.*

Lines to a young man who went to the President's church at Oyster Bay, but who failed to see the Strenuous One:

COME, listen to my mournful lay,
All ye on hero-hunt intent.
I journeyed forth to Oyster Bay,
But did not see the President!

I breathed the Presidential air;
But from the pew where I was sent
I could not turn around and stare,
So did not see the President!

Alas, this world is full of woe
And blighted hopes; and so, content,
I share the common lot—and know
'Twas fate I missed the President!

RULES FOR WAR BALLOONS.

(As formulated at The Hague.)

1. No person, under penalty of death, shall fall out of his balloon over an unfortified town.

2. Under the rules of the Geneva Convention, empty beer bottles must not be used as missiles.

3. Barbed hooks must not be used by balloonists in fishing for chickens.

4. In the event of a non-combatant being hauled into the air on a balloon's grapnel, he should be let go instantly.

5. Balloonists dropping snuff down chimneys shall be treated as pirates and be hanged on capture.

6. Crumbs must not be shaken over the side.

7. In all other respects balloonists must conduct themselves in a civilized way when engaged in dynamiting troops or property.—*New York American.*

Speculation With Bank Deposits

THIS acute and alarming financial disturbance in New York has taken place at a time when the entire country is still enjoying prosperity. Wages are high, and great activity in the industries of manufacture has not been checked. The continuing large volume of traffic on the railroads makes earnings greater than last year's. Southern planters get high prices for a large crop of cotton. Altho the yield of two or three cereals is smaller than the very abundant harvest of 1906, our agricultural journals say that, owing to high prices, the farmers' receipts will exceed those of last year by $500,000,000. In New York we have a panic, with runs on the banks and the suspension of great financial institutions.

Let us see what the causes of this disturbance were. They have been almost exclusively local. The immediate cause was the miserable collapse of a wild speculation in the shares of a copper mining company. As the company was not widely known and had not attracted many investors, this affair might soon have been forgotten if the originators of the reckless speculative movement had not been closely connected with the management of a national bank, and if that bank, on account of the unsuccessful corner, had not been forced to apply to the association of banks for help. Aid was given, as the bank was solvent, but upon the condition—suggested by an examination of the bank's loans—that the controlling owners and officers should retire from the banking business. At the same time several other second-rate financiers and speculators who had obtained control of a group of banks were also forced to sell out and withdraw.

In recent years, certain speculators and promoters have gained control of banks in New York in order that they might use depositors' money to bolster up their speculative projects, such as the making of Ice Trusts and the consolidation of steamship companies. It was their practice to use the stock and securities of one bank as a basis for loans with which they bought control of another, and so on, until a "chain" was completed. Thus, under lax official supervision, there were great opportunities for them to finance their schemes with other people's money. It was, on a small scale, the game played with the huge surpluses of the life insurance companies until the Hughes investigation imposed a check.

These speculators in banks were forced out. Their banks needed help. Their reverses affected other bankers who had been in some measure associated with them. Depositors began to demand their money at the paying tellers' windows. A great trust company largely engaged in banking was forced to suspend. Others have been saved from suspension with difficulty, and several small banks have closed their doors. As we write, the crisis appears to have been past, owing to the efforts of our greatest banks, richest capitalists and the United States Treasury.

Now, the immediate cause was gambling with bank deposits in New York, gambling that is forbidden by law, and for which there should be punishment.

The collapse of the copper share corner precipitated a discovery of the rottenness. Distrust spread, and perfectly sound banking institutions were subjected to a very severe strain. One of the vice-presidents of the broken Knickerbocker Trust Company (which had $57,000,000 of interest-bearing deposits) ascribes that institution's misfortunes to Mr. Roosevelt's speeches. This reminds us again of Brouwer, the clerk who was arrested three weeks ago for stealing $100,000 from his employer, and who sought to place the blame upon Mr. Roosevelt, asserting that the Government's prosecution

of dishonest men had made his stock speculations unsuccessful.

There were other causes which operated indirectly or remotely. The world-wide scarcity of loanable funds embarrassed the speculators. Exposure of the offenses of great railway capitalists, of the life insurance crimes, of the New York street railway jobbery, had shaken public confidence in American finance and contributed to that decline of securities which interfered with the bank speculators' plans and hastened the revelation of their dealings with the controlled banks. Inadequate official regulation of the banking business carried on by some trust companies must also be taken into account. But the main and immediate cause, as we have said, was gambling with bank deposits.

This should have been prevented. So far as official regulation is concerned, either the laws are inadequate, or supervision has been lax. Having in mind the prompt and admirable action of the Clearing House Committee following the Mercantile Bank's application for help, we dislike to say anything which may seem to be criticism of the Association's attitude in the past. But was it not possible for the influence of the Association to be exerted some time ago for the discouragement and discomfiture of these promoters who were using banks for their selfish purposes? That they were doing so was known, we think, to conservative bankers. At least, there must have been a very strong suspicion that this was the purpose for which the banks were acquired. The righteous hostility of the Clearing House Association of New York is something which no bank-owning speculator can endure. If these men had felt the weight of it some time ago, this panic might have been averted. But we must heartily praise the Association, and Mr. Morgan, and the strong men of the older trust companies for the fine work they have done in the last two weeks, and for that which they are still doing.

We should like to think that the disturbance must be exclusively local, but we cannot fully agree with those Western journals that regard it as wholly a Wall Street or New York affair. Experience teaches that the effect of such a shock is felt far and wide, not at once, perhaps, but in the course of time. The immediate causes and the manifestations are local, but the place is at the heart of the body of American finance. Because such a disturbance is always felt to some extent at a distance, tho in obscure ways and not immediately, the need of prevention of such offenses in banking by both legislative and executive action is emphasized. We are confident that as a result of what has already taken place, the conservative bankers of New York will propose or put in force remedial measures suggested by the nature of the practices which have been the cause of so much anxiety and strenuous effort.

A Five Million Dollar Fine

WHILE much noise has been made about the twenty-nine million dollar fine imposed on the Standard Oil Trust, not so much notice has been given to another enormous fine of five million dollars imposed by the Venezuela courts on another American company which is subdivided, like the Standard Oil, into various companies, such as the Trinidad, Bermudez, Barber, etc. For practical purposes we may speak of them all as the Asphalt Trust, as they are all held by one company, and by a standing agreement are trusteed over wholly to the management and control of five men at Philadelphia, of whom John M. Mack is the head.

While the immense mass of testimony gathered for the use of the late trial in Venezuela has not been printed, we have had access to its records, and give the following abstracts of facts, which will show, at least, that a company dealing in inflammable stuff should not play with fire.

In 1901 the Asphalt Trust sent its lawyer, Henry Willard Bean, to Caracas. There on July 5th, 1901, he gave a dinner to chosen friends, at which Manuel A. Matos, a wealthy landowner, was the guest of honor. Be it remembered that this was a time of profound peace in Venezuela, but that there was friction between the Government and the asphalt company because of its failure to keep its agreement to develop internal improvements in connection with its concession to exploit the asphalt of Bermudez Lake. Let it be

further understood that while the Asphalt Trust had purchased this concession from a previous holder, it was not for its interest to develop it, because it was compelled to take its asphalt from the Trinidad supply, or lose that English concession.

Speedily after this dinner Matos arrived in New York with letters from Bean to the officers in New York of the asphalt company, calling at the offices, 11 Broadway, July 23d, 1901. He also met General A. D. Andrews, active head of the asphalt company, and Mr. Sewall, another officer, at Sewall's house in Ardsley, and there arrangements were made to secure money for war purposes in Venezuela. Rudolph Paula was Matos's agent. He went to Europe and purchased the "Ben Righ" in Scotland. He paid a draft of £20,000 ($101,366.67), which was met in New York, November 18th, 1901. This vessel later appeared in Venezuela as a war vessel under the name "Libertador." The draft for the purchase went thru the Seaboard National Bank, 26 Broadway, and was met by Nichol, Anable & Lindsay. The latter is J. R. Lindsay, former Assistant District Attorney of New York. The rebellion thus started in a time of profound peace was suppressed by President Castro at a cost of several thousand lives and several million dollars, besides the loss of business and trade. The Trust lost whatever money it had put in the attempted revolution, besides the advantages it had hoped to gain if Matos had succeeded in securing the Presidency. All this time Mr. Loomis was the American Minister, and was naturally informed as to what was going on, and he received large checks from the asphalt company, which he explained as legitimate, as he was doing his banking thru them.

Now, to return. The Asphalt Trust was doing this thru the Bermudez Asphalt Company, which was operating under a concession for minerals, metals and woods. In the agreement it was under obligation to develop the country, build roads, etc.; but it did nothing. Venezuela got no profit from the export duty. The Bermudez asphalt is much richer than the Trinidad, and will go a half farther, but for the Trinidad Company Englishmen held the bonds, and they must be protected. Of course this had long been unsatisfactory to the Venezuelan Government, and on July 22d, 1904, the Bermudez concession was declared forfeited, and on July 28th a receiver was appointed, Mr. A. H. Carner, with instructions to run the business and export asphalt, on account of whomsoever the courts should declare the rightful owner. The concession had a clause requiring that all disputes should be settled in Venezuelan courts without recourse. After three years, and a final appeal, the concession was forfeited. There is no reason to doubt that the decision was a just one. When the books of the Bermudez Company were seized there were found the canceled checks paid to Minister Loomis, which have given rise to question and scandal, but which he explained as legitimate personal business.

Meanwhile the Venezuelan Government brought suit for $5,000,000 against the Bermudez Company—that is, against the Asphalt Trust, for first fomenting and then aiding the rebellion. General F. V. Greene, former president of the Asphalt Trust, testified that on his arrival at the office of the Trust on the day of the payment of the £20,000 on Matos's account, mentioned above, he did not approve it. He said he could not again go the State Department, as they had estopped themselves from seeking further support there. Then, on the resignation of General Greene, his successor, Mr. A. D. Andrews, swore it was not merely $101,000, but $130,000, that was paid; and further testimony brought the amount up to $143,000, furnished to organize a revolution in time of peace. The result is that, after long litigation and a fair trial, the lower courts have awarded the $5,000,000 claimed against the Bermudez Company. There is no chance that an appeal would change the result.

Is not all this, as told, a very disagreeable story of worse than rotten finance on the part of eminent financiers? The testimony shows that a revolution was concocted in a peaceful country, with which we were at peace, one costing thousands of lives, just to avoid having to keep the engagements in-

volved in the Bermudez concession. They claim that what they did was for protection, but there was no rebellion and no need of protection except as they started the rebellion. Their attempts to involve the United States Government have failed. It is not strange that the United States Government declines to publish the report of Judge Calhoun's investigation. Minister Bowen was removed for trying too energetically to expose the ill-doings of his predecessor; and Mr. Loomis, after being let down easy from a place in the State Department, by being sent to inspect consulates, is out of service, here and there, and was reported the other day as having called on Secretary Root in Mexico. All of Mr. Root's good offices are needed to recover the good repute of the United States in Venezuela, and the Asphalt Trust will get precious little help in Washington.

All this has a general interest just now in this country, for the Asphalt Trust is in difficulty with its contracts thru the Barber Asphalt Company. It laid down the pavement in a great many streets in this city. There are 238 miles of asphalt paving in Manhattan out of 385 miles of streets. Of these 51 per cent. are out of order and need repairing. The Barber Company, which is the street end of the Trust, agreed to keep the streets in good repair for from five to fifteen years. Mr. Ahearn now admits that he finds their condition bad, but did not know it. The deplorable condition is due to his neglect and that of the Barber Company. The latter is now too poor to keep its contract. It has lately given up twenty-seven contracts. Now there is no longer a monopoly in asphalt. There are dozens of companies which will supply it, from Venezuela, Trinidad, Texas, California or Syria. Other cities are in about as bad a condition as New York. What is needed is an efficient board, which shall be out of politics, allowed to get asphalt where it will, and which will watch the streets and repair as soon as a flaw appears. They do things better in France.

We may anticipate no more bullying of Venezuela. She has come out of this better than we have apparently. The moral effect will be for peace; and the exposure of violent and illegal methods, like other exposures, will clear the atmosphere at the expense of some stormy weather, and will be worth the cost. A leading New York financier has explained the present financial flurry as caused "by the bad methods of bad men."

The Episcopal Convention

THE Protestant Episcopal Church moves forward, only it will be no longer the Protestant Episcopal Church, for it has voted to take the name off from the title of the Prayer Book. It will be three years longer before this action is effective, but it is sure and settled. And it is well. The name *"Protestant Episcopal"* has been an undesirable one, acknowledged as such, and kept only out of deference to those who feared that the removal was meant to draw the Church toward Rome. The present movement is not aimed in that direction, but is more truly catholic and broad. The influence comes from the mission fields, where the name is hostile and divisive. *"Protestant"* is a negative name, and depends on its relation to that Church out of which the Protestant Reformation separated itself. That old history no longer needs to be recalled, at least in mission fields. Even the name *"Episcopal"* is no better than *Presbyterian* or *Congregational,* except, as it is one syllable shorter, for it concerns nothing more important than a style of administration. We judge that the tendency now will be to call the body the *American Church.*

Another act of the Convention which will have large results is the decision to elect a Presiding Bishop when the present Presiding Bishop shall cease to serve. Up to this time the oldest bishop in point of consecration has presided. This accident of longevity gave no dignity, and assumed that the incumbent shall have past the years of more active service. Now an effective Presiding Bishop will be chosen, a man of influence and power, who will be a sort of Archbishop or Primate, and will be honored as such. What will follow in time and was under discussion is the division

of the Church into provinces, as in the Catholic Church, each with its archbishop. We can see no objection to this, and it is in the line of ecclesiastical development for the American Church.

The main question before the Convention was that of race bishops. The Church is not at all proud of its success with the negroes, and was ready to take any action which would aid its missions in the South. Bishop Bratton said he had 950,000 negroes in Mississippi, and only $1,100 of missionary money for them. He had the curious idea that all negro education should be in parochial schools, and he "hoped it would be long before another college for negroes should be established." A plan proposed by an Arkansas memorial was to consecrate three negro bishops and establish an African Episcopal denomination and send it adrift with a blessing. Naturally, this was overwhelmingly defeated. Similar defeat, after a long discussion, followed the proposition to separate the negroes in missionary districts, with bishops of their own race, where called for. The Convention had no patience with the propositions looking to dividing the members on the line of color. The result reached, however, which must be approved three years later, does not differ radically. It allows a diocese to choose a suffragan bishop, who has no right of succession, and who may sit, but without a vote, in the House of Bishops, and whose care, we understand, will be with the negro churches. We judge he will usually be a white man. One would not think that the Southern bishops were usually so overwhelmed with labor that they would need such suffragans, at least not in Mississippi. Indeed there is not a diocese in the South that has 1,500 negro communicants.

Another interesting and liberal decision of the Convention was that which, by a handsome majority, allowed an "open pulpit" for those of other denominations. The canon as adopted forbids that any one but a minister of the Church shall "officiate"—that is, perform sacramental acts, but allows any layman or any person approved by the bishop to speak or preach in the pulpit, thus performing homiletic, but not sacerdotal, functions. It was shown that this would allow the clergy to return courtesies from other bodies. This action shows the progress made since the time when two Episcopal rectors in New Brunswick, N. J., Messrs. Boggs and Stubbs, nearly forty years ago, presented the Rev. Stephen H. Tyng, Jr., for trial, and secured his conviction for the less serious offense of having preached in a Methodist church in that town without their consent.

Even more advanced was the proposition presented by Dr. W. H. Huntington, of New York, to drop the Thirty-nine Articles from the Prayer Book. It had much support, but so radical a proposition needed consideration, and was referred to a commission to report three years hence. Those Articles are a motheaten patch on the garment of the Church. No one pretends to believe them, and they hark back to a controversy with Rome which everybody has forgotten.

It is proper to add that the face of the Convention thruout was turned forward, and particularly as to mission work. This is what was in mind on the racial question, and a million dollars was raised for mission work. Thus we see that the most radical Convention ever held, and that in a Southern city, was also the most evangelistic. It all augurs well for the "American Church."

What Can We Do With Them

It's really getting to be a serious question, and threatens to be worse before it is better. By this time there must be at least fifty of them in New York City alone, not to speak of a quite unknown number elsewhere. Their condition is most unfortunate from whatever point of view one looks at it, and it is no longer possible to refrain from looking at it. So long as men could go to their business every morning and return to their apartments at night without once thinking of these unfortunate beings they did not present a social problem. But that day of indifference is past.

The case of the ex-Presidents of the United States is really very different. To begin with, there are never many of

them at any one time. Just now there is only one, and somehow he conducts himself so quietly and with such unassuming dignity that it does not often occur to any of us to ask, as in anticipation we are already asking about Mr. Roosevelt, What can we do with him? Again, ex-Presidents of the United States have, with unimportant exceptions, been very worthy gentlemen, and even tho we didn't do anything with them, they have not in any way disturbed our peace of mind.

But these ex-presidents, secretaries, treasurers, managers and directors of fiduciary institutions, whose terms of office have expired for moral and expedient reasons, are not an element in the population that we can be indifferent to as a number too small to be counted or as an example too commonplace to be ignored. Very few American citizens come in daily contact with an ex-President of the United States, but most of us from now on will almost continually find ourselves meeting on the street, at church or elsewhere, the ex-presidents of trust and insurance companies. There will be no retreat where we can feel sure that we shall not encounter them. Then, too, ex-Presidents of the United States, even when we do run across them, do not, as a rule, awaken in us any great volume of perturbing emotion. We may have believed that during their four or eight years in the White House they made good or bad times, according as their disposition happened to be benign or malevolent, but it does not occur to us to imagine that they are supporting their families and entertaining a few friends in their serene old age on deposits against which we ourselves are no longer permitted to draw checks. Consequently, we cherish no animosity toward them. But any one whose perceptions are tempered by prudence can see that there is an element of danger to public peace and order in having great numbers of ex-presidents of financial institutions at large in the community, which is not involved in our neglect of proper provision for ex-Presidents of the United States.

The problem is complicated, moreover, by our increasing mellowness of heart as a people. Our shrinking from the infliction of capital punishment upon murderers has become a shrinking from inflicting black and white clothing and free hair cuts upon financiers with whom we have been doing business to their disproportionate advantage. Nor does the lunatic asylum seem to us to be quite the appropriate place for them. There has never been anything incoherent in their plan of life, and we are haunted by a suspicion that in the matter of delusion we ourselves have furnished more data than they have to psycho-pathology.

For some of them, possibly, well-appointed sanitaria might be an acceptable and humane provision, but we doubt if more than a respectable minority would feel quite happy in availing themselves of assistance so obvious. As a mere suggestion, to be taken for what it may be worth, we venture to recommend some combination of the pension system with a sufficiently conspicuous decoration. A red ribbon, more nearly scarlet in tone than the somewhat commonplace badge of the Legion of Honor, and wrought into an appropriate design, might be put on the lapel of a plain black frock coat, which is in every way more suitable for men distinguished in high finance than the admittedly awkward garb in fashion at Ossining is. This combination would readily be recognized by former customers and confiding friends, who could then easily avoid the embarrassment and possible heat of personal encounter. The pension should, of course, be generous. It would not be magnanimous to forget that these men have been accustomed to a rather generous way of life, and that they feel the loss of a chauffeur and a valet more than some of us would feel the loss of much humbler personal service. Their wives and daughters, too, ought to be considered. It would be unfeeling and a little boorish if the great American people, with all its material prosperity and its exuberant good spirits, should force these ladies to depend on novel writing, or the giving of moral instruction to women's clubs, or other such employment, for the wherewithal to keep up a quietly genteel appearance.

Some such plan as this, we feel sure, will commend itself to the public, rather than any crude scheme for segregating

these gentlemen in a farm-colony or moral training school, for either of which they have become, by habit and association, as well as by the accumulation of years, in some measure unfitted.

Why the Filipinos Swear

It was brought out incidentally at the Mohonk Conference that the Filipinos are swearing. Some of them seem to be swearing *by* the United States and some of them swearing *at* it.

It is not difficult to see why many of them should enthusiastically swear *by* the United States. They have only to look back a few years to the conditions under Spanish rule to find abundant occasion for gratitude. Their fluctuating and depreciated currency has been put upon a firm basis, and the change has been made without serious financial disturbance. Sanitary reforms of vital importance have been effected. The system of water works now building by the United States Government will relieve the people of Manila from the danger of drinking water charged with dysentery and death. Improvements are now going on in the harbor of Manila which will eventually make it one of the finest in the world. Cable communication has been established with the United States. Under the authorization of Congress the Filipino Government is aiding in the building of railways, which will multiply enormously the possibilities of transportation. A system of general education has been established especially adapted to the needs of the Filipinos, in which industrial education and the study of the English language are prominent features. A Filipino postal savings bank has been established, and in less than four months after the passage of the act sixty-two banks were organized. An agricultural bank has been authorized which will be a great help to the farmer. Real estate is well protected by a title guaranty system established by law. These improvements have cost money, but the people can see where it has gone and for whose benefit it has been expended. They are patient under the increased cost of living. They have enjoyed the unwonted luxury of local self-government and the exhilaration of electing a National Assembly.

It is not surprising, then, that a large number of the intelligent people of the islands are as happy to be under the American flag as the Filipino student who spoke at Mohonk last week; and it is significant that, in spite of the fact that the new National Assembly is made up of all shades of parties and with a predominance of Nationalists, the first vote it past was one of profound thanks to the people and Government of the United States.

Who, then, are the people who, according to report, are swearing *at* the United States, notwithstanding they share the benefits we have recited? There are a good many of them. They are the people who feel that they have not been fairly treated in their commercial relations. All commodities coming to the United States from Porto Rico and Hawaii are admitted free of duty, and those from Cuba are admitted at 20 per cent. of the existing tariff; but a burdensome tax of 75 per cent. of said tariff continues to be imposed upon two of the principal products of the islands. The average Filipino business man raising sugar and tobacco cannot understand why Porto Rican and Hawaiian goods should be let in free and such favor shown to Cuba in preference to the Filipinos; nor does he understand why the product he raises should have to pay this extreme duty while the man who is raising hemp is allowed to send his goods to the United States without tax. There are thousands of people in the United States who wince when they see what the Mohonk platform calls a "glaring inequality" which "does not reflect the prevailing spirit of the American people." Nor do the same Americans see the political and commercial wisdom of forcing the Filipinos to seek a better market for their products in Spain than they can find in the United States.

There is another class of people who are seriously disturbed for want of Congressional action. They are what we call the "men without a country." Under the organic act of July 1st, 1902, provision was made for the conferring of Filipino citizenship upon persons then resident in those islands by registering before a proper tribunal and renouncing allegiance to every other sov-

ereignty. This had reference to the Spanish citizenship which had existed fully or partially in those islands. No provision has since been made for enabling persons not in the islands at the date of our occupancy to acquire Filipino citizenship. Large numbers of persons have gone to the islands as permanent residents; they possess all natural and necessary qualifications for citizenship without the power of acquiring it. Among the number are some hundreds of persons who, prior to going to the islands, had declared their intention of becoming citizens of the United States and had therefore renounced their allegiance to the government of which they were formerly subjects or citizens. They have become curiously expatriated. They cannot become citizens of the United States without fulfilling the term of residence required by our naturalization laws. Residence in the Philippines, tho a dependency of the United States, does not count toward citizenship *in* the United States. To fulfill the terms of our naturalization laws they would be obliged to give up their occupations in the islands, return to this country and live here the prescribed time. A number of these persons are captains of vessels engaged in traffic between the islands. When the coastwise shipping act goes into effect next July in the Philippines they will be disqualified by want of citizenship from performing such service. No change in the naturalization laws of the continent are necessary to remedy this anomaly, but some legislation by Congress is needed along lines already indicated and embodied in a bill which has received the approval of the Department of State and the Department of Justice as well as the Departments of War and of Commerce and Labor.

Another reason for discontent is not confined to the Filipinos, but is shared by the Hawaiians and by travelers from the United States to and from these islands. It is the coastwise shipping law above referred to. What an uprising there would be in the city of New York, what mass meetings would be held, what storms of protest from travelers to Europe from all parts of the country if they were told that they could not sail to Europe in any but an American vessel, under command of an American citizen, without paying a fine of $200 for each passenger. But that is the law which now applies to Hawaii and which next year is to be extended to the Philippines. Secretary Straus and a number of his friends are in a position to explain how the law operates. They were in Honolulu; they wished to return at a certain time to the United States. No American vessel was available. To get back within the prescribed time they were obliged to take a foreign vessel and pay $200 each for the privilege. People ask what is the origin of a law in which the spirit of protection seems to have gone crazy. It comes from the application of the United States coasting laws to a situation totally different from that for which they were intended. Continuous voyages cannot be made in the coasting service of the United States except in vessels under American registry. It is a law which is somewhat dear to the people of Maine, who support it, and dear in another sense to the rest of the country who suffer from it; but the reasons which may justify it for the coast of the continental United States do not justify its extension to Hawaii and the Philippines. The arguments which may apply to a ship-subsidy law do not apply to this, which hampers commerce and trade and places a burden upon travelers.

The people of our island dependencies have enough burdens to bear which are the heritage of centuries without bearing new and unnecessary ones placed upon them by the Congress of the United States.

The Book of Joshua

SOME ten million American Sunday school students are now engaged in a course of six lessons on the Book of Joshua. In twenty-four chapters, about twenty-five pages of an ordinary Bible, this book sets forth the salient features of the winning of the territory which Israel held for over 1,000 years, and on which she worked out her destiny and performed her mission for the world. We know of no modern writer who could de-

scribe an event of equal size in less than four octavo volumes.

Joshua contains a number of narratives of popular interest, and also its full share of the difficulties which have made the Old Testament a perplexity and a stumbling-block to many minds. It is in Joshua we read of the fall of the walls of Jericho at the blast of the ram's-horn trumpets, of the great national defeat at Ai because of the trespass of one man, of the staying of the sun and moon in the valley of Aijalon at the command of the leader, of the wholesale slaughter of men, women and children in town after town. The ten chapters which narrate the division of the territory are not so interesting. There are more weighty considerations for us than the lot and borders of Zebulon and Issachar in 1180 B.C., particularly as the distinctions between Zebulon and Issachar do not appear to have been of any importance, either then or at any later time. But the Bible is an old book, and was not written for any one age or generation. There were times when matters of genealogy and ancestral residence were of great weight to certain people, as books of heraldry are to their relatives today. We ought to be glad that these people had their Bible, and glad that we are not confined to those portions of it which yielded them greatest satisfaction.

From time immemorial moral objections of great force have been brought against the extermination of the Canaanites as recorded in this book. The story is gruesome in the extreme. It reports wholesale massacre of city after city, the murder not only of captive soldiers, but of women and children, the helpless aged and the innocent babes. It does not show good moral insight to defend such deeds. No civilized nation would so wage war. Rome at her cruelest did not do so. Such wild fury of the untamed Bedouin was part of the early barbarism of the cruel East.

Critical students today do not believe that the Hebrews of the conquest were as bloodthirsty as the Book of Joshua represents them. There is another story of the conquest in the early chapters of Judges, in which the narrative is not nearly so bloody and the massacre by no means as wholesale. There is every reason to suppose that this less dramatic account more accurately states the facts. Professor Gray, of Oxford, has called the story of Joshua "an historical romance," and Prof. Henry P. Smith maintains that it states "what did not occur at the conquest."

This may afford some relief as to the conduct of the ancient Hebrews, but it does not help much as to the Book of Joshua. It rather increases the embarrassment, for on this understanding the book hightens the very features against which one's moral feelings protest. It not only relates terrible things, but it makes them out more terrible than they were. The case is a bad one for those who hold that the Bible is on one dead level of truth and authority. In fact, however, the Bible is a broad and tolerant book, recording faithfully the religious conceptions of a remarkable but very human people, whose life extended over thousands of years; who began at a low stage of culture and faith, and advanced only gradually toward purer, truer light. In Joshua we have to do with an early and deficient conception, both morally and religiously. Such ethics and such standards of piety are not binding on men today, and need not be defended.

The belief which underlies the Book of Joshua, that territory in rightful possession of one people can be made over by divine promise and gift to another nation, is not in accord with the best morals. Some American settlers had that notion, and they murdered the Indians and stole their lands. They argued that it was a "white man's country," that the Indians did not deserve it, and various other sophistries. We condemn their assumptions and glorify William Penn. But Joshua was far nearer Miles Standish than he was to the great Friend. This is not to reject the Bible, but only to recognize the long, patient way by which God led men to the nobler ethical standards which prevail in the higher portions of Scripture.

One gets along much easier with the miracles of Joshua when he learns that the book was not written at one time, and that much of it saw the light centuries after the deeds it describes. The story of the damming of the waters of Jordan for Israel to cross is manifestly a

late recension of the account of the crossing of the Red Sea, which in turn had its origin in a perfectly natural occurrence. Some have tried to explain the marvel at the Jordan by mention of a landslide which produced a like effect in the Middle Ages. But Joshua does not speak of a landslide, but of the stopping of a river at the touch of priests' feet. Prof. George Adam Smith declares that Jericho never withstood a siege, which may be true without effect on the credibility of the story of the rams' horns. Relief in these matters is to be sought in the lateness of the traditions.

Notwithstanding its difficulties, we could illy get along without the Book of Joshua. It shows us that the old-time Hebrew was not a weak and canting rabbi nor a money-changing Shylock, but a man of red blood, of courage, ambition and grit. He may not have exterminated the Canaanites, but he certainly gave them a good drubbing, and his successors wished he had wiped them out altogether. He had the faculty of religious conviction on duty that seemed right at the time. If he had to fight with Adoni-bezek, it was well he fought with the sword of the Lord. The time had not come for William Penn. It was the age of Joshua, and Joshua did well to be equal to it, and, according to his light, to be strong and very courageous.

Chewers and Chewing

ACCUSTOMED sights make us callous to their frequency, and the distinguished traveler who summed up the chief products of the U. S. A. as

> "The cud-chewing cow,
> The swill-swigging sow,
> And the gum-chewing girl"

may seem a trifle severe to those of us who have the third product continually in sight. But, viewed impartially, there is something so organically repulsive in this animal mouthing and munching that it may prove of interest to ascertain the cause—or causes—of so uncouth an exhibition.

Primarily, it is known that all nerve tension or emotion finds vent or expression in muscular movement. Even so universal an expression as laughter is nothing more than a switched-off nerve current invading the most used muscles, viz., those of tongue, lips and the respiratory organs; and the raised voice and possible violent action of an angry man is the logical muscular expression of his fervid emotion. In the early pioneer days of this country there were few of the idyllic pastoral conditions that make the picture in Gray's "Elegy" or the scene in Meissonier's "Angelus." The plowing of the early settler had to be done while his rifle lay within easy reach, and at no time during the working day was there any relaxing of his constant, alert watchfulness for signs of the presence of the hostile red man. Similarly, at night, when bolted and barred in the bullet-proof security of his log cabin, he had no waking hour entirely free from the nerve-racking alertness for the warning whoop, or the silent dash. Eventually the enemy was banished to remoter districts, and the nerve strain, as such, became only a memory. But its effects remained, and finally found outlet, solace and expression in that great national invention the Rocking Chair, which has since remained to express and relieve emotional tension when the milder methods of the "devil's tattoo" and the "whittling stick" are inadequate or unavailable.

In those early days the pleasures were limited and primitive; the items of luxury were chiefly gastronomic and all home-made; hence it is to be surmised that the discovery of maple-sugar and spruce-gum conduced to the joy of this continent. And thus it comes that in those early days of limited enjoyment, and under the widespread condition of a slightly deteriorated nervous reserve, there grew into fashion the use and practice of chewing gum. And this practice is prevalent among us today; not for the gustatory charm of the refractory mastic, but chiefly for the unconscious nervous relief that the muscular act of mastication provides.

"But," it may be asked, "what is this pent-up emotion, or nerve strain, that embraces a continent?" And this is the answer: The rocking chair, the whittling stick, the "devil's tattoo," the unnecessarily frequent motion of "fixing the hair," are all more or less symptomatic of neurasthenia; but 90 per cent. of the idiotic champing and facial contortion incidental to the chewing of gum is due to the characteristic peasant-trait of overweening self-consciousness. Observe the

next young woman you see engaged in the practice. Do you think she imagines that she looks her prettiest during the operation? No. But she is conscious that, while not looking her prettiest, the occupation enables her to meet her fellowman with a certain amount of naturalness, and he is expected to picture to himself how much prettier she will look when she deigns, more at her ease, to abandon enjoyment for repose. Whereas, the brutal fact is, that, without the safety-valve of the accustomed jaw-movement, she would be even a more pitiable sight; for of repose she has no knowledge, and her hands, or her feet, or her body would surely show the nervous unrest expressive of discomfort under scrutiny.

The tobacco-chewer comes under a different heading. In his case it is an acquired taste for a narcotic, and possibly the taste may have been acquired under conditions that provide some excuse. For instance, notice the large percentage of tobacco-chewers among the men who wear the G. A. R. button. Also among teamsters, coalheavers, factory operatives —in fact, generally among men whose time is not their own, whose meal hours are uncertain and whose leisure is scant. Of course, tobacco-chewing is to be deplored, especially the villainous sign of it which calls for "receptacles" along the corridors of the National House of Congress. But it is satisfactory to know that this habit can be regarded as a relic of more strenuous times; and it is safe to prophesy that it will eventually drop out of fashion, like snuff-taking and the bob-wig. But gum-chewing, on the other hand, is not a habit in the strict sense of the word. It is an index of defective training, an exhibition of mental disquiet, whether it be one of New York's "Finest" chewing gum on parade, in the attempt to impress the beholder that he is happy, care-free and enjoying the function, or the laborer who rubs part of his anatomy in the attempt to appear at ease when he is spoken to by his "boss," or the countryman who contorts himself on a drawing-room chair to show how thoroughly he is at home in his surroundings, or the office-girls who chew gum and cluster three abreast on crowded thoroughfares to show their balanced calm and equanimity in the surging crowd. All these futile muscular movements are merely the outward, visible expression of the baneful self-consciousness they are intended to conceal; and so long as adequate physical training, for the purpose of eradicating this trait, is not included in our public school course, so long will we have a large peasant population, with gum-chewing as the characteristic stigmata of the class.

The Trust Conference

The National Civic Federation is accustomed to do big things. Tho the report of its Municipal Ownership Commission —a commission which has set a standard for impartiality, thoroness and scientific analysis for all future investigating bodies—is still fresh in the public mind, it has just put the country in its debt again by holding for four days last week a great Trust Conference in Chicago. The resolutions adopted, while neither mentioning nor attacking the more radical remedies proposed to curb trust evils, admirably express the conservative sentiment of the most progressive public men. The recommendations of the Interstate Commerce Commission and of President Roosevelt that agreements between railroads as to rates should be permitted under proper supervision were endorsed; the improving of the Sherman act was recommended; and the appointment of a non-partisan commission to study the whole trust question was urged upon Congress. THE INDEPENDENT is in accord with these three principal recommendations, tho we are sorry to say that the history of official commissions of inquiry in the United States has not been especially happy, and frequently their just conclusions have been ignored by legislators. Still, such a commission to study the trusts can do no harm, and may do much good. With the exception of the Peace Conference held in this city last April, we recall no more important conference held in the United States during the past decade than this one in Chicago. The Governors of forty-three States sent official delegates to represent them, and the best-known men in business, in labor and in public life were present. The National Civic Federation and its untiring executive officer, Mr. Ralph M. Easley, deserve the thanks of the country.

FACTORS AMONG THE TRUST COMPANIES.

1. Clark Williams, the New Superintendent of Banks. 2. Levi P. Morton, President of Morton Trust Company. 3. Edward King, President of Union Trust Company. 4. Edwin S. Marston, President of the Farmers' Loan and Trust Company. 5. General Brayton Ives, President of the Metropolitan Trust Company. 6. Henry C. Swords, President of Fulton Trust Company. 7. Edward W. Sheldon, President of United States Trust Company. 8. Henry Parish, President of New York Life Insurance and Trust Company. 9. David M. Morrison, President of the Washington Trust Company. 10. John I. Waterbury, President of the Manhattan Trust Company. 11. John E. Borne, Chairman of Executive Committee Trust Company of America. 12. Otto T. Bannard, President of New York Trust Company. 13. Edwin Gould, President of Bowling Green Trust Company. 14. Leslie M. Shaw, President of Carnegie Trust Company (copyright, 1907, by J. E. Purdy, Boston). 15. Clarence H. Kelsey, President the Title Guarantee and Trust Company.

Financial

New York's Trust Companies and Banks

An event of much importance in last week's record of severe financial disturbance was the creation of a committee of trust company presidents. There has been need of such an organization. The Knickerbocker Trust Company, standing fourth in the list of New York trust companies, so far as total resources ($69,486,000) and interest-bearing deposits ($57,083,000) were concerned, closed its doors on the 22d, after paying out about $8,000,000. On the 23d, a meeting of trust company presidents was held at J. Pierpont Morgan's office, with John A. Stewart, chairman of the United States Trust Company's trustees, presiding. It was decided to appoint a committee of five, "similar in its character to the Clearing House Committee of the banks," to which applications from trust companies for assistance may be referred, and which shall have power to call upon the companies for information and to report the results of inquiries, with advice, to meetings of the presidents. Mr. Stewart appointed the following strong committee: Edward King, president of the Union Trust Company; Edwin S. Marston, president of the Farmers' Loan and Trust Company; J. N. Wallace, president of the Central Trust Company; J. W. Castles, president of the Guaranty Trust Company; John I. Waterbury, president of the Manhattan Trust Company. Mr. Stewart and Mr. Morgan will actively co-operate with these gentlemen. It is interesting to observe that, by the latest official report, the six companies directly represented by the committee and by Mr. Stewart have $61,282,500 in capital and surplus, that their interest-bearing deposits are $276,480,000, and that their total resources amount to $348,253,000. Among those who attended this meeting were James Stillman, Henry C. Frick, E. H. Harriman, E. H. Gary, Thomas F. Ryan, August Belmont and Paul Morton.

Our trust companies are powerful institutions. Their growth has been rapid during the last ten years. On August 22d the 51 companies in the city of New York were capitalized at $60,636,000, and their surpluses and undivided profits amounted to $167,982,000. Deposits subject to check, not preferred, were $692,744,000; interest-bearing deposits were $909,677,800, and the total resources were $1,205,019,700. The resources of the 35 trust companies in other cities of the State are only a little more than $100,000,000. A majority of the New York City companies, and especially the older ones, have been conservative and highly beneficial to the public. It would be difficult to find, in any other money center, institutions of a more admirable character than, for example, the Union, the Farmers' Loan and Trust, the Central, the United States, the Guaranty and others which might well be named with these. Their affairs have been controlled by financiers of the best type. Some of the younger companies have departed from the purpose for which such corporations were originally formed, which was the execution of trusts of various kinds, and have entered upon a general banking business, which in some instances, has been accompanied by the promoting of new projects and combinations. So far as general banking is concerned, they have been doing such business as the banks do, but not under the restrictions imposed upon banks. For their banking and promotion business there has been need of regulations and safeguards in addition to those already provided by law. We have reason to expect that the condition of the Knickerbocker, when fully shown, will point to this need. It will be recalled that in 1903 the imposition of new requirements as to reserves caused all but three of the trust companies already in the Clearing House Association to withdraw from it, and that in 1906 a law was enacted which requires the companies to keep a reserve of 15 per cent. It may be that the present disturbance will show that further legislation is needed for the restraint of the younger and more specu-

SOME PROMINENT BANK PRESIDENTS.

1. Richard Delafield, President of the National Park Bank. 2. George F. Baker, President of the First National Bank. 3. J. Edward Simmons, President of the Fourth National Bank. 4. Dumont Clarke, President of the American Exchange National Bank (member of the Clearing House Committee). 5. A. Barton Hepburn, President of the Chase National Bank (member of the Clearing House Committee). 6. Thomas L. James, President of the Lincoln National Bank. 7. James Stillman, President of the National City Bank. 8. William H. Porter, President of the Chemical National Bank. 9. Valentine P. Snyder, President of the National Bank of Commerce. 10. Edward Townsend, President of Importers and Traders National Bank (member of the Clearing House Committee). 11. Robert M. Gallaway, President of the Merchants National Bank of the City of New York. 12. Thomas H. Hubbard, President of the International Bank. 13. Seth M. Milliken, President of the Mercantile National Bank. 14. Stephen Baker, President of Manhattan Company. Photographs by Gessford and others.

lative companies. At all events, the new committee will exercise a conservative and protective influence. It should be made a permanent organization.

It will be noticed that during the financial crisis of last week there was no proof that any one of the banks subjected to criticism was insolvent. Even the Mercantile National was pronounced sound and safe, altho a part of its comfortable surplus was affected by loans on securities not quickly marketable. The small institutions which temporarily suspended payment did so because of a lack of currency. Our people have reason to regard the great banks of New York with confidence. On October 19th the totals for the fifty-three banks (thirty-three national and twenty State) in the Clearing House Association were as follows: Capital, $129,400,000; profits, $164,098,300; loans, $1,076,846,300; deposits, $1,025,-711,400. State banks represent about one-sixth or one-seventh of the capital and profits. There are six of the national banks—the City, Bank of Commerce, First, Park, Hanover and Chase—which stand at the head of the list in the matter of deposits, and which show the following large totals: Capital, $74,-000,000; surplus and undivided profits, $80,466,300; loans, $537,005,000; deposits, $535,718,000. The fourth in this list, the National Park, of which Richard Delafield has long been president, is an admirable example of a great commercial bank. Within its fine new building, on Broadway just below the Post Office, it has spacious, handsome and well planned offices. According to last week's statement its capital is $3,000,-000; its surplus and undivided profits amount to $8,934,000; and its deposits are $76,539,000. The solidity and conservatism of many of the associated banks are proverbial. Among the institutions whose names at once suggest these qualities to business men are the Chemical, the Importers' and Traders', the American Exchange and the First National. The Merchants' National (Robert M. Gallaway, president) has done business at the same location in Wall street for more than 100 years.

The most conservative and at the same time the most enlightened and expert elements of banking in New York are represented in the very competent committee of the Clearing House Association. This is the committee which has so recently eliminated certain objectionable speculators and promoters from a group of banks, assistance to the Mercantile National and other banks under criticism having been conditioned upon the withdrawal of these men. It was excellent work, promptly done. We are confident that the influence of the Association and of its committee will hereafter be exerted to exclude such persons, who commonly obtain control of banks—sometimes of several such institutions—in order that the funds accumulating in them may be used for the promotion and financing of various projects and enterprises. To permit such a use of banks is to endanger both the interests of the public and those of the banks which are conservative and properly conducted. In critical times the danger spreads far and wide, the mere occasional association of innocent capitalists with those who are under public condemnation being enough to impair confidence in sound institutions. This has been shown by the recent experience of trust companies in Providence. The ability of the Clearing House Committee has been shown not only in its elimination of undesirables, but also in the support which, with the aid and counsel of Mr. Morgan and his allies, it has given so promptly and vigorously to institutions which were undeservedly in trouble.

Governor Hughes has appointed Mr. Clark Williams Superintendent of Banks, as Mr. Mott's health would not permit him to perform the duties of this highly responsible office. Mr. Williams, at the time of his appointment, was vice-president and active manager of the Columbia Trust Company, an independent institution, organized about two years ago. He is thirty-seven years old and a grandson of Myron H. Clark, who was Governor of New York in 1855. His father was a banker in Canandaigua. A graduate of Williams College in the class of 1892, Mr. Williams was afterward for a time with the Guaranty and Indemnity Company, and then held in the United States Mortgage and Trust Company, successively, the offices of assistant secretary, assistant treas-

urer, treasurer and vice-president. He was president of the Trust Company Section of the American Bankers' Association in 1906, and for four years past has served in the executive council of the Association.

....A report of the British Iron Trade Association shows that the output of pig iron for the first half of 1907 was as follows: United States, 13,478,044 tons; Germany, 6,355,953; Great Britain, 5,194,712.

....J. B. Robinson, chairman of the South African Banking Company, and well known as an owner of gold mines, estimates at $5,000,000,000 the value of the gold not yet taken out at the Rand, and expresses the opinion that there are great deposits yet undiscovered in the Transvaal.

....An order for 15,000 tons of steel rails was received last week by the Carnegie Steel Company from the Japanese Government, with the understanding that quick delivery will bring another order for 30,000 tons. The price is $30, delivered at Yokohama. To American roads the price is $28 at the mill.

....George E. Roberts, who retired from the office of Director of the Mint in August, has completed his compilation of the statistics relating to the output of gold and silver in the calendar year 1906. The gold output of the United States was $94,373,800, against $88,180,700 in 1905. The principal gain was in Alaska ($6,439,500); and Colorado's loss was $2,766,700. The silver output was 56,517,900 ounces, having a commercial value of $38,256,400, the quantity being almost the same as in 1905. The largest losses were in Montana and Colorado, and the greatest gain was in Arizona.

Survey of the World

The Financial Panic

At the beginning of last week there were signs of some renewal of confidence in New York. From many pulpits, on Sunday, good advice had been given to anxious depositors. Among those who thus sought to give assurance of safety was Archbishop Farley, who said his careful inquiries had convinced him that all the fiduciary institutions were sound. In many churches the people were counseled to restrain themselves and be patient. They were told that their money was safe. Early in the week, the runs on banks and trust companies practically ceased, and the besieged Trust Company of America, which had paid out $22,000,000, saw its deposits increased by $2,000,000. Several of the small banks which had suspended made preparations to resume business. Large engagements of gold from abroad were made. At the end of the week these amounted to about $30,000,000, and $18,000,000 of this is expected to arrive this week, $10,000,000 on one ship. In the brokers' offices there was continuous buying of shares in small lots for cash, because the extremely low prices were attractive. One broker estimated that more than $50,000,000 was invested in this way during the two weeks of excitement. Comptroller Ridgely urged the national banks to increase their circulation by substituting first-class municipal or railroad bonds for the Government bonds held as security for deposits of public money, and then using these released Government bonds as a basis for additional banknotes. Many banks took this course, one in Chicago thus increasing its circulation by $2,000,000. It is thought that the total increase by the end of the present week will be at least $10,000,000. The mints were set at work to coin their bullion, and one order for $15,000,000, in double eagles, was given. In the early part of the week, the supporting pools of bankers were dissolved. The national banks, acting thru the Clearing House Association, had subscribed the $35,000,000, which Mr. Morgan in two days loaned on the Stock Exchange, and $12,000,000 more for the aid of solvent banks that needed currency. Clearing House Association loan certificates were used not only in New York, but thruout the country, even in cities on the Pacific Coast where such local associations existed. Exchange between the large cities was discontinued. In the latter half of the week a premium upon currency began to be paid, and on Friday and Saturday from 2 to 3 per cent. was offered in New York. This was mainly to meet the weekly payroll requirements of employers. The Steel Corporation, whose payroll is $3,000,000 a week, arranged to pay 20 per cent. in cash and 80 per cent. in small checks. In Oklahoma, Acting-Governor Wilson, at the request of many bankers, proclaimed a legal holiday of six days. California's Governor made the 31st a legal holiday, owing to the strain upon the currency holdings of the banks in San Francisco, where one small trust company had suspended. Among the relieving influences was the purchase abroad of very large quantities of American copper. These transactions raised the price 1¾ cents, to 15 cents a pound. The great sum of $75,000,000 was due

in dividends on November 1st (against only $53,000,000 one year ago), and payment of a part of it was anticipated. During the week only one brokerage house failed, that of Kessler & Co., which was involved in foreign exchange. A syndicate led by Mr. Morgan, George F. Baker, president of the First National Bank, and James Stillman, president of the National City Bank, bought from the city government $30,000,000 in 6 per cent. revenue (short term) bonds at par, with an option for $20,000,000 more. Among the disagreeable incidents was a controversy over the sale of the Provident Savings Life Assurance Society by the Thomas brothers (who had been induced to retire from the banking business) to a syndicate in Philadelphia. The syndicate had paid for the stock with cash and notes, but could not get possession of it because it was held somewhere as security for loans. There were indications that the Morse combination of coastwise steamship companies would be disintegrated. Improvement and a gradual restoration of confidence were observed thruout the week, but on Saturday afternoon some disquietude was caused by the weekly bank statement in New York, which was withheld until after the closing of the Stock Exchange, and which showed that the reserve had fallen $38,838,000 below the legal requirements. This is the largest reserve deficit ever recorded in the New York Association, but it was pointed out that the reserve (required to be 25 per cent.) was still 21.20 per cent., and that the percentage had been lower in 1893. Bankers predicted that the reserve would surely be enlarged this week.

Asking for an Extra Session

It became known on Sunday morning that the President had been urged to call an extra session of Congress without waiting for the regular session, which will begin on December 2d. The Associated Press, in a dispatch which appears to have originated in the neighborhood of the White House, said that the requests for an extra session had come from "the conservative leaders in the financial world," who had asserted that the present situation was one "compelling action of a character which will affirmatively eradicate all ground for suspicion of American industrial methods." The dispatch continued:

> "The President has been assured from most reliable sources that there will be no opposition on the part of the great industries of the country to the enactment of the necessary laws to carry out his ideas of Federal control to the extent to which he has expounded them in his recent public utterances. These assurances are made at this time to avert what has been represented as the most dangerous situation which has confronted the country during an extended period—that is, the seeming growing lack of confidence based on known irregularities in business methods in some quarters, and no sure and speedy means of separating the good from the unsound.
>
> "To this end it is suggested that the President set Congress to the task first of making such amendments to the financial laws as will result in the maximum of flexibility with the minimum of basic change in our system. Next, and perhaps most important, that the President embody his suggestions on corporation control into succinct recommendations for enactment into law."

Parts of the President's speech at Provincetown were then quoted. His attention, it was said, had been directed to these, which expressed his desire for the national incorporation of corporations engaged in interstate business. He had been told that "the benefit of having Federal legal machinery to detect and eradicate unwholesome business methods at this time" was much to be desired, and that this "would mean a practical wiping off of the slate and a starting afresh under business conditions which would have and could bear the closest public scrutiny." But the Government's observations had not disclosed an alarming situation, and the President had been told by his advisers that a call for an extra session might have a bad effect "by emphasizing in the public mind an apprehension of unfavorable conditions which do not exist." He had also been asked to "make a public statement of the assurance he feels in the sound condition of public credit." This, too, had been opposed by his advisers. Later dispatches from Washington showed that the question of an extra session had been discussed at a Cabinet meeting in which such action was emphatically opposed. At last accounts it was understood that the President would neither call an extra session nor make a public statement.

The Battleship Fleet

It is reported in newspapers which carefully avoid any misrepresentation of the Administration's policy that the President regards with favor a project for a voyage around the world by the battleship fleet—that is to say, a return voyage by way of the Suez Canal. Dispatches from Glasgow say that our Government has engaged there the services of 21 steamships for the transportation of 200,000 tons of coal to Pacific ports. Rear-Admiral Evans, commander of the fleet, at a dinner given to him by a New York club last Saturday night, spoke as follows of the approaching movement:

"This fleet of sixteen battleships, six torpedo boat destroyers and about half a dozen auxiliaries, will sail from Hampton Roads on December 16. I do not think any one wants to stop us, and they could not if they wanted to. I know the men who are under my command, and I know what our ships can do, and I think it will always be the case that they give a good account of themselves, whether it be a fight or a frolic.

"It is a great pleasure to me to take this fleet into the Pacific, and it would be just as great a pleasure to take it to Yokohama. I know the Japanese people. I have lived among them, and I know that they would give us a royal welcome. We don't fear flower bombardments, nor do we fear the dog shows, but I do fear the hospitality of these people."

He described recent target practice in Massachusetts Bay, asserting that the records made excelled those of all other navies.——A long interview with Prince Ookhtomsky, president of the Russo-Chinese Bank and of the Russian East and Central Asian Society, was cabled on Sunday last to a New York newspaper. The opening sentences were as follows:

"Another great war in the Pacific is inevitable. It will be the next inter-continental war. The combatants will be Japan and the United States. It is my firm conviction that only Japan's lack of ready money stands in the immediate way. How long this certain combat can be postponed I am not sure—except that I know it is not for long. Nothing short of an international cataclysm will prevent the declaration of war by Japan before the completion of the Panama Canal. And it is my opinion that the naval strategists of the Mikado are even now devising a scheme which will enable them to force hostilities with America within two years, and which will furnish them with monetary and moral support as the war goes on. These views of mine, I believe, are held by every other Russian who has given study to the Eastern Asia situation."

He remarks that if the American fleet should pay even a short visit to Vladivostok it would never reach home waters again without a battle.

Immigration From Japan

Representatives in Congress from the Pacific Coast have informally given notice in Washington that at the coming session they will ask for additional and more strict legislation concerning the immigration of Japanese laborers. They assert that the legislation of last session has been ineffective and that the Japanese laborers are entering the country in large numbers. Many come in by way of Mexico, buying in that country thru tickets to Canada, but leaving the railway trains at various points in the United States. It is said that the chief offenders are Japanese employment agencies on the Pacific Coast that supply laborers by contract for work on the railroads and elsewhere. During the official inquiry last week in Vancouver concerning riot claims, the testimony of the head of one of the agencies showed that laborers were imported under contract, and that their wages were paid to the agencies, which retained from 5 to 10 per cent.——Some weeks ago the Japanese residents of San Francisco sent a delegate to Japan. On the 27th ult. he had an interview with Foreign Minister Hayashi. Associated Press dispatches from Tokio give the following interesting report of what was said:

"The delegate pointed out that the feeling for exclusion was directed against the undesirable immigrant alone, and that American employers welcomed honest Japanese laborers. He requested, on behalf of his companions, that the Foreign Office permit emigration of nine hundred honest emigrants monthly through Seattle and San Francisco. Minister Hayashi replied that at present it was advisable to limit emigration to half that number. He further assured the delegate that everything would be done to protect Japanese interests, and at the same time emphasized the importance of stopping anything likely to injure the traditional friendship of both countries. The Government would hereafter, he said, supervise the kind of emigrants allowed to go out. When asked whether measures had been taken to procure the right of naturalization for Japanese, Minister Hayashi replied that, as a Minister of his Majesty's

Government, he would never encourage the alienizing of his subjects, but would insist upon procuring for Japanese rights equal to those granted to subjects of other Powers."

——Contractors engaged in construction work on the new Western Pacific road in Nevada have discharged all the Hindus (about 300) whom they recently employed, saying that they have been found to be of little use as laborers.

The Panama Canal

Following a recommendation from the General Naval Board, the Navy Department has asked that the width of the Panama Canal locks be increased from 100 to 110 feet. The present plans call for 100 feet, but it is thought that this is not enough to meet the requirements of future naval and merchant marine construction. The recommendation will be submitted to the Commission.——New borings made over the entire area of the Gatun Dam show that rock foundations are everywhere possible. All previous doubt on this point has thus been removed, and work on the designs for the lock gates and sluiceways is advancing steadily. New borings have been made also in the vicinity of the Pedro Miguel locks and dams, and the excavation on the site of the lock there is proceeding rapidly.——Representative Tawney, chairman of the House Committee on Appropriations, with eleven other members of the committee, sailed for the Isthmus on the 31st ult., and will remain there for nine days. Mr. Tawney says that at the current rate of excavation, the canal ought to be finished by January 1st, 1914, but he grants a margin of one year more.

Seizure of Trust Products

Unexpected action was taken by the Government on the 21st ult. under the Sherman Anti-Trust law. By order of the Secretary of the Treasury, and at the instance of the Attorney-General, the collector of customs at Norfolk, Va., seized 8,750,000 cigarets (valued at $7,172), which were in transit from Petersburg, Va., and Durham, N. C., to New York and foreign countries. The charge is, in brief, that the cigarets are the property of an unlawful combination, being the property of the Tobacco Trust, which the Government is prosecuting, or being owned under a contract between this Trust and the British tobacco companies for the suppression of competition by an allotment of the world's markets. Section 6 of the Sherman act is as follows:

"Any property owned under any contract or by any combination, or pursuant to any conspiracy (and being the subject thereof), mentioned in Section 1 of this act, and being in the course of transportation from one State to another, or to a foreign country, shall be forfeited to the United States, and may be seized and condemned by like proceedings as those provided by law for the forfeiture, seizure and condemnation of property imported into the United States contrary to law."

This section has never been enforced, and it has not been past upon by the courts. In a published statement, the Department of Justice says:

"This is a proceeding *in rem;* that is to say, against the property itself, and not against any individuals. If the owners of the property want to make defense, they must come into court and claim the property, and file their written pleadings denying the charges set out in the information, and showing that the unlawful combination in restraint of trade charged in the information does not in fact exist."

It is said that the Department desires a final decision from the Supreme Court at the earliest possible date, intending, if the section be sustained, to make many other seizures of Trust goods in transit.

Controversies With Indians

Trouble on two Indian reservations was reported last week. A small band of renegades of the Navajo tribe, under the leadership of Chief Bylillie, was threatening the lives and property of white settlers. Soldiers were sent on the 22d ult., and on the 28th they were attacked by the renegades. Three of the latter were killed, and eleven (Bylillie included) taken into custody. Bylillie was disliked and feared by a great majority of the Navajos, who remain peaceful. The other disturbance occurred on the Cheyenne River reservation of the Sioux, to which the White River Utes, about 370 in number, went some time ago from their own reservation in Utah. Being unprogressive and lazy, they were dissatisfied with their allotments in severalty. They quarreled with the agent,

Major Downs, at their new home, and he asked for troops as a precaution, as they had voted in council not to obey his orders. Captain C. P. Johnson, commander of the troops, sought to placate them, and his report to Washington, in which he practically defended the Indians, was regarded as a hostile criticism of the agent, the Indian Bureau, and the Bureau's policy. The Indians' rations had been reduced one-half. He advised that they be fed. They objected to having their children sent to a boarding school eighty miles away. He recommended that the children be kept near them. Commissioner Leupp shows, however, that these Indians have contemptuously rejected two offers, from railroads, of work at $2 a day. If they will not work, he says, they should go hungry:

"Johnson proceeds on the theory that the way to handle troublesome Indians is to set them off and feed them. That is not the Indian Office theory. This office believes in applying the same rule to the Indians that is applied to poor and ignorant men of any race. We believe in finding work for them, and then in permitting them to go hungry if they will not accept the opportunity to make a living. These Utes contemptuously declined to work, saying that the Government would take care of them. I am perfectly willing to stand responsible for all the advice I have given in the matter, which has been that we should treat the Indians kindly, but insist that they shall cease to be paupers when there is work at which they can earn good wages practically at their own doors."

The subject was thoroly discussed at the White House on the 1st, and the Commissioner was sustained. Further opportunities to work will be given to these Indians, and if they still refuse to work they will be left to their own resources.

The English Municipal Elections

During the past week there have been general municipal elections in England, with the result that the Conservatives have gained greatly and the Liberals have lost. But this by no means shows that the sentiment of the people has become Conservative. Hitherto the various progressive elements have been united in the Liberal ranks under one banner, but now the Socialists and the Laborites have, at least for local elections, separated and set up their own tickets. The Laborites had already in part seceded from Radicalism in the last Parliamentary election, but now we have a very vigorous Socialist propaganda. Says a writer:

"So-called non-political organizations have been formed everywhere. There are scores of these in London alone with a membership of from 700 to 2,000 each which did not exist a year ago. The leaders ignore or repudiate the mistakes of municipal ownership which caused the overwhelming defeat of the progressive party in London and other cities last spring. Those mistakes were accounted for by saying that they were made by amateur or unpractical imitators of real socialist principles. The doctrine of the new agitators is the simon pure article, which they easily induce the half educated classes to believe will bring the social and political millennium.

"They nominated candidates for the first time in England in the local campaign which was closed yesterday. The wonder is that they elected anybody, for certainly they did not expect to do so. They actually captured six seats in various places. They succeeded, besides, in changing the whole complexion of the municipal bodies. They split in halves the anti-Unionist vote of the country. The result was a great Unionist triumph, although the successful Unionist candidates in most cases received considerably short of a majority of the votes cast. The emptiness of the Unionist success thus becomes apparent."

The Prussian Court Scandals

Herr Harden, editor of the Socialist journal, *Zukunft,* has been acquitted of the charge of libel brought against him by General Count Kuno Moltke, amid the frantic cheers of the Berlin populace. The charges made by Harden rather implied than asserted vile orgies in which high members in the non-official camarilla which surrounds the Emperor William were involved, and it was declared that their political influence was badly affecting the conduct of the Empire. The resignation by Prince Frederick Henry of Prussia, the eldest son of the late Prince Albrecht of Prussia, and his sudden departure for Egypt, in conjunction with the suicide of several young officers, were the talk of the Guards' messes at Potsdam last autumn and constituted the first signs of the coming storm. One day several officers were discussing these incidents when one of their number drew attention to various articles in the *Zukunft* which seemed to indicate that scandals similar to those suspected in military circles were also rampant in other high quarters. This conversation came to the ears of the

Crown Prince, who thereupon asked to be shown the incriminating articles in the *Zukunft*. After perusing the articles in question his Imperial Highness requested General Count Hülsen-Haeseler, Chief of the Emperor's Military Cabinet, to report the affair to His Majesty. To this proposal Count Hülsen-Haeseler demurred, on the ground that Prince Philip Eulenburg, the personage chiefly incriminated by the articles, was not an officer. The Crown Prince promptly took the matter into his own hands and drew the Emperor's attention to the scandalous stories and suggestions which were being circulated in conversation and in the press. The result of his Imperial Highness's intervention, which took place in the early part of last spring, was the retirement of General Count William Hohenau from his appointment as aide-de-camp to the Emperor, the resignation by General Count Kuno Moltke of his post as commandant of the Berlin garrison, and the loss of the Imperial favor by Prince Philip Eulenburg, sometime German Ambassador in Vienna and an intimate personal friend and political confidant of the Emperor. In addition a French diplomatist, who was also alleged to have belonged to the mystic inner circle which gathered round Prince Philip Eulenburg, at Liebenberg Castle, withdrew from the capital when the catastrophe became imminent. General Count Moltke, after a fruitless attempt to induce Herr Harden to accept a challenge to a duel, instituted the legal proceedings. Both the Public Prosecutor and the Prussian Minister of Justice declined to proceed against Herr Harden, and the action was brought by Count Moltke himself as a private plaintiff. Herr Harden's standpoint is expressed in the following sentence:

"Notwithstanding considerations of personal feeling, it may on occasion become a political duty to point out that proofs are extant of the reaction upon affairs in general of an abnormal, if platonic, friendship between men; after conscientious examination of authentic documents I have no reason to doubt its existence and its tendency to encroach upon the political sphere."

A multitude of witnesses were called and the trial was cut short on the ground that it was not to the public welfare to have so many witnesses testify. The Emperor, whose family have always been strictly moral, has been greatly mortified by these disclosures, and Count Moltke has threatened suicide.

The New Austro-Hungarian Agreement

On neither side does there appear to be much enthusiasm over the final agreement for ten years between the two elements in the Austrian Empire, but it is accepted as a necessity, after the long interval since the ending of the former *Ausgleich*. The details of the treaty have to do with six or eight pressing matters, most of which, however, have little interest outside the two States. They concern certain railways, especially those which link, or will link, Dalmatia with Austria. The treaty provides for the appointment of a Court of Arbitration, with four Austrian and four Hungarian members, who are to elect a ninth member as chairman. It fixes—this being for the moment the most important point of any—the contribution of Hungary to the joint expenses of War, Finance and Foreign Affairs; the said contribution being raised from 34.4 to 36.4 per cent. It is safe to assume that this change would not have been made, in elaborate negotiations which have lasted more than a year, unless its justice had been demonstrated so completely as to convince even such an Independent as M. Kossuth. But the Hungarian newspapers are attacking him fiercely, for a man who consents to such a fresh tax has obviously "sold his country." The sudden and amazing change in the constitutional balance of Austria, which took place when universal suffrage was granted almost without warning, has stimulated the demand for a similar change in Hungary. Demonstrations in favor of the like extension of the franchise took place as much as two years ago; but the anti-Austrian agitation took up for a time the energies of the country, and nothing has been done. But already the workmen are beginning to move again. They have been demonstrating in Budapest; their spokesman, M. Mezöffy, has been interpellating the Government, tho the Independence party protested; and, finally, Count Julius Andrassy, Minister of the Interior, has declared that the

Franchise Reform Bill will be laid before the House very shortly. If its provisions fall short of universal suffrage, it will be out of harmony with Austria, and, if it grants the full suffrage, it will raise in a definite form that dangerous question, whether a democratic franchise is consistent with Magyar supremacy. It is easy to see that to open that question may be to stir the passions of the whole heterogeneous population of the Hungarian kingdom in a formidable way.

The Third Duma

The general result of the election for the Russian Duma is now known, as 395 out of the 442 districts have selected members, and the second election will not materially change the result. Under the new law imposed by Stolypin the owners of land have the right to elect most of the members, while the peasants have almost no chance. Thus we have Monarchists and other Rightists, 189; Moderates, including Octobrists, 113; Constitutional Democrats, 33; Leftists (Radicals), 24. Feodor Golovin, Constitutional Democrat, of Moscow, who was President of the last Duma, has been re-elected, but it is seen that he has few to follow him. Of course this result does not represent the people, and the policy of repression goes on, filling the prisons, while the assassinations are numerous but are not reported. While the Government has the majority, and Stolypin is thus justified by the apparent success, it is by no means sure that the Duma, in which there are so many Octobrists, will accept either autocracy or bureaucracy on the old lines. The struggle will come when it is proposed to ask the Duma to consent to the borrowing of some $800,000,000, a terrible new burden on a people already overwhelmed with taxes. This new loan will have to be based on the imperial lands, which are just those which the people are demanding for themselves, but which will be finally lost to them if the proposed terms of the loan are accepted.

Minor Foreign Items

A petition signed by many prominent British authors has been sent to the Premier asking that the office of a Censor of Plays be abolished. Among the signers are James M. Barrie, W. S. Gilbert, Thomas Hardy, Anthony Hope, Henry James, Maarten Maartens, George Meredith, Bernard Shaw and A. C. Swinburne. It is noticed that the theatrical managers' names are absent, and it is claimed that they favor the retention of the office.——The consecration of a church in the village of Czemova, Hungary, was on October 27th the occasion of a tragedy. The Slovak priest had been convicted for political offenses, and the people were so strongly in his favor that they resisted the advent of a neighboring priest who had been called in to officiate. They resisted his entry into the church and attacked the soldiers who were protecting him, till the soldiers fired on the crowd, killing sixteen of them and wounding many more.——There has been an unsuccessful attempt at a mutiny among Russian soldiers and sailors at Vladivostok. On Tuesday of last week a battalion of sappers attacked the barracks with rifle fire, but the occupants turned their guns on the assailants and scattered them. It would appear that a concerted attempt was made at a mutinous outbreak, for the next day the crew of a torpedo-boat destroyer mutinied, raised the red flag, steamed out of the port and bombarded the town and the troops. Four vessels promptly turned their guns on the boat and it was riddled and driven ashore, and all but two or three of its crew were killed.——One of the most appalling disasters ever known is reported from the town of Karatagh, in Bokhara. There had been a fearful earthquake, and the people of the city, estimated at from 5,000 to 15,000, had fled to the plain, but had returned when the shock seemed to be over. But suddenly at night the mountain which overhung the town fell down into the narrow valley, overwhelming the whole town and all its people. One report says that only the Governor and his wife were saved, but this is denied. There is even yet, owing to distance from communication, doubt as to the cause of the disaster, some believing that it was due to the outbreak of a supposed extinct volcano. Karatagh is one hundred miles southeast of Samarkand, in Russian Turkestan. The earthquake shocks were recognized on October 27th

at Washington and in London.——General Maximoffsky, director of the Department of Prisons for the Ministry of the Interior, was shot last week by a young woman, who was immediately arrested. The act was done by order of a section of the Social Revolutionists, and she intended to blow up the whole building where the secret police have their headquarters, but was prevented. An attempt was also made to assassinate the vice-governor of the political prison at Viborg, but this was a failure.

A Russian Loan

It is stated that the Russian Minister of Finance, and the Minister of Foreign Affairs have been visiting Paris for the purpose of negotiating an enormous loan of $750,000,000, with an additional immediate subsidiary loan of $50,000,000. It would not be natural to expect that Premier Clemenceau would encourage so enormous a loan, especially considering the low state of Russian finances and the impoverished condition of the country. As editor of *L'Européen,* M. Clemenceau was strongly opposed to the oppressive measures of the Russian Government, and declared that it was supported only by foreign gold. M. Clemenceau reminded his Russian visitors that Russia already owes $2,500,000,000, mostly to French investors, and anything further must have the full endorsement of the Duma. The Russian Minister of Finance replied that such sanction would certainly be secured; or, if the Duma should prove refractory, it would be dissolved, and a new constitution proclaimed with such conditions that the Crown should have the power to negotiate foreign loans. In that case the Czar would give his own guarantees based on crown lands. But it is these public lands which the country people are demanding for themselves, and any such loan would put an end to their hopes and would require burdensome leases of the land. M. Clemenceau will approve of the monster loan only on condition that the Duma approves, but that is quite unlikely, even with the new Duma, which is so much more conservative than the last, being elected mainly by the officials and men of wealth. The French Premier will not think it his duty to interfere with any loans which the French bankers may make on their own responsibility on the security of the million square miles of crown lands, the mines or the railroads.

Japanese Affairs

There is good reason to hope that the difficulty between Canada and Japan, caused by the riot at Vancouver, is, or will be, settled. Premier Laurier sent a despatch to the British Ambassador at Tokyo regretting the occurrences at Vancouver, and has received a peaceable reply. The Japanese Emperor says he has received the message with the greatest gratification, and notes with much satisfaction the earnest intention of the Government of Canada to promote the cordial and friendly relations which exist between the British Empire and Japan. ——When a British Government goes out of power its last act is to give honors to its friends. Japan follows Great Britain and England in establishing a system of hereditary nobility, and it gives honors for very various merits. On September 21st patents of nobility and decorating were gazetted for a very large number of persons, chiefly for service in the late war with Russia. The order of rank is as follows: First, the Imperial Princes and 15 other Princes; Marquises, 39; Counts, 99; Viscounts, 377; Barons, 377; a total of 907. Those just created are Marquis Ito, Marshal Marquis Oyama and Marshal Marquis Yamagata, who is President of the Privy Council. Of the so-called Elder Statesmen, Counts Inouye and Matsukata have been created Marquises, as also the late Premier Count Katsura. Admirals Ito Yumamoto and Togo have been made Counts, as also Generals Kuroki, Oku and Nogi, and also Baron Komura, Ambassador to Russia. Americans may remember Baron Kaneko, who was so popular in America during the negotiations for the Treaty of Portsmouth; he is made a Count. The dotations that go with Japanese honors are very modest. The regular grant is 50,000 yen to a Prince, 40,000 to a Marquis, 30,000 to a Count, 20,000 to a Viscount and 10,000 to a Baron.

The Third Term Tradition

BY JAMES SCHOULER

Author of "Eighty Years of Union," "The History of the United States," etc.

IT need not surprise us to find that the time-honored custom of limiting absolutely each President's continuous period of service to two official terms, or eight years, is now in danger of interruption in favor of a longer tenure.

And yet there was more legitimate reason for that longer tenure when our Federal Constitution was first adopted than there is today. For at the outset most of our political leaders looked with distrust upon an authority so comprehensive which should change hands frequently. State pride, State sovereignty and State independence had predominated, and our people yielded with obvious reluctance to a general government of threefold specific powers only when it became manifest that the sort of amphictyonic league symbolized in our Continental Congress could no longer hold this Union together. No common executive authority over the "Old Thirteen" had hitherto been exerted except that of the British king. Our people were not thought qualified to select periodically a new ruler to guide them out of so vast and varied a population in rival States; and hence the convention not only meant by its electoral college plan to have a conclave of distinguished citizens make the choice for the people, but they left the right to re-elect a President entirely open, thereby avoiding, as they hoped, the turmoil and popular disturbance likely to arise from frequent candidacies. Most of our leaders were indisposed to look far ahead with the new experiment. The first President was sure to be our chief of men in peace and war, and with such an exemplar, worthy of being ranked among the greatest of earth's potentates, the new government would start out under high auspices.

Had Washington so permitted, there is little doubt that he would have been re-elected President as long as he lived; but he was too sincere an American and too strongly a friend of republican institutions to consent to anything of the kind. He himself set and established the precedent of retiring positively from office after serving for two terms, and thus making way for any successor agreeable to the people. His notable example was followed by every President of the United States, whether of one political party or another or of no party at all; and without a single interruption that custom has come down to us. Jefferson had been one of those who criticised the Constitution as framed in 1787; he would have wished an amendment, so as to give to each President a fairly long term, such as seven years, with no right of re-election at all; but on experience his mind settled down to the approval of Washington's rule as the best one, namely, to allow eight years as the final limit, with an appeal midway to public opinion as to whether such an extension should be permitted. Early opinion and practice, therefore, came to approve an eight years' incumbency for every President of whom the people should approve, upon a reference to the polls after a first trial, but to make that reference or re-submission, at all events, only once.

Down to 1840, in fact, such a theory prevailed without interruption or change. Not a single President was chosen for a first term who did not, with at least the acquiescence of his own party, become a recognized candidate, before the people and the electoral colleges, for a second term's continuance in office, but for no more. Upon such submission to the people both of the Adamses failed of a re-election; nevertheless, each had accepted the contest. Van Buren in 1840 was similarly the standard bearer of his party, but he, too, was borne down in defeat. And the chief reason of this was that he was looked upon as continuing in his person the plans and purposes of his predecessor, Andrew Jackson; and that Jackson dynasty, with its party intolerance and despotism, its contempt for

Congressional opinion, its blind onslaught upon corporations and corporate capital, and its inevitable tendency to breed quarrels everywhere and to foster class jealousy, became intolerable to the vast majority of our people by the time that financial disaster had followed in the wake of an over-confident prosperity with which the warrior administration had been too meddlesome. In 1840, then, the people, by an overwhelming vote, chose Harrison to the Presidential chair, thereby condemning with no uncertain acclaim all perpetuation of executive power, by party means and discipline, thru more than the customary number of years.

Harrison, in that memorable campaign, pledged himself to serve, if elected, for one term only; and this was meant to offset "King Andrew's" effort to perpetuate his despotic rule thru party successors who would submit to his iron will. And thus, too, Harrison reassured Clay and Webster of his own party, both of whom supported him at the present time, tho each aspired to the candidacy and thought his own claims stronger. Harrison's early death forbade all test of his promise, but from that time forward, for twenty years or more, no President of either party was put forward by the party convention to stand for a second term. Whether it were chance or design that dictated such a course, the single-term idea became most acceptable to our people. But now followed the bloody conflict of 1861; and while Jefferson Davis guided the cause of the Southern Confederacy to its close under a constitution which recalled the old preference for a fairly long Presidential term, which should be the only one, Abraham Lincoln, in order that his tremendous task might be safely completed, desired and obtained a re-election from the Union part of our people; for, to use his own homely metaphor, it was not well to "try to swap horses while crossing a stream." His second condidacy afforded, in fact, the best logical means of sustaining the policy of restoring the supremacy of this Government while incidentally destroying slavery. Posterity rejoices heartily that Lincoln gained a second term, while lamenting that death denied him the opportunity of crowning a national triumph with wise moderation.

Grant, as the military savior of the Union, was next chosen President for a first term, and the public gratitude, in spite of all errors, secured him a second. But the party and set of men that sustained him grew arrogant; and, largely from selfish ambition or a belief that the people could not be intrusted with their own institutions, some of his partisans made effort to put him forward for a third term. Grant's own grim reticence and his soldierly methods of compulsion gave many the impression that he himself favored the sinister idea, and it was predicted of this "smoky Cæsar" that he would never leave the White House until he was carried feet foremost. But the effort, such as it was, did not even avail to carry a third-term nomination thru the Republican convention, and so alarming had meanwhile been the abuse of compulsory rule and the pride of party domination that, as if to assert their own rightful rule in affairs, the people of all sections, by a rightful majority, combined to place Tilden, the opposition candidate, in the White House as Grant's successor. Or so, at least, did it seem in November, 1876, when the returns came in and our presses figured the result. It was a close election, to be sure, and it turned upon permitting opinion in some Southern States, still under the heel of military reconstruction, to be allowed its genuine expression. But this Grant's retiring administration would not concede; and by the time that an expiring Congress reassembled for a final session things ripened for another civil war, and only the adoption of an electoral commission scheme saved us from anarchy over the title to a Presidential succession. That bulldog grip which had won for the Union army an entrance into Richmond kept still the citadel of national strength for the Republican party. Grant gained no third term, and yet there was no surrender to the Democrats.

Hence, however, came about a tacit compromise. The Republican party in power still retained the national administration with its patronage, but reconstruction ceased at the South, and States

once disloyal regained henceforth their autonomy in local concerns. And thus it continued, with something of the old peaceful relation and yet something of a menace, until the first election of Cleveland restored this Government fully to its pristine condition as one which either of two great opposing parties of the nation might be trusted to administer. Cleveland, we well remember, stood for a second term; and, more than this, being defeated, he ran a third time, and made the record, unparalleled before or since, of serving as President for a second term, after one term's intermission. Since then McKinley has been nominated and elected for a second term, and so, too, has it been with Roosevelt; yet few Republican Presidents have been so honored, nor has anything appeared in recent times of that unanimity of sentiment such as accorded to every President once chosen a chance to go before the people to take their sense as to whether he should continue to administer for a full eight years' period.

Many are now urging that, in disregard of past practice, our people give to Theodore Roosevelt the unexampled honor of a third term in the Presidency. He himself has given his solemn pledge not to be a candidate again, and I doubt not he has been sincere in doing so. I further believe he will adhere to his pledge, regardless of all pressure. But suppose he should successfully run the gauntlet of the Republican convention next summer and gain the party nomination, there will still remain the ordeal of November; and if he has an opponent who can well unite the opposition strength, an anti-third-term argument, when properly presented, ought to convince at the polls. Even with all this overcome and Roosevelt re-elected for a third term, in defiance of precedent, his new administration, conducted under such circumstances, would be clouded by the imputation of undue ambition, selfishness and broken faith; and its conduct, thus handicapped, would be likely to drag him down rather than exalt him higher in history. The greatest evil of all, however, resulting from any such experiment would come upon the people themselves by permitting those in power to plan for unlimited continuance in supreme office, thus opening a highroad to monarchy, and permanent mischief would result.

Autumn

BY CAROLINE E. MacGILL

OH, the wine o' life, oh, the shine o' life,
And a song, for the year is true;
Oh, the rhyme o' life, oh, the chime o' life,
Sweet o' life, that is all for you!

Oh, the dream o' life, oh, the cream o' life,
With the hope that is over all;
Oh, the swing o' life, oh, the ring o' life,
And the tang, when the crisp leaves fall.

Conquerors of the Road

A Forecast of Automobilism for 1908

BY WILLIAM FREDERICK DIX

[Our readers remember some former articles in THE INDEPENDENT by Mr. Dix. Before he became the Secretary of the Mutual Life Insurance Company since its reorganization, he was the editor of *Town and Country*. Mr. Dix is the author of "The Face in the Girandole," a romance of old furniture, and a novel, "The Lost Princess," recently published. It is needless to add that Mr. Dix is the owner of an automobile.—EDITOR.]

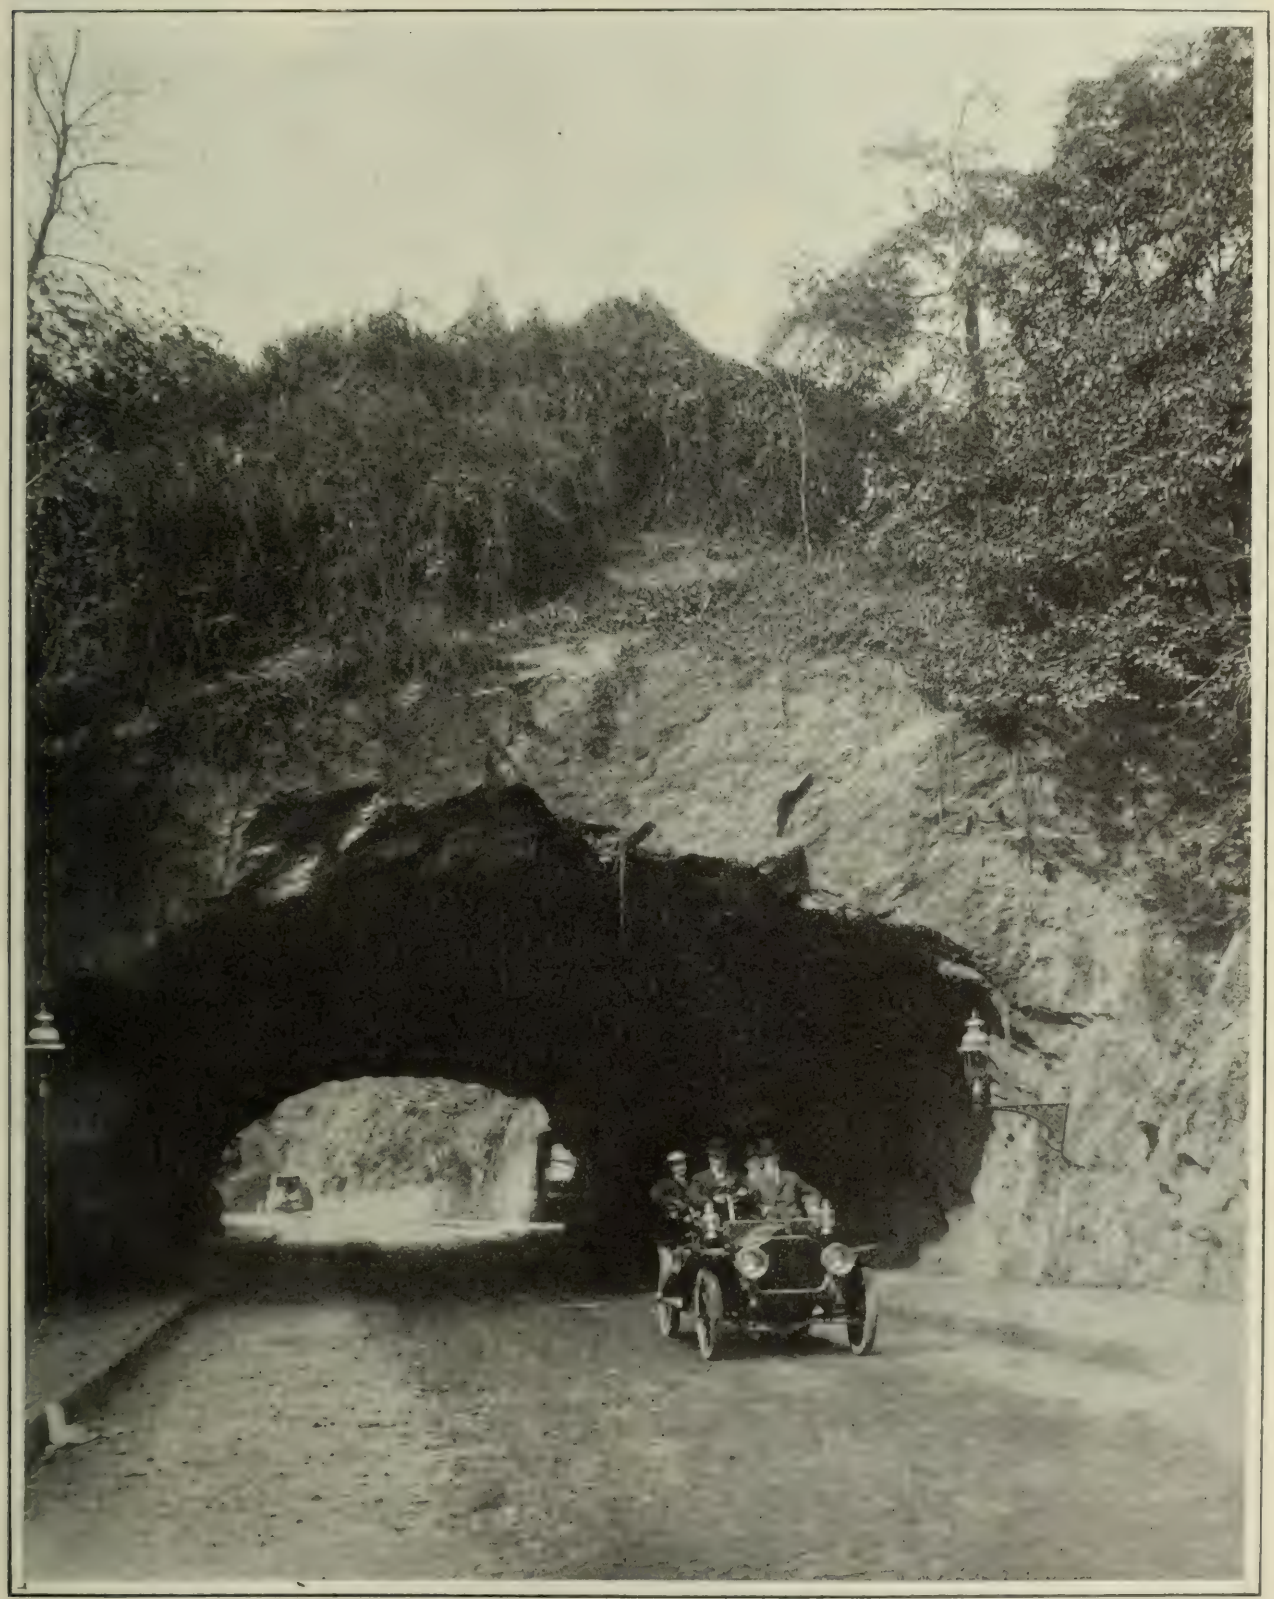
IF one will look over the advertising pages of the magazines of five or six years ago the pictures of the automobiles then sold will strikingly illustrate the development since then of this modern sport. At that time the manufacturers seemed to have an ambition to conceal the fact, so far as possible, that their vehicles were machines. They made buggies and surreys with the engines hidden away beneath the seats and the flooring, and a new topic was given to the joke writers and cartoonists—that of the motorist lying on his back in the dusty or muddy road, tinkering awkwardly at the almost inaccessible inner parts above him. The world still regarded these vehicles as "horseless carriages," and it was several years after they came into use before the makers realized that they should forsake the designs of carriage manufacturers and treat the cars frankly as engines.

Gradually, bicycle wheels and light bodies were discarded, the engines were taken from their ignominious position under the body and placed forward under a protecting bonnet, where they might be easily reached; the chassis became suitably heavy, and the modern motor car emerged triumphant as an engine of locomotion. Today it no longer sails under false colors; it looks the world in the face, an enfranchised motor car.

I recently asked a woman who runs a motor runabout for shopping, calling or short pleasure drives about a suburban town how she managed to crank it, as she had no chauffeur.

"I never crank it," was her surprising reply.

"But surely you don't leave the engine running while you are at the grocer's or making a call?" I queried.



"No," she replied; "but I ask a grocery wagon boy or some man who is passing to do it, and they are always most charmed to do it. Every man is interested in motor cars, and the joy of a grocer's boy at being allowed to do something to one is really amusing. I have the pleasant feeling that I am conferring a real favor in letting the passerby crank my car for me."

That remark sums up the present status of this delightful sport epigrammatically—"every man is interested in motor cars."

Just at this season the subject is of especial interest, because those who have bought cars last spring are comparing their summer experiences with others and deciding whether their purchase was a success or not, whether they like motoring enough to keep on with it, whether or not it is too expensive, and whether they will keep their car another season or exchange it off for a new one of the same or another make. The people who, ten years ago, were flocking to bicycle shows are now absorbed in automobiles, just as perhaps, a few years hence, they will be excited over balloons and flying machines.

Tho the new year is still two months off, there has already been one large automobile show opened in New York—at the Grand Central Palace on October 24th—and the 1908 models are largely in evidence. A forecast of next year's designs can therefore already be drawn. The burning question of the day is, "What will the new year bring forth?" In a general way it may perhaps be said that the present tendency is toward a motor car that is a powerful, speedy engine, rather than toward a vehicle of luxury and comfort, and built for moderate gait. The speed mania is, unfortunately, the inspiration of the motor car of the near future. This does not mean that all the new cars show this influence, for in the 1908 models are delightful electric Victorias and coupés, with broadcloth cushioned seats, luxurious exten-

sion top tonneau cars, with soft, springy seats and princely limousine bodies, upholstered, fitted with soft rugs, cabinets for toilet articles, luncheon outfits, luggage carriers, and every device for safety and comfort; but a notable feature of the recent exhibition was the preponderance of what might be termed "sporty" or "racy" types. The season just past produced a number of powerful, high-speed runabouts, immensely strong cars, with seats for only two, with engines rating from 22 to 50 or 60 horse power, capable of sustaining a speed over average roads of from 40 to 60 or 70 miles an hour, and negotiating almost

A PICTURESQUE BIT IN CENTRAL PARK, NEW YORK, FAMILIAR TO MANHATTAN MOTORISTS.

HALTING BY THE WAYSIDE IN KOKOMO, IND.

any hill at high speed. The next season will see more makes of this kind of car, even more exaggerated as to power and speed. And the new runabouts usually have a "rumble seat," a small seat for the chauffeur behind the two "owners' seats."

There is an entirely new feature for next year which might be called the "double runabout." This is a car which, while seating four passengers, has no tonneau. The four seats are all small, with scarcely any back or sides; there are no side doors for the rear seats and no top. The immense bonnet in front shields a four or six cylinder engine of enormous horse power, and the cost ranges up to four and five thousand dollars. It is frankly and exclusively a racing machine, not a luxurious vehicle, where those on the back seat may recline comfortably upon high-backed seats, protected from dust and the weather, but a sporting car, where one can only imagine the occupants, with nervous and strained faces, leaning restlessly forward and rushing along the roadway at a remorseless clip.

This seems to be the distinct feature of the sport as it will be largely practiced during the coming season. The newspapers may daily recount horrible accidents to automobilists, rural sheriffs may enrich their town coffers with fines, chauffeurs may be sent to jail and the entire countryside may be menaced by this new phase of American neurasthenia, but still they increase and multiply, those speed-infected motorists and these menacing engines of the road.

Every phase of motoring has been discussed so thoroly, both verbally and in print, that it would be superfluous to speak of how deeply it has become a part of our present-day social life. The city streets, the avenues of suburban, residential towns, and the country roads tell the story more effectively than the pen, and the expression "The automobile has come to stay" is as trite as one of Gellett Burgess's bromidical quotations. The throngs of cars of every description upon Fifth avenue, the theater 'buses at night, the endless procession of automobiles faring out into the country of a week-end, the industrious little electrics, all are eloquent

of the hold the sport has taken upon the popular fancy. Sport? It is more than that, this automobilism; it is as necessary as the telephone and the typewriter. The question is, What is its logical development to be? That is a difficult question to answer. But what its logical development *should* be is quite as interesting.

It is to be hoped that we American motorists will soon realize that we are going a little to extremes. The real pleasure of motoring is not in trying to run from the White Mountains to New York in one day, or not in operating a car that is made for great speed at the expense of comfort. Let us hope that the pendulum will swing back a little and that the public will want cars of sufficient power to travel quickly and to negotiate hills sturdily, but which will be comfortable, which will be true pleasure vehicles. Let us hope that improvements will be made in tires and in cranking, so that one is not in constant danger of becoming suddenly helpless upon the road, a condition only to be remedied by long and laborious work removing the heavy shoe and replacing the inner tube. It seems strange that, in spite of our boasted mechanical skill, the most vulnerable part of the car is in the most exposed position. And the starting of the gas engine by a frantic, convulsive wrestling match with the crank is certainly an unpleasant detail for which some device should be produced. Also, the present tendency of automobile manufacture seems to be toward larger and more expensive cars, and the needs of the poor man or the man of moderate means are being somewhat overlooked. An inexpensive car to buy, which, because of its strength and its enduring qualities, *will also be inexpensive to maintain*, a car which a man's family may enjoy during the day while he is earning his wage—a practical little pony cart of a machine, in short—is the crying need of modern automobiling. And it is safe to predict that American ingenuity and American common sense will, before very long, supply this need.

TYPE OF RACING CAR

The Second Hague Conference

BY HAYNE DAVIS

Copyright, 1907, by Hayne Davis

[Last week we began an exhaustive series of three articles on the work of the Second Peace Conference at The Hague by the only American except the official delegates who was present during the entire session. We shall conclude the series next week.—EDITOR.]

The International Court of Justice

FRANCE sent M. Leon Bourgeois as her first delegate to both the First and Second Conferences. He acted as president of the "Commission on Arbitration" at both Conferences. This Commission evolved the Tribunal of 1899, of which M. Bourgeois is a member. In the Second Conference this Commission had to pass primarily on all proposals for courts of justice and for treaties of arbitration. Perhaps M. Bourgeois's position prevented his becoming an avowed advocate of any of the proposals mentioned in the chapter on "Proposals." Apparently he did not use his great and continually increasing influence for any one of the proposals in preference to the others. Early in the Conference, however, he did throw his whole force into a declaration for compulsory arbitration and a court for rendering judgments in such questions as were included in the treaties. He always used his position to conciliate the various elements in the Conference, and to bring them, if possible, to an agreement upon *both* of these proposals as parts of one proposition.

His initial declaration had great influence in strengthening all who were advocating definite proposals on either of these lines, and his incessant efforts, supplemented by those of his French associates, contributed largely to the results. Bourgeois preferred to see the international jurists who are members of the "Tribunal of 1899," constituted a sort of Judiciary Committee of that Tribunal, to serve the purpose of the new court which the Americans were proposing, and upon which they mainly concentrated their energies.

In the early days of the discussion on the American plan for a court and a treaty of arbitration, Baron Marschall von Bieberstein, the first delegate of Germany, raised the discussion to a higher plane than was ever before possible by declaring that Germany would support the United States in both these proposals. His address constituted in itself one of the most important events of the Second Peace Conference. Indeed, it was an event in the progress of the world toward *Law* as a substitute for *War*.

At the First Conference Germany opposed obligatory arbitration, and when it seemed as if the Permanent Tribunal of Arbitration would be approved, Germany's delegates were instructed from Berlin to oppose it. It pertains to others who know the inside facts to tell how this opposition was overcome. It was overcome, however, and the Permanent Tribunal of Arbitration issued out of the First Conference as its chief result. But the opposition of Germany, exerted at the very moment when success was about to crown the efforts of the progressive members of the First Conference, left a feeling among the delegates and thruout the world that Germany was not in sympathy with the cause of arbitration. This was the general opinion about Germany when the Second Conference opened. It disappeared like mist before the plain words of Baron Marschall, delivered with the ease and assurance properly belonging to the representative of a great Power. When Baron Marschall took his seat it was known at The Hague, if not thruout the world, that the cause of arbitration had swung into a higher and wider orbit.

He made no effort to conceal the fact that Germany had opposed obligatory arbitration at the First Conference. On the contrary, he plainly stated the fact, and then declared that Germany's opinion was now changed. Then obligatory arbitration seemed to Germany not ripe for discussion. Eight years have past; arbitration has been used during that

time; furthermore, Germany has used the interval to study the question, and "as a result the German Government is today in favor of obligatory arbitration in principle." Such were his plain words. Their significance will be missed unless it is borne in mind that during last winter a committee of competent persons sat regularly at Berlin, in order thoroly to weigh every proposal contained in the preliminary program proposed for the Conference by Russia. This, then, was not a personal or an unconsidered declaration. It was the deliberate voice of one of the greatest European Powers, on a question of the gravest concern to the people of all countries, and it placed Germany's weight on the right side, the side of progress.

In closing this memorable address, the first delegate of Germany said:

"The most important reform is that indicated in the proposals of the United States and Russia, and which consists in giving to the Tribunal at The Hague, a really permanent character . . . a really permanent court, composed of judges whose character and capacities will win for them universal confidence, will exercise, as it were, an automatic attraction upon all kinds of juridical disputes. An institution of this kind will secure for arbitration a wider and more frequent use than any general obligatory clause qualified with reservations and restrictions. We are ready to use all our forces for collaboration with our associates to accomplish this task.

"In continuing thus the work of 1899 the Second Peace Conference will justify the hope that its labors will contribute to the maintenance of peace, while we await the establishment of the Empire of Law and the strengthening of the sentiment for international justice."

With Germany's face favorably turned toward an international judiciary, from which would flow a uniform stream of law binding upon the German nation, what might not the Conference accomplish!

England's unreserved acceptance of the American proposal for the High Court of International Justice resulted in the general recognition of this proposal as the joint proposition of America, England and Germany.

Strange to say, tho Baron Marschall was everywhere applauded for what he had done, little or no attention was paid to the British delegate, who had cast without reservation the entire influence of Great Britain for the same proposals. This was most noticeable in the *Courier of Peace,* the unofficial organ of the Conference. It is explicable only on the theory that this was expected of England, but came as a surprise, as an astonishment from Germany.

Perhaps Baron Marschall's individuality had something to do with the result. The first delegate of Germany was an unusual man. Tho immense in size, he carried himself with an ease that approached grace. He was evidently master of himself and of the situation, and yet he attracted rather than repelled, as a result of the consciousness of control. Furthermore, his perfect command of the French language enabled him effectively and instantaneously to speak the word necessitated by the circumstances, in order to make his country's position thoroly understood. He knew his position; was immovable in it or from it. And subsequent events proved that there was no power that could make him recede one step from or proceed one step beyond the limits which his own and his Government's well considered opinion had placed around him.

This became manifest when the details of the American proposition for selecting international judges, and of the various proposals for a treaty of arbitration, to be signed by all the Powers, were under discussion. The proposal for selecting the judges for the High Court of International Justice, as agreed to by the American, British and German delegates, gave to the few so-called great Powers the right to maintain one judge on this court all the time, leaving the small Powers to divide the remaining few judges among themselves.

All the great Powers assented to this plan, and to the proposed system for enabling a court thus constituted to act as an integral part of our judicial machinery. But the small Powers showed no disposition to vie with each other in assenting to this. There were some plausible reasons for their doing so. Their security depends upon the use of judges instead of generals, courts instead of "Big Sticks" by the great Powers. Here was a proposition whereby *they,* the great Powers, proposed to make a beginning in the building of a real system of international justice thru law in-

stead of war, and each great Power proposed to content itself with naming one out of fifteen judges, whereas under the existing system each of these Powers names *all* those to whom it entrusts its interests, be they generals, admirals, or the lowest subordinate officer of its armed forces.

The German Empire was formed only a few decades ago, and it was the King of Bavaria who proposed that the German States be united into an Empire under the Kings of Prussia as hereditary Emperors of this federated Germany. The judges of the High Courts of Justice in this Empire are appointed by the Emperor, who is Emperor because he is King of Prussia, the largest of the kingdoms thus united to form this great Empire. It hardly seems surprising, therefore, that the Germans at the Hague Conference should regard as very reasonable a proposition which gave Germany a permanent right to appoint *one* judge on this High Court of International Justice, even tho this made it impossible for many smaller States to have the same right. On the other hand the Americans had reason to know from the history of our country that a very strong "States Rights" sentiment would be manifested by the smaller Powers. Our making this proposal must have been due to anxiety to win the great Powers to the general idea of this High Court of Justice.

Be this as it may, the states rights sentiment of the small Powers found in Barbosa, of Brazil, an able advocate, and this resulted in such a determined opposition to the American-British-German plan for constituting the court, that the hope of getting it created by this Conference was almost dead. Then a small special committee was appointed to consider the constitution of this court. The committee consisted of a representative of all the Powers accorded a place of first importance in the plan as submitted, and of Barbosa, presumably as the representative of the other Powers, who were given inferior positions on the international bench.

The Americans, being devoted to the idea of such a court and not being afraid to trust the elective principle, resorted to in all their national affairs from the least to the greatest, found little difficulty in getting their consent to an equal *voice* for every nation in the selection of all the judges. Barbosa, of Brazil, was willing to abandon his demand for a *judge* for *each* Power and to accept an *equal voice* for each Power in the *selection of all the judges.*

All the great Powers except France abandoned the Americans when they proposed to accept the principle of each State having an equal voice in the election of the judges. France is the only one among them that has accepted the elective principle and absolutely rejected the hereditary claim, for the conduct of the national affairs. There seems to be enough significance in this fact, to make it worthy of careful consideration.

Thus the constitution of such a High Court of International Justice proved to be an impossibility at the Second Peace Conference. But was no progress made toward the creation of such a court? Great progress was made in that direction. It is impossible to weigh the invisible but real value which came from this discussion. All the Powers, great and small, have entertained the idea of a High Court of International Justice. They have gotten their consent to have such a court exercise a jurisdiction superior to their highest national courts, and become the fountain head of a stream of international principles which they will consider themselves bound to obey as the law of nations made in a manner authorized by them. Some method satisfactory to all concerned, for finding the persons most worthy to act as judges on such a court, can certainly be discovered, and the establishment and use of this institution will result in a better administration of justice than can be possible thru the agency of armed forces. The day when this will be done will probably not seem distant if we duly consider the fact that the United States is only a little more than one hundred years old. A decade now can be expected to produce results corresponding to those of half or even whole centuries in the past.

Obligatory Arbitration.

Interwoven with the question of a High Court of International Justice was the question of obligatory arbitration. The French constantly exercised their in-

fluence to keep the two subjects together, and to all appearances they esteemed progress in obligatory arbitration as more important than changes in the International Court. The fact that the three chief delegates of France at the First Peace Conference were her three chief delegates at the Second, and that these three men are members of the Permanent Tribunal of Arbitration created by the First Conference indicates that France has a very good opinion of the "Tribunal of 1899." No other country has placed on that tribunal three persons who were considered by its present Government as worthy of representing it at the Second Conference. No other country sent to the Second Conference three men who had acted as its representatives at the First. Furthermore, these three Frenchmen are all men of the first importance, in individual worth, in the knowledge of this fact among their own countrymen, and in other countries. Perhaps no Frenchman in the political world today occupies a position of such importance and influence as M. Leon Bourgeois. Some evidence of this is found in the fact that the delegation of which he was made chairman came to the Second Conference absolutely free to act as seemed to it proper, on all questions, without referring them to the Foreign Office at Paris. Then, too, Bourgeois is not seeking the Presidency of France, but the Presidency is seeking him.

At a critical moment in the First Conference it was Bourgeois who saved the situation by a quick and irresistible flash of truth, spoken as only the inspiration of such a moment makes possible.

The Germans had received instructions from Berlin compelling them to become an obstacle to further progress in the creation of "The Tribunal of 1899." A German delegate drew a picture of Germany carrying without effort all her burdens of taxation, both for administration of law and preparation for war, and giving this as a reason against the cry for something different from what then was. Then Bourgeois's time had come. He spoke of a France who could also bear the burdens of the existing system and with a free spirit. But he declared that the question which confronted the delegates to that Conference was not the capacity of their particular country to maintain itself under the existing system, but how a state of national policies which increase the burdens of the world can be changed into one of concerted and helpful effort among the people of all countries in man's warfare against the cruel servitude of matter. From that hour the spirit of the Conference was higher and its hope of fruition both brighter and more intense.

Such a time came in the Second Conference. The various proposals for a treaty of obligatory arbitration had been submitted. The forces for and against both the Court of Justice and these treaties, had been drawing themselves into line. Some of the declarations of Baron Marschall's memorable address had been obscured by the great light of his words about "The Empire of Law." He had promised his co-operation, in taking steps toward this "Empire of Law," by adhering to the reforms suggested in the American and Russian proposals. These proposals had proven unsatisfactory to the Conference. A general treaty of arbitration, to be signed by many or all the Powers, but going no further than the Anglo-French form, was America's scheme for obligatory arbitration. Germany had gotten her consent to this treaty; indeed, a treaty between Germany and the United States drawn in this form was one of the nine negotiated by John Hay in 1903, and pigeon-holed by the President because he was unwilling to consult the Senate when the time should come to sign the "subsequent agreement," whereby a particular question would be acknowledged as properly falling within the terms of the treaty and therefore as suitable for settlement by arbitration.

No country had considered it worth while to propose the Interparliamentary treaty, as adopted at London, for consideration by the Conference. And in its session at Berlin the German committee apparently had not studied this treaty. But now the American delegation had succeeded in securing the reversal of instructions from Washington against consideration of the essence of this treaty, contained in the Portuguese and also to some extent in the British and Swiss

propositions, and were throwing their influence for these more progressive plans. The Conference was moving rapidly on toward acceptance of the idea that certain questions could be designated, at the time of the ratification of the treaty, and that questions of this kind would go automatically to "The Tribunal of 1899," or to other International Courts if such were created.

Accepting this idea would have resulted in defining an area in which arbitration would immediately become *obligatory* between all Powers consenting to be subject to the International Courts in this area. It was proposed, further, that each Power could enlarge this area by designating additional classes of questions as not reserved from the arbitration area, the treaty becoming operative in the newly-designated questions among the Powers designating the same questions as arbitrable.

The German delegates had not considered these ideas before they reached The Hague. They were all to be found in the records of the Interparliamentary Union, but these had been neglected by the governments. Its ideas found a way into the Conference, however, thru individual members, and thus the Conference was confronted with continuing in the customary way for the strengthening of arbitration, namely, the conclusion of treaties by the governments *in pairs,* and opening a new way, namely, formulating a mondial treaty, that is, one which all governments could sign.

Confronted with this situation, the Germans decided to do their utmost to defeat this plan. An address made by Dr. Kreige, one of the German delegates, in the "Commission on Arbitration," brought the Conference to a crisis on this question. Then began an attack upon Germany's first delegate as insincere, as having played to the world's gallery to win general approval when it was supposed that practical results could not be obtained, and of reversing its more progressive stand at the opening of the Conference in order to reshow the cloven foot put forward at the crisis of the First Conference. The versatile editor of *The Courier* published accusations and justifications of Baron Marschall, in which even some members of the Conference participated.

But the German first delegate was unmoved. He came out of commission meetings and full sessions of the Conference with his customary easy, genial manner. Even his manner to the editor of *The Courier* seemed unchanged.

Finally the movement of events brought him to his feet in the Commission of Arbitration. He took a stand absolutely against the proposed method of defining an area, in which arbitration will be obligatory and automatic between all Powers accepting the same defined area. He insisted upon going in the customary way of treaties between the various Powers in pairs. He declared that a treaty which all or many are to sign must be limited and undesirable in its substance. He reasserted his devotion to the *principle* of obligatory arbitration. He warned the Conference against taking steps that might have to be retraced; and during the long period of struggle which followed, he voted against every class of subjects (some twenty or more) which any Power proposed as suitable now for compulsory arbitration.

In the state of the proposals on this point as they then stood, acceptance of Baron Marschall's view would have meant failure to agree, at this Conference, on this very important subject. In his address, the German first delegate had compared obligatory arbitration to fruit, and desired the Conference to join him in cultivating this fruit till it was ripe instead of trying to gather it green.

When he resumed his seat, compulsory arbitration at the Second Conference was a lost cause unless some one could counteract the influence of the German declaration. Baron d'Estournelles de Constant had been secretary of the commission having this matter in hand. He had been practically out of sight at this Conference, never having addressed the Conference on any important questions. But he had never ceased to watch every move and to wait for, and, when possible, to make the opportunity to speak in private a word that was necessary to conciliate, to harmonize, to speed the wheels of progress. This silence had lasted a long time, and the pressure of self-restraint was great even before the German declaration was made.

When Baron Marschall took his seat

on that memorable day, d'Estournelles could keep his no longer. Taking up the word "green fruit" which had fallen from the lips of the German delegate, d'Estournelles declared that obligatory arbitration was "green" when the Conference convened, but that it had ripened during the heat of its long labors. He then delivered an impassioned plea for getting away from the regulation of war, which had occupied necessarily so much of their thought, and for proceeding to take *actual* steps in the organization of the better system, which it was their duty to devise—the system which the world had a right to require at their hands.

The argument of Baron Marschall was not answered, but its effect was nullified for the moment at least.

The German first delegate, in support of his position publicly taken, said to me privately that certain parts of the world are higher in their development of the legal system than other parts. He mentioned the high parts and the low parts juridically speaking. Without stating where these parts, in his opinion, are located, the fact that this is his opinion and Germany's opinion, as *he* understands Germany, becomes a light on the way we must proceed.

Baron Marschall says Germany will be willing to make treaties with highly-developed juridical States which it would refuse to make with other States. This fact seems to necessitate Germany's making her treaties individually, and improving them thru experience with arbitration, and as the juridical status of various States is improved, in Germany's opinion. While talking with Baron Marschall it is impossible to distrust his motive, and I found it difficult to answer his argument, tho it was my privilege to collaborate with Hon. Richard Bartholdt in the formulation of the very plan proposed in this Conference to meet the condition which Baron Marschall emphasizes.

In our preliminary work for the Brussels and London Interparliamentary Conferences, the first question was how to formulate a mondial treaty (one to be signed by all Powers if they approve its provisions) which could hope to be approved by both the President and the Senate, and next how to prevent such a treaty from being too narrow for the progressive countries or too broad for the backward ones. After careful study of existing treaties and the proposals made by such men as James G. Blaine, John Bassett Moore and Judge George Gray, the only possible solution of these problems seemed to be an elastic treaty, part of which would enable the International Tribunals to act as an integral part of the world's judicial machinery in such an area as should be marked out by another part of the treaty, and to let the other part be different for the different countries. Thus each country could decide for itself just how far it was willing to submit itself to the decisions of the International Courts, and these courts would act upon the various countries only so far as they mark out the same area as the arbitration area.

Thus progressive and backward Powers *could* sign one treaty without its being too narrow for some or too broad for others. By enabling each country to include other classes of questions, within the scope of the treaty, by suitable declaration *after* ratification, an easy way to make progress would seem to be found. For the arbitration area could thus be enlarged constantly by the act of individual governments.

The presentation of these ideas to the Conference by the delegates of America, England, Portugal and others was necessarily very gratifying to all who had any part in their original presentation to the Interparliamentary Union. Nevertheless, there is ample room for difference of opinion among the most devoted advocates of arbitration upon this plan and Baron Marschall's plan of treaties in pairs. Even the Interparliamentary Commission on Treaty of Arbitration did not accept and incorporate into its proposed model treaty all these ideas which were being pressed upon the Conference.

A progress along both lines at the same time seems possible. States that prefer to join in a many-sided treaty of the kind proposed can easily insert a clause improving slightly the method of selecting judges from the existing "Tribunal of 1899." The arbitration area can thus grow under the jurisdiction of that tribunal for the Powers that make this experiment. Powers that prefer to

act in pairs can conclude such treaties, and they can empower the "Tribunal of 1899" to act in the area which their separate treaties mark out, or they can build up an International Court of Justice, in contradistinction to the existing tribunal, which is regarded by many as more political than judicial in its composition.

If both systems are tried in this way that system which proves best in practice will certainly survive and in due time will displace the other. On the other hand, the swift current of international progress may sweep all this away in a few years, and construct a complete system of international machinery for the administration of justice, after the model of the best national machinery that can then be found.

The position taken by Bourgeois on the question seems the wise one. As early as August 6th, in an address whose influence for good was permanent, regardless of the conventions signed at the Second Conference, the eminent statesman said:

"The definition of a certain number of cases for *obligatory arbitration* and the establishment of a *really permanent international judiciary* are two inseparable means to the same end as we see it.

"We have confidence in the increasing power of great moral forces, and we hope that the Second Conference of 1907 will make decisive forward steps in the work begun in 1899, by a practical and *real legal organization for peace.*

"We hope for, indeed we will salute with joy, the day when, by the side of the Tribunal of 1899, or better still, within its precincts, and, perhaps, by that Court itself, a *permanent Tribunal* will be constituted, to deal with matters of a judicial character, under such conditions that the weakest, as well as the most powerful, States will find in it *equal* guarantees for the definition and security of their rights."

After long and faithful endeavors to harmonize all the conflicting opinions upon the true principle on this question of obligatory arbitration, by a vote of forty yeas and no noes, with four refusing to vote (United States, Turkey, Haiti and Japan), the Conference approved the following resolution proposed by Count Tornielli, of Italy, and adopted in the committee:

The committee, in conformity with the spirit of mutual concession which is the spirit of the Peace Conference, has decided to present to the Conference the following declaration which, while reserving for each one of the States represented the benefit of its votes, allows all of them to declare the principles which they consider as unanimously accepted:

The committee is unanimous, first, in accepting the principle of obligatory arbitration; second, in declaring that certain differences especially those relating to the interpretation and application of international conventions, are suitable for obligatory arbitration without restriction.

The committee is unanimous, finally, in proclaiming that if it has not been possible to agree at present upon a convention to this effect, the differences of opinion which have manifested themselves have not gone beyond the boundaries of a juridical controversy, and that by working together during four months, all the States in the world have not only learned to understand one another better and to come closer together, but have been able to draw from this protracted co-operation very high sentiments for the common welfare of humanity.

Mr. Choate refused to vote for this because he considered it a recession from a position previously gained in the Commission on Arbitration, where he had succeeded in getting a large majority in favor of a treaty of arbitration (1) specifying certain questions as going automatically to the International Courts; (2) agreeing to arbitrate all other legal questions, unless they involve vital interests, national honor, or the interests of third Powers; (3) reserving the right to specify what questions are not in the reservation and therefore arbitrable, by a "subsequent convention," and (4) expressly providing that the treaty must be ratified by each country according to its own constitution, this latter clause clearing the way for agreement between the President and the Senate.

In reporting to the Secretary of State upon their work at the First Conference the American delegation said:

"As to the question between *compulsory* and *voluntary* arbitration, it was clearly seen, before we had been long in session, that general compulsory arbitration of questions really likely to produce war could not be obtained; in fact, that *not one* of the nations represented at the Conference was willing to embark in it so far as the more serious questions were concerned. Even as to questions of less moment it was found to be impossible to secure agreement except upon a *voluntary basis.* We, ourselves, felt obliged to insist upon the omission from the Russian list of proposed subjects for compulsory arbitration international conventions, relating to rivers, to inter-oceanic canals and to monetary matters."

Tho Mr. Choate's plan failed to secure unanimous consent, it is plain that the

adoption of the Tornielli declaration by a practically unanimous vote was a great advance upon the sentiment developed at the First Conference for obligatory arbitration.

This unanimous declaration for the *principle* of obligatory arbitration places all the governments on record as favorable to the present application of the principle in *some way*. Apparently it is a victory for the *German* way of accomplishing this, for treaties in pairs will be easier to conclude since the Conference than either before or during the sessions. But securing general assent to any form of mondial treaty will be much more difficult, if not impossible, when the Powers are no longer assembled together. Indeed, Argentina, Italy and Mexico practiced during the Conference the doctrine which Germany preached so forcibly, for obligatory treaties of arbitration were actually concluded at The Hague between Argentina and Italy, Mexico and Italy, the negotiations being conducted by the representatives of these countries at the Conference.

The Argentine-Italian treaty of arbitration binds the contracting Powers to arbitrate all differences except those affecting their respective constitutions, and specifies that questions concerning the interpretation and application of treaties between the contracting Powers or of a principle of international law shall always be settled by arbitration.

Unless otherwise agreed the court shall be composed of three persons, one chosen by each party, preferably from the Tribunal of 1899, and the third by these two, and, if they cannot agree, by the Queen of Holland or her successor.

The treaty runs for ten years and renews itself for similar and successive periods until denounced by one of the parties six months before the end of a ten-year period. It was signed at The Hague in the Hall of the Second Conference, September 18th, 1907. The treaty between Italy and Mexico is in the same terms, with only one important exception, namely, the Tribunal of 1899 is given no preference for supplying the arbitrators.

Thus Argentina, Mexico and Italy actually carried compulsory arbitration further forward during the Conference than any other Power. Argentina had previously concluded similar treaties with some South American countries, thus furnishing the model arbitration treaty, and at a date prior to the signing of any of those treaties which have broken out like stars in Europe's sky during the past decade.

(*Concluded next week.*)

NEW YORK CITY.

To the Memory of Sidney Lanier

BY WILLIAM ADAMS BROWN

LIGHT-POISED upon his slender quivering stem,
I watched a larkspur lift its spreading head,
A wealth of blue shot thru with white and red,
Each petal iridescent as a gem.
But in the night the wild wind's strategem
Snapped the slight stalk and left its promise dead;
And when I marked the buds unopened,
I broke my heart in pity over them.

Such wealth of beauty died, Lanier, with thee;
Such varied store of ever-changing hue;
Unfathomed deeps of faith and insight true,
Shot thru with passion and with purity.
If such the glory of thine opening,
What were the songs thou didst not live to sing!

NEW YORK CITY.

The Coming Political Crisis in England

BY JUSTIN McCARTHY

WE are on the eve of a great political struggle. The next session of Parliament in England will open before the time usually appointed for such events, and this coming event certainly casts its shadow before in a manner which promises or threatens, according as the observer may chance to regard it, some memorable realities to follow. The Prime Minister, Sir Henry Campbell-Bannerman, announced in a recent speech the determination of the Government to carry out its program with the strictest resolve and with full energy during the session.

As my American readers already well know, the principal feature of that program is to be the measure for compelling the House of Lords to submit to the House of Commons on the great legislative proposals already made to the peers and rejected by them, and if the House of Lords should persist in the policy of obstruction the Government will dissolve Parliament and appeal to the country by means of a General Election. There can hardly be any question or doubt as to the course which will be taken by the country if the persistence of the peers in their recent, and, indeed, their habitual, policy should render necessary the appeal to the national tribunal. The vast majority of the people in these islands will sustain the Government against the House of Lords. Then, if the same Liberal Government should return to power, about which there can hardly be any reasonable doubt, Sir Henry Campbell-Bannerman and his colleagues will bring forward their measure of Home Rule, which I sincerely hope, and indeed have every reason to believe, will prove a genuine scheme of national self-government for my country and entirely unlike that poor little compromise offered not long since under the name of the Irish Councils Bill. That measure, as we must all admit, was offered only as a compromise and a merely temporary compromise, but it utterly failed, even as a compromise, to satisfy the demands of the Irish people, and it had to be withdrawn. The next attempt of Sir Campbell-Bannerman and his ministry, should they remain in power—or, rather, should they return to power—after the General Election, will, I hope and believe, proclaim itself and prove itself as a full and genuine measure of Irish national self-government.

In the meanwhile the prospects of the coming session are filling all the Tories, Conservatives and Liberal Unionists of these islands with a fury of wrath against the Liberal statesmen in office. Some of the London Tory journals are already insisting day after day that the ministers themselves are losing confidence and heart and are growing into a condition of utter despair. Some of these newspapers have actually insisted that the Cabinet itself is even at this moment becoming divided into two disputant parties, and that at any moment these two parties may break into open antagonism. Even the names of expected seceders have actually been put into print in the columns of certain journals. Now, it is well known, and always has been known, that some of the members of the present Cabinet are not quite so radical in their political principles as are the Prime Minister and many others of his colleagues. But then we all know very well that there never was a British Cabinet, Liberal or Conservative, which did not include among its occupants some men who were not nearly so far advanced as others of their colleagues in the political doctrines professed by the party. Be the Cabinet Liberal or Conservative, this fact always remains the same, and in most cases the stronger division of the Ministry is able to carry the other along with it thru the struggles which have to be encountered. The history of all the great ministries during my own recollection and during long generations before bears witness to the same fact. I am therefore quite willing to believe that some members of the present Cabinet—men, for instance, like Mr. Asquith, the Chancellor of the Ex-

chequer; Sir Edward Grey, Foreign Secretary, and Mr. Haldane, War Secretary —are not by any means as far advanced in Radical opinions as Sir Henry Campbell-Bannerman and several others of his colleagues. But when certain Conservative journals inform me that Mr. Herbert Gladstone is among the statesmen who are falling away from the principles of advanced Liberalism, I can only say that I regard such an assertion as something rather too absurd for extreme Conservative partisanship itself to put forward as a serious announcement.

Nor do I believe that there is any probability whatever that the Cabinet will divide on any of the great questions now coming forward, and that the Government will have to be reconstituted or go to pieces. I feel well assured that Sir Henry Campbell-Bannerman and his colleagues in office will hold firmly together in the constitutional effort to reconstruct the upper house of Parliament, and if the Lords do not give way will make united appeal to the decision of the country. Then, when the General Election comes on, it seems to me quite possible that there may be here and there, in this or that constituency, some diminution in the numbers of ministerial voters.

The Socialist question will probably do something toward this result, for a large number of Socialists are inclined to set themselves against any Ministry, on the ground that no Ministry likely to be constituted just at present would go far enough to satisfy the Socialistic demands. Then there are no doubt some Liberals of the old-fashioned order who are still not won over to the cause of Home Rule for Ireland, and who, altho they probably would not vote for a Conservative candidate, might easily make up their minds to abstain from the ballot-box altogether on this occasion. There is also a small section among professing Liberals who are rather inclined to take conservative views with regard to the admission of foreign goods to British ports without the payment of any import duty, and who might, for that reason, allow the election to go thru without contributing their own votes. But when all allowances are made for these possibilities or probabilities, I feel as certain, as well as one can be of anything in the future, that the Liberals will return to power with a very large majority, and will be enabled to go on with that great Liberal program which Sir Henry Campbell-Bannerman in his latest public speech declared to be still in its every article the purpose and the resolve of their official existence.

While still dealing with political subjects I take the opportunity of making some reference to a letter lately received by the editor of THE INDEPENDENT with regard to a phrase used by me in one of my INDEPENDENT articles, the phrase "English politics," as describing what the writer of the letter thinks should be spoken of and written of as "British politics," because the word "English" only includes the southern part of this island and does not apply to Scotland or Ireland. My readers may remember that in a more recent article of mine I said in my own defense or excuse that I used the word "English" quite casually and merely in its ordinary colloquial sense, and admitted that it could not properly be held to include Scottish political affairs. But I also pointed out that the word "British" would not of itself have correctly set forth my meaning, because the word "British" does not in any sense apply to Irish political affairs, and that the Imperial Parliament is always distinctly described in official phraseology as the Parliament of Great Britain and Ireland. The writer of the letter, who is a Scottish gentleman, has written a second letter on the same subject. I have already so fully admitted my error in the use of the word "English" that I do not think it necessary to make any further allusion to that subject, but the writer, who is evidently a sincere and patriotic Scottish Nationalist, concludes his letter with the words "I fear that the strongly Anglicized atmosphere of St. Stephen's has not been without its influence on our good friend Mr. McCarthy." The writer apparently is under the impression that I have become Anglicized by my many years of Parliamentary life, and that I am entirely indifferent to the national feelings, the national claims and the national rights of Scotland. This is the one point concerning which I desire to make my views clear. My long occupation of a seat in the House of Commons has certainly never Anglicized me

as regards the national sentiments and rights of my own country, nor has it Anglicized me any the more with regard to the political position and feelings of Scotland. I count many dear friends among patriotic Scotchmen; I was during many years a frequent visitor to Scotland, and my voice has been heard again and again from many public platforms on the northern side of the Tweed. No spoken or written words of mine ever showed that I had fallen away in any sense from my sympathy with Scotland's national feelings, and I should have to change my whole nature before any such change as that could be brought about in me. I had always believed that my views with regard to Scottish nationality were perfectly well understood wherever anything was known or noticed about me and my political and literary work, and I am certain there are many Scotchmen at the present day who could assure the writer of the letter to THE INDEPENDENT that I have never proved myself Anglicized in any such sense.

THE HON. MRS. HENNIKER.
Author of "Our Fatal Shadows."

I now turn from politics to literature. One of the most remarkable novels given to the world here for some time in this age of novel writing is "Our Fatal Shadows," by the Hon. Mrs. Arthur Henniker, and published by Messrs. Hurst & Blackett, London. Mrs. Henniker has already won a high reputation for herself as the author of "Sowing the Sand," "In Scarlet and Gray," "Contrasts," this last an especially delightful volume of short stories, to which I invited the attention of my INDEPENDENT readers at the time of its publication. "Our Fatal Shadows" is a story told after a fashion once more familiar to the writers of romance than it has been for many years past—a story told entirely thru the medium of letters supposed to have been written by the principal character in the book. It is, therefore, above all things else, a revelation of the heroine's inmost feelings, for the writer of the letters in "Our Fatal Shadows" is the heroine, and she writes only to her most intimate friends.

The story is a wonderful study of emotion, and the emotions it illuminates are caused by incidents often in themselves exciting and thrilling. The heroine is not by any means presented as that faultless, perfect creature which the reader generally expects to find in the heroine of a romance, and she reveals herself all the more effectively because she evidently always believes she has good reason to give in justification of her sometimes self-centred, if not quite selfish, impulses and decisions. The book seems to me to touch a new chord in the harp of our present-day romance, a chord more familiar in the days when the novel writer dealt more with emotion and character than with incident and plot, the ways of society or the contrasts between poverty and wealth.

I shall not attempt to give any condensed version here of the story told in "Our Fatal Shadows," for I think I have

already made it quite clear that the great charm of the book is the manner in which its purpose is revealed by its author. But I can cordially recommend the book to American readers, and I feel well assured that among those readers there will be many to appreciate and to admire. Mrs. Henniker is a woman of aristocratic birth, position and surroundings, but a woman who has ever taken the deepest interest in the welfare of the poorest and the lowliest in the land.

Mr. H. de Vere Stacpoole, whose novel, "The Crimson Azaleas," was one of the successes of the early part of this year, has just published, in collaboration with Mr. W. A. Bryce, a most delightfully amusing story called "The Meddler." I have seldom read a story which has amused me so much. The episodes in it are wildly funny and are all the more so because they are not impossible, and the characters are like real human beings and not mere caricatures, as is so often the case in stories of this kind. The adventures of Mr. Lamb and the "Prince of Bohemia" in London are most diverting. All the characters are individual and distinct, and one is very sorry to have to part from them and their amusing adventures. The writing of the story has a literary charm one does not often find in stories of this light-hearted type. "The Meddler" is published by Alston Rivers.

The London world is just now deeply interested in the publication of "The Letters of Queen Victoria" in three volumes, being a selection from the late Queen's correspondence during the years between 1837 and 1861. The book is edited by A. C. Benson and Viscount Esher, and is published with the authority of King Edward. [Longmans, New York. $15 net.] These volumes have only made their appearance this day on which I am writing, and I can therefore form only a rapid impression of their contents; but they seem to me to be full of enduring public interest and to give an illuminating idea of the late Queen's sincerity and straightforwardness, of her devotion to her constitutional duties and her simple, absolute integrity of purpose.

London, England.

The Relationship of Plants and Animals —A Scientific Fantasy

BY CAMILLE SAINT-SAËNS

[Camille Saint-Säens, altho one of the greatest of living composers and musicians, had always taken a profound interest in literary and scientific matters, as the following suggestive essay shows.—Editor.]

THE object of these reflections is to show that a close relationship exists between the animal and vegetable kingdoms. They are addressed solely to persons who are already familiar with the theory of evolution and ready to accept all its consequences; those who are inclined to reject evidence rather than admit any kinship whatever between man and the other animals will have the opportunity to make fine sport of my conclusions, for I do not offer any evidence in support of my contention, and, in fact, it will require a considerable effort to follow me in a line of thought so little in harmony with received ideas. It has for a long time been the custom to say *"Omne vivum ex ovo,"* and also to assimilate the seed of vegetables to the egg of animals. This assimilation is not quite correct; in reality, to find the equivalent of the egg we must go back to the obule. Between the latter and the egg of the mammifers there is more than the analogy between them. Both, after a fecundation, develop in the same manner, by a proliferation of cells obtained by segmentation. The analog of the seed is the embryo. Look at a human embryo, for instance, before the develop-

ment of the members, and then observe the young seed of a kidney bean; you see that both have the same curvilinear form, with an umbilicus in the center, giving birth to a nutritive cord. If all seeds have not this form, that is to say, this external resemblance to the embryo of the mammifers, they, nevertheless, exhibit such a close analogy with it that the membrane to which the young seeds are attached has received the name of *placenta.* The seed developing in the fruit occupies the same situation as the embryo in its envelopes.

Let us now follow both in their several developments. In each case we notice an axis, one extremity of which, called the inferior, terminates in a point, while the other assumes a rounded form; and, on each side of the axis, are developed, sooner or later, appendages, which are invariably directed toward the extremity to which they are nearest. Two proceed in one direction, two in another, as, among vegetables, the branches and the roots. All four present the same structure. To an articulation at first succeeds a bone, which terminates in a second articulation bearing *two* bones. The advantage of this subdivision is extremely problematical; it does not seem to answer any need; its most apparent result is the enfeeblement of the resistance which the member might be capable of opposing to shocks, to agencies of destruction. Every one knows, in fact, that fractures of the forearm and of the leg are much more frequent than fractures of the thigh or of the arm.

Starting from the third articulation, we find that articulations and subdivisions are multiplied; we come to the five fingers of the anterior and inferior paws, of the hand and of the foot. The hand has become, in the case of the monkey, and, above all, of man, such a marvelous instrument that it is very difficult for us not to believe it to have been specially organized for the employment which it exercises actually. There could be no possible hesitation, if the paw were a degeneration of the hand, or if, at first simple, it had gradually grown complicated, in order to arrive at the perfect form. But such is not the case. The hand exists only among the superior animals, and those that have come last in the chronology of beings. And yet its complicated structure has been found in certain ancient animals, among which its presence is inexplicable. We meet it, in remote epochs, in the powerful paddle-like flippers of the ichthyosauri and the huge swimming turtles. Of what use can these fingers, with their numerous phalanges, have been, imprisoned as they were in a sheath which held them immovable, and acting in unison, all of a piece? They are useful for opening and shutting the wings of birds and the fins of fish; but even there the phalanges are a luxury, for, if the wing and the fin have need of a certain suppleness, they are not designed to bend transversely. Many animals, to which fingers are necessary or simply useful, only utilize a part of them; finally, their usefulness in the human foot is of a very restricted character; it is certainly still more so in the massive foot of the elephant. If we question, on the other hand, certain teratological examples, they will show us supplementary fingers, often even claws on other fingers.

All these considerations lead us to suppose that we are in the presence of organs formed, not by necessity, but in virtue *of a general law of ramification,* which attains, in vegetables only, its complete expansion, a law which we discover even in the crystallizations of metals, and with which is probably connected the *law of segmentation,* by virtue of which is accomplished the proliferation of the cells, the essential condition of the development of all living beings.

Let us now consider the anterior part of the animal and vegetable axis, which bears in both cases the name of *head.* In the case of the plant the head supports the principal inflorescence, at times unique; in the case of the vertebrae, the brain. Evidently these functions are very different; but the difference will seem less great if we but reflect that, in both cases, this place is occupied by the organ that is of most importance for the conservation of the species. In fact, for the plant, motionless and defenseless, fecundity is the principal agent of this conservation; it is in the function intended to secure it for the plant that the plant concentrates all its vitality and displays all its luxury. In the case of the

animal, as soon as the development of the nervous system has brought into existence intelligence and conscious will, everything changes; the future no longer appertains to the most prolific species, but to the most intelligent; of this fact the power exercised by man is a proof to which there can be no reply. From that time the organs of fecundity have been relegated to the second plane; they have lost their place and their beauty, and what they have lost, the brain, and those purveyors of the understanding, the organs of the senses, have gained.

It now remains for us to study the inferior extremity of animals, the tail, which has already played so great a part in the history of evolution. It is impossible not to be struck by the disproportion that exists between its seemingly enormous importance and its really trivial importance. The great majority of animals were provided with a tail, and it often happens that those animals which were destined ultimately to lose it have possessed a very developed tail in the embryo state. For nearly all of them it is useless. Some, it is true, have managed to utilize it; the kangaroo has made a fulcrum of it; the scorpion a weapon; the giraffe and the horse have made a fly-flap of it, and some monkeys use it as an organ of prehension. Do not the rarity and the variety of these adaptations show us that we are in presence of an organ without determinate destination? In regard to many animals, the tail may be suppressed without any damage to the individual apparently resulting from this suppression, as if, in their case, it could be regarded only as a simple ornament. But how can we be reconciled to seeing nothing but an ornament in an organ which, among vertebrates, is a prolongation of the vertebral column, and which, in the case of some of them, is completely developed in the embryo at a time when the members are still only formless buds? This is inadmissible.

Everything is explained, it seems to me, if we admit that the tail of animals is nothing else than the *pivot* of vegetables, which became useless when the living being had found and had adopted another mode of alimentation than that of which the root is the organ. But how has such a profound change in the conditions of existence been produced? The solution of the difficulty may, perhaps, be discovered in the so-called carnivorous plants. Darwin, who made a long study of them, ascertained that some of them, as, for instance, the *utricular,* fed upon the products of the decomposition of captured animals, but that others, like the *Dionœa muscipula,* gave evidence of real phenomena of digestion. These plants, in view of their rarity and of the small number of species, seem abnormal; but there is nothing to prevent us from supposing that those with which we are acquainted represent the last survivors of a group, at one time numerous, in which the new manner of nutrition was probably substituted gradually for the old, and which thus served as a transition between the plant and the zoöphyte; the latter still bears a striking resemblance to the plant in its external form. We know also that the zoöphytes do not possess either mouth or stomach, properly so called, but a simple digestive cavity.

If all the preceding considerations be admitted, it will no doubt be acknowledged that they authorize us to formulate the following conclusions:

1. The plant and the animal, having started from the same point of departure, *evolve according to the same laws,* and differ only by a simple divergence in their mode of evolution, analogous to those which produce such profound differences in remotely related species of the same kingdom; 2. the prototype of vital evolution is vegetable evolution.

Examined from this point of view, many mysteries are at once cleared up; and we are no longer surprised at the phenomena presented by animal appearances observed among vegetables (the spores of the algae, the antherozoids of the cryptogams, the movements of the sensitives, etc.) nor at the vegetable forms affected by the polyps and the zoöphytes.

When we descend to details we meet with difficulties; this is the peril to which everything connected with the transformist theory is exposed. These difficulties are not insurmountable; it would be easy for me to anticipate many objections, in order to give myself the pleasure of refuting them; there are

other objections, on the contrary, that would embarrass me very much. But every one who is sincere will admit that in such matters we should take cognizance of the great lines especially, because, inasmuch as our incomplete knowledge does not allow us to gain a sufficiently intelligible comprehension of details, by giving an excessive attention to them, we risk losing our way, or, at least, remaining stationary until nature is known in all her mysteries. It would take a long time to acquire such knowledge, and, in certain cases, its acquisition would be absolutely impossible, as, for instance, when the question regards early beings, easily destructible, which paleontology is powerless to restore to us, and whose existence we are simply obliged to suppose.

I leave to a naturalist, if there is any naturalist ready to adopt this hypothesis, the task of defending it, as well as that of pushing it farther, of seeking, for example, whether the *neck* of the plant, from which issue the roots, has not its analog, perhaps, in the pelvis of the vertebrates, the starting point of the lower members; whether we might not connect with this idea the existence of the apophyses, that of the embarrassing antlers of the cervidæ, the brilliant attire with which certain animals invest themselves at the moment of the *"floraison,"* all of which I confine myself to indicating, being afraid that, should I do more, I might fall into fantasy. But I cannot refrain from mentioning that zoölogists have already compared the skeleton of the vertebrates to a plant, and that between the articulations of vegetables and those of animals the resemblance is striking.

Painters, in certain fantastic pictures, often give to trees a human appearance, transforming their branches into arms and their roots into legs; perhaps they are nearer the truth than they imagine.

PARIS, FRANCE.

Lumbering in the State of Washington

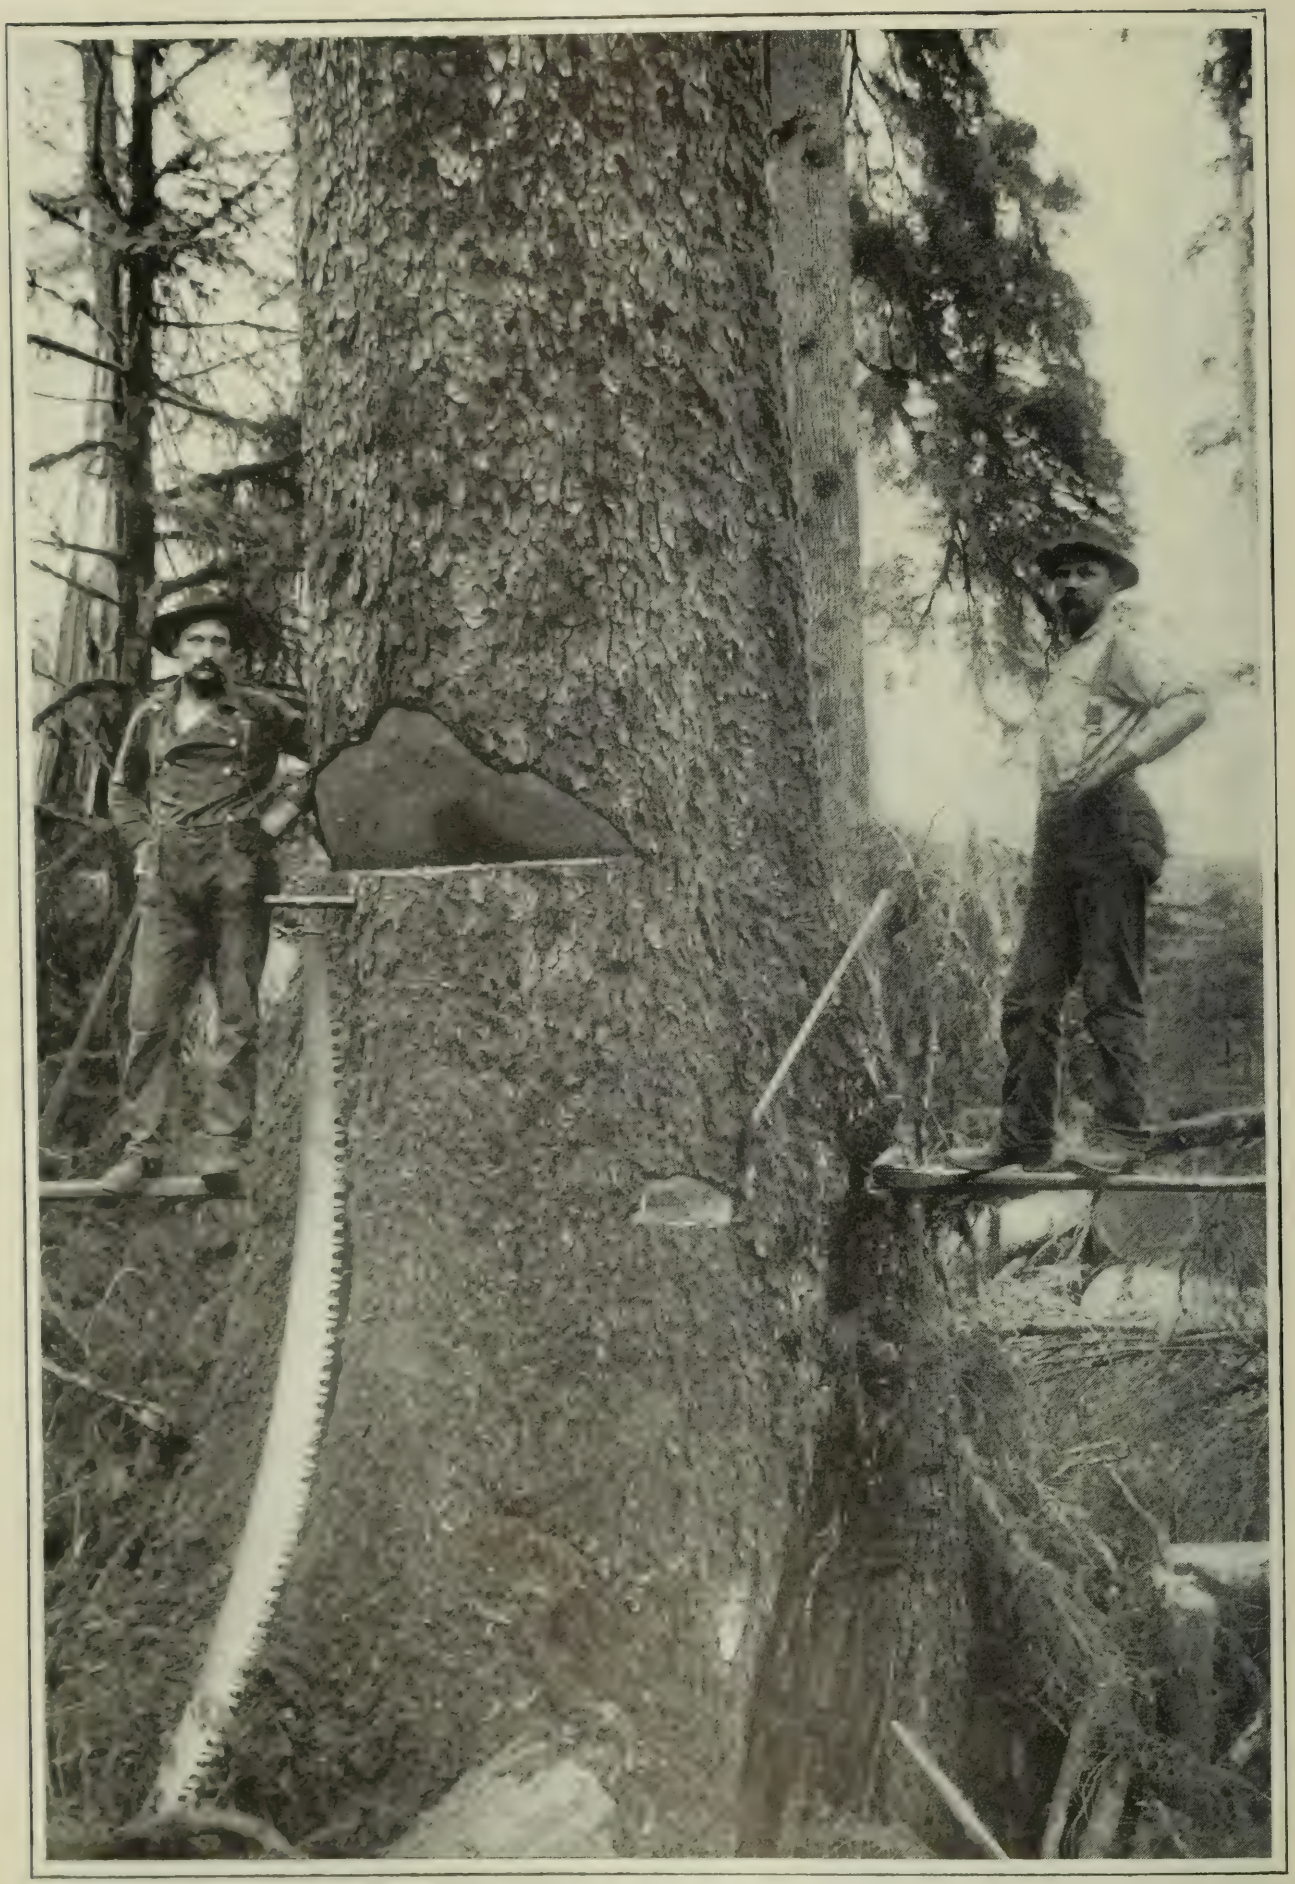
BY ADELE M. FIELDE

AUTHOR OF "A CORNER OF CATHAY," "PARLIAMENTARY PROCEDURE," ETC.

IN traveling thru the vast wooded tracts west of the Rockies one is everywhere impressed by the prodigious waste of excellent wood in all the lumbering districts. The most extensive primeval forest, the only great timber tract now remaining on the globe, stretches from Canada thru western Washington and Oregon to Humboldt Bay in California, a mighty area of evergreens.

In the State of Washington the forest is the greatest single natural resource. It is difficult to conceive of forests more magnificent. The trees of tropical jungles are also evergreen and of towering hight, while their foliage is more varied, more vividly green and more strikingly luxuriant. But in the tropics venomous creatures crawl and fly among the trees and noxious exhalations vitiate the air, while these Northwestern woods are free from poisonous reptiles and insects and their resinous odors are wholesome and invigorating. They have a certain dignity and solemnity, too, befitting the years that have brought them to their majestic maturity.

The Easterner may possibly miss in these forests some of the charms of the deciduous trees. He may note that the wild flowers growing underneath are but few; and he may observe that they lack the freshness of springtime verdure, the cheering luxuriance of summer foliage, the glory of multi-colored autumn leaves, the grace of dark, bare limbs displayed against a wintry sky. But there is something in the enduring cleanness and innate majesty of these somber forests that captures the imagination and holds the affection of the lover of trees,



and perhaps contents him perfectly. A reckless destruction of them is a bitter wrong to future generations, even tho concrete supersede wood as a building material, aluminum replace it for furniture, and radium come into common use for heating purposes. And at the present rate of destruction they will last only a hundred years.

The Chamber of Commerce in Seattle now joyously records that if the trees of the State were sold at their present value, standing in the forest, they would bring more than three hundred millions of dollars; but if cut into lumber and placed in the market at present prices they would bring more than three billions of dollars, or three thousand dollars for every inhabitant of the State.

The monarch of these forests is the fir, with two hundred feet of bole rising cleanly to its lowest limb and with a

LOGS IN THEIR PASSAGE FROM THE WATER TO THE SAW-MILL.

THE FIRST CUT IN A FIR TREE,
Determining the direction in which it shall fall.

coronal of dark green swaying gently in the breeze for a hundred feet more. This is the sort of tree that, under the name of "Oregon Pine," has furnished masts for ships sailing on every sea and has supplied the sawn lumber for dwellings under every sky of the world. Its wood is elastic, has great tensile power, is straight-grained and stands pre-eminent among commercial timbers.

Associated with such superb firs are colossal spruces, cedars of lofty hight and satiny texture, somber, aromatic hemlocks, pines of several species, with a sprinkling of larch and tamarac. Beneath the giant evergreens, vine maple, dogwood, hazel, briars and berry bushes form a dense thicket, and in opened spaces maple, alder and ash spring up. So dense is the forest that the sunshine scarcely filters thru the foliage, and the trails alone offer chance of making rapid headway thru the wilderness.

In these forests lies great wealth. Single trees may contain sufficient lumber for the building of a five-roomed house. Single acres have yielded a half-million feet (the foot of lumber being twelve inches square and one inch thick). The annual output of the State exceeds two billion feet. The lumber industry gives employment to over thirty thousand men, in about three hundred logging camps, the annual payroll amounting to twenty millions of dollars and the value of the products to thirty-five millions. During the year 1906, 86,585 carloads of lumber and shingles were shipped from the thousand lumber and shingle mills of the State.

The cities on Puget Sound are centers of the lumber trade, and are themselves important consumers of lumber in their extensive manufacturing and building operations. The city of Seattle alone buys lumber to the amount of many millions of dollars every year.

The coastwise trade is far greater than that with foreign lands, and a fleet of steamers carry lumber from Puget Sound to Alaska, British Columbia, California, Hawaii and South America. Much lumber also crosses the Pacific to Australia, the Philippine Islands, China, Siberia and Japan, and many shipments go to other countries, especially the long and strong timbers that are required in the construction of bridges and in buildings where beams and joists of seventy feet and upward are demanded.

The lumber camps send to the sawmills logs of various sizes up to one hundred and ten feet in length and eight feet in diameter.

The ordinary demand for boards is for widths of twenty inches and under, and the large logs are sawn on four sides consecutively, the outer layers of fiber being of handsomer grain than those near the heart.

Many of the mills have kilns in which the sawn lumber is dried for five days at a temperature of 185 degrees Fahrenheit before it is shipped upon car or boat.

It is not the wood that is used, but the wood that is wasted that gives the observer cause for much thought. The expert woodman can make a fairly exact estimate of the amount of lumber upon the acre of forest, of the cost of felling the trees and the probability of profit in transporting the logs to the sawmill. Four or five dollars per acre may be paid for all the standing timber that the purchaser desires to remove from the tract. The foreman of the lumbering crew decides at a glance where a tree shall lie, and the first excision in its side determines the direction of its fall. The branches are lopped from the fallen tree, chains are attached to the log, and it is drawn to a chute, down which gravity carries it to the water to float with its fellows in a great "boom" to the sawmill, where it is drawn up by machinery to pass under marvelous steam saws. There are mills in the State having a capacity for sawing a hundred and fifty millions of feet of lumber annually.

But the lumbering only partially denudes the land, and from one to three hundred dollars per acre needs be spent in clearing it for agricultural uses. It "does not pay" to cut the smaller timber, and trees of even so much as two or three feet in diameter are often burned with the underbrush. Two auger holes, one for inward draft and one for the exit of smoke, are made in the bole of the tree, an inflammable wad is lighted in its heart, and it is left to burn itself up, adding its great tongues of flame to the destroying fires that are consuming its fellows.

Stumps twice the hight of a man often

remain on land that has been lumbered, and one wonders at such neglect of the largest portion of the tree trunk, until one learns that the lower part of the bole is a great reservoir of pitch, that is avoided because it clogs the saws.

Trees in a forest are all screened by neighbors, and therefore their grip upon the earth is but superficial. Any tree left in isolation soon falls, and its upturned roots appear like aerial branches. These roots are added to the extracted stumps and other debris of the land under clearing, and vast piles are formed and ignited, to burn for many days and fill the country with blue haze.

To one who has lived in the Orient, where all wood is costly, and where children of school age are sent out to gather fuel for domestic use, and think the time well spent if they collect a bushel a day, this woful waste of wood in the West appears culpable. It is true that "it does not pay" the American to utilize this refuse of the lumberman. Then why should not the United States Government present it to Japan or China, that the government of one of those countries, where every twig and knot and chip is made to be of service, may send junks and men to take away that which encumbers our acres? Oriental laborers will gladly work for their rulers at twelve cents a day and can be recalled to their native country when their work abroad is completed. The agriculturist here would benefit by having the wood taken from his land without cost to him.

And what is, after all, most important, we should be less chargeable with wastefulness. We have been accustomed to justify our own occupancy of the country of the Indians by the plea that they did not make sufficient use of the area possessed. If we also fail to utilize the gifts of Nature to us, there will surely come more able people to oust us and to hold fast what we reject. After all is said, moral justification for a condition or action has in the long run great potency in bringing it to pass.

Advice to Young Ministers' Wives

BY HENRY'S WIFE

ADVICE is always the swan song of the passing generation, the quavering high treble of our experiences which we insist upon dedicating to those who come after us. And so the admonitory tone of the following pages may be pardoned on account of the age and experience of the writer, who has been a minister's wife for many years and who knows the peculiar difficulties of the position.

In the first place, do not take your husband too seriously, nor act as if you regarded him as peculiarly sacred. The very meekest preacher will look out after his own halo unconsciously, and with many of them humility is strictly a knee attitude toward Heaven. They are not so humble as they should be except before the Lord. Also, they are more often tempted to fall into a kind of unctuous vaingloriousness than other men, because if one of them has the gift of expression certain people of his congregation are disposed to spoil his sincerity with compliments after each sermon. And, spiritually speaking, it is one of the most egregious customs church members practice toward their pastors.

Do not worry if he gets "in the brush" now and then and makes a flat failure of his Sunday morning discourse. When you consider that he must preach one hundred and four times a year, make fifty-two prayer-meeting talks, besides funerals and revival services, you will know that it is only thru the direct interposition of divine Providence that he does not become a driveling idiot, and you can be thankful. Neither must you meddle with his sermons. The Lord called him to preach, not you, and so you had better leave even his palpable blunders alone. They may be the results of a kind of cross-eyed inspiration especially suited to some spiritually astigmatized person in the congregation. And never question his right to minister, no matter if he is not a perfectly modulated saint in his home life. Forgive him his faults quickly, remembering that he is on tenterhooks to Heaven anyhow and usually disposed more than other men toward remorse for his faults. The preacher whose wife discredits his ministry in any way must quit or become a conscious hypocrite. He simply cannot hold out against the sneer or even the doubt upon the face of the one human being whose relations to him are so intimate that she knows all his uprisings and downsittings as well as does the recording angel. Just bear in mind that a man is probably called to preach because he is needed for that purpose in the scheme of things, and not because he is by nature so much better than others. He may not have the more common grossly carnal faults, but the average preacher only manages to be moderately better than other men by the very skin of his teeth, so to speak. And nothing could be more unjust or exasperating than to have a wife who, for the lack of sympathy and some tender, benignant sense of humor, holds him up, unresting, to a God-awful standard of celestial excellence.

Do not gossip adversely about members of your husband's congregation to him. This is one of the gravest and most common faults among ministers' wives. You should remember that his relations to the worst of sinners is peculiar, and must not be critical. I have sometimes thought if a preacher could serve his people without knowing anything about the skeletons in their closets, and without always having to recollect the whispered catalog of each one's faults, he would have better success. And preachers' wives who tattle to their husbands about everybody's sins, especially those that the poor souls have tried to bury, are often responsible for the development of that beak-pecking instinct which makes some ministers sustain a butcher-bird relation to the sinners in their congregation.

Do not feel that there is anything peculiar in the fact that there is always a saint in every church who is the thorn

in the pastor's side. In the first place, he may need a thorn. Some preachers require a good deal of urging of one sort or another. In any case, nothing is more disgusting than the martyr-mind preachers and their wives often adopt in regard to this kind of persecution. We all come up thru great tribulations if we get up, and they are as necessary for the perfecting of a minister's character as they are for the rest of us.

Do not sustain a funereal relation to the best worldly society in the community because your husband is the pastor of the church there. If you are invited to a reception, be sure to go, but do not wear your dark wool prayer-meeting dress, nor look like a peaked-faced catbird in a cage full of brightly hued, chirruping canaries. If you cannot afford anything better buy a five-cent muslin. The idea is the same as if you had a silk, and it is the idea you want to realize; make it with elbow sleeves, and do your hair as nearly as you can like the most fashionable woman's in town. Put a little powder on your nose and chin where you have burned your complexion over a hot stove, and sally forth in a good humor to have a good time. This is not worldly mindedness—this is being as wise as a serpent and as harmless as a dove in dealing with the worldly minded. It is an innocent and becoming concession to make to their customs, and it will be easier later on for your husband to get them to come to church on Sunday.

Do not let the good people in your husband's congregation spoil your children. They will do it without a qualm, and then relate to the next preacher's wife how bad they were, without giving a hint of the real reason why Bessie and Johnnie became gluttons and mendicants. Nothing that children ever come in contact with, as children, is more subtly demoralizing than the humoring they get from these fat old lady saints. And no enemy in after life will surpass the damage done to their young reputations by these same old dames, who are fond of saying that it is queer how preachers' children are always worse behaved than anybody's else.

Do not let your husband make a better appearance than you do. There is something disgusting in the contrast one sometimes sees between the minister in his broadcloth clothes in the pulpit and his wife in the pew below wearing her rusty dress and bonnet, with the dim, sweet air of a martyred scarecrow. It would look more godly to all thinking people if she wore the broadcloth and if he wore the rusty coat. But men do not think of these things unless they are taught. And it is the wife's business to see that her husband does not look like a selfish monster to those who observe and compare and think. In particular, it is a mistake not to take as many vacations as your husband takes. Ministerial forms of domestic selfishness are very easily contracted, especially when all the spare money is used to send him to conventions and institutes and what-not while the wife stays at home to retrench expenses accordingly. It would make the average preacher feel a great deal better morally if he stayed at home and minded the children now and then while his wife made a visit to her "folks." He could cook, clean the house and keep the baby from falling downstairs if he really wanted to do the square thing, and with less fatigue than his wife suffers, because he is stronger. But I have never seen a preacher's wife yet who could grasp this fact with sufficient courage to live up to it. Nearly all of them do their best to make their husbands selfish, and it is a moral wonder that ministers are not monsters of egotism and general meanness.

And, finally, do not develop a morbid self-consciousness in your husband by criticising his little mannerisms in the pulpit. We all have them, and they are usually an evidence of sincerity and self-forgetfulness. For example, the first Sunday after we were married Henry preached on the Beatitudes—all of them. Since then I have heard him deliver longer discourses on half of one of them, but no sermon I ever heard impressed me so deeply as that first one that I listened to from Henry's inspired lips—not spiritually, but as a performance. I had very little idea of the substance, but the manner of his delivery, the effect of certain slow-clenching sentences were subjected to the worldly minded analysis of his young and ambitious wife. One thing in particular I noticed was a little absent-minded gesture he made about the time he reached that division of his sermon

which dealt with the blessedness of peacemakers. He began to stroke his left eyebrow with the forefinger of his left hand, and with the dim meditative air of a man who has forgotten that he is not absolutely alone before Heaven with his idea. Since then I have heard him preach many times, but whenever he gets thru the introduction without that passing of the spirit gesture I am sorry, for I know that he is not free, that he has not what he calls "liberty." And I would not tell him of it on any account, no matter if it made some nervous critic in the congregation have a conniption fit to see how regularly he does it.

How the Colored People of Washington Raised $25,000 in Twenty-six Days

BY BOOKER T. WASHINGTON, LL.D.

PRINCIPAL OF TUSKEGEE INSTITUTE

SOME time ago Mr. John D. Rockefeller offered to give $225,000 toward the erection of Young Men's Christian Association building for the colored of the District of Columbia on the condition that they would raise an additional $25,000. The required sum and something like $6,000 more was raised in less than a month, in twenty-six days to be exact. The story of the campaign to meet the requirements of Mr. Rockefeller's gift is an important chapter in the history of the colored people of Washington. It shows their ability to act in an organized capacity and illustrates a disposition which, I think, is increasing among the members of my race in every part of the country to unite to help themselves.

The first attempt to establish a Young Men's Christian Association for colored men in Washington was made in 1904. A group of some twenty men, representing various occupations and different religious denominations, composed the first organization. During the first year they added some 600 others to the organization. With this number of active workers they decided to erect a building, one that would be adequate to meet the wants of the city of the largest negro population in the United States, and a building at the same time appropriate to adorn the capital of the nation.

They secured the services of Mr. Lewis E. Johnson, secretary of the association at Buxton, Ia. Buxton is a negro mining camp, which has been converted into a model town, largely thru the influence of the Young Men's Christian Association at that place and to the control exercised over the community by Mr. Johnson thru the association. Mr. Johnson obtained leave of absence for three months and took charge of the Washington campaign. He was assisted by J. E. Moorland, one of the three secretaries of the colored department of the International Committee of the Young Men's Christian Association.

The central association had offered to give one-third of the $25,000 necessary, provided the colored men of Washington would raise the other two-thirds, but Mr. Moorland and Mr. Johnson made up their minds that the whole sum should be raised among the colored people. They spent two months in preparation. They began by sending out letters and making addresses urging all members to attend Sunday meetings. Then they secured a storeroom in a building at the corner of Twelfth and V streets, owned by the True Reformers, a colored fraternal organization. This is where they made their headquarters.

Lists of names were made out, embracing every vocation in the community, from business and professional men to day laborers. These names were classified, placed on properly prepared cards, with the amount which it was estimated

that each individual could and should give.

While this work was going on at the headquarters a remarkable series of meetings for colored men were being held Sunday afternoons. Frequently the talks were illustrated by stereopticon, showing the growth of the Young Men's Christian Association and the character of its work. At the end of the first month two committees were chosen, a Citizens' Committee, with a prominent physician, Dr. J. E. Shad, as chairman, and a Young Men's Committee, with Benjamin Washington, a teacher in the Manual Training School, as chairman. These committees met separately, each preparing its own plans of campaign, and after all of the preliminary work had been completed two joint meetings were held. Then the canvass began.

The Young Men's Committee divided itself into teams, each with a captain. A generous rivalry at once sprang up among the different teams, each seeking to accomplish more than the other in the work in hand, and they were all united in their desire to outdo the Citizens' Committee.

In order to stimulate interest a chart was designed and hung on the wall, upon which was recorded every day the amount raised by each one of the teams and by the Citizens' Committee.

A large clock was devised with a dial four or five feet in diameter, which showed every hour of the day the amount of money that had been raised up to that time. This was placed in a window with a strong light to illuminate it at night. A thermometer was constructed to show the total amounts raised every day. A careful report was kept of each day's work, the names of the people visited by the canvassers and the amount of their subscriptions. As the canvass progressed the enthusiasm grew. At one public meeting subscriptions amounting to $1,000 were obtained. Henry W. Chase, an employee of the Government Printing Office, gave $500. Mr. Chase was born a slave, a plain, simple unassuming man who has saved his wages and invested his capital until he is now well-to-do. Having no family of his own, he thought this, as he says, "A fine investment for his money." Another young man, a teacher, gave $200. At the end of four weeks the sum of the subscriptions amounted to $31,000. At the present time it has reached the sum of $45,000. About one-half of this money has been paid in. With this money a lot has been purchased at a cost of $9,000. It is now proposed to raise the amount of money to be expended on the land, building and equipment to $100,000. Part of this sum will undoubtedly be furnished by the central association. It is believed the rest of that amount can be obtained in Washington. With this sum it will be possible to erect a building that is in every way adequate and architectually beautiful. It should be a monument to the good will of the people of Washington and to the self-sacrifice of the colored people. I should do wrong if I left the impression that the white people of Washington were not interested and had not aided in the raising of this money. The committee in charge was composed of both white and colored men. President Wilbur P. Thirkield was president. Many others were generous in the aid they lent to the enterprise.

The erection of such a building, so largely thru the efforts of the colored people themselves, will have a far-reaching influence for good in the community. One prominent business man has tried to express the thing in figures; he said: "This is worth a million dollars to the city."

The success of the effort to build a Christian Association in New York and in Washington has encouraged other cities to attempt the same thing. Kansas City, I am informed, has during the past summer raised $10,000 for a colored Y. M. C. A. building in that city. It is believed that other cities, North and South, will follow the example of Washington and Kansas City. Meanwhile the generous enthusiasm which united all classes and all denominations in the effort to accomplish this good work has created a spirit of co-operation and a sense of solidarity among the colored population of Washington which will be of lasting good both to them and to the city.

TUSKEGEE, ALA.

Literature

Meditative Fiction

THE literature of introspection, to which Mr. Benson's books* are a contribution, has a peculiar and delicate function to maintain. It must supply, amid the withering influences of our materialistic and superficial generation, those inner springs of wistful aspiration which only can refresh the spiritual life. Its access is thus restricted to quiet minds in quiet occupations, and to those "serenest of the progeny of God," who, like Brother Lawrence, preserve amid all outer and sordid confusions the happy sanctity of an unruffled soul. Mr. Benson, accordingly, will reach but a limited society of congenial minds.

The narrative which Mr. Benson employs is so tenuous as to awaken no interest by its perusal and to occasion no regret when finished. For the narrative is but a subterfuge of style. In the guise of very fragile fiction, Mr. Benson, speaking from the grave cloisters out of which his college window looks, gives us a scholar's philosophy of life. The style is sure, chaste and at times beautiful. In the later volume there is a finer restraint than in its predecessor, where here and there perhaps a simile from nature is overwrought, but the total effect is of one whose love for and familiarity with Pater, whose biographer he is, has given him something of the witchery of Pater's lucid prose.

The Altar Fire is not a pleasant book. Mr. Benson admits that it is morbid. It contains, in the form of a friend's diary, Mr. Benson's conclusions upon many things, from the doctrine of the Atonement to the Browning Letters, but chiefly on the processes of personal religious life. Bound together by an introspective melancholy which wearies with its insistence, the essays hangs together but distantly, lacking an inner cohesiveness. Much of the varied counsel is wisely good, but that which deals with religious

*BESIDE STILL WATERS. *By A. C. Benson.* New York: G. P. Putnam's Sons. $1.25.

THE ALTAR FIRE. *By A. C. Benson.* New York: G. P. Putnam's Sons. $1.50.

THE HUNTER.
After the painting by Homer. From McSpadden's "Famous Painters in America." Crowell & Co.

theory has only the academic point of view, an amateur assurance thinking to sap, in a clever sentence, the tragic earnestness of martyr-making centuries, asserting a new truth where it has but fallen upon some long-discarded fallacy.

One feels there is a message, but hardly formed and loosely articulated and lacking the virile note. Perhaps Mr. Benson has felt this himself, for he wrote:

"Books like the *Life of Carlyle* and Mrs. Carlyle's *Letters* take the wind out of one's imaginative faculties altogether, because one is confronted with the real stuff of life in them."

And then, out of the tedium of the volume, with its monotonous letter-press, there flashes the exquisite pathos of the boy's death, and a searching analysis of profound emotion, expressed in perfect prose, one is swept on solemn tides of suffering to a passionate, yet quiet, acquiescence in the smiting tenderness of God.

A. C. BENSON.
Author of "Beside Still Waters."

The succeeding catastrophes contribute less strikingly to the priestlike serenity of the resigned life. But if the book slopes to the end like a valley from some flaming peak, there is a retroactive gospel in it which illumines all preceding tedium as a sunset glorifies the duller east. The message finally is such as came to Lanier, dying by the marshes of Glynn, of

"—the catholic man who has mightily won
God out of knowledge and good out of infinite pain
And sight out of blindness."

One cannot but wish the book a larger reading than its somber monotony will invite.

Of the message of *Beside Still Waters* there will be little criticism. This eager, impatient generation needs the summons to a serenity of purpose which does not reckon life in terms of action and achievement only; which has but an incidental interest in profit and loss; which is intent upon a discipline of self, to culminate at last in reverence and confidence of soul, alert for every influence from the realm of spirit; content to the heart with worth and sincerity, and reckoning not at all of recognition and reward.

But Neville, for all his protests, can be convicted of dilettanteism in life as in literature. He is no ensample to the modern flock. He is too reticent, too much given to reverie, too eager to haunt churchyards, too easily passing from sentiment to sentimentality; a man out of touch with the grimmer, redder-blooded brethren of the practical world around him. He would admit all this with a patronizing acquiescence. And the grimmer, redder-blooded world, which has to work for its living as Hugh Neville had not, and which resents his patronage and implied superiority, needs much more of the temper of his unassuming spirit, pursuing with mild but relentless fortitude his quiet path to the highest personal quality and appreciation. At the same time, it will have none of his message from him. He will speak comfortably to those who do not need his speech; he will be unnoted by those who need him most. He speaks from too distant a plane. He is too cloistered and remote. Prophets do not preach with power from towers and city walls; they walk like Isaiah, suffering, upon the city streets. Neville has never known the stress of commonest necessity. The man whose days are driven by the needs of life he will never reach. He will never reach the man whose giant enterprises, waged amid the accouterments of wealth, are urged by the impulse of irrepressible constraints within him. Such men are of an alien world. Neville has no constraints. He is intent upon himself, the center of his own solar system. The thought of service has glanced harmlessly from his well-guarded self-esteem.

Give Carlyle that sound-proof upper room in Chelsea, with its window opening only toward the sky, and let him spend his days therein content to write

his journal of his own complaints, discomforts and unachieved ambitions, and you would have in life Hugh Neville's career as portrayed in Mr. Benson's fiction. But Carlyle in his upper room stormed, suffered, wrote, served in agonies his generation, alert to all the current ugliness and emptiness of industry, society and politics—in other words, wrought out a practical contribution to the fabric of the current but eternal life of men. Such biography as Mr. Benson himself has indicated will be a sure corrective to the beautiful but fallacious appeal of Hugh Neville. And it will endure among the widening generations of sincere and consecrated minds when the chaste philosophy of Neville has been long since forgotten.

Both Sides of the Alcohol Question

THE two volumes that we review together* represent very nearly the opposite poles of medical opinion with regard to alcohol. There is no doubt at all that in recent years physicians have been abandoning the use of alcohol more and more, tho a certain number of them still cling to its medical value. While Sir Victor Horsley is the protagonist of the English school of scientific medical thought which condemns the use of alcohol in medicine, Dr. Starke's book represents the German school of opinion which still favors the employment of alcohol, and considers that the moderate use of it not only not harmful, but is distinctly useful, especially in times of fatigue, and when serious crisis threatens to exhaust vitality before the natural reaction of the bodily powers can provide sufficient resistance to overcome threatening symptoms.

As in most cases of controversy, the truth lies probably somewhere between the two extremes of opinion. Dr. Starke's book brings out very forcibly the fact that the morbid impulse to drink to excess must not be mistaken for the ordinary craving for mild stimulation which has characterized every people that has ever been studied in history, and for which some substance has always been found as a response. While alienists generally, as quoted by Professor Horsley, are very much opposed to the use of alcohol and consider that it is an active factor in the production of mental disease, Dr. Starke urges that indulgence in liquor to excess is probably rather an effect of already lowered mentality than a cause of the mental state which sends the individuals studied by the alienists to the asylums.

One thing is perfectly clear after the reading of the two volumes. It is that the status of alcohol is very different from what used to be claimed for it in the comparatively recent past. While it was the custom to proclaim very confidently that alcohol was a precious stimulant, the use of which could not be dispensed with without seriously impairing the efficiency of the means which the physician has at hand for the control of disease, now its employment is urged more or less apologetically and the possibility of its evil influence palliated in order to provide a rational basis for its medical use. The change in the sentiments of the medical profession in this matter is very well represented by the interesting statistics from the London Hospital. Forty years ago the cost of the alcoholic liquors provided for the London hospitals was three times as much as that of the milk for patients. At the present time the milk supplied costs three times as much as the alcohol. Nutrition has taken the place of stimulation. It has come to be realized that nature's ordinary forces if only properly encouraged are even more efficient than the artificial energies produced by stimulation, to enable the system to overcome even the serious inroads of disease.

*ALCOHOL. The Sanction for Its Use, Scientifically Established and Popularly Expounded by a Physiologist. *Translated from the German of Dr. J. Starke.* New York: G. P. Putnam's Sons. $1.50.

ALCOHOL AND THE HUMAN BODY. An introduction to the Study of the Subject. *By Sir Victor Horsley, F.R.S., F.R.C.S., M.B., B.S., Lond., Hon. M.D. Halle, Etc. and Mary D. Sturge, M.D., Lond., with a chapter by Arthur Newsholme, M.D., F.R.C.P., D.P.H.* New York: The Macmillan Company. $1.50.

The Struggle for Canada*

"IT is not in the power of any man to command success," wrote Washington to General Arnold in December, 1775,

*OUR STRUGGLE FOR THE FOURTEENTH COLONY: CANADA AND THE AMERICAN REVOLUTION. *By Justin H. Smith.* Two Vols. New York: G. P. Putnam's Sons. $6.00.

"but you have done more—you have deserved it." Just how far Benedict Arnold was actually entitled to the praise of his chief is well revealed in Professor Smith's two imposing volumes on the struggle for Canada; for the Canadian venture was Arnold's own idea, and it was his skill and perseverance that make the enterprise stand out as one of the most honorable of the near-victories of the American Revolution. Were we not already disposed to regard Arnold highly on the score of his ability and service, we should find here ample foundations for his reputation. Indeed, we have no desire to accuse the author "of palliating treason, because he sets down some things to Arnold's credit," and we regret that he finds it necessary to apologize for so doing (I. 117). The treason of Arnold was, after admitting all palliatives, bad enough; but he paid for it. Before treason he has a right to be judged by the creditable things that he accomplished.

Some years ago Professor Smith established his position as the historian of the Canadian campaigns thru his critical study of "Arnold's March from Cambridge to Quebec," in which he displayed a wealth of knowledge of military, biographical and geographic details not elsewhere applied to this theme. The patron of his own college, the Earl of Dartmouth, had played a first-hand part in the story he was telling; and his own vacations in the Maine woods had brought topographical reconnaissance to the aid of the historian. As he now tells us, this earlier volume was meant to be a preliminary clearing of the path, to remove the accumulation of driftwood of tradition that obscured the course of the Quebec campaign. The present work covers the whole history, as he describes it in his title, of *Our Struggle for the Fourteenth Colony; Canada and the American Revolution.*

The story is told at great length. It begins with the Quebec Act, altho it has some introductory pages on the French colonial system, drawn chiefly, as the author states, from Parkman. It ends, approximately, with the confusion and failure which Lafayette called a "hell of blunders, madness and deception," and with the resulting withdrawal of Congressional aid in 1778. It is not likely that any facts of importance will be added to those which Mr. Smith has unearthed and worked into his mosaic. Certainly they cannot change its general aspect. So great have been his diligence and accomplishment, so careful his efforts to reconcile geographic description with geographic fact, that we believe the detailed statement of the Quebec enterprise has been made once for all.

Yet we are so ungracious as to wish that this definitive work had been done differently. Professor Smith was on firmer ground in describing the military details of Arnold's march than he is in discussing Congressional policy in general. Here his eye is somewhat too close to the object for broad vision. And thus his defects in point of view make his attempt to fix this episode in general revolutionary history the weakest part of his book.

In literary style the author manifests a desire to free his book from the heaviness that is the bane of many scholarly histories. At the very start we find Canada likened to "a thatched roof," a "magazine of gunpowder," a "wall of ice"; and Cartier ascending the St. Lawrence in "a water-fowl never seen before in that region" (I. 13). At the close we are assured that the hopes and fears of America "do not hover like unshriven ghosts about the rocky pinnacle of Quebec" (II. 571). Thruout both volumes this picturesqueness of expression runs riot. We find "that fledgeling, the first Continental Congress, had nested timidly in Carpenter's Hall" (I. 86); "Pittsfield, reclining like a conscious beauty among its fair hills" (I. 124); "Arnold's luck had placed him in the thicket just where Abraham was looking about for a lamb" (I. 188); "War is the grand opera of nations, . . . and it was now as if the good people of Beaver Meadow . . . should undertake to give 'Parsifal' on a week's notice" (I. 261); Northern gallantry emerges "from the dust and smoke like a Gibraltar in motion" (I. 416); Carleton has a smile "like a prickly pear in the desert" (II. 5); Montgomery has a will like a flexible penetrating "Damas-

cus blade," and "This Damascus blade had an Aeolian cord strung in its groove, and every stroke was a song, a song from Tara's ruined halls, powerful but sad, and yet forever breaking into a sparkle of gayety like the waves on the beaches of Sligo" (I: 370). For every historian there is this problem of illuminating a heavy text. Mr. Smith has been spendthrift and ostentatious with his lights.

We deplore the localism of Mr. Smith's point of view, and certain tendencies of his literary style, but we leave his book with a feeling that a rather important task has been well done. His arrangement of notes is unusual and somewhat difficult, but he has at once given the scholar an opening into all the source-material of his subject, and the reader a picturesque narrative that errs only in being too picturesque.

The New Religion: A Modern Novel. By Maarten Maartens. New York: D. Appleton & Co. $1.50.

The doctors have a bad time of it. If they stick to the bald blunt truth and tell their patients how sick they are and how little they can do for them, they go away and seek consolation and encouragement of the faith-curist and the patent-medicine man. If the doctors, in their desire to keep their patients and to relieve at least their minds, give them doses of bread pills and injections of *aqua pura,* then our sharp-penned Dutch satirist writes them down or shows them up as hypocrites and fakers. This volume contains specimens of all the kinds of practitioners who live off of the ills of others; the well meaning but ignorant country doctor; the specialist who bleeds his patients in a different but no less fatal way than his predecessors; the trained nurse, who knows nothing but the rules of the code; the dietarians, who study the habits of the Moroccan monkeys to learn how human beings should live; and especially the sanatorium managers, each with his peculiar system of medication and rigorous regimen. As one of these successful quacks puts it:

MAARTEN MAARTENS.
Author of "The New Religion."

> The parsons had better look out. They've had their day; it's the doctor's turn. The world has given up caring for its soul; it has got all the more anxious about its body! The old beliefs have gone; your digestion's your conscience to-day. . . . Is it our fault if it crowds to the new shrines, the new confessionals, and babbles of its symptoms, not its sins? We can't make half out of our 'homes' what the priests made out of hell. But the convents of the twentieth century to which the new fanatics come crowding are the Sanitoria. . . . 'Tis the new religion. The old medication with its incidental draft and bolus, is forgotten: hygiene, as a persistent occupation, is the medicine of the future. The coming age is going to live for, and think of, the body."

As a novel this latest work of Joost Marius Willem van der Poorten-Schwartz will not bear comparison with "Dorothea," still less "God's Fool," but it contains interesting characters, witty comments and pathetic scenes, and its satire, unfair and exaggerated, like all satire, nevertheless has point and significance.

Famous Painters of America. By J. Walker McSpadden. New York: Thomas Y. Crowell & Co. $2.50.

This is a book about painters, not about paintings. The author makes no pretensions to art criticism and confines himself to giving a sketch of the lives of eleven artists he has selected, with lively anecdotes, illustrative of their character, collected from their biographers and acquaintances. The names and somewhat forced appellations which he has attached to them are Benjamin West, The Painter of Destiny; John Singleton Copley, The Painter of Early Gentility; Gilbert Stuart, The Painter of Presidents; George Inness, The Painter of Nature's Moods; Elihu Vedder, The Painter of the Mystic; Winslow Homer, The Painter of Seclusion; John La Farge, The Painter of Experiment; James A. McNeill Whistler, The Painter of Protest; John Singer Sargent, The Painter of Portraits; Edwin Austin Abbey, The Painter of the Past; William Merritt Chase, The Painter of Precept. There is a portrait of each man mentioned and two or more specimens of his work included in the present volume. The author has done what he has tried to do, which is more than can be said about every writer.

Richard III: His Life and Character. By Sir Clements Robert Markham. New York: E. P. Dutton & Co. 325 pp. $3.50.

Who has not vowed a thousand curses on King Richard III when Tyrrel, in the fourth act, exclaimed:

> "The tyrannous and bloody deed is done.
> The most arch act of piteous massacre
> That ever yet this land was guilty of."

At last Sir Clements Markham would have us believe that it was not King Richard, but Henry Tudor—Richard's victorious foeman at Bosworth—who did the young princes in the Tower to death, as those tender babes lay "girdling one another within their innocent alabaster arms." The author's argument, which has been known for some time to readers of the *English Historical Review*, is too long and intricate to be traced out here, but Shakespeare students as well as those interested in English history cannot afford to neglect the volume. It is based upon critical research, and makes out a strong case against Henry—who was undoubtedly capable of the cruel deed—tho one would hardly want to hang him on the evidence. At all events, Richard III has never had his due (for he was not without royal virtues), owing to the fact that so much of our information comes from men who wrote under the favor and patronage of his victorious successors. Richard as a revolting monster, deformed and hateful to behold, has now disappeared in creditable modern accounts, and many would like to see the blood of the poor little princes removed from his garments, tho they may not agree with Sir Clements. Evidence is a subtle and elusive thing—unless one has Professor Münsterberg's measuring machine—and the problem of Richard III seems hardly solved; perhaps it must ever remain unsolved to the satisfaction of all.

KING RICHARD III.
From a picture in the National Portrait Gallery.

The Development of Western Civilization. By Jacob Dorsey Forrest. Chicago: The University of Chicago Press. 406 pp. $2.00.

There are some books which defy the most experienced and patient reviewer. Professor Forrest's *Development of Western Civilization* is surely one of them, for if he had not stated its purpose in the preface no one would have ever discovered it. The professor finds himself confronted by certain conditions and institutions in which he is deeply interested, and he turns to the past for the facts that will explain them to himself. That he has made patient research and knows good books when he sees them there can be no doubt, for every page is bristling with facts gathered from the four corners of the field of learning. He starts with the contribution of antiquity to modern society and then takes up what he calls "the problem set for medieval society"—a peculiarly metaphysical proposition for the patience of the hard-minded person. This is followed by extensive accounts of medieval agriculture and commerce, and "the end of the Middle Ages," which, according to our author, do not seem to have ended at all. The volume concludes with a chapter on social movements of today, and here we have the industrial revolution, labor unions, capitalism, the economics of distribution, culminating in inconsequential inanities.

Reforms Suggested by the Panic

REFORMS, both national and local, are forcibly suggested by the financial panic of the last two weeks. As the immediate causes of the disturbance were in New York, the banking reforms needed here may first be considered.

Panic was precipitated when certain speculators and promoters were summarily ousted from the banks and similar institutions of which they had obtained control, and whose resources they were using in their projects. Such men should not be permitted to own banks in New York and to hold offices in them which give authority for the handling of depositors' money. If the men in question had been excluded from the banks and offices which they have now surrendered, this panic would not have taken place. The New York Clearing House Association of banks possesses great power. It should be exercised in guarding carefully the condition of all banks subject to the Association's influence, in scrutinizing changes of ownership, reorganizations and the character of directorates. Thus may great loss, and even disaster, be prevented.

In some way the banking business of the New York trust companies should be separated from their trust business, and the former should be subjected to the restrictions and safeguards required for the banks of the Association. The trust companies should become members of the Association. Banks in the Association must carry a reserve of 25 per cent. against their deposits. This is not too much for the banking business of the trust companies. Their demand deposits are said to exceed $700,000,000. For these there should be a cash reserve of 25 per cent. Under the statute recently enacted, trust company reserves are required to be 15 per cent., but only 5 per cent. must be in cash; half of the remainder may be in deposits with approved banks and the other half in approved securities. This law should be amended. Undoubtedly it will be, as a direct result of the panic.

There is need of national currency legislation, and the need is greatest in New York. It should be possible in time of stress to increase quickly the volume of our banknote circulation, under reasonable safeguards. Such a time is the autumn of almost every year, when currency is drawn from New York to meet the harvest demands of the West and South. This year, to such drains upon resources at the money center have been added the panic runs upon banks. Statutory authority is needed for such emergency additions to the circulation as are made under similar conditions by the Imperial Bank of Germany. The plan recommended by the New York Chamber of Commerce and the American Bankers' Association should be the basis of legislation at the coming session of Congress. If the national banks of New York could have issued, last week, new circulating notes to the extent of 40 per cent. of their bond-secured notes, protected by assets and a cash reserve of 25 per cent., and subject to a tax, the situation would have been greatly relieved. There should be provision for such emergency circulation, automatically coming into existence to be in due time automatically retired.

Is it not possible by reforms, not necessarily enforced by legislation, to restore popular confidence in corporation finance and corporation securities? Following the disclosures of Saturday's New York bank statement, prominent financiers sought to convince the President that he ought at once to call a special session of Congress, altho the regular session will begin only four weeks hence. "The request," said the dispatch of the Associated Press, "comes from, and represents the judgment of, the conservative leaders in the financial world,

who have represented the present situation as one compelling action of a character which will affirmatively eradicate all ground for suspicion of American industrial methods." This eradication could be accomplished, in their judgment, by Federal control of corporations, which the President desires:

"The benefit of having Federal legal machinery to detect and eradicate unwholesome business methods at this time was said to be the desirable end to be accomplished. This would mean, it is pointed out, a practical wiping off of the slate and a starting afresh under business conditions which would have and could bear the closest public scrutiny."

Now, this Federal control of all corporations engaged in interstate business is something that, even if it be needed for the public welfare, cannot easily be obtained. Legislation to this end would be opposed bitterly in the interest of State rights and State power.

Has it ever occurred to these "leaders in the financial world," whoever they may be, that the eradication which they desire might be accomplished by the ousting of certain other financial leaders from high office in corporations and from other places of great financial influence? For example, have they considered what the effect upon public sentiment and confidence would be if a certain very well-known railway financier should be induced to withdraw from his companies and the railway business? Is it not true that the resources of great life insurance companies were used for more or less selfish purposes by very prominent financiers who are still in the front rank of financial leadership, and that the operations of some of them with depositors' and policy-holders' money have not differed greatly from those of the bank officers who were recently required by the Clearing House Association to retire from the banking business? Suppose that the conservative leaders who desire to eradicate all ground for popular suspicion as to American corporate finance should begin by sending to back seats all those corporation officers and corporation capitalists whose exposed offenses have excited public resentment and hostility. Undoubtedly there would straightway be a revival of public confidence.

It may not be feasible to cause by the suggested Federal legislation that change in the public attitude which these gentlemen desire, but reform by the action of the financiers themselves is possible. There has been no time in the last ten years when the united efforts of a dozen powerful men could not have compelled the railroads of the country to obey the rebate laws. The same men today, with the aid of a few more, could, by their action and influence, satisfy the popular demand for square dealing in the management of great corporations, if they should undertake the work with sincerity and earnestness.

Fifty Years of the Atlantic Monthly

THE present writer remembers well the extraordinary impression made by the appearance of *The Atlantic Monthly,* which, in its November number, celebrates the fifty years of its distinguished literary career. It marked an era. We had had previously the *Harper's Magazine,* with its miscellaneous pictures and stories and travels; and we had had *Putnam's,* with its higher ambition and the distinction given to it by George William Curtis; but here was a new, fresh coterie of writers, all of whom discovered the literary art, and nearly all young and less known than the elder Irving and Poe and Cooper and Bryant. The elder generation of writers were passing away and a new generation were here claiming their own.

Longfellow and Lowell and Holmes were young men. Mrs. Stowe had won her sudden fame, but was of the same period. Ralph Waldo Emerson and Edward Everett Hale were in the strength of their youth. So was Mrs. Julia Ward Howe; and Hale and Howe are still with us. Hawthorne had already reached his perihelian. Then there were the ambitious writers, especially girls scarce out of their teens, Rose Terry (Mrs. Cook) and Harriet Prescott (Mrs. Spofford), Gail Hamilton and others of similar fame or promise, who lived nearly all in the country's literary center and were able to meet and converse in the Corner Bookstore. It was a most extraordinary company of authors that followed with

The Atlantic, the greatest our country has yet seen.

The one of them all who gave especial distinction and favor to the new magazine was Oliver Wendell Holmes, and we were surprised to see him break out in so new and splendid a form. We had known him chiefly as the writer of mirthfully extravagant and ridiculous verses, and of others which most skilfully joined the tender with the ludicrous. But who had thought him capable of that most remarkable, successful and popular series of articles which appeared under the title of "The Poet at the Breakfast Table." That was a new creation, and the characters who sat together at the boarding-house table were wonderfully well outlined, as distinct as Shakespeare's creations. To Holmes's contributions we turned first, even before those of Lowell. But the short stories, "In a Cellar" and "The Amber Gods," were scarcely less our delight, and it delighted us to learn that the women had come to the front.

Since then the range of *The Atlantic* has been wider, but its quality no higher. We have had editors from the West, and even the Pacific Ocean has flooded over to the Atlantic Coast. We do not say that Howells and Bret Harte shine dimmer than some of those earlier lights, but there has been since no such famous galaxy of stars as represented those earlier years.

Then *The Atlantic* was the premier monthly of the country. It has kept pure its literary aim, and has not fallen to pictures, but now we are flooded with magazines of every sort, which compete for every mushroom writer that appears. But the general aim is no longer literary. Even the story ceases to be literary, altho we have still Mrs. Phelps Ward and Mrs. Wilkins Freeman. We seek the exciting, or the scientific, or the historical, or the economic. It is less an aim to find one who says a thing well, and more to find one who has something to say, no matter how poorly he says it, or one whose name will deceive men into expecting him to say something, and the higher level of pure literature, the poetical, was never so hard to reach as now. Everybody writes rhymes, limericks, indeed, but few are able to write good poetry. This is a scientific age, the age of achievement in physical success, not in the art of permanent expression. Who is there to take the place of Poe and Bryant and Holmes and Lowell and Longfellow and Emerson? Lanier died young. Stedman has given up poetry for business. Stoddard was of a second rank, and he is gone with Celia Thaxter and Helen Hunt Jackson. It would be hard to find one single poet name that stands out pre-eminent today in our great company of warblers, no hermit thrush among the woods full of chirping sparrows. But the voice will come again, and we shall be glad to give once more the first rank not to mountainous wealth, not to the product of the laboratory, not to science or invention, but to that art supreme over all arts which welds wisdom with fit words, beauty of thought with sweetness of utterance, and so fits together the breath of sounds with the grave and gracious weight of sincere and serious thought. After all it is the great poets who link the centuries in the chain of one human fellowship.

The Recovery of Menander

It is too much to say that the diggings in Egypt have quite recovered for us the lost Menander, of whom Quintilian said that his brilliancy quite obscured the fame of all others who essayed that sort of drama, for "his plays presented the very image of life"—*omnem vitæ imaginem expressit.*" For while we have now thirty-four pages of Menander, where before we had only a few lines, these are disjointed and belong to four different plays. There are, however, some complete scenes and they are sufficient to justify Quintilian's estimate. One of them, which fortunately is an episode, we can give to our readers, following M. Maurice Croiset's paper, read to the French Academy, October 25th.

It is a story such as might have been dramatized of the two women who appealed to Solomon to settle the rightful possession of an infant. In this case an infant has been exposed in a wood and the dispute is as to who shall have the infant and its little objects of jewelry. It has been found by the shepherd Daos, near Athens, by an oak grove frequented by shepherds and charcoal burners. He

took it home, thinking he would adopt it, but when he considered the expense, he decided the next morning to dispose of it. The charcoal burner Syriskos comes along, as rudely dressed in goat-skins as is Daos, and he instantly offers to take the child to replace the infant his wife has just lost. It is given to him, but Daos says nothing of the little ornaments found with it. Syriskos later learned of them and demanded them, but they are refused. Just then Smikrines, a crabbed, miserly old fellow, comes along, who, it turns out later, was the grandfather of the child, and they appeal to him to settle the dispute. The story proceeds:

Syriskos (addressing Daos and pointing to the old man)—See that man—will you have him for judge?

Daos—Yes; by good luck.

Syriskos (going to Smikrines)—In the name of the gods give us a few moments.

Smikrines (rudely)—You? Why?

Syriskos—We have a quarrel over a certain matter.

Smikrines—What business is that of mine?

Syriskos—We need an impartial judge to decide between us. If you are not too busy settle our difference.

Smikrines—You good-for-nothing, do you expect to plead a law case here, dressed in your goat skins?

Syriskos—Well, well; it is a short matter and easy to understand. My father, do us this favor. In the name of the gods do not deny us. You ought to do it; chance brought you here, and you should fill your part.

Daos (aside)—My opponent has spoken not badly. Why did I give him any part of what I had found?

Smikrines (more pleasantly)—At least tell me if you agree to accept my decision.

Syriskos—Yes; fully.

Smikrines—Well, I agree. After all, why not. (To Daos)—You have hardly spoken; speak first.

It will appear that Syriskos, honest fellow, took the child out of love and pity, while Daos is purely mercenary, but pretends he has done a favor in giving the child to Syriskos. The case opens:

Daos (to the judge)—I must go back somewhat before the meeting which raised the dispute, so as to make the case clear to you. In the bushes near here, while caring for my sheep, some thirty days ago, I found on the ground this child left all alone, a little baby, with a collar and some ornaments—

Syriskos (interrupting, rudely)—Yes, that is exactly what we are disputing about.

Daos—Ah! he will not let me speak.

Smikrines (to Syriskos)—If you do not hold your tongue while he is talking I will strike you with my staff.

Daos—Yes, that's right.

Smikrines (to Daos)—Go on.

Daos—Yes. I took up the baby and carried it home. I proposed to bring it up. But during the night, as everybody does, I thought it over and made my calculations. "Why, what business have you to bring up the child and have all the bother of it? Where will I find the money it will cost? What will be the use of all that trouble?" That is what I said. The next morning, when I was herding my sheep, this charcoal-burner here happened to come along to pick up fire-wood where I was. I knew him, and we talked a little while, when he broke out—"Why is it, friend Daos, that you seem troubled?" "Why," said I, "because I don't know what to do," and I told him the story; how I had found the baby, how I had taken it up. Then, immediately, without letting me finish, he turned to me and cried: "A thousand favors for you, Daos" (and he enumerated them), "if you will give me the baby. So you will be free of it. You see," he added, "I have a wife who has just lost a child." The woman he spoke of is the one who is here holding the baby.

Smikrines—Is it true, Syriskos, that you asked for it in that way?

Syriskos—Yes; just so.

Daos (continues)—All that day he did not cease to beseech me. At last, he persuaded me. I promised him the child; I gave it to him. He went away repeating his desires. He took my hands and kissed them.

Smikrines (to Syriskos)—Did you do all he says.

Syriskos—Yes, I did.

Daos—Then he went away with his wife. Afterward he met me and demanded the jewelry which had been exposed with the child; only small, silly things, worth nothing at all, and he pretended that I had done him a wrong because I would not give them to him, and intended to keep them as my own. On the contrary, he ought to recognize, I say, that what he has was my gift in answer to his prayer. And if I don't give him everything that is no reason why he should ask me to give account of the rest. What! if in walking he had made the discovery at the same time as I, if Hermes had favored us equally, he would have had his part without doubt, and I would have had mine. But when I am the only one who made the find, do you pretend that you, who were not there, must have the whole, while I should have nothing? In fact, I have voluntarily given a part of that which belonged to me. If that part suits you, keep it; if that part does not suit you, if you don't want it any more, give it back to me. Indeed, you have a part of the find, thanks to my kindness, but that you should take the rest without my consent—no that cannot be—I have said my say.

It was a telling argument, but a specious one. It overlooked human rights, the rights of the infant; and Greek thought had a strong sense of the rights

of man. Menander will not forget that, and he will let the charcoal burner speak hesitatingly, roughly, but with a rustic eloquence very different from the polished terms of Isocrates.

SMIKRINES (to Syriskos)—Daos has ended (seeing that he remains silent). Don't you understand? He is done.

SYRISKOS—Ah, yes; then it is my turn to speak. Yes, he found the baby all alone. Yes, all he has said is true. Everything happened, just as he says. I do not deny it. I did pray him, did beg him, and just so I did persuade him to give me what I wanted. He has told the truth. Only, one of his men, a shepherd, came and told me that he found with the baby certain ornaments. O my father, consider that the infant is here present pleading his own cause. Yes, Daos, this infant demands of you an accounting. (Turning to his wife): It says, "Woman, give me the necklace and the things which show what was my origin." The child says that those things were put about him not to please you, but to adorn him, and I join my word with his, because I am now his guardian. It was you, Daos, who made me such when you gave him to me, and now it is for you, our judge, to decide whether these golden ornaments and other things, valuable or not, ought, as the mother wished they should be, to be kept for the little one until he is grown up; or whether it is right that this man, after taking them off the child, should keep what does not belong to him because he found it first. But you say, when I took the child, why did I not demand these things, too? Why? It is because then I had not the witness at hand who now speaks for him. And now it is not for myself that I demand these things. Oh, I know what you say, "What is found belongs to the first comer." No, no! Not when it belongs to a human being from whom the taking of it would be a wrong. This here is not a find; it is a theft.

This rude woodsman calls things by the right name. Menander adds the great thought of human rights to his humble story. Syriskos feels that this little outcast has rights which may some time be reclaimed. It was no unfamiliar story in the plays of Euripides or Sophocles that the son of a king was thus exposed, and as he grew up felt the impulse to slay lions or tyrants and to learn his own parentage. So Syriskos proceeds:

And further, father, consider this. Perhaps this child is of better blood than ours. Brought up among humble people he will one day disdain our poor life. Following his nature he will want to do some great thing—to hunt lions, to carry arms, to run in the arena. You have certainly seen the tragedies played, and you know what I mean; how an old goatherd found a certain Neleus, and also Pelias, those famous heroes—a goatherd who wore a jacket of skin, like mine. Seeing that these infants were superior to himself, he told them everything, how he had found them, how he had taken them up. Then he gave them a little bag which contained the things by which they might be recognized. It was thus that they found out the whole secret of their birth, and became kings, after they had been goatherds. Supposing that Daos had taken those things and sold them to get a dozen drachmas, they would have always remained ignorant, those heroes, that were sons of a noble race. It is not then right, my father, that I should bring up this little child, and that Daos should take and lose the hope of the child's future. One who was about to marry his sister was stopped in time because certain objects he had were recognized; another delivered his mother, whom he happened to meet; another saved his brother. The life of all men, you see, is exposed to dangers. We must guard against them by foresight, my father, by taking care a long while beforehand.

But he says, "Give back what you had if you are not satisfied," and he thinks that argument ends it. No, there is no justice in that. Because you will not give up a part which belongs to the child, you want to take back the child, too. You think that then you can steal with less risk if you can hold that which belongs to him. I have said my say. Do you, judge, now decide what is right.

SMIKRINES—The decision is easy enough. All that was exposed with the infant belongs to him. That is my decision.

DAOS—Very well; but the child, to whom does it belong?

SMIKRINES—To whom? By Jove, it is not to you that I give it; to you who wanted a little while ago to steal what belonged to it. No, it belongs to him who protected its interests, and who has fought you when you wished to do it wrong.

It is a pretty story and we may be sure that an Athenian audience applauded the decision. It is a great gain to have learned this much and something more of the real merits of the comedian whom Greek and Latin critics put at the head of his class. Such discoveries pay for the expense of exploration.

Another Basket of Apples

THE rural editor had been skirmishing. He found the Grand Duke plum trees still full of purple fruit, altho the leaves had crisped to the frost. The flavor was fine, yet it is a pity to carry appetite to spoil such a beautiful sight. This is the hard part of it at this time of the year. Last night Nature left the knob turned so that the northwest wind

had the full mastery of our beautiful valleys; and this morning every leaf is loosened, and the great exposition of a year's work has closed up. The gay maples (and they love gayety) have lost heart. The big magnolia leaves had waited in their glossy brown for a hint to let go; they have now heaped themselves over the sod in a cushion of artistic beauty—brown, brown, and everywhere brown. The purple ash leaves have been littering the highways this last ten days, and most of them are already ground under horse hoof and wagon tire into incipient humus.

How wonderful it is, this morning, to look up thru the bared limbs at the birds' nests, now exposed. Little did we know how many neighbors we had, and friends and allies as well. Sensible fellows! Their houses were for use, not for permanent residence. Every one of them has gone southward, except a few who love to pick the scattered seeds that have been overlooked by the flock. Will you and I ever learn common sense—we mean bird sense — in the way of home building? Will we ever learn that it is not so much the house as it is the out of doors that makes the real home? "What a bother you are to yourself," says the Japanese; "for truly your house is not for comfort, but for hard work, and all the time!"

But at this rate we shall never reach the orchard. But reach it we do, and here we sit down on the stump of the dear old friend of our boyhood and give ourselves up to the eyes and the heart. A robin twitters a disturbed note or two and looks us boldly in the face—to know if we, too, have been belated on our passage, or if we belong to some flock of passage. These Northern flocks are still going southward, and one of them spent yesterday on our mountain-ash trees. This fellow had probably overslept when they started on their last night's flight. He will probably join in the next flock, or maybe will hide in our evergreens all winter. Mem.: look you for a belated robin, when the cold weather comes on, and see that he does not go hungry.

The apples are more than half picked, and the full barrels stand in their scarlet beauty uncovered beside the piles of cider apples. Who wonders that the boys are whistling or singing up in the trees? Yet "It goes hard," Tom says, "to set the pickers at the McIntosh and the Walter Pease and the Spitzenburgs, to rob the trees of their glorious beauty." Each tree has done its best, and nowhere in the world is there such individuality as in an apple orchard. Every kind has its own color, even its own number of stripes. The apple artist knows his kinds as readily as he knows the names of his children. Here are eighty sorts, but every one has its own features as well as its own juices. To test them all is like making music; it creates a gamut of sweet flavors. If you were all here we would sit down to a challenge to decide which of all among the apples is noblest. In Michigan they used to say that the big yellow Bellflower was fairest and finest, but that is not even a second-rate apple here; and the King, which is so heavy and full of rich juices that the trees of western New York can scarcely hold them, cannot lead here; nor even the Albemarle Pippin of the Hudson Valley. Each locality has its own prince. In response to an editorial on "A Basket of Apples" there came to us, from what used to be, on our maps, the Great American Desert, a basket of Jonathans, thrice painted in crimson, but even more gloriously golden at heart; but on these Eastern hillsides this superb apple is not half-size. Here are five which we lay at your feet, and you may name the best: McIntosh Red, Spitzenburg, Fameuse, Golden Pippin and Walter Pease.

Apple enthusiasm is something by itself. You should read the letters that come from over the whole apple belt. You would suppose that each writer was praising his own children, yet it is only his favorite apple that is calling out all his art of expression. Fortunately our tastes not only differ, but they change from time to time. What we like best one year we do not necessarily care for the next. This you must count on if you have regular customers for your orchard products. It is not a whimsy, but a real growth, that makes us call this year for a black Gillifleur and refuse a Rhode Island Greening. There is much also in the year, for truly the Seek-no-further is not always such an apple that it should

forbid us looking beyond itself. This year it is an ideal. It recalls the days when, with little Lucy, we filled our pockets as we started for the little red school-house on the corner—where the mint grew and the brook gurgled.

Yet one cannot identify himself quite as closely with his apples as with his pears—at least he cannot become quite so touchy over the criticism of his elegant Howells and his exquisite Bergamottes. The editor knows a friend whose admiration for the Seckel amounts to a passion. For our part we prefer a Sheldon—for which he quite holds us in contempt. There is a big quarrel raging in the Middle West, over the rival fruit of the Ozark Mountains and the Hood River—Missouri against Oregon. Both are so near perfection that the contention is unnecessary. It is not worth our while to live in an impossible apple section—nor in a poor one for that matter, unless it be to improve it. Fine fruit is the pride of fine minds. Every brainy farmer should determine to have the most perfect of trees and then the most beautiful apples in his county. The contention brings out the stronger qualities of a man's nature. It tests him, and sets him to his mettle.

The rural editor got some of his best primary lessons in and under the apple trees. He has not forgotten almost the only blow that he ever received from a kindly father, for engaging in an apple-throwing contest. "Apples are one of God's best gifts; not to be lightly tossed about, nor to be used like stones, my lad! Live to improve, and not to waste!" Even yet, as we look down thru these avenues of trees, over the wide valley, it is the goodness of God that crowds the sunshine, and makes the world so charming a home. Then there was but one white man's orchard in the heart of New York State, altho the Indians still tarried by the ashes of the great orchards burned by General Sullivan during the Revolution. Now all the hillsides are dotted with Northern Spys and the wagon loads go rolling down the valley, marketward into the city.

The misunderstood Indian has forever gone from his beloved valleys, and we are working out, very slowly, the American home. We have found it a problem hardly to be solved without an orchard—and best of all an orchard of apples. Together the human folk and the Rosaceæ move forward in the way to a perfect evolution. We lift our hats reverently, on this golden day, to the fruit that alone makes it possible for us to be artists in land culture, and lords with Nature. Nor must we forget the ethics of the orchard, which multiplies smiles and innocent joy, while rendering us wealth and health.

The Immortality of the Soul

Sir Oliver Lodge is trying to teach the teachers religion. His late "Catechism" attracted no little attention, adapted as it was to the teachings of physical science. He has now given a lecture which we presume will appear in *The Hibbert Journal*, in which he makes declarations on the immortality of the soul. He is thus quoted:

"Nobody knows what the controlling entity called life, soul and by other names is, but common sense rebels against it being nothing. No genuine science has presumed to declare it a purely imaginary nonentity.

"No really existing thing perishes. It only changes its form. Science shows this clearly enough concerning matter and energy, and it must so also regard mind, consciousness, will, memory, love, adoration and all the other manifold activities which strangely interact with matter and appeal to the bodily senses. They are not nothing and will never vanish into nothingness.

"They do not arise with us. They never spring suddenly into being from previous nonexistence. They are as eternal as the Godhead itself, and will in eternal being endure forever."

That conclusion is very satisfactory and comforting if somewhat apodictic. We wonder if this is all that science has to say.

The New Football

The Princeton-Carlisle game in this city last Saturday is another demonstration that football is still very much alive despite the acts of President Butler and the words of President Eliot. When twenty thousand people pay a good-sized fortune to see twenty-two lusty youths chase an inflated pigskin about a field and then cheerfully sit in a drenching rain for two hours rather than miss a single point, it can be said that there is a fascination in the game that far outweighs the

fear of pneumonia, bronchitis or grip. We are glad to bear witness that football as now played under the new rules is far more interesting to the spectator than formerly. The old close formations, monotonous mass plays and frequent injuries are a thing of the past. The ball is now visible most of the time, the opportunity for brilliant individual play is increased, luck plays a much more important role and, at last, agility counts for more than beef. Saturday's game afforded an interesting study in race psychology, if there be any such thing. Individually the Indians seemed more sturdy and agile and daring than the Princeton team, and yet at the psychological moments they did not rise to the occasion. It has always been said that the Indians do not play a good losing game, and, if this is so, it seems to indicate that the Anglo-Saxon blood of Princeton does in the long run tell. Football has its chief hold upon the populace, we think, because of its similarity to war. It is the only game where it is permitted for a strong combination of players to single out the weakest man on the opposing rush line and then seek to put him *hors de combat*. Moreover, with the exception of prize-fighting, it is the only sport where personal encounter is allowed, and personal encounter, it will be remembered, was declared by a Yale professor some time ago to be a necessity in some form or other for the development of all healthy young men. If it is true, as Ruskin has said, that war is the greatest of games because the stake is death, it follows that football is the next greatest. THE INDEPENDENT, as our readers know, has no special admiration for football as a phase of higher education, but as a game it surely stirs the blood.

Father Tyrrell

After all Father Tyrrell challenges excommunication. It is not usual for a Jesuit—now an ex-Jesuit—to be a disciple of Modernism. That school does not encourage anything but intellectual submission to authority. First, he tried in a long private letter, which got into print, to explain to a scholar of science how he could hold to the conclusions of his science and yet remain in the Catholic Church. But the kick of the gun wounded the gunner. He was suspended from the Jesuit order and commanded by superior ecclesiastical authority to submit all his correspondence to censors, as a condition of his being allowed to celebrate mass again, and thus earn his living as a priest. After some months came the report that he had submitted, but the fact was that he had only agreed to submit to the usual discipline, which requires a good Catholic, when about to publish any doctrinal matter, to get an imprimatur; but a censorship of his private letters he would not submit to. Meanwhile he had made literary engagements, one of which was the two letters to the London *Times*, which have now appeared. They are frank enough, but he declares that he does not and will not leave the Catholic Church, for he believes, if the Pope does not, that there is room for a liberal wing in the Church; and he declares that already it includes cardinals, archbishops and bishops. The letters are stiff reading, but they are plain in their conclusion that there is no truce between the scholasticism of the thirteenth century, to which Pius X sends the Church back, and the science of the present day. He brings out the fact that the Encyclical does not come under the conditions of infallibility, but is simply the judgment of one man and his *entourage*. He much resents the condemnation of that evidence for theism found in immanence and in the teachings of the multitude of mystics who have been among the most honored saints of the Church. We presume these two letters will be published in a booklet, but the Encyclical forbids any seminary to allow it to be read by teacher or pupil. The bishops must see that this is enforced, and must report to Rome as to their faithfulness in making inquisition.

Secretary Taft's Diagnosis

Secretary Taft sees clearly just what is the chief difficulty we have in securing the good will of the Filipinos for the American people and Government. It is, as we have often said, the arrogance of our assumed Anglo-Saxon superiority in our relations with them. Mr. Taft has over and over again by his own ex-

ample rebuked this snobbish offishness, and has taken opportunity to associate on equal and familiar terms with the people at public functions. In an address to an American club in Manila he is reported as emphasizing this danger and this duty. He urged the Americans not to hold aloof from the Filipinos, to take no action hostile to them, not to show racial feeling, and to avoid the Anglo-Saxon attitude of "better than thou." We commend this utterance, at a place where it was sadly needed and none too welcome, to those of another race in this country who believe, because of Secretary Taft's relation to the Brownsville affair, that he is unjust to them.

Bishop Ingram at Home

After the rest of the voyage following a very strenuous visit to the United States, in which the Bishop of London preached many times and attended the Episcopal Convention in Richmond, Va., he has returned to England, and in his first sermon at Paddington gave an account of his impressions gained from his visit to the United States. While here on so short a visit he was entirely devoted to Church matters, and naturally spoke chiefly of them. He was struck by the much more kindly sentiment between Episcopalians and other Protestant Churches than exists between Anglicans and Dissenters in England. He says he observed far greater generosity, love and trust between bodies of Christians and between schools of thought in the same Church here than there is in England. It was like another atmosphere, he says, to pass from the wrangles of Great Britain into an atmosphere where they are unknown. He found that the bitterness which disgraces the Church at home is unknown in the United States, altho there are conscientious differences there. It was quite a shock, amid the love and harmony there, to take up English newspapers and read the reports of the British Church Congress, to find the eternal wrangling which is going on today and which has been going on for fifty years. He says:

"If we want to keep and uphold the love and affection of our spiritual children let us pray for union and peace in our disturbed Church to-day. We only need more discipline of temper to have the same harmony in the old country to-day. It was a great lesson to be present at the general convention of the churches of the United States and to see the Chamber of Deputies elected.

He found it highly instructive to see the millionaire from Wall Street sitting side by side with the workingman representing New York. It was true democracy. There was a feeling of freedom, a sense that every individual member of the Church had to work for the Church. He added:

"There are no parlor cars in that Church. It is a living organism which has to be worked, and a splendidly inspiring feeling it gives to come in contact with it, and the English Church has got to get back that feeling. It is not a question of establishment or disestablishment. We have to realize that everybody has a voice in it and that there are no sleeping partners; and then what services we had out there! Talk of lively services! Talk of a mechanical ritual! Why, I have heard the rafters shake with praise, and there was no sneaking home afterward, dispirited and discouraged."

The creation of a parcels post ought to be one of the principal items of business before Congress at its approaching session. We are in this behind all civilized countries and ought to be ashamed of ourselves. The opposition comes from express companies and certain retail dealers, who fear competition with the mail - order houses and department stores. An example of our backwardness is given in the Consular Reports from India. Consul Denison, at Bombay, says that "the United States is the only large commercial nation that has no parcels post convention with India." The result is that to send small packages to India, such as samples of goods, the American manufacturer has to send them by express to England and there mail them to India. The failure of Congress is really a restraint of trade.

Under our prison system the punishment imposed by the court often falls far more heavily on the family than on the prisoner. The latter is sure of shelter, food and clothing; the wife and children, deprived of the bread-winner, often lack the necessities of life. The Prison Association of New York is trying to alleviate this suffering by extending the probation

system. Under this system the offender is not taken away from his work or his family, but is held under proper surveillance. If a fine is imposed he can pay it in instalments and not be sent to prison because he has no money, as happens in thousands of cases. In a single year probationers placed in the custody of the Association, in addition to supporting themselves and their families, have paid $4,800 as restitution to the victims of their crimes.

Savannah, Ga., has done its little best to stir up afresh an international difference by excluding a young Japanese from its evening schools. As soon as Superintendent of Schools Ashmore learned that this lad had been admitted he told the Board of Education that it would never do, because to admit him was a breaking of the racial line, to which the South would never consent. So he was excluded, and they luckily remembered that he was over age. One would have thought they would have been glad to teach the poor fellow a bit of English, remembering that yellow is not black any more than red is; and does not the best chivalry boast its descent from Pocahontas?

It is rather an inconsequent position taken by the London *Times* in seeing in the disastrous break in financial confidence the result of President Roosevelt's speeches. Hereabouts it is clear that it was nothing but the revelation of unbusinesslike conduct of the banks they controlled by dishonest financiers which brought the crash. It had nothing to do with any action of the President as to railroads or trusts. It was wholly the Heinzes and those of their sort who had to be driven out of their banks, not by the President, but by the Clearing House, that made the financial disaster, one that will leave conditions much better.

From June to September this year there were 41 persons killed and 313 injured in the State of Massachusetts owing to automobile accidents. Accidents result from speeding and incompetent handling of the machine. Those who propose to drive an automobile should be compelled to pass a strict State examination before they get a license, and then the license should be revoked for overspeeding. In addition, the machine should be seized for a few days or the owner put in jail if overspeeding or carelessness in the handling of the car can be proved. Small fines as a cure for automobile evils are a universal failure.

Harvard is not likely to be caught napping, or to be guilty of an indiscretion, but certainly it was a blunder that she sent to Berlin a British subject from her faculty, in the person of Professor Schofield, to represent America in the international exchange of good feeling between the two countries. Possibly President Eliot did not know he is a Canadian.

We are sorry to see so sedate and conservative a journal as the New York *Times* adopting the English craze and establishing a limerick contest, in which the readers send in, for a prize, "missing lines" to fill out the imperfect verse. There is some skill in it, but it is mainly a game of chance, as a multitude of lines equally good are likely to be presented.

We need not raise the question any more whether those are real double canal markings which have been seen on the surface of Mars, or only a visual deception; for Professor Todd, of Amherst College, brings back from Peru the photographs which now for the first time show these double markings. Now, will the wise men tell us what they mean?

A recent bookseller's catalog is divided into three departments headed "Famous Books," "Readable Books" and "Gift Books." No titles are duplicated.

Whenever we see a lady on the street we cannot help a shiver at the thought of the ostriches this winter.

Duty is what makes you feel bad when you don't do it.

Insurance

The Control of the Provident Life

In our issue of October 17th we called attention in these columns to the sale of a controlling interest in The Provident Savings Life Assurance Society to parties already in control of the Pennsylvania Mutual Life, of Philadelphia. It now appears that the buyers parted with $100,000 in cash and $1,000,000 in notes, but because of the recent disturbances in financial circles the sellers—F. Augustus Heinze, O. H. and E. R. Thomas and their associates, whose speculative operations were a considerable factor in the recent financial crisis—were unable to arrange for the delivery of the stock to the purchasers, because of the hypothecation of it to secure loans, and of the further impossibility of substituting other acceptable collateral. The syndicate members have accordingly agreed to consider the transaction as null and void, and the control of the company accordingly reverts back to its former owners.

This agreement was reached thru the agency of Timothy L. Woodruff, sometime president of the Provident Life, and prolonged litigation was, thru his diplomacy, happily avoided. It is now proposed to thoroly reorganize the company and to elect some practical insurance man as president.

The Conviction of Dr. Gillette

Dr. Walter R. Gillette, the ex-vice-president of the Mutual Life Insurance Company, was last week convicted of perjury and was sentenced by Justice Dowling, sitting in the Criminal Branch of the Supreme Court, to six months in the penitentiary. Dr. Gillette is sixty-seven years of age. During the insurance investigation he first denied but subsequently admitted the existence of a "yellow dog" fund. The charge of perjury arose because of a statement made under oath by Dr. Gillette before the Grand Jury when he swore that an account in the Dobbs Ferry Bank which stood in his name, as trustee, consisted of his own money. It was found that the money really came from the funds of the Mutual Life Insurance Company. Dr. Gillette has since been released on bail fixed at $15,000.

Nominations for Mutual Trustees

At a meeting of the trustees of the Mutual Life Insurance Company held last week steps were taken to invite members of the International Policy-holders' Committee, which was active in contesting the election of a year ago, to participate in the management of the Mutual. Colonel A. M. Shook, Stewart Shillito, Emile O. Philippi, James H. Wilson, Herman Ridder and Charles Emory Smith, all of whom were either members of the International Committee, of which Samuel Untermyer is counsel, or were candidates on the United Committee's ticket, were placed in nomination on the administration ticket for the next election, to be held in June, 1908.

Mr. Shillito is nominated as the successor of Charles Lanier, who will retire at his own request. Other changes contemplated are made evident by the nomination of Frederick H. Eaton and Alfred E. Marling to succeed Frederick Cromwell and James N. Jarvie. J. Rogers Maxwell is slated for the place made vacant by the recent death of Charles R. Henderson, who was killed by falling from the window of his residence a week ago Sunday.

George F. Baker, A. D. Juilliard and Julien T. Davies are the only members of the McCurdy administration on the ticket.

In addition to the gentlemen mentioned, the following are on the administration ticket:

Dumont Clarke, Cyrus H. K. Curtis, H. Rieman Duval, William H. Lambert, George P. Miller, Theodore Morford, Thomas M. Mulry, Leroy Springs, Henry W. Taft, Cornelius Vanderbilt, Robert M. Woodward, William F. Harrity, William B. Dean and Emory W. Clark.

Financial

Trade With Germany

On July 1st the temporary agreement with Germany concerning tariff rates went into effect. Opponents of that agreement, notably the Protective Tariff League, have asserted that the concessions made by the United States with respect to the valuation of dutiable goods would sanction undervaluation and largely increase imports of certain competitive merchandise. It is partly on account of this assertion that the Government has published the following statement, showing imports and exports for the quarter in question since 1902:

July, August, and September.	Imports from Germany.	Exports to Germany.
1903	$30,996,789	$33,016,659
1904	32,322,827	35,174,125
1905	34,207,897	49,508,211
1906	38,278,453	46,028,390
1907	43,844,495	50,307,064

It is evident that trade both ways has been stimulated and enlarged by the agreement. Comparison with last year shows increases of $5,500,000 in imports and $4,250,000 in exports. Figures indicating changes, if any, in valuations are not yet available. About $3,500,000 of the increase of imports is assigned to paper, toys, silk manufactures, cotton knit goods, wool dress goods, earthenware and gloves, the values of the additions being in this order. A comprehensive treaty of reciprocity with Germany will be submitted to Congress at the coming session.

Steel Corporation's Report

It appears that the earnings of the United States Steel Corporation for the quarter ending with September were $43,804,285, a sum exceeded only once in the company's history. Below are shown the earnings for the first three quarters in each year since 1904:

	EARNINGS.		
Quarters.	1907.	1906.	1905.
First	$39,122,492	$36,634,490	$23,025,896
Second	45,503,705	40,125,033	30,305,116
Third	43,804,285	38,114,624	31,246,582

As had been expected, there was a decline in the volume of unfilled orders on hand, from 7,603,878 tons on June 30th, to 6,425,008 at the end of September. This appears to have been due not to less need on the part of customers, but to the monetary stringency. In the course of his remarks to the Board, at the meeting on the 29th, ult., Chairman Gary said:

"As to the future: If the results are measured by the necessities and the pecuniary ability of the people of this country generally, there should be no doubt of continued prosperity. There has existed during the last week a delirium of excitement. The feeling in a large measure has been without cause, and there is already a change for the better. If all of us do everything in our power to maintain a high standard for the conduct of affairs in our charge, we can be of great benefit in restoring the confidence necessary to success."

The company has $76,000,000 cash in banks, and its cash resources are greater than at any time in the past.

....Marshall S. Driggs, president of the Williamsburgh Fire Insurance Company, has been elected president of the Williamsburgh Trust Company, of Brooklyn.

....According to the *Financial Chronicle's* reports, railroad gross earnings continue to improve, the increase having been 13 per cent. for August, and nearly 14 per cent. for the eight months.

....It is interesting to know that one large national bank in this city during the recent panic loaned $35,000,000 at 6 per cent. and did not call a loan, and last week ordered from Europe $8,000,000 in gold.

....The Minnesota State Board of Equalization has decided upon $186,752,406 as the taxable valuation of the iron mines and undeveloped iron ore deposits in the State, against $69,851,845 last year, and less than $30,000,000 in 1903.

....The Boston Stock Exchange, on the 1st, inst., at a special meeting after the close of business for the day, adopted resolutions in which the president and members expressed "their great and deep admiration for the timely, disinterested, courageous and wise action of J. Pierpont Morgan and his associates during the recent crisis."

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Elections in the States

At the elections which took place last week, the issues were mainly of a local character. Considered with respect to their bearing upon national politics, they indicate no reaction against the President and his policies, nor any loss for the Republican party. In Kentucky, Augustus E. Wilson, Republican candidate for Governor, and his associates on the ticket were elected by about 14,000 majority, and the Republicans elected a Mayor in Louisville by 4,500. It is expected, however, that the Democrats in the Legislature will be able to elect Governor Beckham to the Senate. Henry Watterson, whose paper was silent during the campaign, says the cause of Democratic defeat was the one-man power established by Governor Beckham. He adds the following characteristic remarks concerning the prohibition issue:

"At the last moment the day might have been saved if the Democratic ticket had said, as indeed to all intents and purposes the Republican ticket did say: Prohibition does not prohibit. Nowhere has it resulted in anything but evasion and hypocrisy, adulteration and outlawry, smuggling and extortion. What shall it profit us if we confiscate one hundred millions of yielding property and a hundred years of productive trademarks, hundreds of millions of contiguous values, transferring two or three millions of taxes from the manufacture and distribution of distilled and malt liquors to the shoulders of the already overburdened farmer merely in order to make Kentucky as dry as Maine, which is not dry at all."

In Massachusetts, where the Democratic party had been divided by the disorderly convention at Springfield, Governor Curtis Guild, Republican, was re-elected by the large plurality of 105,000, Henry M. Whitney (candidate of the regular Democracy and an advocate of tariff revision) receiving 84,000 votes; Hisgen (Independent League), 75,000, and Bartlett (Democrat, opposing the railroad merger), 11,700. Mr. Hisgen is well known as an oil merchant who has fought against the Standard Oil Company. In Boston, District-Attorney Moran, whose administration of his office has been somewhat sensational, was re-elected by 27,000 plurality as a representative of the Independent League. Pennsylvania Republicans gave a majority of $175,000 to John O. Sheatz, for State Treasurer. He will succeed Mr. Berry (Fusion), who exposed the capitol frauds. A large majority of the independent Republicans of the recent Lincoln party voted for Sheatz. In Delaware, prohibition was the issue in an exciting campaign. Wilmington and Newcastle County, in the north, voted for license; Kent and Sussex Counties for prohibition. Austin L. Crothers, Democrat, was elected Governor in Maryland by 7,000, with a Democratic majority in the Legislature which will elect ex-Governor John W. Smith to the Senate for a full term, and Senator Whyte for the remainder of the late Senator Gorman's term. More than 30,000 votes are said to have been thrown out, owing to a bad ballot law. Rhode Island re-elected Governor Higgins, Democrat, by 2,400 plurality. The Legislature is Republican. In Nebraska, where the customary fusion arrangements against the Republicans had been made under the supervision of Mr. Bryan, the Republicans were successful, electing their candidates for the Supreme

Court and Railroad Commission by about 20,000. It was thought at first that the Democrats had carried New Jersey, and this was pointed out to Mr. Roosevelt by some of his newspaper opponents as a warning; but it soon became known that J. Franklin Fort, Republican, had been elected Governor by about 7,000. In the State of New York there was little change. In the new Assembly there will be ninety-five Republicans and fifty-five Democrats. On the 7th, President Roosevelt issued the following statement:

"The President regards the results of the elections as extremely gratifying. He has sent a letter of hearty congratulation to Mr. Heney on the result in San Francisco. The victory in New Jersey was precisely what happened nine years ago in the middle of President McKinley's Administration. He had carried New Jersey by 88,000, and two years afterward the Republican candidate for Governor had 5,500, the vote being cut down just as happened in the case of Judge Fort.

"As compared with the elections next preceding the last Presidential election we have done decidedly better than we did in 1903. Then, as on Tuesday, Rhode Island and Maryland went against us; but this year we have won a sweeping victory in Kentucky, for the first time since McKinley's first election, and the victory in Massachusetts was also remarkable. The showing in Pennsylvania and Nebraska is equally good. The showing in New York State, as a whole, was excellent—far better than was the case prior to the last Presidential election.

"That the result in Manhattan was due to purely local causes is shown by comparing it with the decisive triumphs in Brooklyn, Buffalo, Albany and in the State generally. The President's own home county of Nassau made a better showing than it ever has in an off year. As a whole, the showing has been an improvement over what it was four years ago and eight years ago."

Considerable gains for prohibition were made in several States. In Illinois the number of prohibition counties was increased from ten to fifteen.

Results in the Cities

In San Francisco the foes of municipal corruption won a grand victory, electing Taylor Mayor by a plurality of about 10,000 (with an absolute majority of 1,000), and re-electing District Attorney Langdon by a majority of 10,000 and a plurality of 14,000. Taylor, now Mayor (having been chosen for the place by the supervisors, to succeed Schmitz), was opposed by McCarthy, nominee of the Union Labor party, and Ryan, candidate of the regular Republican organization. McCarthy was notoriously the choice of ex-Mayor Schmitz. Many Republicans and labor union men voted for Taylor.——A very active campaign in Cleveland, O., had attracted attention thruout the country. Congressman Theodore E. Burton had been nominated for Mayor by the Republicans, with the approval of President Roosevelt, Secretary Taft and Secretary Garfield, against Mayor Tom L. Johnson, who for three terms has contended against the local street railway company in the interest of three-cent fares. Mayor Johnson was re-elected by a majority of 9,313, winning an increased majority in the Council, where twenty-five of the thirty-two members will be in accord with him. For some weeks before the election, the street railway company sold seven tickets for 25 cents, but it is now selling eleven for 50 cents. Several of the company's franchises are soon to expire. If it refuses to sell tickets at 3 cents, a considerable part of its mileage may be taken by the company which the Mayor has promoted. Practically the sole issue in the election was Mayor Johnson's street railway policy. Upon similar issues, Mayor Brand Whitlock was re-elected in Toledo.——Colonel Markbreit, a journalist, was elected Mayor of Cincinnati by the Republicans, who gave him 20,000 plurality. He frankly promises a political administration, saying that "the lid will not be nailed down," altho the city will not be "wide open." On the whole, the municipal results in Ohio are not favorable to Secretary Taft. George B. Cox, the Republican leader in Cincinnati, remarks that Mr. Burton has been eliminated as a possible successor of Mr. Foraker in the Senate.——In Salt Lake City, the American, or anti-Mormon, party elected John S. Bransford Mayor by 10,000, the opposition being about equally divided between the Democratic and the Republican tickets. By a majority of 34, Sioux Falls, S. Dak., refused to adopt the Galveston, or commission, plan for its municipal government. In Bridgeport, Conn., Dennis Mulvihill, known as "the stoker Mayor," was defeated.——In Philadelphia, the Republican organization showed its old-time majorities, which were voted in favor of a loan of $10,000,-

000, three-quarters of which will be expended in public improvements. Opponents of the Reyburn government assert that the contractors have regained control.——In the city of New York Tammany was victorious in Manhattan Borough, electing its judges and other candidates, with Foley to be sheriff of the county. Foley owns several saloons and had been denounced by the clergy in their pulpits. The fusion of Republicans with Mr. Hearst's Independence League was a failure. It had been disapproved by many Republicans. The Democrats will have two-thirds of the new Board of Aldermen.

The Financial Disturbance

At the beginning of last week the most prominent subjects of discussion among financiers in New York were the unfavorable bank statement of the preceding Saturday and the conferences at Mr. Morgan's residence concerning the affairs of the Lincoln Trust Company and the Trust Company of America. The first of these conferences, attended by leading bankers and capitalists, was held on Sunday night and was not adjourned until 5 a. m. on Monday. Another followed, and it soon became known that the two institutions were to be supported, upon certain conditions. Experts had examined their affairs and had found that the America could pay all depositors and still have a surplus of $4,000,000, and that the Lincoln, after such payment, would have a small surplus. Complaint had been made that they were paying depositors very slowly. But the America's deposits had been reduced from $57,000,000 to $15,000,000. Authoritative announcement was made on Wednesday that a majority of the stock of each had been placed in the hands of a committee of the largest trust companies and that the two institutions would be supported. It appears that the Lincoln's directors had been required to furnish $2,500,000 from their private fortunes and to give the committee their resignations. The conditions imposed in the case of the other institution have not been disclosed. Thereafter, payments to the depositors of the two companies were made rapidly and the runs ceased. On Wednesday, President Thorne, of the America, published a long statement in defense of his company, pointing out that during the run it had paid out $34,000,000. Involved with these proceedings was a transfer of the ownership of the Tennessee Coal, Iron and Railroad Company, in which the Trust Company of America and other institutions were interested by reason of loans upon the stock. This was one subject of the Morgan conferences. As a result of the negotiations the property past to the United States Steel Corporation. We refer to this elsewhere. This transfer caused a feeling of relief in banking circles. Further relief was given by the arrival on Tuesday of $7,100,000 in gold on board the "Kronprinzessin Cecilie." Owing partly to the American demand for gold, the Bank of England had increased, on Monday, its discount rate to 6 per cent. Gold engagements then amounted to $30,000,000. On the 7th the Bank of England made a further crease to 7 per cent., fixing this rate for the first time since the panic of 1873. This change was at once followed by advances at Berlin (to $7\frac{1}{2}$), Paris, Brussels, Calcutta and Bombay. The movement of gold was not checked, however, and at the end of the week the engagements had reached $51,000,000. On Friday the "Lusitania" brought $12,361,000, packed in 334 wooden boxes. From Mexico came $2,000,000, sent to that country some time ago as a guarantee of the new gold standard, and now returned in the original packages. Saturday's New York bank statement showed an enlarged deficit ($51,924,000) in reserve, but improvement during the present week was expected. The movement of wheat has been checked, and the price has fallen 17 cents in two weeks. It is said that the Government will prosecute persons who were connected with certain banks, for making false reports or for loaning money in violation of law. At times during the week currency commanded a premium of $3\frac{1}{2}$ per cent. The only large industrial suspension was that of the Arnold Print Works, at North Adams, Mass., which is said to have $15,000,000 of assets to meet $9,500,000 of liabilities.

The Steel Corporation's Acquisition

Immediately after the conference at Mr. Morgan's house on the night of the 3d, E. H. Gary (chairman of the Steel Corporation) and Henry C. Frick went to Washington and had an interview with President Roosevelt and Secretary Root. It is commonly believed that they inquired whether the acquisition of the Tennessee Coal, Iron & Railroad Company by the Steel Corporation would excite the Government's opposition. They returned promptly to New York, and the purchase was speedily made. It had been reported that the loans of New York banking institutions on the stock amounted to $10,000,000. About two years ago, control of the company was bought by the Gates-Schley syndicate, who dislodged the old officers and directors. These had been associated with the Hanover Bank interests. The capital stock, then $23,000,000, was increased, and the amount now outstanding is about $33,000,000. Among those representatives of the new control who went into the board were John W. Gates, Grant B. Schley, Anthony N. Brady and Oakleigh Thorne, president of the Trust Company of America. Mr. Brady's dealings with the New York street railway capitalists were recently the subject of investigation. The United States Steel Corporation now buys by exchanging for the stock, dollar for dollar, par value, the second mortgage 5 per cent. bonds of the Corporation, which were in the treasury, and were quoted at about 84. At last accounts, it had taken $27,000,000 of the stock on these terms. It is reported that the Corporation unsuccessfully offered a very much higher price for the syndicate's holdings last year. Sales of the stock were made at 135 on the 4th and at 101 on the 7th. Mr. Gary says that the acquisition raises the Corporation's proportion of the steel output by 2½ per cent. to about 60 per cent. The property includes sixteen blast furnaces and a great open hearth rail plant, at Birmingham and Ensley, Ala., 105 miles of railroad and 450,000 acres of land containing iron ore, limestone and coal. It has been estimated that the ore supply is 700,000,000 tons, and that there are more than 1,500,000,000 tons in the coal deposits.

The Killing of Officer Walker

Joseph A. Walker, for many years a well-known and successful officer of the Secret Service, was shot and killed on the 3d inst., near the entrance of the Hesperus coal mine, a few miles west of Durango, Col., by Joseph Vanderweide, an employee of the mining company, who asserts that he acted in self-defense. This is also the assertion of William R. Mason, superintendent of the company, who was with him at the time. Officers of the Government, however, express the opinion that Walker, a very important witness in approaching trials of coal land fraud cases, was assassinated. The mine is owned by the Union Pacific Coal Company, which recently purchased it from the Porter Fuel Company. The officers of the latter company are under indictment for obtaining the coal lands by fraud. Walker had collected much of the evidence against them. In company with three experts employed by the Government, he was seeking additional evidence when he was shot. He was then alone at the mouth of the shaft, his three companions having gone into the mine. Important documentary evidence which he was accustomed to carry on his person is missing. He had an excellent record, and in twenty years of dangerous detective work had never found it necessary to use a revolver. On the 5th the President addressed the following note to Attorney-General Bonaparte and Secretary Garfield:

"My attention has been called to the dispatches in reference to the murder of Secret Service Agent Walker while in the performance of his duty investigating certain coal land frauds in Colorado. I trust every effort will be exerted by your departments to prosecute vigorously every violation of the land laws which Walker was investigating."

For ten months Walker had been at work on coal land fraud cases, and the indictment of the Union Pacific Coal Company and Porter Fuel Company was due mainly, it is said, to his efforts. Mason says he did not know Walker. There is plenty of evidence to the contrary. The inquiries Walker was making when he was killed related to the charges upon which twenty-one men were recently indicted. Among these

were the president of the Porter Fuel Company, the president of the Durango Lumber Company, several bankers of Durango and Pagosa Springs, a former clerk of the District Court, and the geologist of the Denver & Rio Grande Railroad Company. Several of the accused men are millionaires. —— President Roosevelt has by proclamation added 490,451 acres to the Stanislaus and Lassen Peak national forests in California. The tract joined to the first of these reservations contains the famous Calaveras grove of big trees. He has also created on the Pacific Coast four reserves for birds and animals. This was done at the suggestion of the National Association of Audubon Societies, the purpose of the action being to prevent the extermination of the sea lions and of certain birds. One of these reserves is a group of rocky islets off the coast of Oregon; three are in the waters of the State of Washington and include islands near the entrance of Puget Sound. Wardens will be appointed.——Government Forester Pinchot, who has just returned from an inspection trip which consumed six months, says that at the present rate of cutting the timber supply of the United States, on private holdings and Government reservations, will be exhausted in twenty years.

Secretary Taft Starts for Siberia

Owing to the mutinous outbreak at Vladivostok, Secretary Taft said, on the 5th, that it might be advisable for him to return by way of San Francisco. On the following day, however, he decided to take the route which he had at first chosen, and he sailed for Vladivostok on the 9th. At a banquet given to him by the Progressive party in Manila he pointed out that popular governments could be conducted only by means of political parties, and remarked that voters on the islands should learn to be good losers. He commended the new Assembly, in which, he said, up to that time all matters had been "treated in a conservative manner by both the minority and the majority." On the day when he left Manila he gave this statement to the press:

"I feel deeply grateful for the reception and entertainment given me by the people of the Philippine Islands. It far exceeds in its warmth and spontaneity anything I expected, and I cannot sufficiently express my gratitude and satisfaction.

"The condition of affairs in the Philippine Government is most satisfactory, and, taken thruout, the progress made during the past two years is remarkable.

"From the first I had full confidence in the Legislative Assembly, a confidence which has been justified by its actions. So far it has taken a conservative form, and I have no doubt it will continue its useful, patriotic and diligent course. I have yet to see or hear of a single member who does not apparently feel a full sense of the responsibility of his duties toward his constituents and country, and I am sure that conservatism, rather than radicalism, will continue to mark the official conduct of this body.

"I leave the Philippine Islands with renewed confidence in the future of the islands. What I have seen and heard on this trip has confirmed my opinions on the subject, which I had previously formed and have frequently expressed."

At the time of his departure the people showed their respect and affection in many ways. The horses were taken from the carriage in which he was seated, and it was drawn to the dock by Manila schoolboys, thru cheering crowds of natives. Representatives of all factions and interests agree in saying that the effect of his visit has been highly beneficial.

Various Notes

Judge Wellborn, at Los Angeles, has imposed a fine of $330,000 in the case of the Atchison, Topeka & Santa Fé Railroad Company, which was recently found guilty of paying rebates on shipments of lime from Arizona to California. There were sixty-six counts. Under the law, the penalty could be $66,000, or $1,320,000, or an intermediate sum. Judge Wellborn said the evidence showed the concessions had been intentionally and systematically made, and that it was hard to believe that the company did not know they were unlawful departures from its established tariff. The company will appeal. It asserts that the payments were not rebates but allowances made on damage claims.——The fine of $15,000 which the Burlington road was ordered to pay for rebating on lard shipments from Kansas City to New York has been approved by the Circuit Court of Appeals.——In Texas, the Attorney-General has filed

suits against eleven oil companies, alleging that they are controlled by the Standard Oil Company and are doing business there in violation of the Anti-Trust laws of the State. He asks for penalties amounting to $75,900,000, and an injunction restraining the companies from removing their property to other States has been granted. Among the companies attacked are two as to which testimony was recently taken in New York showing that they were indirectly owned by the Standard.

London Fetes

The British public has had, during the week, an unusual amount of the patriotic pageantry in which it delights. The celebration of the King's birthday and the Lord Mayor's show came on November 9th, and it did not rain. King Edward received as a birthday present the Cullinan diamond, the largest ever discovered, from his new subjects in the Transvaal, as a token of their loyalty and esteem. The stone, which appears from its shape to be a fragment of a much larger crystal, measures 4½ by 2¾ by 2½ inches. Being a unique specimen, its value is incalculable, but if estimated like other diamonds, it would be worth over three-quarters of a million dollars. Its safe conveyance to Sandringham Palace, England, required careful planning. The sealed package, which was sent from Johannesburg to the Coast by night in the care of two detectives with ostensible secrecy was a blind. The diamond was really sent as an ordinary package by registered mail. It was conveyed from London to the palace at Sandringham by special train, strongly guarded, and the railroad station was closed to the public when it arrived. At the palace were the kings of England and Spain, and the queens of England, Spain and Norway, and later the Queen of Portugal. The new Lord Mayor, Sir John Bell, spared no expense to make the parade impressive and instructive. The six predecessors of King Edward who have borne the same name, again rode thru the streets of London, accompanied by court and guard in the costumes of their day.—— The Government presented no names for the peerage, evidently thinking that it would be an impropriety to put Liberals in a body against which the party is at war.——Empress Augusta Victoria will accompany Emperor William of Germany on his visit of a fortnight to England. One reason for this change of plans is said to be to insure a favorable popular reception to the Emperor as he passes thru the streets of London to Guildhall. The Socialist leader Hyndman calls upon the people to greet him with hoots, groans and hisses. The Emperor will rely entirely upon Scotland Yard for protection, as he has left behind his usual bodyguard of detectives. —— Rear-Admiral Sir Percy Scott, commander of the First Cruiser Squadron, and an enthusiast for target practice, has got himself into trouble with his superior officers by the facetious way in which he transmitted the orders to prepare for the reception of the Emperor of Germany. He signaled to the fleet at maneuvers in the Channel: "Paintwork appears to be more in demand than gunnery, so you had better come in in time to look pretty by the 8th inst." Admiral Lord Charles Beresford calls this "contemptuous in tone and insubordinate in character."

The Premier's Speech

In his address at the inaugural banquet of the Lord Mayor in the Guildhall the Premier discussed the Hague Peace Conference. He admitted that he had been over-sanguine in his expectation, but said that he was glad of it, for he had spoken for a nation that had no aggressive designs upon its neighbors and desired only to live in peace and amity toward all. The Hague Conference, the Premier declared, was a plant of slow growth, but he had great confidence in it, and believed the day would come when there would be a cessation in the mad race for armaments, which now was the scourge of our common civilization. The work accomplished by the Conference had by no means been insignificant. The British delegates had done all that they could to advance the question of arbitration. If they had attempted to force the issue the result would have been negative or even worse—friction. An interna-

tional or prize court would be a notable step in advance, he said, and it might be necessary for the leading maritime powers to come to an agreement for the establishment of such a court and the adoption of rules therefor. Great Britain had also left things in shape for the future amicable discussion of the abolition of contraband and the restriction of floating mines. The Colonial conference, the Anglo-Russian treaty, and the steps taken to prevent the plague and sedition in India having been disposed of, Sir Henry took up the Kongo question. As great as the contrast was between the hopes of the English people when the Kongo was established and the conditions existing there at the present time, he felt he must speak with the greatest reserve, because the Belgian Parliament would shortly be asked on what terms it would take over the Independent Free State of the Kongo. Great Britain would not interfere in the negotiations, he declared, but the Government was so deeply impressed with its responsibility that it, in common with others, felt that the government of the Kongo should be put on a footing with those of the colonies administered by other nations, and in accordance with the treaties under which the Kongo came into existence.

Railroad Arbitration in England

The great railroad strike which has been impending in England and appeared inevitable has been averted by means of an agreement secured thru the energy and the initiative of Mr. Lloyd George, president of the Board of Trade. The King sent him a telegram of congratulation, the premier praised him in his speech at the Lord Mayor's banquet, and he is receiving universal applause from the press for averting what was recognized to be an international calamity. The plan which has been adopted by both sides has some features of the New Zealand legislation, which has been so successful in preventing strikes in that country and Australia. The disputes as to hours and wages are to be dealt with by arbitration boards, of which there is to be one for each grade of work, composed of an equal number of representatives of the men and of the directors. In case one of these sectional boards fails to agree, the question will be referred to a general conciliation board, composed in like manner. In case of continued disagreement, the matter will be placed in the hands of a single arbitrator, selected by mutual consent, or, if this is impossible, the arbitrator is to be appointed by the Speaker of the House of Commons and the Master of the Rules. The decision is binding upon all parties for six years, and longer by a year's notice. The expenses of the arbitration will be divided equally. If this plan of arbitration had not been adopted, probably a bill would have been introduced by the Liberal Government making it compulsory. The men gain a greater power over the conditions of their work than ever before, and on the other hand, the directors are not forced to recognize the Amalgamated Society of Railway Servants and the scope of arbitration is limited to questions of hours and wages.

The Kongo

The report that King Leopold had robbed Belgium of a large part of the Kongo by transferring to a private company the perpetual control of the Crown lands about Lake Leopold II has been officially denied. The Belgian Ministry has issued the following statement:

"The decree of July 20th, 1907, was drawn up upon bases of which the Belgian Government was informed. The act is legal. It does not affect Belgium's recognized right of annexation nor her eventual rights of sovereignty. No cession or concession has been made to this new company, and none will be granted to it pending the negotiations now going on. Moreover, the new company has not obtained any exclusive privilege."

——Mr. W. Cassie Murdoch, of the Baptist Mission at Bolobo, Upper Kongo, has recently made a tour of 450 miles thru the Crown Domain and reports that the natives have been reduced to slavery of an atrocious kind and the country is being ruined. We make the following extracts from his letter:

"The Crown Domain west of Lake Leopold has been depopulated to an alarming extent. There are evidences of it everywhere. I passed thru at least three districts which had once contained very large towns, but which are now completely empty. The clumps of palms are there, and the sites of the houses are indicated by a jungle of tall, strong grass, and the

bunches of rank tobacco plants. There is not a house to be seen.

"And what do the natives get? I was present at the solemn farce of buying the rubber, and what I saw was enough to make one ashamed of being white.

"First of all, arrears were collected. How there came to be arrears I found out as I watched the process. When this was over the 'tax' was collected. The name of a town or district was called out by the white man, and a number of men came forward. Each man had thirty 'lengths' (strips) of rubber. The average length seemed to be about 5 feet. I managed to buy one when I was on my way back. It is, of course, dry now. It is 3½ feet long, about 1 inch broad, about half an inch thick, and weighs 170 grammes. If this be taken as the average (it is actually less), the thirty pieces weigh over 5 kilos (10 pounds) of dry rubber. As each bundle was hung on the balance two State men examined each piece carefully. If the quality of one seemed doubtful they took hold of it and pulled with all their strength. If it broke it was thrown out. Nearly every bundle had bad pieces; a large number as many as five or six. The white man wrote the number thus condemned on a slip of paper and gave it to the man concerned. These were the arrears. When the rubber had all been examined and weighed the pieces thrown out were piled up in a heap and set fire to. This was to prevent the men taking them off and presenting them the following month. When this was all over the men were again lined up, and one by one they filed past the white man, and received their pay. Each man was given a fathom of trade cloth (blue baft); some of them got a few bits of salt in addition. Only half of this, however, was his own, as each bundle was the work of two men. The 'tax' for each man is 15 lengths of rubber, but they take it in turns to carry the rubber to wherever it is collected. For his 300 miles' walk, therefore, and his ten nights in the forest, and his rubber and his twenty-five days' labor per month, each man receives half a fathom of cloth.

"Just as the white man was about to return the chief capita (corporal) asked for a 'dash.' This was refused, but he was determined to get something, so I saw him walk over to where the men were standing and take the cloth from one and the salt from another. This, I learned, was a common practice. Often quite a number have their 'wages' stolen as soon as they receive them."

Japanese Peace Talk

The Japanese Minister of Foreign Affairs Hayashi has endeavored to put an end to the rumors of war between the United States and Japan by the unusual course of granting an interview on the subject. The Minister said that the relations between the two nations were as smooth and cordial as ever and there was no ground for the alarmist reports of the newspapers. The emigration question was the most serious matter, but he was positive it would be settled without friction. It had been practically decided already. The Japanese Government proposes to control emigration in such a manner as to benefit Japan and at the same time conform to the wishes of the American Government, and is taking most active steps in this direction. Minister Hayashi continued:

"According to reports from various sources dealing with what is called the Japanese situation, it appears certain that in a portion of the press of the United States, bent on representing an ultimate conflict with Japan as inevitable, and in order, apparently, to subserve this special purpose, events of trifling importance are magnified into matters portending grave consequences.

"Facts that can be explained easily and naturally by the commonest kind of common sense are commented on and called into question on some far-fetched, impossible hypothesis, and the uninitiated public gradually is led into the vague belief that the relations of Japan and the United States are anything but smooth and cordial. These misrepresentations are incomprehensible, and we are unable to explain them except upon the ground of a financial nature.

"The repeated publication abroad of intimations of strained relations is deplorable, chiefly on account of the painful effect it cannot but fail to produce upon commerce, a delicate plant, which thrives only in the general atmosphere of mutual confidence and cordial interdependence.

"A relieving feature is found in the happy fact that these ominous statements find no echo on this side of the Pacific."

The Ambassador Extraordinary and Minister Plenipotentiary of Japan to The Hague, K. Tsuzuki, has spoken in a similar tone. He condemned Rear-Admiral Evans for saying in his speech at the Lotos Club that he would be ready for a fight or a frolic when he reached the Pacific with the squadron:

"You must dispose of your great natural resources and manufactured products and Japan needs them. I do not really think that the recent unpleasantness will permanently interfere with our trade relations, and I believe that within a short time Japan will be as good a customer of the United States as ever.

"Foolish as it would be to go to war, the actual contest would prove more disastrous to both countries than is generally imagined. The Pacific Ocean provides a great buffer between the two countries, and, from the point of view of sending fleets, the long distances would prove almost an insuperable obstacle. This is at once to be seen when it is remembered that no war could be settled without land fighting. It would be necessary for America to extirpate the entire land population of Japan before the the entire population of Japan before the war ended."

THE PEACE CONFERENCE IN FULL SESSION

Just after the presentation of the American proposition for a Court of International Justice and a treaty of obligatory arbitration. The American Delegation is in the foreground on the platform with the president of the Conference. The Germans occupy the corresponding position on the opposite side of the platform.

The Second Hague Conference*

BY HAYNE DAVIS

[This concludes the series of three articles by Mr. Davis on the results of the Hague Conference. Our readers may expect other articles to appear shortly from the various delegates themselves.—EDITOR.]

The American Invasion of Europe.

WHILE George Washington was rising to the highest place in America the political situation in Europe was as follows:

The people of every European country were submerged under the insidious claim that a few families, deriving their right by Divine appointment and thru hereditary human arrangement, were entitled to rule, not only over Europe, but also over all America and the larger part of the then known world. This falsehood had been consecrated as the truth by the established religious systems of Europe, and during the greater part of Washington's life this falsehood was in legal possession of America. Against it there was rising in the spirit of the American people a resistance which finally culminated at Philadelphia in the unanimous declaration by the representatives of all the American colonies, severing the political bonds which connected this country with England, and announcing to the world, in justification of this act, certain ideas, which ever since that time have been waging war

Copyright, 1907, by Hayne Davis.

against established institutions in various parts of the world. Among these ideas it is necessary to mention the right of the people to alter, or even to abolish, the existing form of government, and to institute a government founded upon such ideas as may be acceptable to the people of the present time.

As a result of this declaration, the American colonies entered upon a long war with England, and on the 17th day of October, 1781, the commander-in-chief of the British forces surrendered to General Washington at Yorktown in Virginia.

This act constituted the first *defeat* of the ancient *European system in America* and prophesied the final overthrow of the old régime, not only in America, but thruout the whole world.

France Accepts the True Idea.

France was present at the surrender of Cornwallis in the persons of Lafayette and Rochambeau, and thru their eyes saw the overthrow of the false claims of hereditary right to rule in America, and *foresaw* the overthrow of this claim in Europe. A few years afterward, and as a direct result of the action of the American patriots, the French people took up the cry of liberty, equality and fraternity. Indeed, the ideas for which Washington fought in America invaded Europe by way of France, and succeeded in gaining possession of the French Government. Shortly afterward, and as a result of this, democracy began to rear its head in Spain, also in Naples. This triumphal entry of the true principle of government into Europe resulted in the organization of a conspiracy, the avowed object of which was to destroy democracy, which, to the honor of the French people, was derisively designated as "French Principles." This conspiracy was instigated by the then Emperor of Russia, and was participated in by all the leading governments of Europe, including Great Britain. The conspirators declared the exact reverse of the principles set forth by the Americans at Philadelphia on the 4th of July, 1776, and agreed with one another that the whole military power of Europe should be used to destroy utterly the ideas advocated by the Americans and accepted and put into practice by the French.

Having moved their armies into Paris and Madrid, and re-established the ancient monarchies by overthrowing the new representative governments, the conspirators began a scheme for the resubjugation of America. The first point of attack was to be Spain's lost possessions in South America—possessions that were lost as a direct result of France's having taken up in Europe the war which Washington successfully waged in America.

The Salvation of Spanish America.

Tho England had taken part in this unholy alliance for the purpose of destroying representative government on the Continent of Europe, the Premier of Great Britain was opposed to continuing this work in America, and he gave information to Mr. Benjamin Rush, the American Minister at London, in regard to the plans of the conspirators, suggesting the advisability of a joint declaration by Great Britain and the United States against the proposed move upon South America. Before there was time enough to agree upon a joint declaration by England and the United States, President Monroe sent to our Congress his famous message containing the declaration which has become current as the Monroe Doctrine. This declaration was a notice to the Holy Alliance that any effort to resubjugate any American State that had achieved liberty and whose independence the United States had recognized would be resisted by the armed forces of our country. England thereupon gave notice to the Continental Powers that, in the event of their proceeding against South America, England would consider herself free to act as her interests might appear.

These two declarations together saved for the South Americans their right to representative government without the necessity of striking a single blow in the defense of their newly acquired liberty.

The Surrender of Europe.

This took place only three-quarters of a century ago. M. Nelidoff, who acted for Russia as president of the Second Hague Conference, knew personally, in his youth, that Emperor of Russia who

instigated this conspiracy against the idea of representative government, hurled into the political world by the action of our forefathers in 1776. During the life of Nelidoff this idea has succeeded in breaking up the conspiracy organized against it in Europe, and in gaining possession of *some* part of the political machinery of *every* government in Europe. In some cases the overthrow of the hereditary claim has been complete. In one case it has been only temporary, the Parliament of Turkey having assembled but one time. In a great majority of cases the idea has gained *permanent* control of *some* of the departments of government. A fairly intelligent study of Europe's political history for three-quarters of a century would suffice to show any one that the most determined opposition, backed by the entire military power of Europe, has been utterly unable to resist the irresistible march, upon the political capitals of the world, of the idea upon which the United States is founded and of which it is the foremost exponent in the world.

Having succeeded in gaining possession of some of the strongholds of every European Government, the American idea of representative government was actually invited to take possession of all the world in 1899, upon the initiative of the successor to that sovereign who, shortly after the formation of our Government, instigated the scheme utterly to annihilate this idea. I do not mean to say that Nicholas II, when he invited the Powers to a conference at The Hague, realized that he was preparing to witness the absolute surrender of Europe to the American idea of government. But I do mean to say that that was the fact, and the battle preceding the final one in this great war for the true political principle was fought at The Hague this year, and was won by the representatives of the American States. Any one who disputes this, or who fails to recognize the significance of it, cuts himself out from due appreciation of the work accomplished by America at the Second Hague Conference. The Americans at The Hague brought the Europeans face to face with the universal acceptance of the principles against which the Holy Alliance was organized in the early part of the century, by the various propositions put forward, the chief of which was the proposition by the United States in favor of periodic, self-governing, international conferences, containing representatives from all the States universally recognized as sovereign over some portion of the world.

Supplementary to this were:

1. The Porter proposition, removing from the arena of war to the precincts of International Courts of Justice pecuniary claims, alleged against one government by another government, on behalf of its citizens.

2. The proposition of Drago, of Argentina, against the use of force for the collection of *any* pecuniary claim from a sovereign state.

3. The proposition by Brazil's First Delegate, prohibiting the use of force for the acquisition of territory without first offering to carry the claim into an International Tribunal.

4. The proposition of the United States in favor of the establishment of a High Court of International Justice in addition to the existing Tribunal of Arbitration, whose composition makes it more of a diplomatic than a judicial body.

5. The proposition of Uruguay for a League of Peace, constituted so as to provide a judicial means for the settlement of all questions between the members of the League, and for intervening in controversies between Powers not in the League, where the League considered this necessary for a just settlement of the question.

Assailed with these various proposals, all of which constitute merely a part of the general scheme for the establishment of a system of representative government in the international domain, it was not reasonable to suppose that the Europeans would be able to accept immediately all of these progressive ideas.

The resistance developed in the Conference was merely the struggle of Europe in the agony of final and complete surrender to the American principle, against which it was up in arms so recently, and to which a conditional surrender was made by all Europe at the Second Hague Conference.

National Sovereignty in International Assembly.

In his address upon assuming the presidency of the Conference, M. Nelidoff declared that—"The luminous star of universal peace and justice (loud applause) to which we shall never arrive (dead silence) must ever guide our endeavors for the welfare of humanity." In those subsequent endeavors at The Hague under his presidency a moment came when, according to European ideas of a conference of sovereign States, the making of proposals should cease. M. Nelidoff's declaration to this effect evoked a simple statement from Mr. Choate, the First Delegate of America, that the United States was not ready to submit all of its proposals, and would submit them later. They were submitted later. Some of them were accepted, and constituted the chief fruits of the Conference. This was an exercise of sovereign rights. Later, the occurrences in one of the leading commissions raised the question as to the right of discussing questions not included in the prepared program. This brought forth from Barbosa, of Brazil, the declaration that one sovereign may invite other sovereigns to a Conference, but that every sovereign who comes into the Conference *carries in himself* the power to present any idea which he desires to have the Conference consider.

In these and other ways great principles which lie unseen at the base of our political structure found expression, both in word and in action, during the labors of the Second Conference, and began that "Empire of Law" in the place of arbitrary authority, to which Germany is now marching with the rest of the world.

Self-Governed International Assemblies.

Perhaps these evidences of conscious equality and power to effectuate their ideas, on the part of the representatives of republics, did not increase the prospects of the American proposal for periodic conferences to assemble at convenient intervals hereafter, without the initiative of any sovereign, *and to be self-governing*. In presenting this proposal to delegates privately, the Americans declared themselves frankly as opposed to such a Conference being "run" either by the United States, Russia or any other Power. There was apparently no opposition to these proposals. But in due time it was suggested from certain quarters that it would be better to provide for the convening of the Third Conference within a time analogous to that which intervened between the First and Second, and for a special committee on arrangements, appointed by the Powers, to assemble two years before the expected date of the Third Conference, to prepare and submit to the Conference a program for the organization and procedure of the Conference and also for its discussions.

With a view of securing unanimous agreement upon this, the most important matter presented to the Conference, the Americans consented to the modification. The text of the proposal was approved in the appropriate committee, and then came before the Conference in full session. By pre-arrangement with the Americans, it was presented by Russia, and was unanimously approved.

Emperor or President?

Then came a scene unlooked for by the Americans. M. Beldiman, a representative of Rumania, declared, in accepting the proposition, that it was defective in not defining the manner of convoking the Third Conference, and that he was of the opinion that, by initiating the First and Second Conferences, the Emperor of Russia "had acquired the right" to convoke the Third. With such right, according to diplomatic usage, goes the right to name the president of the Conference. The presidency enables one to maintain a certain grip on the body. This is significant in view of the frank confession of American delegates about "Self-governed" and "run" conferences. Mr. Beldiman was followed by others who spoke in the same strain, among them the Austrian representative.

This was not at once communicated to the press, and when it was made known, an editorial appeared in the *Courier* for which Mr. Stead deserves the thanks of our country primarily and of other republics secondarily. He declared plainly that the Second Conference was convened on Mr. Roosevelt's

initiative; that everybody knew this, and that the Conference should express its appreciation of this act. Persons in and out of the Conference were becoming displeased with the continued claim that the Emperor had *initiated* the Second Conference, coupled with an avoidance of the fact that he only carried on the preparations for the Conference after delaying it for two years by the war in Asia, when Roosevelt graciously consented to give to him the privilege of issuing the formal invitations.

Up to this time the continued ignoring of the facts had only affected the grateful acknowledgments made to the Emperor and not as yet made to the President. Now this neglect on the part of the Conference was made the means of basing an alleged right whose proper or improper exercise would affect the people of the whole world. It was even possible to construe this neglect, in the light of certain addresses made in accepting the proposal for a Third Conference, as a rebuke to Roosevelt for invading a "right acquired" by the Emperor of Russia.

Recognition of Roosevelt.

The day after the Conference convened, in view of its neglect to express its appreciation to President Roosevelt at its opening session, I suggested the necessity of doing this at an opportune moment, say July 4th, to several persons, some of them being delegates to the Conference. The suggestion was welcomed by those to whom I spoke, but no action of the Conference followed. At an opportune moment I mentioned it to a member of the Russian delegation; also in an address I was asked to make to an audience of private persons at The Hague, a report of which was placed by the *Courier* in the hands of all the delegates. I spoke of it also to members of the Interparliamentary group in the Dutch Parliament, and I know that they recommended such action to the Dutch representatives in the Conference.

As nothing was done prior to my departure from The Hague, during the last days of the Conference I wrote to a member of the Russian delegation suggesting that Russia was the one to propose a cablegram to President Roosevelt, because the President and the Emperor are the only two chiefs of state who have initiated a conference, and because Roosevelt graciously conceded to the Emperor the honor of issuing the formal invitations, and at the same time I handed him a marked copy of my book, "Among the World's Peacemakers," in which is to be found the record of Mr. Roosevelt's initiative.

In reply to my letter, the Russian delegate to whom it was addressed left at my hotel his card, with the following memorandum: "With best thanks for the interesting books and the *excellent* suggestion."

At the closing session, upon motion of Russia, the Conference authorized M. Nelidoff to send a cablegram to President Roosevelt, expressing its appreciation of his having proposed the Second Conference.

The Right to Call a Conference.

Meanwhile, Mr. Scott, the legal adviser of the American delegation, to whom I had not mentioned the matter, asked publicly whether the Americans were to understand that the Conference desired to make no reference to Mr. Roosevelt's act in taking the initiative for its convening. A member of the Conference declared in response that recognizing Roosevelt's act would recognize the right of sovereigns other than the Emperor of Russia to convene Conferences. Certainly the assembling of this Conference in response to Mr. Roosevelt's initiative was an instance of the successful exercise of one of the rights of sovereignty. And it does not require a Barbosa to discover in "sovereignty" the right of inviting the Powers to a Conference.

If the Emperor of Russia has "acquired the right" to convene the Third Conference, the President of the United States has acquired for our country the right to see that this is done at the proper time.

The future Presidents of the United States and of other republics seem now to be charged with the duty of seeing that the International Duma does not share in any of the dangers to which the Russian Duma is subject, while the great and agonizing State called Russia

is getting herself launched into the twentieth-century sea with a modern mechanical equipment.

The right of the people of all nations to the periodic assembly of a Conference in which they are all represented exists. And some way will be found to give this right adequate expression in words and exercise in fact. This is both prophesied and assured by the way in which the Second Conference was called into existence and by the things which transpired during its sessions.

With the light of this bit of past history shining on the page which contains the record of the Second Peace Conference, there is no cause for discouragement. On the contrary, we have every reason to rejoice that Russia's representatives joined with the representatives of the other European kingdoms in the forward march initiated at the Second Peace Conference by America, instead of resisting the movement, as was done eight decades ago.

Finding themselves called upon to go at a pace which was too rapid for them, they did fail to fulfill their full duty in the recognition of American initiative. I am persuaded, however, that this was more from fear of "self-governed" Conferences at which American methods would prevail than from lack of personal appreciation for Mr. Roosevelt's act. The most they could accomplish was to postpone for another decade the actual establishment of representative government on a world-wire scale by ensuring a Third Diplomatic Assembly in 1915. It can be confidently prophesied that resistance which decreased to this extent in eight decades under conditions of the past will disappear entirely before the advancing light of the immediate future.

Freedom of Speech.

No American nation felt the least uneasiness at the thought of entering a Conference run on the free and open lines of discussion which are customary in the various American countries. On the other hand, a feeling of relief spread thruout Europe when it was learned that the Emperor of Russia would issue the formal invitations to the Second Hague Conference instead of the President of the United States. This relief was due to the fact that the issuing of these invitations included the right to name the president of the Conference. Europeans realized that any fairly competent Russian as president of the Conference would be perfectly familiar with the political conditions of Europe, and would use his position as president of the Conference to keep the Conference within the limits which Europe's safety necessitated. This fact deserves the profound consideration of Americans, arising as it does from a fundamental difference in the political atmosphere of the Old and New Worlds. In America freedom of speech and wide publicity is essential to strength in any position. On the other hand, the public policies to which Europe has been a slave for so many centuries necessitate restrictions upon freedom of speech, until the nations of Europe see the wisdom of accepting fully the elective principle of government.

The extent to which freedom of speech is permitted in Europe is in direct proportion to the acceptance of the elective principle in place of the hereditary policy of government. In Russia this restriction goes to the extent of blacking out from all publications entering Russia from abroad the ideas which the Russian Government does not wish the people to see, and of forbidding the publication in Russia of ideas which the Government does not wish to hear. In various European countries suppression of speech ascends from this depth of error to the hight of complete freedom, such as is enjoyed thruout both the American continents.

In my opinion the representatives of the countries where freedom of speech is a part of the improved political conditions should respect the dangers which surround their brethren in the Conference from countries whose conditions make freedom of speech dangerous. They should wisely limit their remarks to things which make for international progress and which will not cause national explosions, in so far as this is consistent with their fidelity to the true principles, for which they must of course stand if occasion necessitates. We of the New World should always bear in mind that the holding of International Confer-

ences, even when discussion is not free and open, is itself of immense importance, and that the holding of such Conferences successively will automatically enlarge the area of safety in discussion, by the improved national conditions which will result in the more backward of the nations represented. Indeed, the time is not distant, in my opinion, when discussion in a National Conference will be as free and safe as at the present time in the halls of Congress or the British Parliament. An evidence of this is to be found in the closing of the Second Conference at The Hague. The prevailing opinion was that no one spoke in the open Conference what he really felt in his heart. The supposition that this was the custom of diplomatic assemblies necessarily raised this presumption, and to a certain extent this belief was well founded. The limitation upon the freedom of action by the Conference was sufficient to make the delegates of the United States restive, and to bring out from them the proposition that future Conferences shall elect their own officers and thus become self-governing. Nevertheless, some of the delegates did speak as they thought, notably among these being Barbosa, First Delegate of Brazil. He did not ask the other delegates to subscribe to the doctrine that the Conference should be self-governing, but he did exercise the full rights of the sovereignty of his nation by speaking as no responsible statesman has before spoken in such an assembly. When some incident raised the question of the right to discuss a matter not on the program, he declared that every sovereign entering such an assembly carried in himself the power to propose any idea which he desired to have the Conference consider. During the four months of the Conference the atmosphere at The Hague and thruout all Europe was full of talk about great and small States. Suggestions were made, emanating from high sources, that it was an error to invite South America to the Conference; and, indeed, that it was an error to have such large and open assemblies, and that hereafter the things that were to be done ought to be arranged in a petty committee of the Big Powers, and then submitted for the ratification of the states in general conference. These facts, coupled with the claim on the part of the great Powers, measured by population plus armed strength, that they were entitled to impose upon the world a sort of judicial monarchy by naming a majority of the persons who shall sit as judges upon the affairs of the sovereign states, finally brought the Conference to a dramatic close. If there was any doubt in regard to the freedom of speech in such an assembly, that doubt was dispelled at its session of October 9th.

Having laid bare the motives of Brazil in opposing the proposition to which the American delegation was most devoted (a High Court of Justice upon which the great Powers would be permanently represented, and the small ones only quasi represented), Barbosa declared that he, and the states which stood by him, had exerted themselves in behalf of the general aspirations toward peace by opposing with all their might the victory for *inequality* in the establishment of International Courts of Justice. He denied the charge that Brazil was hostile to the United States, and declared that a spirit of friendship has, does and will always animate the nations of America, and that, if Brazil found it necessary to oppose two of the important propositions advocated by the United States at the Second Hague Conference, in doing so it had followed an independence of spirit habitually practiced by that country, and which, he declared, is the surest basis for mutual understanding and respect.

"We have always thought that, in order to raise ourselves to a noble friendship, we were bound, first of all, to be worthy of it, by deserved self-consideration and respect. . . .

"Reciprocal justice is the strongest bond of great friendships, and the two largest States of the two Americas can never forgot how they have exercised it toward each other."

Petty Conferences of Great Powers.

He then took up the claim as to small and great States, and the proposition for petty conferences of the so-called great Powers, where a few would arrange the matters which concerned the many.

"Concerning the other States kept dancing at attendance, and having only the privilege of subsequent acquiescence, I have a thing to tell you. It is the most abominable error, and one persistently committed, that of insisting on teaching the peoples that rank among States is to be measured by their military standing."

Then came the scene of the Conference. He said:

"No one denies that force has its rights. Alas, in our wretched world it looks sometimes as if force owned every right, and as if the worst crime is to be feeble. Superstition regarding power has so permeated human thought that many accept freely the supposition that the great Powers possess not only the heavy armament, but that they have a right to monopolize also the most precious gift, the genius of justice and inspiration.

. . . . . .

"The great Empires are in the habit of entertaining exaggerated notions of themselves; owing to their monopoly of armies and navies the world over, they can enact regulations for these armies and navies; and this fact leads many among them to imagine that the control of armed forces places in their hands the sceptre of the universe. Nothing could be less true. We are willing to render to the Cæsars of Berlin, St. Petersburg and London what belongs to Cæsar, but only unto God what belongs to God. And it is to God that justice, law, independence, liberty, and the right of individual sovereignty belong.

. . . . . .

"The moral of all this is that the representatives of the greatest among the great Powers might do well to be quiet and unassuming toward their colleagues, even toward those from Guatemala, and to force themselves not to forget that since the days of Solon and Solomon, up to the very present time, the wisest judges have often belonged to the smallest States."

Dr. Barbosa closed this memorable address by contrasting the entry of Japan and the South American States into the concert of European Powers, pointing out that the insistence upon grading States according to their military standing was productive of more terrible consequences in our day than ever before. He said:

"About three years ago, Europe saw on her political horizon outside of herself only the United States as a sort of European outpost. . . . Asia and Latin America were hardly more than geographical expressions, having a political status through condescension only. One day a frightful apparition appeared in the Orient. It was the unexpected birth of a great Power. Japan entered the European Concert through the gate of war, which it burst open with its sword. We, the Latin-American States, have been invited to walk in through the portals of peace. We have entered into the precincts of this Conference and you have begun to know us as workers in the cause of peace and law; but should we find ourselves deceived, should we be disillusioned by actual experience in finding that international greatness is determined *only by armed forces*, then, by your work, the result of the Second Peace Conference would be a reversal of the political tide of the world in the direction of war, compelling us to seek proper recognition of our position by large armies and great navies, a position that we have proven in vain by population, intelligence and wealth." . . . *"But, in spite of all things, the authority, the utility, the necessity of these assemblies, occurring periodically hereafter for the promotion of peace, have achieved for them an irrevocable conquest. They cannot be prevented, frustrated nor replaced. They are an open door for all time, thru which the rights of nations shall enter effectively into operation, little by little. The field occupied in 1899 has been enlarged in 1907, and in spite of all that has occurred, enlarged with glory.* As the First Conference made the second necessary, so this one renders inevitable the convening of the third."

The representatives of the monarchies that organized the Holy Alliance at the beginning of the nineteenth century, on the supposition that from the people can come no man worthy to control the destinies of a nation, had to hear these words from the mouth of a representative of a republic of the continent against which their conspiracy was organized; and they had to hear from the assembled representatives of the whole world a deafening applause, at the conclusion of this memorable address, applause which will be to them the sign of these times.

This address closed the diplomatic Conference that had been in session nearly four months and opened the World's Parliament, where statesmen will first make known their highest ideas and then enact them into law.

The closing words of this address declared the facts and constituted the chief fruits of the Second Conference. They destroyed the possibility of substituting for World Conferences a petty assembly of Big Powers. They opened for all time the door of the Parliament of Men!

Certainly the light of hope for better things never has heretofore shone so clear and far into the obscure world called the future. The added brilliancy is due to the untiring efforts of many, whose names can not even be mentioned in such an account as this, and tho the appreciation and gratitude may not be expressed to them which would necessarily be evoked by an adequate knowledge of the facts, they have done their work and they have their reward, in the better things made possible for mankind.

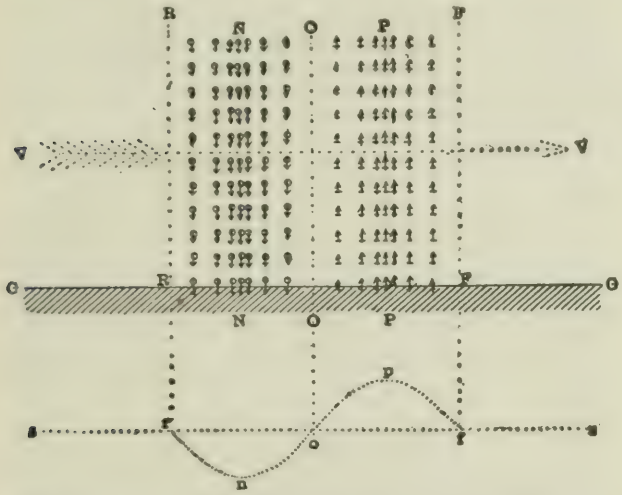
New York City.

A Simple Explanation of Wireless Telegraphy

BY DR. A. E. KENNELLY

[Now that Marconi has established a regular commercial service between America and Europe, we often hear the remark, "I wish I could understand how it works, but I never expect to." Some of these persons have never tried to find out about it because they assumed that it is an unfathomable mystery. Others have attempted to inform themselves, but have been baffled by encountering an unfamiliar nomenclature. The following explanation of the nature and processes of wireless telegraphy by the Professor of Electrical Engineering of Harvard University is both scientifically accurate and comprehensible to the average reader. The cuts are borrowed from Professor Kennelly's little book on "Wireless Telegraphy," published and copyrighted, 1907, by Moffat, Yard & Co.

WIRELESS telegraphy is one of the most recent wonders of our wonder-revealing age. The public has not yet had time to grasp the principles of this latest achievement. It is commonly supposed that the subject of wireless telegraphy is too intricate for any one except a specially trained scientist to grasp. Nevertheless, the fundamental principles of wireless telegraphy are simple, and may be readily apprehended by all who are interested in this fascinating inquiry, however abstruse and difficult the details may be.



Wireless telegraphy employs electric waves which are invisible to the eye, but which run over the surface of the sea and land at an immense speed.

A fair analogy to wireless telegraph waves is presented, on a small scale, in the waves artificially created on the surface of a pond by throwing in a stone. We are all familiar with the series of events following the fall of a stone into the middle of a previously smooth sheet of water. First we have a big disturbance or splash where the stone falls. Then we see one or more ring waves spreading out in all directions from the splash over the surface of the pond. These waves continue to advance radially in every direction—north, south, east and west—at a steady rate, and if attentively watched they may be seen to go on, getting fainter and weaker as they run, until finally they strike the banks of the pond, or any prominent obstacle, such as a stake stuck in the mud and projecting above the water. Where the wave strikes either one of the banks, or the stake, it raises a little splash or disturbance of the water. This little splash, on the arrival of the wave, is much feebler than the original splash due to the impact of the stone in falling on the water, because the wave spreads out into such a long contour that only a small portion of the original disturbance can be imparted to an obstacle in its path. In fact, if the pond is sufficiently large, the wave may be so feeble by the time that it approaches the banks that no splash on arrival can be discerned. In other words, if the wave on reaching the bank is to be capable of producing a discernible disturbance, it must have an appreciable strength and not be reduced by expansion to microscopic dimensions.

From the standpoint of wireless telegraphy, the impact splash of the falling stone corresponds to an electric signal sent out from the mast of a sending station, and the faint little splash on the arrival of the wave at a bank, or an obstacle, corresponds to the faint electric disturbance or signal detected at a distant receiving station as soon as the electric wave arrives there.

If we suppose that two boats are quietly anchored in the pond at a suitable distance apart it might be feasible for a man in one boat to send signals to a friend in the other by striking a succession of short and long blows on the water, in conformity with the telegraph Morse alphabet. The letter *a* would be formed by a short blow followed by a long one, the letter *b* by a long blow followed by three short ones, and so on.

Each blow on the water at the sending boat would send out a new wave in all directions over the pond, and the letters of the message would lie in successive expanding rings on the surface of the water. The man in the receiving boat would intercept these expanding ring-waves at some point of their circle. He might be able to watch the little splashes they formed on his anchor chain, or

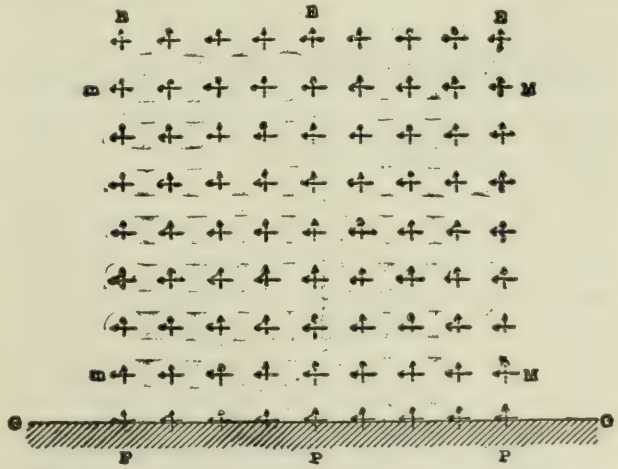
Section of a Single Electromagnetic Wave Along Line of Advance and Near to Surface of the Ground.

other obstacle, and so might be able to read the message, each letter being received a few seconds later than it was hammered out by the sender. Practically, of course, this plan would have little chance of success, if only because the least ruffle of breeze would prevent the wave signals from being discerned. Moreover, the range of water wave signaling would be very small, even in calm weather.

In the case of pond wave telegraphy, as above suggested, the waves would be emitted from a sending station by producing there a relatively powerful disturbance of the pond or liquid medium. The disturbances would move off as waves in all directions, with a definite speed. At any point, within the working range, a receiving station could intercept and perceive the disturbances caused by the waves on their arrival, and could thus spell out messages. The receiving boat might be north, south, east or west of the sending boat, but if its distance away was the same it should be able to decipher the water waves equally well.

Electric wave telegraphy, or wireless telegraphy, operates in a somewhat similar way. Instead of using water waves it uses electric waves traveling thru the ether over the earth's surface. The electric splash or disturbance is created at the sending station by the sudden electric charge or discharge of a wire or wires on a tall mast, while the expanding waves, being invisible, have to be detected by a delicate electric responsive device connected to a tall receiving mast placed at any point within the working range. The advancing electric waves strike the receiving mast and produce feeble electric splashes, or disturbances, in the wire or wires suspended there.

It is necessary to regard the wireless telegraph waves as running thru the ether, rather than thru the air, even tho they appear to be carried by the air. If the waves were carried by the air, they would be sound waves, which have quite different properties, and which, moreover, are only capable of being detected ordinarily at relatively short distances. There is every reason to believe that if the air which surrounds the globe could somehow be completely removed, so as to leave only so-called empty space on its surface, the electric waves would still be able to run over it, substantially as they do now with the air present. It is universally admitted that so-called empty space, or interstellar space, must be occupied by something invisible, which is called the ether, and which transmits light, heat and electric disturbances generally. This ether permeates all matter, and the atmosphere is permeated by it. Consequently, the wireless telegraph waves run thru the atmosphere, but are borne by the underlying invisible ether.



Those who have witnessed that magnificent spectacle, a total eclipse of the sun, from a favorably placed viewpoint, say the top of a mountain, will remember that as the sun's disk becomes obscured gradually by the moon, the sunlight on the landscape steadily dwindled, but without any sudden changes, until the first instant of totality, when the sun was completely hidden behind the moon. The observer watching for this moment discerns a black shadow on the horizon, like a dark veil or curtain, spreading from earth to sky and running toward him at great speed. The wall of shadow sweeps over the landscape in a stealthy,

majestic rush and passes by the observer, leaving him in the semi-obscurity of the total eclipse. This is perhaps the nearest approach that nature gives to our senses of the phenomenon of electric wave movement. It conveys only a weak image of that phenomenon, because the speed of the moon's shadow, which the eye sees running over the landscape, is only a few thousand miles per hour, while the speed of the electric waves is known with practical certainty to be almost the same as that of light in free space, i. e., 186,000 miles per second, or sufficient to run seven and one-half times round the world in one second by the clock.

If, however, we assume that our eyes could see an electric wave of wireless telegraphy running over the earth, just as we actually see the waves running over a pond, or the shadow of a cloud running over a landscape, we should expect to see a hemispherical wave thrown out from the sending mast every time an electric spark discharge was produced there. The hemisphere would cover the land like an inverted bowl, and would expand in all directions like the upper half of a gigantic, swelling soap-bubble, at the speed of 186,000 miles a second. At the upper portions of the hemisphere, and particularly at the top, the waves would be very thin and weak. It would be denser and stronger in the lower portions, and especially in the lowest portion that spreads over the ground like a ring.

In the celebrated Marienfeld-Zossen railroad experiments, made in Germany a few years ago, the highest attainable train speeds were striven for, and speeds of 120 miles per hour were reached over portions of the road. An observer stationed near the straight track and on the lookout for the car with his unaided eyes would see it coming on the horizon, would watch it approach, pass, and vanish on the opposite horizon all within thirty seconds, or half a minute of time. This assumes that he would lose sight of the car half a mile away from him. But if the speed of a passing wave, instead of being 120 miles an hour, were 670 millions of miles per hour, how small would be our chance of getting a look at the passing wave, even tho it reached from the earth to the sky? A twinkling of an eye would be a relatively long and dreary delay in comparison with the time of passage.

By way of example, suppose the sending mast were located in the Brooklyn Navy Yard just off Manhattan Island, and suppose a single spark discharge, or electric splash, were made at this mast, corresponding to a "dot" signal in wireless telegraphy. Immediately we should see, if we possessed the imagined powers of vision, a hemispherical wave rush off from the mast in all directions over the earth. Strictly speaking, there would not be just one wave. A stone thrown into a pond generally produces one principal wave followed immediately by a train of successively smaller waves. So an electric splash, or spark discharge from the sending-mast wire, usually produces a train of waves, of which the first is strongest and the rest are successively weaker. But ignoring this detail, if we confined attention to the first or leading wave, we should expect to see a nearly vertical wall running over the sea and land, north, south, east and west with the speed of light. The wave would, indeed, be made up of two successive walls,

Diagrammatic Section of Plane Vertical Electromagnetic Wave Parallel to Wave-Front and Advancing Toward Observer, with Electric Flux Rising Vertically from Positive Charge on Ground and Magnetic Flux Horizontal.

say first a "positive" wall and then a "negative" wall, with a clear space between, just as a water-wave is made up of a positive wall, or crest, and then a negative wall, or trough, immediately behind, with a mean-level space between them. The length of the wave would depend upon the hight of the sending-mast wire, and with a plain vertical wire, the wave, including both positive and

negative walls, would stretch over, or cover, a distance on the ground about four times the hight of the wire. Consequently a mast 150 feet high would throw off a wave about 600 feet long, the positive wall being 300 feet wide, and the negative wall also 300 feet wide. In practice, however, coils of wire are included in the discharge path of sending-mast wires, and these artificially increase the virtual hight of those wires, so that a 150-foot mast may act as tho it were much higher, say even a mile high. In the latter case, the outgoing wave would cover four miles of ground, or its wave-length would be four miles.

If we transported ourselves somehow in a flying machine over the earth's surface at the speed of light, Jules Verne's celebrated flying projectile being hopelessly too slow for our imagination in this respect, we could keep up with the

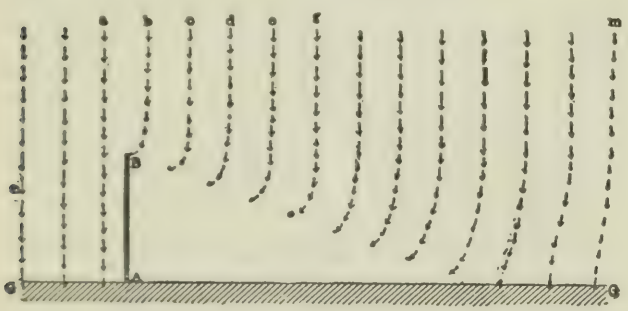


Diagram Indicating the Electromagnetic Shadow Cast by a Vertical Conductor in the Path of an Advancing Plane Wave.

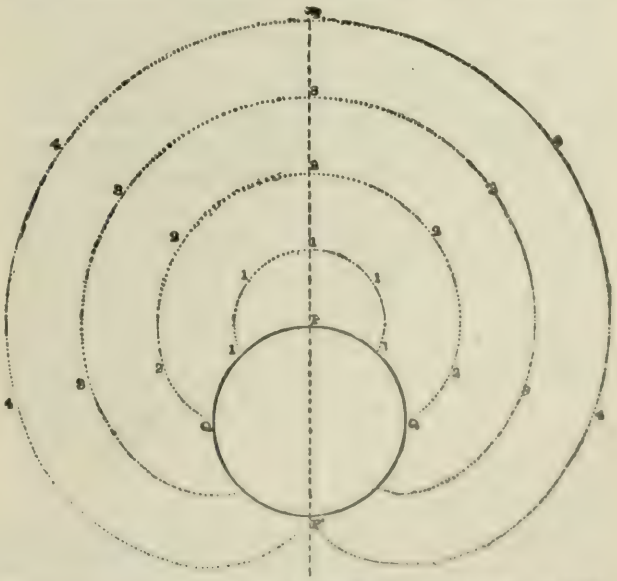
outgoing wave and watch what happened to it as it ran. What happens far up above the earth would lie beyond our ken, and we need not attempt to follow the wave upward. But along and near the earth's surface we should expect to see the wave bend over the globe, so as to keep advancing over it like a nearly vertical wall. The wave in its westward progress would be expected, after starting, to reach the Great Lakes in 1-270th of a second, and the Pacific Coast in the 1-90th of a second. If we followed it in our airship eastward we should expect to reach Europe in about 1-50th of a second, and the distant shores of the Levant in about 1-35th of a second. If we took our imaginary aerial automobile northward with the wave, we should expect to see the wave pass the north pole in about 1-50th of a second. If, on the other hand, we selected the southerly direction of flight, we should expect to see the wave pass the south pole in about 1-20th of a second.

One naturally inquires how long could the imaginary aerial chase be kept up. If it could be kept going for a single second of time, the wave would have past New York on the seventh time around the world. The answer is that possibly in theory the chase of an ultramicroscopic ripple might be kept up as long as one pleased, but that, in practice, the waves have not yet been detected at distances exceeding a few thousand miles from their source. The reason is that they weaken so much as they expand. Just as the wave expanding over a pond spreads and weakens until it is rapidly lost to sight, so the wireless telegraph waves, being spread over such immense distances, become diluted to inappreciable residuals. Not only do they suffer in intensity by spreading over a continually widening area, but they are also weakened by absorption into the surface of the ground. If the ground were a perfect electric conductor, the electric waves, or the vertical walls that our imagination depicts them, would skim over the ground or ocean without being absorbed therein. But the earth's superficial layers are far from being a perfect conductor, and so the earth is always swallowing up or absorbing the wave, to some extent, at the ground surface, and the upper portions of the wave feed down energy into the lower portions to try to make good the defect as the wave runs along; but the result is to make the wave disappear so much the sooner. The salt water ocean conducts electrically much better than the dry land and also presents a smoother general contour. On this account wireless telegraph signals can ordinarily be detected much further over the sea than over the land. For a given electric splashing power, or discharging disturbance power, at the sending mast there is a certain range over the sea and over the land at which high receiving masts can pick up the disturbance of the passing waves and make them appreciable to our senses by the aid of a very delicate electric apparatus. The bigger the sending splashing, the higher the masts at both sending and receiving stations, and the more delicate the electric receiving apparatus, the greater is

this range. At present the range extends right across the Atlantic Ocean.



Wherever a vertical wire is placed in the path of an electric wave an electric disturbance will be created up and down this wire during the passage of the wave, and this disturbance, if strong enough, can act on suitable electric apparatus so as to register a signal. A single wave may pass by a mast in, say, one-millionth of a second, according to the length of the wave. But this brief disturbance suffices. In sending a wireless message every dot and dash involves a succession of waves, or an individual wave train. This train is short for a dot and long for a dash. Dots and dashes, in proper sequence, spell out the message.

What is the nature of the wave, or of these vertical walls, that we imagine to fly across the landscape at such an enormous speed? If we carried our imaginary aerial automobile into one, so as to travel in the wall and examine it leisurely before it dwindled away to insignificant remains, we should expect to find that in the advancing wave there was a feeble vertical electric force, so that an electrically charged pithball suspended from the aerial automobile would be attracted either vertically upward or downward, according as we examined the positive or negative wall. Moreover, there would be an accompanying feeble horizontal magnetic force, so that a delicately poised compass needle on board our flying car would be deflected either to the right or to the left, according to whether we traveled in the positive or negative wall. Such are the warp and the woof of the electromagnetic fabric which constitutes these waves. They are not tissued of matter, but of electricity and of magnetism.

And how are we to distinguish at any receiving station between waves coming simultaneously from New York, Boston, Philadelphia, Chicago, San Francisco, London, Paris, Vienna, Bombay and Pekin without invidious disregard of other places and ships at sea? The more remote places take care of themselves at present, because their waves are too feeble and exhausted to reach us. The nearer places might well conflict, but by tuning the apparatus at our receiving mast to respond only to waves say 500 yards long, all waves save those of the particular station or stations which emit that length of wave will not be audible. Besides, there are other modes of securing artificial selection of signals, otherwise a modern tower of Babel would be erected in the circumambient air.

Manifestly, wireless telegraphy is destined to become a great civilizing and socializing agency, because the firmament of the world is the common property of all nations, and those who use it for signaling inhabit it, in a certain sense. When all nations come to inhabit the firmament collectively they will be brought into closer communion for their mutual advantage. A new upper geography dawns upon us, in which there is no more sea, neither are there any boundaries between the peoples.

Now that wireless telegraphy has entered the commercial field of transoceanic telegraphy, it becomes of interest to inquire whether it is likely to supplant the submarine telegraph cables, some 200,000 miles of which engirdle the oceans of the world. Wireless telegraphy has an undisputed territory on the ocean in maintaining telegraph communication with moving vessels, where submarine cables cannot reach them. Now wireless telegraphy proposes to compete with cables for messages from continent to continent. It may be safely said that, up to the present time, wireless telegraphy has helped the ocean cables by bringing messages

Hypothetical Expansion of Wireless Telegraph Waves Over the Globe.

to them from ships at sea much more than it has hurt them by robbing them of messages. If wireless telegraphy were to remain stationary, and make no further technical progress, it is very doubtful whether, with its present capabilities, it could reduce materially the traffic over submarine cables. On the other hand, however, wireless telegraphy is still very young, and its limitations have by no means been determined. It is, therefore, conceivable that at some distant date it may attain such a degree of development as to render ocean cables no longer necessary.

CAMBRIDGE, MASS.

Judge Clark and the Supreme Court

BY JACOB TRIEBER

UNITED STATES JUDGE OF THE EASTERN DISTRICT OF ARKANSAS

IN THE INDEPENDENT of September 26th, 1907, appeared an article written by the Hon. Walter Clark, of North Carolina, under the head of "Is the Supreme Court Constitutional?"

It is not my intention to take issue with the distinguished jurist as to his views, but there are some misstatements of historical facts which I think should be corrected in order to prevent any misapprehensions as to those facts.

The distinguished gentleman in his article says:

"In the great convention of 1787, when the Constitution of the United States was framed, a proposition was made that the Judges should pass upon the constitutionality of the acts of Congress. That was defeated June 5th, receiving the vote of only two of the States. It was renewed June 6th and again July 21st, and for the fourth time it was urged on the 15th of August, but altho it had the powerful support of Mr. Madison and Mr. James Wilson, at no time did it receive the votes of more than three States. . . . Prior to this convention, the courts of four States, New Jersey, Rhode Island, Virginia and North Carolina, had expressed an opinion that they could hold the acts of a Legislature unconstitutional."

It is true, as alleged, that the courts of the four States named and also of New York had, prior to the convention of 1787, assumed the right to declare acts of the Legislature which were in conflict with the constitutions of the respective States void, but it is not true that any proposition giving to the courts or judges the power to pass upon the constitutionality of the acts of Congress was ever defeated, as no such proposition had ever been submitted to that body.

The proposition which was before the convention on June 4th and was defeated was the eighth proposition of Mr. Randolph's resolution for a constitution, which had been proposed on May 29th. This proposition was for a Council of Revision with power to veto all acts of Congress. This council was to be composed of the Executive and any convenient number of the national judiciary, the number to be determined by the convention. By referring to Madison's journal of that convention, Vol. V, Elliott's Debates, p. 151, it will be found that the proposition before the convention was the eighth resolution of Mr. Randolph, which was as follows:

"Resolved, That the Executive, and a convenient number of the national judiciary, ought to compose a council of revision, with authority to examine every act of the National Legislature, before it shall operate, and every act of a particular Legislature before a negative thereon shall be final; and that the dissent of the said council shall amount to a rejection, unless the act of the National Legislature be again passed, or that of a particular Legislature be again negatived by —— of the members of each branch." Vol. V, Elliott's Debates, p. 128.

On June 4th, p. 151, the following is found:

"The first clause of the eighth resolution, relating to a council of revision, was next taken into consideration.

"*Mr. Gerry* doubts whether the judiciary ought to form a part of it, as they will have a sufficient check against encroachments on their own department by their exposition of the laws, which involved a power of deciding on their constitutionality. In some States the Judges had actually set aside laws as being against the Constitution. This was done, too,

with general approbation. It was quite foreign from the nature of their office to make them judges of the policy of public measures. He moves to postpone the clause, in order to propose, 'that the National Executive shall have a right to negative any legislative act which shall not be afterwards passed by —— parts of each branch of the National Legislature.'

"Mr. King seconded the motion, observing that the Judges ought to be able to expound the law as it should come before them, free from the bias of having participated in its formation."

This resolution of Mr. Randolph's was defeated, evidently upon the ground as stated by Mr. Gerry:

"as the judiciary will have a sufficient check against encroachments on their own department by their exposition of the laws, which involved a power of deciding on their constitutionality."

The proceedings on July 21st referred to by Judge Clark practically related to the same resolution as found in V Elliott's Debates, p. 344. The proposition was made by Mr. Wilson, who moved as an amendment to the tenth resolution "that the supreme national judiciary should be associated with the executive in the revisionary power." This was negatived.

The proceedings on August 15th, which Judge Clark claims were an effort to vest in the judiciary the power to declare acts unconstitutional, were merely another effort to make the judiciary a part of the revisionary council, authorizing them, with the President, to veto bills enacted by Congress, and not an effort to authorize them to declare acts unconstitutional.

The resolution, which was introduced by Mr. Madison and seconded by Mr. Wilson, was as follows:

"Every bill which shall have passed the two Houses shall, before it becomes a law, be severally presented to the President of the United States and to the Judges of the Supreme Court, for the revision of each. If, upon such revision, they shall approve of it, they shall respectively signify their approbation by signing it; but if, upon such revision, it shall appear improper to either, or both, to be passed into law, it shall be returned, with the objection against it, to that House in which it shall have originated, who shall enter the objections at large on their journal, and proceed to reconsider the bill; but if, after such reconsideration, two thirds of that House, when either the President or a majority of the Judges shall object, or three-fourths, where both shall object, shall agree to pass it, it shall, together with the objections, be sent to the other House, by which it shall likewise be reconsidered, and, if approved by two-thirds, or three-fourths of the other House, as the case may be, it shall become a law."

This resolution had the approval of Mr. Mercer, and while approving it he made the remarks referred to by Judge Clark, but he did not say that the courts did not have the power to declare an act of the Legislature unconstitutional, but he "disapproved of the doctrine that the judges, as expositors of the Constitution, should have authority to declare a law void. He thought laws ought to be well and cautiously made, and then to be uncontrollable." This motion of Mr. Madison's was rejected, but not any motion that the judiciary should be granted the power to declare acts of Congress unconstitutional.

In view of the fact that all the courts which had ever past upon that question had, prior to the meeting of the convention, assumed that power, a fact which must have been well known to the members of the convention, among whom were some of the greatest jurists of the time, if the framers of the Constitution thought that power should be denied to them, why did not some member offer a resolution to that effect? There was no necessity to grant them a power which already existed, and for this reason no such proposition as stated by Judge Clark was made.

It would be folly to have a written Constitution, which is declared to be "the supreme law of the land," limiting the powers of the legislative department, if that department could enact laws regardless of the Constitution. If there is a conflict, certainly the supreme law of the land must prevail over every other.

A very valuable article on this subject, written by William M. Meigs, of Pennsylvania, will be found in 19 *American Law Review*, p. 175.

Little Rock Ark.

Grand Opera

Earlier than ever before, the grand opera season began on the 4th of this month with the performance at the Manhattan Opera House of "Gioconda," with Madame Nordica, who sang with her usual beauty of voice and finished art, and Hammerstein's new tenor, Zenatello, of whom great things were expected and who fulfilled them all. He has a genuine, manly voice of great power and a quality that suggests Caruso's, of whom he will prove a much more formidable rival than Bonci was. Perhaps, after all, we shall have that war of tenors! He will give strength to the Italian operas in the repertory, while Dalmores and Mesdames Nordica and Schumann-Heink will lend splendor to several Wagner operas to be produced at this house under the great Campanini. Of particular interest will be the modern French operas of Debussy, Massenet and Charpentier, for the principal rôles in which Mr. Hammerstein has engaged Miss Mary Garden, the leading ornament of the Paris Opéra Comique.

The season at the Metropolitan begins on November 18th with the first performance in this country of Cilea's "Adrienne Lecouvreur." Mr. Conried has engaged an almost unprecedented number of world-famed singers, and promises a repertory that will make the season a notable one. Financial troubles will not affect his audiences, for nearly the whole of the house is sold for the season by subscription. The engagement of Gustav Mahler, the famous conductor of the Imperial Opera at Vienna, will strengthen the Metropolitan in the ensemble work, which has heretofore been its weak point. A brilliant season is assured beyond all possibility of doubt, with a roster of artists including such names as Sembrich, Eames, Farrar, Fremstad, Gadski, Morena, Homer, Abott, Caruso, Bonci, Knote, Burrian, Burgstaller, Goritz, Campanari, Van Rooy, Plançon, and the sensational Russian basso, Chaliapine, reputed the most diabolic of operatic devils.

Hofmann and Hambourg

The first piano recital of the season was given by Josef Hofmann, who therewith opened his fifth American tour. There is a country where this admirable Polish pianist is even more popular than in the United States, and that is Russia. In St. Petersburg, during the past season, he gave twelve recitals to crowded houses within six weeks, and he had the exceptional honor of being invited to play in the Hall of Nobles. When he undertook his first American tour he was not yet in his teens, but an unerring instinct enabled him to play—particularly Chopin—with more subtle expression than the most mature pianists had at their command. He lost that instinct, as a boy loses his child voice, and for some years it seemed as if he was to be only an ordinary musician. But appearances were deceptive; he has become an extraordinary musician, one of whom it may be said that Paderewski alone of all pianists excels him. He plays Beethoven without pedantry, Schumann with passion, Chopin with poetry, Liszt with brilliancy. He is also a special champion of Scriabine and other Russians, which is very kind of a patriotic Pole.

Concerning Mark Hambourg it would be pleasanter to write if he were able to curb his excessive impetuosity. In technical skill he is up to all modern requirements, and occasionally, in playing a

Chopin piece or a Beethoven sonata, he fascinates with a luscious tone and dainty expression; but as a rule his fingers thump and scamper over the keyboard like a herd of buffaloes stampeded by a prairie fire.

Paderewski

The ill health from which the greatest of living pianists suffered for more than a year because of the nervous shock caused by a railway collision kept him from the stage last season. Fortunately it did not prevent him from composing; two of his new works are on the repertory of his present American tour. One of these, a sonata, will be played by him at Carnegie Hall on the 23d of this month; the other, entitled "Variations and Fugue," was the opening number at his first recital on the 4th, which, it is needless to say, attracted the usual throng of enthusiasts — worshipers who would not desist from applauding until the amiable pianist had added six extra numbers, making the concert last two hours and a half; but these devotees would be happy if a Paderewski recital lasted as long as a Wagner opera. That the great Polish pianist has fully recovered from his illness was shown by the leonine strength of his playing—a strength alternating with feminine tenderness. His new piece is too long, lasting as it does twenty-seven minutes, and the themes are over-elaborated. But there is much that is beautiful, and it is a masterwork of pianistic achievement. The public will prefer his earlier, more melodious pieces. It is needless to dwell on the incomparable charm of his interpretation of Beethoven, Chopin, Schubert, and, above all, Liszt.

Orchestral Concerts

Nearly if not quite 150 orchestral concerts will be given in New York City before the end of next May. This is probably 100 more than the public really requires, but as most of them are placed on a safe basis by the generosity of guarantors no harm is done, and a large number of players will be sure of their bread and butter. The Philharmonic and Boston Symphony Orchestras, under Safonoff and Muck, will give the usual number of concerts; so will the orchestras presided over by Frank Damrosch, F. X. Arens, Arnold Volpe, Modest Altschuler, Victor Herbert and Sam Franko. The grand opera houses will have their evening concerts every Sunday, while twenty Sunday afternoon concerts will be supplied by Walter Damrosch and his New York Symphony Orchestra, in addition to eight on Saturday evenings. This orchestra was the first in the field, with a concert at which Schumann's fourth symphony received an animated rendering, and which was further made notable by the first appearance here this season of perhaps the greatest of living violinists, Fritz Kreisler. He chose the Brahms concerto, of which it has been said that

GIOVANNI ZENATELLO
As Enzo in "La Gioconda."

BERTA MORENA.
At the Manhattan Opera House.

it was not written for the violin but against it. One forgets that joke, however, when Kreisler plays it; he puts more into it than the composer did—literally, for the cadenza he usually plays is his own, and it is really the best thing in the concerto. For the display of the emotional side in his art—his strongest side—Mr. Kreisler will have better opportunities at his recitals. A word is due here to Carl Pohlig, who brought the Philadelphia Orchestra to New York last week and proved that he is a first-class interpreter of Liszt and Wagner.

David Bispham

After an absence of two years in England Mr. David Bispham returned to his native country (he was born in Philadelphia forty-seven years ago), and opened the concert season with a program on which the late Edvard Grieg occupied a prominent place. Now that Grieg is dead, many other singers will doubtless discover the pearls so abundant among his 125 songs. Perhaps, after another season or two, they will also discover the beautiful songs of the American Grieg, Edward MacDowell. The lapse of time has left some mark on Mr. Bispham's voice, but he knows the art of concealing art, and his seriousness and clear enunciation enable him to render his interpretation of songs eloquent. There will be two more Bispham recitals, at Mendelssohn Hall, on November 14th and 21st. At the second of them a special feature will be a group of nine Franz songs.

Opening of the Artists' Season in New York

SINCE the last art notes were published in THE INDEPENDENT, we have lost our greatest sculptor, Augustus St. Gaudens, a man whose work must be better and better understood if the standard of taste and sincerity in American art is to be kept high. Fortunately we are to have a chance to study his work *en masse* under excellent conditions in an exhibition

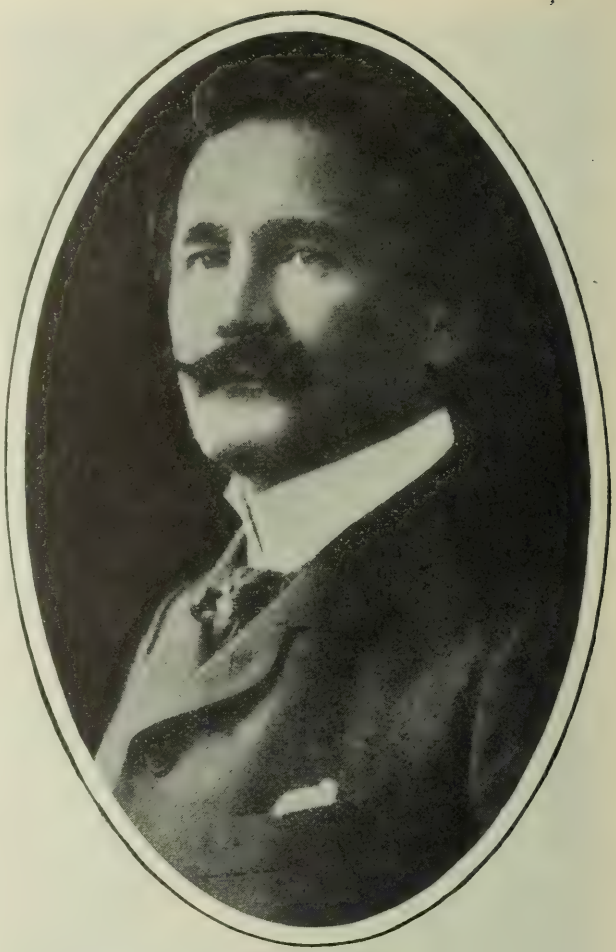
MLLE. GERVILLE-REACHE.
New contralto discovered by Hammerstein.
Copyright by Mishkin, N. Y.

MARY GARDEN AS MELISANDE
In "Pelleas et Melisande" at the Manhattan Opera House.

to be held early in 1908 in the Metropolitan Museum of Art. A committee composed of the museum officials, the heads of the various art societies and representative painters, sculptors and architects, will, with Mrs. St. Gaudens's aid, gather together as many original works as possible, and supplement these with casts and large photographs of works not in the exhibition. The opportunity thus granted us of seeing a great man's life work will be a rare one.

The Water Color Club

First of the exhibitions of the year to be held in the Fine Arts Galleries, this gives us the opportunity of seeing the great improvement made there by enlarging the section of the building between the south gallery and the Vanderbilt gallery and removing the partition that formerly divided it into a central corridor and two small side rooms so badly lighted that they were known as "the morgues" to exhibitors. This section is now a pleasant gallery of about the same size as the south room, and a place on its walls will no longer be considered unfortunate. Of the exhibition itself not a great deal can be expected. The summer rarely calls forth the best work in painting. The most important things here are, however, very good indeed. Notably Mr. Hugh Breckenridge's portrait of F. R. Whiteside, which had a



THEODORE CHALIAPINE.

gold medal at the Philadelphia Art Club. This strong young painter is to have an exhibition of his own at Fishel, Adler & Schwartz's this month. Next to Mr. Breckenridge's portrait and quite as important is Mr. Snell's spacious bay scene, with the dazzling rainbow and delicately understood values in the stormy tones. The Beal prize picture, "Vacation Time," by Mora, is not quite satisfactory in handling of values in shadow, but is a good breezy rendering of a sailing party. Comparatively few pictures show us a personal point of view. One that does is by Mary Langtry, and in lieu of title for it the catalog quotes: "And scurvy care is dead to such as we." The picture makes one into a person with a sense of humor standing on a bare beach looking down on a fine insolent old duck who dominates the situation, so that we cannot see more than a mere strip of the sea at the top of his world. The thing is delicately handled in color.

There are many charming landscapes in which good tone and atmosphere are rendered, but few that hold one for any great length of time. Marianna Sloan's landscapes are full of her intense interest in her subjects and usually show mood. Florence Snell has two charming street scenes and others not quite so successful. Eli Harvey, the animal sculptor, shows a twilight nook in which a poorly drawn Orpheus charms some very interesting and interested lions. Hilda Belcher shows a picture called "The Checkered Dress," which is clever in handling, but ought not to have been painted. Albert Herter's "Almond Tree" is knowing and tedious to a degree. A. P. Button has a whimsical imagination and clever technique. The illustrations by Elizabeth Shippen Green are not improving with the years, and the decorative motive in landscape or figures here is not interestingly handled. The Japanese artists, Yeto and Makino, show works that make one wish that they had not denationalized themselves. They have lost the delicate Japanese decorative sense and apparently gained nothing.

The most important exhibition announced for November is that of the National Society of Craftsmen, which will open November 19th at 119 East Nineteenth street, and will be of greater scope than any crafts show ever held in New York, it is hoped. At the Macbeth and Montross Galleries group exhibitions have already been held of works by the special men whose productions these two dealers handle. Following the first group of oils, Mr. Montross has hung water-colors by American artists, and Mr. Macbeth announced an exhibition of the works of Mr. Augustus Vincent Tack. Mr. Macbeth's corridor exhibition of photographs of the artists whose pictures he likes to hang is very interesting. Obviously the possession of large and well-set noses is important for art production of quality. Of all the men represented William Morris Hunt seems to have been best equipped intellectually.

CARL POHLIG.
Of the Philadelphia Orchestra.

Old Masters Dispersed

The sales of two of the choicest European collections, which took place recently —that of the Kann collection in Paris and the Ashburton collection in London—will eventually increase the number of great works by old masters now in America.

There were 161 canvases in the Kann collection, and it was bought by Dureen Brothers and Gimpels and Wildenstein, and most of it will be dispersed in December to various collectors who have been buying of the dealers since the sale. Mrs. C. P. Huntington has bought the Rembrandt "Philosopher" for $280,000 and several other valuable works. Mr. Morgan, Mr. Gould, Mr. B. Altman and other Americans are reported to be among the purchasers of the beautiful examples of old French, Italian and Dutch masters. The collection as a whole is rumored to have brought nearly $4,000,000. The Ashburton collection was bought by a syndicate of London dealers, the Agnews, Sully and Wertheimer, for $800,000. It contains about sixty fine Dutch, Flemish and Spanish masters.

An exhibition of the work of American artists living abroad is to be arranged by the International Art Association, the pictures to be hung in other cities after being shown here. Later the same society will give us a chance to see some contemporary French art.

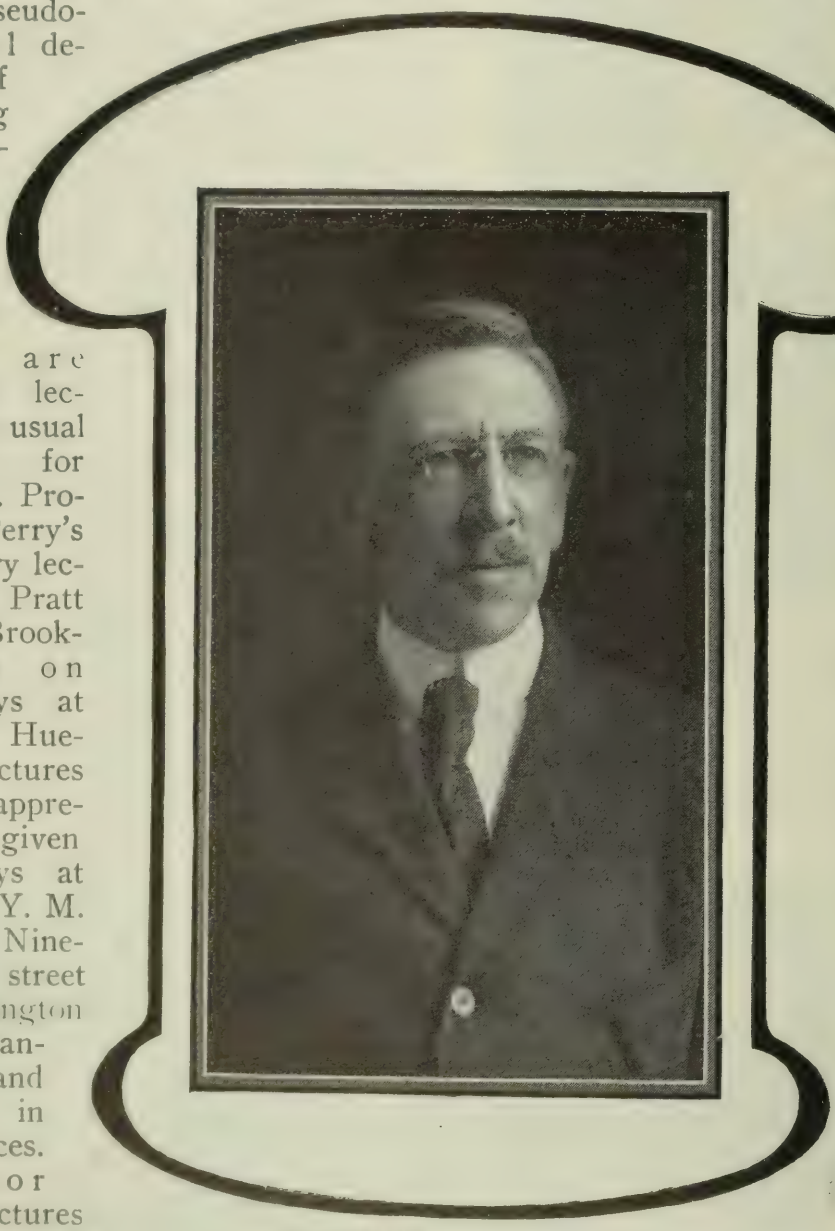
Next summer an International Congress of Art Teachers is to be held in London, and plans for it are already being formulated. The amazing number of serious people who are advancing the general knowledge of art thruout the world will send representatives to this great meeting, where the exchange of ideas, exhibitions of the work done educationally in the various countries, discussions of theories, etc., will be stimulating to a great degree.

Mayor McClellan has appointed Walter Cook, of Babb, Cook & Willard, advisory architect for the city as a result of the report of the Municipal Art Commission in regard to present haphazard methods in the selection of civic sites and in the choice of designs for city structures. The commission is preparing a catalog of the works of art belonging to the city. Their absence in the boroughs of Bronx and Richmond is lamentable in one way and fortunate in another.

New Church Decoration

Elliott Daingerfield has completed the decorations for the Lady Chapel of St. Mary the Virgin in West Forty-sixth street. He has been at work upon them for five years and they represent a rather more ambitious decorative scheme than any other church has commissioned in recent years. The subjects chosen are, as befits a ritualistic church, traditional—the Epiphany, the Magnificat, etc. They are treated with almost pedantic symbolism, and the attempt to combine realistic por-

THE MAGNIFICAT.



New Decoration by Elliott Daingerfield for the Church of St. Mary the Virgin.

Copyright, 1907, by Elliott Daingerfield, N. Y.

traits of models in groups composed to present a mental survey of the course of Christian tradition thru the ages fails, partly thru absence of all emotional effect in the color and lighting. It is difficult to criticise a decorative painter trying to be religious in these days when so little in life prepares him for such work, and Mr. Daingerfield has carried out very well the pseudo-medieval demands of the setting of his canvases.

Art Lectures

There are more art lectures than usual announced for the season. Professor Perry's Art History lectures at Pratt Institute, Brooklyn, are on Wednesdays at 4. Dr. Huebach's lectures on art appreciation are given Wednesdays at 8 p. m. in Y. M. H. A. Hall, Ninety-second street and Lexington avenue, Manhattan, and repeated in other places. Professor Hamlin lectures Wednesdays, 8 p. m., in Public School 165, 108th street, near Amsterdam avenue, on the architecture of great cities. N. B. Tuthill is also giving architectural lectures at the Public Library Building in East Ninety-sixth street. On November 26th, under the auspices of the Guild of Book Workers, Mr. T. J. Cobden-Sanderson, of London, the noted head of the Doves Bindery, will speak at Carnegie Lyceum on his craft.

ARTHUR FAIRBANKS.
Lately elected to the directorship of the Boston Musuem of Fine Arts.

Arthur Fairbanks, who lately assumed the directorship of the Boston Museum of Fine Arts, is the son of Prof. Henry Fairbanks, of Dartmouth College. He was born at Hanover, N. H., November 13th, 1864. He was graduated at Dartmouth in 1886. He spent some time at the Yale Divinity School and at Union Theological Seminary. His degree of Ph.D. was given him by Freiburg-in-Breisgau University in 1890. He resided as a Fellow of the American School of Classical Studies at Athens, and has attained high rank as an educator and archeologist. Professor Fairbanks is the author of "Introduction to Sociology," "First Philosophers of Greece," "A Study of the Greek Paean," "A Handbook of Greek and Roman Mythology," and, most recently, "Athenian White Lekythoi." He will have an unusual opportunity in Boston in his new field of work, and there is every likelihood of his securing new laurels.

The first exhibition of the present season, consisting of ornamental leather

bindings executed in America before 1850, began at the Grolier Club with a private view on November 7th, and will continue until the 30th inst. A Bible, in first edition, printed by Christoph Saur in 1743, which was the second Bible printed in this country, was a notable exhibit. No. 10 in the catalog was a prayer book printed by Hall & Sellers in 1786. Hall & Sellers, as was also Benjamin Franklin, were printers of much of the Continental currency. No. 18 was the first American edition of Robert Bloomfield's "The Farmer's Boy," illustrated by A. Anderson. Twenty-seven prints, including portraits of Gutenberg, Thos. Dibdin, William Blake, Richard Bently, Bartolozzi and Hans Holbein, and a collection of American works on bookbinding, were also incidentally shown in the Grolier galleries. The catalog, with its reproduction of the cover of Miss Hart's "Letters from the Bahama Islands" (1827), contained 136 numbers.

A little collection of the drawings and paintings of Sigismond De Ivanowski was shown for the first time at Pratt Institute during the first half of this month. A portrait of the artist's wife was perhaps the central figure, around which were grouped Ethel Barrymore, Maude Adams, Alla Nazimova and other theatrical stars in character poses. His figure and *genre* pieces were well chosen and typical of this notable artist.

The Drama

The scope and purpose of dramatic criticism in THE INDEPENDENT are so different from that of most periodicals that a few words of explanation may be necessary. We are under no obligations to mention all or any of the plays presented, but we realize that there are a great many persons thruout the country who want to know what are the best plays now on the American stage, just as they want to know what are the best pictures and the best books now being produced. The number of plays which the readers of THE INDEPENDENT would regard as worthy of their attention is comparatively small, and it is all the more important that these few should be picked out from the host of trashy and vulgar productions among which they are hidden. For those of our readers who live outside the large cities, but visit them for a few days once in a while, the monthly numbers of THE INDEPENDENT with its brief dramatic guide will be of special service in preventing their wasting their limited time.

David Warfield in "A Grand Army Man" has abandoned the foreign element that he portrayed so skillfully in "The Auctioneer" and "The Music Master," and he is now presenting a type that is purely American. The simplicity of method affected by Warfield is emphasized in "A Grand Army Man." There is, of course, a story to tell, and he tells it without fuss or feathers, and those who look at his acting might as well see a real Grand Army man in his simple life and with his homely joys and virtues so intense is the realism. Warfield is most effective in the second act. When his protege is charged with taking the funds of the army post he repudiates the charge with fine scorn. The sorrow that falls upon him and all but overpowers the old man is a magnificent piece of acting. When the reaction comes and he realizes that the boy he has loved with such pure sentimentality has become a fallen idol, he strikes him with a blacksnake whip, only to be instantly sorry. Warfield's reputation as a great dramatic artist is not in danger of losing any of its deserved luster thru his presentation of "A Grand Army Man." It is already one of the season's unqualified successes.

From an artistic and literary point of view the most conspicuous event of the opening season is the presentation of the "Master Builder," one of the most interesting of the Ibsen dramas to read, but one which has never been a popular success until Madame Nazimova took it up this fall. In our issue of October 17th Madame Nazimova gave her views of the significance of the character of Hilda, so here we have only to consider her bodily interpretation of it. It is her favorite rôle and one which she is exceptionally fitted by physique and temperament to fill. Hilda's gauche girlishness and whimsical charm are portrayed in a way to attract a much wider audience than the mere Ibsen lovers. It is only those who have seen her in the Russian company in the little theater on the East Side who have expressed disappointment

in her present work. To be sure she had then Orleneff for her Master Builder, and a supporting company better than her present one, but besides she seems to have modified her conception of the part, now giving to Hilda less of mystical and poetic element necessary to bring out the meaning. On the whole, therefore, we prefer Madame Nazimova in Russian, for one has to have the play pretty well in mind anyway because her English is more often unintelligible than last year owing to her rapid enunciation.

It has been often prophesied that the next step in our literary evolution would be the development of a poetic drama, but the reception that has been given to such plays does not afford much ground for the opinion. A better example of American work in this field could hardly have been chosen than Percy Makaye's "Sappho and Phaon," which we reviewed September 5th. It was staged by Mr. Fiske in an artistic manner, with Bertha Kalich as the Lesbian poetess. The interesting prelude, the double frame in which the tragedy is set, was not utilized, altho it seems an ingenious device to effect the difficult transition from the present to the semi-mythical and symbolic world of the play. It gives us a stopping-place nineteen hundred years back where we can catch our breath before going on six hundred years further. Whether for this reason or the failure of most of the company to give the verse dignified and clear declamation, the play, as presented in New York, lacked poetic power and charm. Madame Kalich had a worthy rival in Miss Adele Block, who made the most of the part of Thalassa, the impersonation of domestic love in its perpetual strife with sensuous love typified by Sappho.

"The Thief," a drama of passion by Henri Bernstein, in which the principal parts are taken by Kyrle Bellew and Margaret Illington, achieved popularity at once. It is typically French, both by its excellent stage-craft and its fantastic codes of honor, in which the sexual differentiation of ethics is carried to the extreme. When the young man is found guilty of not stealing 20,000 francs but only guilty of perjury and attempted seduction of a friend's wife, he is regarded as a good fellow by everybody, including the injured husband. When the wife is proved innocent of unfaithfulness, tho guilty of lying, burglary and forgery, she is held to have vindicated her honor and is restored to the esteem and affection of all. It is impossible to have any sympathy for the vain and silly heroine or with men actuated by such conventionalities.

"The Evangelist," by Henry Arthur Jones, a more rational play and far better acted than "The Thief," did not meet with the same popular favor. Without any great star in the cast every part was adequately taken. The first act, in which the coming of a sensational revivalist to the village is discussed by the bishop, the vicar, the Congregationalist minister, the Baptist pastor, a manufacturer and a scientist, was as perfect a bit of comedy acting all around as one ever sees, pointed in its satire without dropping into the usual inartistic and offensive caricature. There is also a strong dramatic moment in the third act, but the fourth is a useless addendum.

The Wild West show is as popular this year as ever. "The Round Up," by Edmund Day, is in fact nothing more than a stage adaptation of such exhibitions as Buffalo Bill and the 101 Ranch have given out of doors. Real bucking bronchos, a tribe of mounted Indians, cowboys, horse thieves and soldiers, mountains and plains, are all brought in some marvelous way known only to the stage carpenter into the space of a few feet. But except for the spectacular effect of the big battle in the wind-eroded Trias of the bad lands of Arizona, the play amounts to nothing.

Just over the border in old Mexico is the scene of Augustus Thomas's new play, "The Ranger," in which Dustin Farnum, formerly the "Virginian," takes the leading part. It is a more artistic play than the preceding; the acting more restrained by regard for dramatic power and conformity with reality. The contrast between the American hustle and Mexican mañana method is well brought out, an unusually fine touch being the consistent use of the Spanish language by the Mexican characters. Mr. Farnum has a stalwart boyishness that is very taking.

It is unfortunate that George Ade

seems unable to repeat his earlier successes in the portrayal of American character. Most of our plays deal either with the slums and the frontier or with the circles of fashion and wealth, quite neglecting the range of the middle classes, from which Mr. Ade's characters are taken. His latest comedy, "Artie," is delightfully clever and lifelike in its portrayal of the loves of shop girls and clerks, and amusing and original in its lines, without at any moment descending to vulgarity, yet there is in it not enough of the deeper meaning of life and of human interest. The slinging of slang and the success of a bluff in real estate are not in themselves sufficient to make a great play.

"The Merry Widow"

Two decades ago real operettas were plentiful everywhere—stage works with coherent plots, funny and not too farcical dialogue, and music by masters of melody like Strauss, Suppé, Sullivan, Lecocq, Audran. Then a blight struck this form of entertainment; after a while it seemed as if Victor Herbert were the only man left to create something approaching genuine operettas, and even he was compelled to make concessions to the managerial demand for vaudeville under the name of "musical comedy."

About two years ago rumors came from Vienna that a new Strauss had been discovered—a man named Franz Lehar, who could write waltzes and operettas like the Waltz King. His "Merry Widow" was an immediate success; it has had nearly five hundred consecutive performances in the house where it was first produced, and of the leading waltz in it more than a million copies have been sold.

The merry widow is a native of the mythical country of Marsovia; her name is Sonia and she is loved by Prince Danilo. But the ruler of the country, the Prince's uncle, does not allow him to marry Sonia, because she is poor, and sends him off to Paris. Sonia marries a banker, who soon dies, leaving her a vast fortune. With this she also goes to Paris, and there, after diverse very Parisian adventures, she marries the Prince. There is much frothy dialogue, some of it really witty, and the music is equally light and entertaining. With hardly a dull moment, the operetta has a swing which carries the audience along and often arouses its enthusiasm. Lehar has the true Austrian, semi-Asiatic faculty of alluring the music-lovers, of hypnotizing them by his dreamy, languorous measures; and Mr. Savage has provided an excellent cast, headed by Ethel Jackson and Donald Brian, together with a sumptuous stage setting. There can be no doubt that "The Merry Widow" will remain at the New Amsterdam Theater till next summer. A second company is being trained for the road.

STAGE SETTING FROM ACT III IN "THE MERRY WIDOW."

A Race Exhibition

BY WILLIAM HAYES WARD

I HAD seen numerous American expositions, even in childhood that of the Crystal Palace in New York, and I was not particularly anxious again to see the somewhat stereotyped displays made by the Government and by the States, the machinery, the output of mines, the cannon and the jewelry; but I had never seen a negro exhibit, and was curious to learn what it would amount to. I knew well enough that I could not see such a grand display of products as the rest of the Exposition would show, and I was not disappointed. It is not very great in itself, but it is full of encouragement and hope.

It will surprise many readers to learn that there was serious opposition on the part of not a few influential colored people to having a separate negro exhibition. They said they did not want any Jim Crow separation of their products and work. There is a very sharp line of division among negroes as to their attitude toward the race discrimination that exists in this country. A certain class, including many of the best educated among them, prefer to resent any and all injustice and refuse to bend before it. Another class, best represented by Dr. Booker T. Washington, think it best to yield for the present to the irresistible, and to take advantage of the privileges allowed by the dominant race, in hopes of something better in the future thru education and wealth and the better understanding sure to come between the two races. The opposition of the former class nearly wrecked this exhibition, until the men in charge of the plan secured

PRESIDENT ROOSEVELT ENTERING THE NEGRO BUILDING.

THE BALTIMORE SCHOOL EXHIBIT.

from Congress an appropriation of $100,000, the only appropriation made except one of $5,000 made by the Legislature of North Carolina, whose Governor was the only one to visit the exhibition on the States' days.

The president of the Jamestown Exposition Company was General Fitzhugh Lee, and the man at the head of the Negro Exposition Company is Giles B. Jackson, who was Lee's slave and body-servant during the Civil War, who slept by his side in the field, and who carries in his forehead the scar of a Yankee bullet. He is now a lawyer in Richmond.

As soon as funds were secured Mr. Jackson, and the men he called to his help, took hold vigorously of the task, and the result shows that not only can negroes work individually but also co-operatively. Everything about their exhibition has been done by colored people. The building, a large and attractive one costing $40,000, was designed by a negro architect, Mr. W. S. Pitman, a graduate of Tuskegee and Drexel Institutes. The contractors were Virginia negroes, and the executive committee, who have directed the entire work, are negroes. Mr. Thomas J. Calloway (efficiently aided by his wife, both graduates of Fisk University), Mr. A. F. Hillyer and Mr. G. B. Jackson.

In a two story building, 213 feet long and 129 feet wide, there is room for a considerable display, and it is well filled and in parts crowded. Indeed there are 9,114 exhibits installed. This does not mean that they are all of a high order of art or workmanship, for they are not. Indeed among the individual exhibits there are those which display great labor with a very crude culture in art. There are embroideries that are very creditable and others that are merely laborious efforts to do something fine. But these

show pathetic ambition and persistence even tho untrained, and a pride in success which has reached the utmost limit of their opportunities.

But if there are occasional exhibits by individuals which excite admiring pity, by far the largest number do credit to the race so lately out of slavery and so short a time at school. At the first entrance is a bank in actual operation. It is a branch of the True Reformers' Bank, of Richmond, Va. The central institution does an annual business of $1,500,000, and carries deposits by negroes of $336,272.87; while this branch bank has done an actual Exposition business of $25,000 in the cashing of checks and money orders for visitors, a concrete demonstration of the ability of the negroes to do business not easily to be gainsaid.

But, naturally, the most notable part of the display is that of education. It does not differ much in general character from that with which visitors are familiar in other expositions, but it is impressive thus to see the work of colored schools set by itself so that one can actually see what progress has been made in these forty years. Of course the ordinary piles of copy-books in which pupils do sums in arithmetic or draw maps are not particularly exhilarating anywhere, but it is different with the products of industrial education, and in these the display is excellent. Particularly is it a surprise to see the work of certain colored public high schools in Maryland, Virginia and North Carolina, and in the District of Columbia; for in these States the display of the colored schools has been allowed to go to the Negro Building rather than to the general exhibit of education in those States. That public schools as well as the larger private institutions are beginning to em-

FISK UNIVERSITY BOOTH.

phasize manual training is an agreeable surprise, and this even in rural schools, as shown by the schools of Norfolk County, Va. There is a benevolent society which aids and directs this class of work, thus supplementing the support from public funds. The public schools of the cities of Newport News, Lynchburg, Norfolk and Portsmouth, in Virginia, and of Durham and Asheville, in North Carolina, together with other cities, have very good exhibits of both literary and manual training work. There is also a fine exhibit from Washington, showing the work of the schools from the elementary grades thru the high and normal schools. Miniature school rooms display the equipment of these schools, and appropriate figures represent pupils and teachers at work.

Every one knows the good work done in education for the negroes by such private institutions as Hampton and Tuskegee Institutes, which are devoted particularly to industrial and manual education, and by Howard, Fisk and Atlanta Universities, among those which are devoted especially to literary education. Atlanta sends no display, for it is strict in objecting to any Jim Crow separation of the races in civil matters. The exhibit from Hampton is admirably displayed, not by a multitude of objects, but by, first, a picture of the students performing the work, then by a single sample of it, and then by a chart outlining the course of study for that trade or industry. For example, the machinist trade is represented by a picture of the shop and by an engine made by the boys; printing by a picture of the students at work and by books and pamphlets turned out by that department. So wheelwrighting and blacksmithing are objectively represented by a fine delivery wagon, and harness-making by a fine set of harness. So agriculture is illustrated by growing plants, and the girls' training is shown by exhibits of cooking and dressmaking.

There are two or three Catholic schools for negroes, supported by Miss Drexel, which offer fine exhibits of industries. Such is the St. Francis de Sales and Saint Emma Industrial Institute, with its many fine vehicles and other industries for boys, and its sewing and fancy work for girls, which surpasses anything else of the sort in the building. We notice a large embroidery representation of Da Vinci's Last Supper, which is admirably wrought. In iron work there is nothing better in the building than the various display of Tongaloo University in Mississippi, which also shows good literary work. Prominent among other schools with creditable displays are the Claflin University of South Carolina, the Joseph K. Brock School of Virginia, and the Robert Hungerford Industrial School of Florida. From the public schools of the Gulf States there is nothing on exhibition.

But the educational exhibit which attracts the most attention is that by Fisk University, of Nashville. It has the usual exhibit of products and school work, and added to it is a demonstration by the students themselves of what they have learned. A sophomore gives a little lecture on chemistry or biology or any other study, and this is followed by songs from the Jubilee Singers, which are listened to by a crowd of visitors with great delight, and by no means all negroes. Indeed one is surprised to see how many white people visit the building. A man from Mississippi reported that he was told by an earlier visitor not to fail to see the Negro Building, and a visitor from Texas tells what a good thing it would be for his State if the colored people there had the development shown here. He does not know what the Texas negroes are doing, and it is one of the special advantages of this exhibition that it gives the Southern whites a fresh view of a phase of negro progress which they have not suspected.

But we must not neglect to refer to some of the individual exhibits. We have mentioned the bank already. The most striking and artistic is a series of historical tableaus by Miss Meta V. Warrick, a young colored Philadelphia sculptress, representing the development of the negro in this country. The figures are small and in plaster, appropriately dressed. The first represents the landing of the negro slaves at Jamestown. They are bound and wear only their native savage dress. Then follows their work in the cotton field; then we

have the runaway slave in hiding; then their organizing a church in a blacksmith's shop, the beginning of the African Methodist Church; then the negro's loyalty to his master in the Civil War, defending his owner's home. The scenes which follow show the pathetic beginnings of negro education in the new era of freedom, the erecting of their first homes, their service as soldiers, their work as farmers, builders, contractors and bankers. All these are artistically and effectively presented. It is notable that we have, among the many other art objects, no painting by Mr. Tanner, the famous artist, whose work is so well known in the Paris exhibitions. Perhaps they could not afford to insure it.

Of other individual exhibits may be mentioned the fine samples of wheat, corn, tobacco, cotton, etc., particularly in the North Carolina exhibit. There is a list of over five hundred patents issued to negroes, with fifty models displayed, particularly for agriculture, railroads and manufactures. Another notable exhibit is a list of five hundred authors and a collection of books by negro writers, and a surprising display of newspapers edited by negroes.

If the numerous commendations by visitors in any way indicates effective results, it is safe to say that no single effort to demonstrate the negro's claims upon the South and the country for an American's fair chance has ever been as successful as the negro exhibit at Jamestown. Considering the opposition there has been on the part of leading negroes to the making of any exhibit at all, the success attained has proved that no opposition from within the race, any more than prejudice from without, can discourage the negro from making the most of his opportunities.

Literature

The Stooping Lady*

A new spirit has been born in us, as if God had created another Adam soul and begun the world again. And when a new spirit is born it not only breasts the future, but the wings of it stir the very dust of centuries dark and deep. And so now, while the Socialists and other economists are filling the heart of the world with the young, impatient blood of human brotherhood that shall first destroy and then reclaim it, the novelists are reforming the past, so that all history shall tally with the present in ideals and emotions, and shall only differ from it in the accident of facts. Looked at from the standpoint of veracity this is an absurd undertaking, but it proves the noble madness of the modern mind. And it accounts for the spirit of Socialism to be found in the historical romances of the year. There is Mr. Thorne's story of "The Serf," which calls so loudly for the reform of the twelfth century, and which represents the rebellious serf as the ragged pilgrim of progress, carrying within his hairy breast a vague passion for liberty and love which in this day has got the lower orders of manhood born into a kind of universal herodom. And now here is Maurice Hewlett writing as if he were a sort of John the Baptist to Robert Owen. He lays the scene of his story in England at the beginning of the nineteenth century. The heroine is the beautiful, headstrong daughter of an Irish rebel, who had stolen her mother from the very iron coffer of the English Whigs. The scene opens with the return of this Hermia Mary to her grandmother, whose sympathies were all with the nobility and against the common people. And it soon develops that Hermia has exactly the same order of intelligence as that of, say, Emma Goldman, dashed up with the fire and spirit of patrician blood rather than anarchistic aspirations. The combination makes a splendid lady of the imagination, and Mr. Hewlett is to be congratulated upon having created her out of psychic phenomena which the Lord himself never could have provided in the real order of things.

What Hermia thinks and what she does in this iron coffer life of the aristocracy form the interest and incidents of the story. That she could love the butcher, become engaged to him, and wind up by standing under the pillory at Charing Cross during the hours of his punishment like a sixteenth-century heroine in the presence of a Chicago mob shows the power of Mr. Hewlett's imagination and his erratic ingenuity for making a confusing but stimulating compound of the past and the present. Note, for example, these words of Hermia after a visit to her beautiful, brave, refined and scholarly butcher; she burned with shame

> "to be driven about in a carriage, splashing mud in the face of honesty with my hoofs and wheels, to be herded in a pack among men who drank too much and women who wore too little; to gape at a conjurer, at pictures, at women jigging, . . . what a life to lead in a busy world!"

Undoubtedly these were the circumstances of her life which some have come to regard as ignominious, but no one knew it at that time save a few attic philosophers and passionate dreamers. And Mr. Hewlett's insincerity consists in placing Hermia Mary out of drawing with her very state of being by claiming such sentiments. One might as well represent the magnificent old Abraham as making an apology for polygamy.

The one truthful sentiment uttered in regard to Hermia (provided she did what is claimed for her) is that of her noble lover, as if for the moment the author ceased to be the heralder of reforms and became the true artist. Hearing of her standing with her butcher at Charing Cross, Lord Rodono exclaims: "She's mired herself—she's draggled—faugh! What a maid fell there! Bewitched, be-

*The Stooping Lady. By Maurice Hewlett. New York: Dodd, Mead & Co. $1.50.

sotted, beguiled, betrayed. What a high head—and down it droops! What a bold flight—toppled, shot in the breast!" And then at the very end comes the idealist's plan. In the last sentences the author flings himself upon his knees in gratitude and adoration for the "stooping lady." And, all told, it is an admirable story, but as unfaithful in spirit to the times it is supposed to portray as it is loyal to that of the present.

Factors in Modern History

It is long since we have approached a book of historical philosophy so intelligent or so incisive as this series of lectures on England in the sixteenth and seventeenth centuries which Mr. A. F. Pollard, a professor in University College, London, has collected under the title *Factors in Modern History*.* The function of the historian is, as Mr. Pollard insists, vastly more important than the English patronage of history would lead one to believe. He says:

"Nothing can be explained in human affairs without reference to the past. . . . History . . . supplies the only means whereby we may understand the present, and the only solid ground on which we can base our forecasts of the future . . . [It] has to deal with the problems which have baffled statesmen and thinkers thruout the ages, and the mental equipment required for the adequate discharge of that function is seldom found, and is only acquired at the cost of infinite patience and toil."

In the prolonged debate upon the educational value of history this volume will give much comfort to the advocates of its study.

The purpose of Mr. Pollard is, distinctly, *not* to write a text-book for the period of his lectures. He has a low opinion of text-books in general, since they contain too often "a re-hash of old facts flavored only with an original spice of error," and "prefer knowledge to understanding, and seem expressly designed to nip the bud of historical interest and to clip the wings of historical imagination." Our American-made historical texts are perhaps less open to this attack than are those of English origin; but we are well content to allow their whole breed to be slandered when the revolt against them leads to a brilliant summing up of views rather than facts, such as we have here.

The author has written of the institutions of England during the Tudor and Stuart centuries. He has something to say of nationality, the advent of the middle class, and the new monarchy in its relations to the reformation, parliament and the social revolution. The political, religious, constitutional and imperial ideas of his period all come in for attention, to say nothing of a final lecture on the study of history, or, more accurately, the lack of it, in the University of London.

The growing tendency to include in history all the elements of life, economic, social and political, and to regard the economic conditions as of fundamental importance, has compelled a re-writing of history in terms of present thought. The older historians—and some of them are still living—have often believed that the history of the sixteenth and seventeenth centuries has all been written. But the demand for a cause for every event has uncovered a wealth of source material upon economic points that has still to be excavated and appraised. So far from being done, the work is hardly begun. It is more important, now, for a professor of history to point out these changing ideas than to recount more facts. History has ceased to be a memory drill, teachable by any instructor with a vacant hour, and has become a vital force in education. If it is still wretchedly taught, that is because the new leaven is too new to have lightened the whole loaf. But once its real significance is appreciated there will be no lack of hands and heads for the work. And toward this appreciation Mr. Pollard has made an eminently sane and useful contribution.

The Virgin Birth of Christ

Some four years ago two able monographs on the miraculous conception, written by the German scholars, Professors Soltau and Lobstein, made available to English readers the arguments on which a large number of Continental students base their rejection of the historical character of the narratives of the infancy contained in the First and Third Gospels. These books were circulated

*Factors in Modern History. *By A. F. Pollard.* New York: G. P. Putnam's Sons. $2.25.

quite widely, and revealed to large numbers, greatly to their astonishment and sorrow, how strong a case could be made out against the opinion which has prevailed for centuries. It is a little remarkable that no adequate reply has been made to these treatises, despite the great and tender interest in the subject and the controversies it has occasioned in recent years. We have now, however, two very good essays on the topic, from the conservative point of view, written independently and about the same time. The book of Professor Orr[1] is the result of lectures delivered in this city last winter under the auspices of the Bible Teachers' Training School. They attracted wide interest at the time, doubtless partly owing to the case of Dr. Crapsey, then fresh in the public mind. Dr. Orr is a strenuous conservative, a man of wide reading and information, and of unquestioned integrity and sincerity of conviction. He never quotes an opponent's position unfairly, nor intentionally presses his own argument beyond his honest conviction of its worth. His book is probably the clearest and strongest defense of the traditional view that can be made at the present time.

It is doubtful if such as have felt that in reading the early chapters of Matthew and Luke they were in the presence of legend rather than history will change their minds after reading Dr. Orr's earnest apology. The reason is that Dr. Orr is a dogmatic theologian, and the problem he handles is one of literary appreciation. With all his penetration and his honest endeavor to put himself in the place of those who doubt, it cannot be said that he realizes the obstacles in the way of literal acceptance of the infancy narratives. For example, a familiar argument against the miraculous birth is that the genealogies trace the descent thru Joseph, which would make it appear that their compilers had no knowledge of the claim of supernatural conception. But to Dr. Orr it is a sufficient answer that to Luke and Matthew the genealogies were not inconsistent with birth from a Virgin, and therefore they are *not* in reality incompatible. Dr. Orr is thinking of the Evangelists as careful historians whose logic can be trusted; but those he labors to convince are thinking of earnest Christian teachers who desired to edify, and who gathered here and there stories of their Master which they believed would be spiritually useful, without considering always whether they would logically hold together.

It may further be doubted whether Dr. Orr has caught quite the spirit in which his problem should be approached for the large number of those who are seeking light upon it. He writes of "attacks" upon the doctrine, and of its "assailants," and the image of a Puritan pike and broadsword seems almost to start out from some of his pages. But those in the camp against him do not need to be charged with the truth; they require only to be shown clearly and unmistakably where are its lines. In this respect Mr. Sweet[2] would seem to have the better of the Glasgow professor. His position is essentially the same, his examination of the subject is much more detailed, his reasoning is not always cogent, but his research has been patient, his consideration of the subject on all sides thoro, and he has preserved thruout the convincing spirit of inquiry. These volumes supplement one another, Mr. Sweet's being fuller in the examination of particular subjects, Dr. Orr's being superior in clear presentation, and together they carry the discussion as far as it can go until the larger question of the literary character and inter-relation of the Gospels is more nearly settled.

Three Art Books

THREE new volumes in that excellent series of monographs, known as The Library of Art, claim the attention of lovers of pictures and students of art history.

Miss Maud Crutwell, whose extremely interesting book on "Verrocchio" was reviewed in THE INDEPENDENT of June 15, 1905, now gives us an equally interesting, well-written and informing treat-

[1] THE VIRGIN BIRTH OF CHRIST. *By James Orr, M.A., D.D.* New York: Charles Scribner's Sons. $1.50.

[2] THE BIRTH AND INFANCY OF JESUS CHRIST ACCORDING TO THE GOSPEL NARRATIVES. *By the Rev. J. Louis Matthews Sweet, M.A., with an introduction by James Stevenson Riggs, D.D.* Philadelphia: The Westminster Press. $1.50.

ise on *Antonio Pollaiuolo*[1]—who was sadly in need of it, for this is the first book devoted to that master of the quattrocento Florentine school ever published in any language. Miss Crutwell acknowledges her indebtedness to Mr. Berenson's suggestive study of Antonio and Piero Pollaiuolo in his "Florentine Drawings of the Renaissance," and she goes even further than that subtle critic in exalting Antonio and debasing Piero; her judgment on the brothers amounting to a complete reversal of the relative positions formerly accredited to them by Vasari and the whole tribe of writers on Italian art who have followed his lead. Some of her ascriptions to Antonio will impress her readers as being dictated by a fine enthusiasm rather than by sufficient evidence—even of that internal and intimate kind which she professes to discover. Yet she makes out a splendid case for Antonio as "the greatest scientific artist of the Florentine School," and must convince the thoughtful student that while Antonio, next to Donatello, occupies the position of chief and pioneer of the Florentine realistic school, the brother, Piero, "but for his influence and assistance would probably be as little known as any of the nameless imitators of Botticelli, whose feeble work we are content to class 'school.'" That the names of these brothers, who were so far asunder in artistic power and achievement, have been confused inextricably for so long she points out has been due in part to Vasari's misleading notice, and in part to the scanty study that has been made of the work of the great Antonio.

Miss Crutwell's book, in some respects an advance on her earlier volume on "Verrocchio," is one of the best—one of the most scholarly as well as most readable art books issued in many a day; and no doubt it will long remain the authoritative treatise on the Pollaiuoli.

Mr. T. Sturge Moore's book on *Correggio*[2] is of a different kind; different in purpose, in plan and in execution. Mr. Moore is one of England's minor poets of the day, and he sometimes writes poetical prose — sometimes indulges in a sort of poet's license in his prose writing. As was the case in his earlier monograph on Durer, he again devotes rather too much space to the exploitation of his own critical creed; and he is unnecessarily hard on Mr. Berenson and Signor Conrado Ricci: decrying with lofty scorn Morelli's method, while at the same time showing that he can use it, on occasion, most adroitly and to good purpose. However, if the patient reader will persevere he will find that the author's real purpose is to help toward a better understanding of Correggio himself and of his master-works in the art of painting. And this, be it said to his credit, Mr. Moore assuredly accomplishes.

By a process of studious and thoughtful analysis he takes up one after another the important pictures of the master, seeks in each the inherent character of the painter's conception, and attempts thereby to explain it to the reader. Despite his tendency to prolixity in "general considerations" (including apt quotations) he is seldom dogmatic and seldom pedagogical. As he proceeds with his critical, yet often beautiful descriptions of the pictures, he points out the ingenuity and individuality of the painter, and traces the development of his inventiveness and his skill in handling color, and light and shade, and in expressing his own peculiar emotion.

The considerable collection of portraits by Sir William Beechey, reproduced for the illustration of Mr. W. Roberts's book about that painter,[3] by no means substantiates the contention of its author that Beechey "is one of the many distinguished artists of the Early English School, whose merits have not been sufficiently recognized." Indeed, Beechey is not of large enough importance, as compared with the artists heretofore included, to deserve a whole volume to himself in this Library of Art. And this expanded catalog of the work of that rather commonplace portraitist is both commonplace and dull. It should never have been put forth to claim shelf room beside such superior volumes as those of Miss Crutwell and Mr. Moore.

[1] ANTONIO POLLAIUOLO. *By Maud Crutwell.* London: Duckworth & Co. (Imported by Scribner's.) $2.00.

[2] CORREGGIO. *By T. Sturge Moore.* London: Duckworth & Co. (Imported by Scribner's.) $2.00.

[3] SIR WILLIAM BEECHEY, R. A. *By W. Roberts.* London: Duckworth & Co. (Imported by Scribner's.) $2.00.

Gillette's Social Redemption. By Melvin L. Severy. Boston: Herbert B. Turner & Co. $2.50.

There are few subjects that are not touched upon in Mr. Severy's truly amazing book. One could wish, however, for less material and a better sorting of what is used. Mr. Severy is confessedly a disciple of Mr. King C. Gillette, who some years ago proposed a Fourierite reorganization of society in a book entitled "The Human Drift." Since then he has achieved both fame and fortune as an inventor and manufacturer of a certain kind of razors. But his interest in social reorganization has apparently not lapsed, and he furnishes the inspiration and no doubt the means for Mr. Severy's exposition of his Utopian plans. We use the term "exposition" guardedly, since the author is well-nigh as reticent in divulging Mr. Gillette's scheme as is another Boston author, Mr. Thomas W. Lawson, in revealing his own. Details are promised in a forthcoming volume. The present work is taken up almost entirely with accounts, more or less dependable, of present social evils. Nothing is omitted, and the most various sources are drawn upon for material. Indeed, it may be said that the book contains enough matter, properly handled, to make two good books. But not many persons, we imagine, will have the hardihood to struggle thru it. One is reminded of Goldsmith's comment on Lord Kames's "Elements of Criticism," that it would be easier to write such a book than to read it. We await, however, with impatient interest, the solution of present problems, promised us in the succeeding volume.

Money Magic. By Hamlin Garland. Harper & Brothers. $1.50.

One may foretell with comparative certainty the character of a new novel by Hamlin Garland. It will be "Western" in a sense that many of the writers of wild West stories cannot attain because of their lack of the long knowledge which is Mr. Garland's surest asset and also his snare. He makes no mistakes in some things. He is not likely to mix the dialects of New England and New York with the Western vernacular; a cañon or a mesa will be properly set in his pages, and bits of description will be not only accurate, but exquisite. His people, however, will disappoint the expectations raised in their favor, and will, somehow, show coarse streaks in their composition, of which the author is hopelessly unconscious. It has seemed sometimes that Hamlin Garland could not draw a gentleman. But in *Money Magic* he has achieved a better hero than ever before. Mart Haney, ex-gambler and saloonkeeper, suddenly rich, but keeping his head and singularly free from the offensiveness of the usual type of newly rich, is a gentleman; as fine as the frank, boyish and unspoiled girl whom he lifts from the ghastly and sordid poverty Mr. Garland is so fond of depicting into a life of ease and luxury made possible by the magic of great wealth. But, as always, he saddens us by caring too much for the meretricious, for huge houses and gems and automobiles. He does not really worship, or even respect, money or the servile court it creates about its possessors, but we cannot help feeling that it counts far more than it is worth in his estimate of life. Fashionable life in America, or elsewhere, is like an overdressed woman; it would look all the better for shaking off some of its superfluous ornament. Self-respect needs no motor cars. Mr. Garland has written short stories, admirable in their technique and powerful in their restraint. He has not been so happy in the style of his novels. If publishers would only pay more for a short book than for a long one!

A History of Commerce. By Clive Day. New York: Longmans, Green & Co. 626 pp. $2.00.

Professor Clive Day's *History of Commerce* will undoubtedly take front rank in the all too meager text-book literature of the subject, tho one cannot help regretting that the author, who is well equipped for the task, had not undertaken a more monumental work. In deference to the teacher he begins his story with thirty pages on antiquities, but gets down to serious business in his description of medieval commerce—town, sea and levant trade, gilds, fairs, economic theory and exploration. Modern commerce begins with the opening of the sea routes, and here our author reviews the origins

of commercial enterprise, mercantilism and the development of credit—taking up each European nation after a general survey of economic principles. The industrial revolution—machinery, international trade and recent economic transformations—receive the proportion of space which their importance warrants, and for the benefit of the American student nearly one-third of the volume is devoted to the commercial history of the United States. The chief features of the book are excellence of arrangement, proportion, clearness of presentation and extensive bibliographical apparatus.

Literary Notes

....Among the most important fall books of Duffield & Co. are "Painters and Sculptors," by Kenyon Cox; "Plays of Our Forefathers," by Charles Mills Gayley; "The Holy Graal and Other Fragments," by Richard Hovey, with a preface by Bliss Carman; and "The Bed-Time Book," by Helen Hay Whitney, illustrated by Jessie Willcox Smith.

....*The Youth's Companion* is a progressive and up-to-date paper, but in two respects it has not fallen in with the prevailing fashion. It sticks to its old rule of one price for everybody, under all circumstances, and it maintains its cheery optimism of tone, instead of catching the critical and muckraking spirit now epidemic among its contemporaries.

....*The Pilgrim's Scrip* (E. P. Dutton & Co.) is a new anthology for wayfarers. In its name and purpose and above all it its form, it imitates the "Open Road" of Mr. E. V. Lucas, one of the most successful and original of recent collections. This is the greater pity, in that the excellence of the contents and the reputation of the editor, Mr. Quiller-Couch, should have been enough to have secured for the book a wide public, without any such exploitation of Mr. Lucas' success.

....At the present time the study of the nervous system is more popular than that of any other branch of anatomy. Professor Johnston, of the University of West Virginia, has compiled an excellent textbook of *The Nervous System of the Vertebrates* (Blakiston), which enables the reader, as far as is possible with so large a subject, to see at a glance the comparative relationships of the nervous systems of the higher animals. A volume of this kind has been needed in English, in order that the ideas at the basis of opinions with regard to comparative psychology might not be too exclusively derived from the anatomy of the highest type of vertebrates alone.

....Years ago, when the boys at school found out that there were such things as postage stamps, they all wanted to collect them. The idea of stamp collecting took root spontaneously, and almost every boy and many of the girls have since collected postage stamps. A recent book, "How to Collect Postage Stamps," by Bertram T. K. Smith (Macmillan & Co., $2.00 net), is, of course, intended for collectors who are more serious than are boys and girls in stamp collecting. Many postage stamps now have a value that absolutely takes them out of the reach of school boys and girls. The present book, with its admirable illustrations, will be found useful to the advanced collector, as it is informing regarding values, rarities, forgeries, reprints and a host of other matters interesting to philatelists.

....Miss Katharine M. Abbott, author of "Old Paths and Legends of New England," is bringing out this fall a new book entitled *Old Paths of the New England Border,* having special reference to Connecticut, Deerfield and Berkshire Miss Abbott has drawn upon her large fund of material, and presents in her forthcoming volume a pleasing picture of New England and many of its quaint byways. She has caught the spirit of New England, and introduces incidentally curious and charming out-of-the-way places, historic spots, Indian legends and New England folklore. She has traced it all with a literary skill which is above the average, and has succeeded in charging her text with animation and entertainment without the loss of historical accuracy. The present volume is copiously illustrated and has a photogravure frontispiece. G. P. Putnam's Sons are her publishers. ($3.50.)

Pebbles

"Don't you know, dear," said his wife, sweetly, that it is wrong to talk behind a person's back?" He was trying to button her waist at the time, and really there seemed to be provocation for his remarks.—*Philadelphia Public Ledger.*

ONLY NEAR BAD LUCK.

"So this is the opal ring Mr. Porley gave you?" said Miss Bright, examining it. "Are you—er—pleased with it?"

"Oh, yes," replied Miss Dumley, "but you know the old superstition about opals. I'm afraid it'll bring me bad luck."

"But—er—this can't bring you anything worse than an imitation of bad luck."—*Philadelphia Press.*

FORM OF REJECTION TO BE USED BY THE EDITOR OF THE AVERAGE MAGAZINE.

To Contributors:

The editor regrets that this manuscript is not suited to his present uses.

A manuscript may be unavailable for a number of reasons. It may not appeal to the advertising department. It may not appeal to our women readers. (We don't know what they want, but we think we do.) It may be too original to use. It may be too simple in style. It may be so clever that some of the members of our staff who are writing for us regularly would be disturbed by it.

N. B.—Manuscripts should always be accompanied by one year's subscription.—*Life.*

The Independent

A Weekly Magazine. Entered at the New York Post Office as Second-Class Mail Matter
Publisher, Clarence W. Bowen
Owner, The Estate of Henry C. Bowen
130 Fulton Street, New York

TERMS OF SUBSCRIPTION, PAYABLE IN ADVANCE
One Year, $2.00. Single Copies, 10 Cents

Single Copies over six months old twenty-five cents. Postage to any Foreign Country in the Postal Union, $1.75 a year extra. To Canada $1.00 extra.

Order for the change of an address should be received one week before change is to take effect; the old as well as the new address should be given.

Persons desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, in that case, hold ourselves responsible for their return. Authors should preserve a copy.

A Compulsory Arbitration Treaty With Japan

In their report to Secretary Hay concerning the results of The Hague Conference of 1899, the American delegation said:

"As to the question between compulsory and voluntary arbitration, it was clearly seen, before we had been long in session, that general compulsory arbitration of questions, really likely to produce war, could not be obtained; in fact, that not one of the nations represented at the Conference was willing to embark in it so far as the more serious questions were concerned. Even as to questions of less moment it was found to be impossible to secure agreement except upon a voluntary basis."

This summer, after a lapse of eight years, all the Powers at the Second Conference at The Hague unanimously declared their adherence to the principle of obligatory arbitration, while thirty-five nations, including Japan and the United States were willing and ready to sign a general obligatory arbitration treaty. Tho the Conference was unable to frame such a treaty, all the Governments of the world therefore are on record in favor of compulsory arbitration *in some way.*

At the recent Conference it was a source of gratification that the United States delegation assumed the leadership in the fight for obligatory arbitration. This signifies that President Roosevelt and Secretary Root—the men behind the delegation—stand for obligatory arbitration. We were not surprised, therefore, to read a despatch from Washington last Thursday announcing that our State Department would shortly negotiate arbitration treaties with various Powers.

By a singular coincidence on the next day Count Hayashi, the Minister of Japan for Foreign Affairs, made an official statement of the relations between Japan and the United States, and concluded with this significant sentence:

"The attitude assumed by the Japanese Government, which, after all, is only a reflection of public sentiment, is that they are convinced that the cause of civilization as well as community interest demands lasting peace and friendship between the two nations bordering the Pacific."

Ever since the United States Congress in 1900 past a resolution calling upon President Cleveland to invite interested Powers to negotiate arbitration treaties with us, we have been morally bound as a nation to the principle of arbitration. In response to that resolution Secretary Olney and Sir Julian Pauncefote negotiated a treaty between England and the United States, which, in 1897, was defeated in the Senate by lack of three votes of the required two-thirds majority.

In 1904 Secretary Hay negotiated nine treaties, which were defeated in the Senate, but for different reasons. On account of the conflict between the President and the Senate in regard to the prerogative of the Senate the treaties failed, the President refusing to accept the amendment proposed by the Senate. But these treaties as amended by the Senate were approved by an almost unanimous vote, thus proving conclusively that the sentiment in the Senate today in favor of the treaties of arbitration is overwhelming.

Times have greatly changed since then. The Senate has learned much. The National Arbitration and Peace Congress held in this city last April demonstrated that both our government and our people are committed to the most progressive form of arbitration. Even the objections that many of our people have against negotiating a treaty with England or any of the European Powers are utterly lacking in the case of Japan. Japan has no Irish in America. Thus, should we negotiate a treaty of arbitration with these modern Greeks, not only would the two leading

nations of Asia and America set an example to all the world as to how international affairs should be conducted, but all this infamous war-talk that has been so mysteriously prevalent during the past few months would instantly cease.

In an editorial entitled "The United States and World Politics," in our issue of October 24th, we indicated how President Roosevelt by his indirect stand at the Algeciras Conference in favor of a result which ultimately made the Japan-English treaty less valuable, by his advocacy of a lock instead of a sea-level canal, so as to get our battleships as quickly as possible from the Atlantic to the Pacific, by his settling the Russo-Japanese war to the advantage of Russia, and by his sending the fleet to the Pacific, has created a chain of circumstances which have led some people to think that perhaps he is not Japan's best friend. Here is now an opportunity for the recipient of the Nobel Peace Prize to show his real feeling toward the people of Japan.

As we are chiefly responsible for stirring up all this war talk with Japan, it would hardly be fitting for Japan to make the first move toward an arbitration treaty. It ought to come first from the United States. If President Roosevelt will initiate and carry to a successful termination such a compulsory and inclusive arbitration treaty it will mark one of the highest achievements in world politics yet accomplished.

The Elections

WHILE the ruling issues everywhere at last week's elections were local, the results show that the Republican party has suffered no loss of strength. There were no signs of a reaction against that party's national policies, no indications that Mr. Roosevelt's popularity has declined. This is all the more noteworthy because losses for a dominant party in off years are the rule rather than the exception, and there was added this year the influence of widespread financial stringency, following a great decline in the market value of securities. The effect of such conditions is commonly injurious to the party in power. In this instance, however, even the business men of New York's financial district who reside in New Jersey disappointed those who had predicted that their disapproval of the President's policies would be expressed with much emphasis and weight at the polls. On the other hand, the elections were in some places distinctly discouraging to the Democratic party. Fusion, supervised by Mr. Bryan, was beaten by 20,000 in Nebraska. In Massachusetts the party has been torn apart and wrecked by bitter quarrels, and the regular nominee, a prominent advocate of tariff reform, had but a few more votes than were cast for the candidate of the Independent League. Kentucky, where Mr. Bryan made speeches, elected a Republican Governor, and its chief city a Republican Mayor.

In two notable municipal contests, however, Republican national political interests suffered some loss of prestige. Mr. Roosevelt and Mr. Taft unwisely induced Mr. Burton to attempt the defeat of Mayor Tom L. Johnson, who well deserved to be re-elected. Mr. Burton's defeat has been harmful to Mr. Taft as a presidential candidate, in Ohio and elsewhere. The unfortunate fusion alliance with Mr. Hearst in the city of New York appears not to have been suggested or approved by Mr. Roosevelt, but it was made by the local Republican leader whose political association with the President has been intimate. The miserable failure of it was foreseen.

Neither the attack upon Mayor Johnson nor the alliance with the Hearst forces in New York was good politics in any sense of the term. Mr. Burton is an upright man of exceptional ability, which may best be exercised in Congress. But we have thought that his assault upon Mayor Johnson's stronghold was made with a view to the effect of his possible success upon national politics and the presidential aspirations of Mr. Taft, rather than with a regard for the welfare of the people of Cleveland. It was unwisely conceived, for Mr. Johnson has been a good mayor, and failure has given much pleasure to Boss Cox and the reactionary foes of Mr. Taft in the Republican organization of Ohio.

All good men rejoice over the victory for honest government in San Francisco. The election of McCarthy, whose campaign was managed by the contemptible Schmitz from his prison cell, would have been for the stricken city a misfortune second only to the earthquake. Many of the union workingmen voted for Taylor, but it is difficult to understand why any of them should have supported Schmitz's candidate or the man who was set up against Langdon, the honest District Attorney who has stood by Heney while that remarkable prosecutor has been bringing the thieves to justice. Ryan, the regular Republican candidate for Mayor, must be classed with McCarthy, for his candidacy must have been designed to defeat Taylor in the interest of McCarthy, Schmitz and their allies. It is an interesting fact that the influence of Mr. Hearst's paper in San Francisco was exerted in behalf of this man Ryan.

Fortunately, there were enough right-minded union workingmen and bolting Republicans to unite with the Good Government party and the Democrats in giving Taylor and Langdon not only large pluralities but even majorities over all. The defeat of these two candidates would probably have ended the prosecution of as foul a group of rascals as ever robbed a municipality; their triumphant election will be of almost inestimable value to the city, proving that a majority of its people are entitled to the confidence of the outside world, and promoting reconstruction by drawing in the capital which awaited the result of this contest at the polls.

Mayor Brand Whitlock, novelist and protégé of the late "Golden Rule" Jones, was re-elected in Toledo, where the street railway problem is like that in Cleveland, and where his attitude toward a company whose franchises will soon expire closely resembles Mayor Johnson's. The defeat of Mayor Fagan in Jersey City is to be regretted. Elected six years ago as a Republican, he became widely known as a practical reformer, and has now been overcome by a combination of the machines of both the prominent parties. In New York City the Hearst-Republican alliance caused loss of voting strength for both of the partners and increased the power of Tammany. Against the decline of Mr. Hearst's Independent League in New York, however, may be counted its vigor in Massachusetts, where Hisgen, as we have said, received nearly as many votes (for Governor) as were cast for Whitney. Mr. Hearst and his party have not been eliminated. The Democrats must reckon with them next year.

In many places, prohibition or regulation of the sale of intoxicating liquors was a prominent issue. Kentucky's new Governor has been elected on a temperance platform. The defeated candidate for Mayor in Louisville favored repeal of the Sunday closing law. The number of prohibition counties in Illinois was increased from ten to fifteen. Half of Delaware chose prohibition. In New Jersey the Sunday closing law was one of the leading subjects of discussion, and the non-committal attitude of the Democratic candidate toward this question contributed to his defeat. The movement which has suppressed saloons thruout great areas in the South was seen last week in many parts of the North.

Inverted Hypocrisy

THERE is a vice, widely prevalent, very deleterious in its effects, yet rarely condemned by moralists; so rarely in fact that it has had no proper name given to it. Perhaps the nearest we have to a suitable designation is that of "inverted hypocrisy," first applied to Dean Swift by his friends when they discovered how much piety and benevolence he concealed under the cloak of skepticism and malice. Ordinary hypocrisy consists in pretending to be better than you really are. Inverted hypocrisy consists in pretending to be worse than you really are. The inverted form is more injurious both to the individual practicing it and to his associates than is the ordinary. If one assumes a virtue when he has it not, he raises the moral standard of the community and the ideal of human nature to the extent to which his profession is credited by the people who know him. When one falsely confesses a wicked deed or a mean motive he is lowering the moral tone of society in so far as he is believed. The sin of the deception is the same in both cases, but since the evil in our own nature delights to recognize

its counterpart in others, we are more apt to assume the truth of the ignoble profession rather than the claim to virtue. The reflex action upon the individual posing as saint or sinner is also very important because one inevitably and unconsciously tends to become what he habitually pretends to be and is generally regarded as being.

The amount of lying that a man will do to prove that he has been a rogue is appalling. It is a vice common to the prayer-meeting and to the saloon. The convert who proclaims that he has "broken all the ten commandments time and again, year after year," may, after all, be only breaking that against lying. In Shaw's play of "Major Barbara," the repentant sinner brought in much revenue to the Salvation Army by telling how he used to beat and kick his poor old mother until the appearance on the scene of the indignant lady in a belligerent state of mind compelled him to retreat and retract, and freed him at one stroke from the burden of his fictitious sins. The practice of confession offers an insidious temptation to over-indulgence even beyond the limits of truth. Like Topsy, it is hard to stop when we get started. It requires great moral restraint at times to avoid becoming an inverted hypocrite.

That one's motives for adopting this perverted form of moral prevarication are often creditable does not, of course, excuse it or neutralize its evil consequences. Whether it is modesty, cynicism, an abnormal sense of one's own unworthiness, a desire not to be peculiar, or the fear of being taken for a prig, the practice of wearing one's clothes seamy side out and putting the worst foot forward has deplorable effects. A man who "never does a proper thing without giving an improper motive for it" is apt to be an undesirable citizen. We measure up by the hight of our companions, and what lowers them in our sight lowers us in reality. In a pine forest all trees grow tall.

We should do unto ourselves what we would have others do unto us, that is, credit us with the highest motive for our actions. Why we do things is often quite as inexplicable as it is why others do them, but if it is necessary to adopt an interpretation let us give our good angel the benefit of the doubt. When we are caught giving 10 cents to a street beggar we begin to apologize for the act, which, however unwise it may be, is certainly creditable in itself. We say, "I couldn't help it. I am so constituted that I must give money to the poor," thus throwing upon fate or heredity the responsibility for our virtues as we commonly do for our vices. Or we say, "I did it from a purely selfish motive; I should have felt uncomfortable all day if I had not," which is a fallacious assumption of inverted hypocrisy, because it is indirectly boasting the possession of an ingrained benevolence of character and an active conscience.

The employer who voluntarily cuts down the hours of work takes pains to state publicly the fact or the fiction that his hands will do more in eight hours than ten. If he provides lunch rooms and resting places for the girls he is careful to explain that it saves time and increases their efficiency. If he puts up model tenements he always professes to do it as a profitable investment. This disguised philanthropy is so common that it has been given a special name, "3 per cent. charity."

Inverted hypocrisy is more common among men than among women. Women generally disguise their vices rather than expose and exaggerate them. A boy will boast of the number of cigarets he smokes, so many that his doctor has warned him that he will die in a year unless he stops, but no girl will admit lacing too tight. Still women may often be observed to affect cowardice in order to stimulate masculine gallantry. And we have heard ladies who have given away some piece of valuable clothing tell their friends that they never did like to wear it; it was not becoming.

In the minor form of inverted hypocrisy which belong to the realm of etiquet rather than ethics, there is apparently a tendency to improvement. An affectation of inability to sing or speak in public, once almost a requirement of politeness, is now discountenanced. It is not regarded as consistent with true sportsmanship to underrate too greatly one's own skill at golf or chess.

This gives ground for some hope that

the more objectionable manifestations of the vice may likewise be eliminated by public opinion. The time may come when alumni returning to their alma mater will find other methods of ingratiating themselves with the undergraduates than by telling tales of their college pranks and misdeeds which, if true, would be ground for depriving them of their degrees; when a man who does not believe it right to drink wine will not think it necessary to profess a dislike for the taste or to create a fictitious physician to prohibit his indulgence; and when men, in order to prove themselves no better than other people, will not invent a "past" or steal sins from printed books like Kipling's "Tomlinson."

Many a man has been discovered by accident or death to have been leading a double life; professedly idle and frivolous, really industrious and serious; or posing as a hardhearted miser, really self-sacrificing and charitable. In such a case it is a question whether his secret goodness has been sufficient to overcome the evil influence of his bad example. Beware of sheep in wolves' clothing.

Church Union in India

PERHAPS there would be, at present, as little hope of the Presbyterians and the Congregationalists uniting in one body as of almost any other union, except with the Episcopalians. And yet it is just this union which the two denominations are now planning in Southern India. It is always the missionaries that lead the way. The missionaries in Japan of the Congregational, United Brethren and Methodist Protestant Boards sent a letter asking that the three denominations might be united, but the Congregational Council in Cleveland voted for delay, altho approving in principle.

The Presbyterians of the United States and the English and American Congregationalists have strong missions in Southern India, with many thousand communicants. They have agreed on a plan to unite in a single body of native churches under the designation of the South India United Church.

But how can they unite when their plans of government are so different? It is easy, for it is essentially the same as that which was involved in the "Plan of Union" between the three denominations here at home. It provides that they shall have one General Assembly, which shall have advisory powers, but that in the conferences or synods of the several missions, Presbyterian or Congregational, their present methods of administration shall not be disturbed. The object of the union is thus most admirably expressed:

> "To bind the above Churches into one body with a view to developing a self-supporting, self-governing and self-propagating Indian Church, which shall present a united living testimony to Christ, and worthily represent to the world the Christian ideal."

There is a Confession of Faith, which, like that embraced in the Tri-Church "Plan of Union," is not binding, but is a testimony. It opens with this introduction:

> "As the Confession is a human instrument it is understood that persons assenting to it do not commit themselves to every word or phrase, but accept it as a basis of union, and as embodying substantially the vital truths held in common by the uniting Churches."

And it concludes thus:

> "The South India United Church reserves to itself the right to revise its general Confession of Faith whenever the consensus of opinion in the uniting body demands it."

The Confession is general in its character, covering the accepted evangelical doctrines, but that on Holy Scripture is so admirably phrased that we give it in full:

> "We believe that God, who manifests himself in Creation and Providence, and especially in the spirit of man, has been pleased to reveal his mind and will for our salvation in various ways with ever growing fulness, and that the record of this revelation, so far as needful for salvation, is contained in the Scriptures of the Old and New Testaments, which are therefore to be devoutedly studied by all; and we reverently acknowledge the Holy Spirit speaking in the Scriptures to be the supreme authority in matters of faith and duty."

When it comes to Church government the Constitution declares that the pastor with the elders or deacons constitute the sessions or church committees, and the local church has "authority to manage its own affairs either by the whole body of members or thru its session or church committee." The churches are united into church councils (conferences), which adopt their own system of rules, and have direction of matters

of general interest, such as organizing and recognizing churches, ordaining and disciplining ministers, and giving counsel and aid to churches, maintaining order and carrying on evangelistic work. These church councils may be united into synods.

The General Assembly meets once in two years. We quote:

"The General Assembly is the representative body of the South India United Church, and its counselor. It assumes no authority *per se* over the churches, but will consider references that come to it thru and with the approval of the Church Councils. Its general duties are to advise regarding the organization and boundaries of Church Councils, and to decide all matters referred to it by such councils; to co-operate with the Missions carrying on evangelistic and other Christian work; to unite in cordial fellowship all ministers of the Churches . . . to tabulate statistics . . . to devise ways and means for strengthening and advancing the interests of the whole Church."

It is in every way likely that this plan of union will be adopted as reported and recommended. There is a movement for a much broader union of denominations in India, in which Presbyterian missionaries are taking the lead. It may include the Baptists and other smaller bodies, but the Methodists and the Episcopalians hesitate to take part in it. The union between Congregationalists and Presbyterians in South India, now practically assured, marks an aim for American Christians, after the Tri-Church union now under consideration shall have been accomplished. It is toward such union that the heart of Christendom moves.

Gray Days

THERE are days in late autumn that make us feel as if the world had stopped its wheels to listen. The air is so absolutely stirless, and a cool gray haze abolishes every tint of color. The atmosphere is so quiet that it does not, so far as you can see, in the least move a half dozen beech leaves that still cling to the branches. Altho the air is cool, it does not at all bite your flesh, even if you sit down in some nook where you can overlook the valley and study the landscape. Poking open the heaps of leaves meditatively (it seems to be the only sound or motion in the world) you uncover a belated dandelion flower. The stem is short, to be sure, but how companionable it at once becomes. Are you quite sure that these inanimate flowers are entirely devoid of emotional life? Surely this dandelion is glad that you have come to it.

You look up and are astounded to see a single seed floating across the sky, on flossy wings. There must be a mild current of wind somewhere up there, for it floats steadily eastward till out of sight. Curiously you watch, hoping to see one more, and you will try to find where it comes down to its rest. And there it comes, following hard after the other, but catches on the limb of a plum tree, for a moment, and then moves on eddying softly into the orchard, and at last coming down to the ground where the melons grew. It is a trifle, but then it is all there is to show you that the world is alive, and it has sown itself exactly where next year you will have to hoe it up.

But what is a hoe? Just now it seems to be something very far off—as far off as the muezzin's cry on a Syrian minaret. Why does summer seem so far off, as far as if we were living in another world? The sun feels its way thru the gray, but seems to be asleep. It mellows the tone of the grass, and makes the leaves a little more russety in their brown beds. A little whirlwind, no bigger than a barrel, that you do not feel at all, catches up an armful of leaves in a corner of the hedge and throws them up at random. They look like a bunch of interrogations, and then tumble down again, each one separated from its old acquaintances. Somehow one can never think of anything in this world apart from home. Even these leaves must like to rest under the mother tree that bore them.

It is a good day to study the trees. Character stands out stiff and determined everywhere. The elm is peculiarly moody under the influence of gray surroundings, and the oak looks stubborn. You can see, by the turn of the limbs and the big elbows, what all these trees have been trying to do—their aim in life. You are surprised to see in what beautiful curves some of the trees work out their life thought. Every twig is artistic, and the whole grouping of limbs is delicate without weakness. When one has become accustomed to study the trees in this man-

ner, they seem even more beautiful, and certainly more companionable, than in the blue days of spring or in the yellow days of midsummer. Evergreen trees never quite lose their brightness, but, dripping off the mist, they do not appear out of harmony with the gray gloom of the day. These great spruces and pines come down to us from an age that had no winter, so that they seem today to be rather like visitors, inquisitive of our modern ways of doing things.

And yet color is not quite suppressed. Color is a note of growth, changing with every period of plant development. Even the gray mantle, which covers all things, is itself one of Nature's colors. Looking down the slope, thru the shrubbery, the dogwood, that last month was green, is now fiery crimson, and, if you will study carefully, you will find that every bush and every new twig, on every tree, is a trifle redder than it was a while ago when it was growing. Red is the color of ripeness, and the grayness of the day can hardly veil the richness with which Nature finished up her growing season. One thing we may always feel sure of, that Nature is an artist, in sentiment as well as execution.

With the absolute silence, or rather thru the silence, there comes a note of inquiry. It is much like the stopping of machinery in a factory at night, for it wakes up people. The quiet rather startles us, concentrates thought, and we begin to look around with an investigating spirit. The squirrel has his head outside of his hole, quietly wondering. He himself was never so still before. He misses the buzz of millions of insects, the rustle of cornstalks, the whistle of the wind blowing among leaves. He has come out to see if the world has stopped moving. Yet, after all, there is a song abroad, for Nature is always singing. Only our hearing is thrown out of tune with the gray silence. It is something like the music of a midnight in summer, when the chirp of a half-dozen sorts of crickets so blend together as not to affect the ear without thoughtful listening.

These gray days are in the soul also. We need them as much as we need the bright life of June or the heartful days of October. Like the trees, we must have our rest periods. We cannot always be coloring, nor can we always be growing. In summer we are much like the rest of Nature, changing from blue to red, and now the soul is as gray as the landscape. If not too well schooled by a well-educated life we grow sad and cheerless. Memories have no quickening in them. It is as when one wakes in the night and the blood is congested in the brain. For awhile it seems as if brightness were forever gone, and one must forever go around by starlight. But the power of a soul to rise above environment is mighty, as it ought to be, to make of us men. Spenser makes Belphoebe to create sunshine in a shady place. There are a good many who can do this beautiful work. These dark days call out our power. Only a few become victims of the casual and unreal. Always the sun is shining on the top of gloom, and love and truth are always warm in a true soul.

While we moralize to this effect, the cheerless haze has suddenly lifted; the gray has gone and the blue has come into control. The wind has changed. A few flakes of snow sift down thru the bare arms of the trees. The air grows colder as it grows clearer. Autumn and winter are exchanging crowns. The flakes fall faster—soft and unshapen, they drizzle from the trees and melt on the dry leaves. The evergreens drip with the mist and the great spruces are the first to shake off the gray gloom. A half hour passes in indecision. Small icicles form on the twigs. The gray passes into crystal white. The green goes out of sight steadily; brown leaves are hidden with frost; winter has come, and at last we are content to have it.

The Parcels Post

THE American people need a parcels post; the American people demand a parcels post; the American people will certainly have a parcels post. The matter has been talked over long enough; what we must now have is action. The coming session of Congress cannot safely avoid bringing this matter to conclusion. There is no reason why our nation should remain in the rear of all civilized peoples on this

and similar affairs. Our present mail accommodations are simply arranged to debar us from any privileges not extended to us by express companies. While the stock of common carriers was trembling below par, that of the Adams Express Company remained at 165 and that of the American Express Company at 175—above the conditions and contingencies of a financial crisis. This is precisely as we wish it might be, and hope that it always may be, but we see no reason why these powerful companies shall forbid us those advantages which will rapidly develop trade, to their advantage as well as that of the people.

It is the true policy of the party in control at Washington, as it is of all parties, to inaugurate a constructive program. It is in danger with the people because it has stood simply for an overhauling of old and abused privileges. Public attention should now be drawn to and centered upon, not only correctives in the way of lawsuits, fines and imprisonments, but also upon plans of development and measures of a progressive character. Our post office is emphatically the property of the people. It alone enabled up to become a united nation, from the Atlantic to the Pacific. It brought about intercommunication, that underlies all commerce, as well as manufactures, while a large share of our productive industries as surely depend upon this marvelous machine for abolishing time and space. It has already done what cannot be estimated in thought and in words. It has done its best as a carrier of thought and purpose; it must be allowed to do a great deal better as a carrier of things.

The economic advantage to the people will be annually tens of millions. The British post office carries parcels not to exceed 11 pounds and not more than 3 feet 6 inches in length; but in the United States we are limited to parcels not exceeding 4 pounds in weight. The English parcel of 11 pounds is carried for 22 cents; but in this country the 11 pounds must be subdivided into three smaller parcels, and these will cost eight times as much, or $1.76. Registration service, carrying as high as 2,000, is in England secured for a fee of from 4 cents to 44. The German parcels post carries at even lower rates, for the charge on a 12-pound parcel is only one-fourteenth what it is in the United States. The charge on a parcel sent from Chicago to Liverpool is one-fifth only of that which must be paid on a similar parcel sent from Chicago to St. Louis or from Chicago to Milwaukee.

To pay 64 cents on a 4-pound package is practically prohibitive, and it seems to have been so intended. The law was arranged, unqualifiedly, in the interests of corporations and not of the people. It was an announcement on the part of the Government that we do not intend to carry parcels if we can help it. We have so far been in this sort of business, with the sign out that we do not like it, and that we shall do only what public sentiment forces us to do. That public sentiment is more pronounced on this subject we are certain, and we are quite sure that the American people will demand reform.

As excuses we have heard that a parcels post would burden the mail service. The answer is if it pays there is no burden. In Great Britain and in Germany it does pay. It facilitates the trade of small country stores. It brings the people closer together in their everyday financial affairs, as the ordinary mail brings them together in matters intellectual. In our vast country this matter is becoming of vital importance. The apple orchard of the Maine farmer is a distinct part with the olive orchard of the California producer. Migratory farming finds the same man planting corn in Minnesota in summer and cassava in Florida in January. We cannot afford to have our lives and our work less closely united than steam and electricity make possible.

The question is coming before the next Congress with a most decided conviction and sentiment behind it. The common folk will constitute a universal lobby, and will make their influence felt. Set it down to Theodore Roosevelt that the overweening voice of an interested lobby has lost its absolutism. The people can be heard far more distinctly than they could be ten years ago. But behind this movement for postal progress will be an efficient Postmaster-General, a man of business methods, as well as foresight. His predecessors have paved the way, but

they have not been able to secure the passage of a parcels post bill. With Mr. Meyer, we imagine, will stand the better class of Congressmen, and with the almost united push of the press, we prognosticate for him success. The United States cannot afford any longer to remain in the rear of civilized peoples. The bill must pass. We must and we will have a Parcels Post up-to-date, and based on the economics of the twentieth century.

Concerning Meat

A DOCUMENT of extraordinary interest, just published by the United States Department of Agriculture, is a report on "Meat Supply and Surplus, with Consideration of Consumption and Exports," by George K. Holmes, Chief of the Division of Foreign Markets. Mr. Holmes, it may be remembered, was chief of that division of the Eleventh Census which was charged with the work of obtaining, for the first time in our history, statistics of farms, homes and mortgages. The scientific and practical ingenuity displayed in that enterprise gave Mr. Holmes rank among the best statisticians, American and foreign, and his report has been accepted from the first as the most important document we have on the distribution of wealth in America. His present report on meat supply will take rank as the most valuable source we have of knowledge of a chief item of food production and consumption.

As an item of wealth, the meat animals of the United States are of much greater importance than people in general have suspected. The value of all meat animals on and off farms and ranges, according to the Census of 1900, was $1,929,000,000. The value of cattle amounted to $1,500,000,000 of this total. The values of swine came next, and of sheep third. The capital involved in the production of meat amounts to the grand total of $10,625,000,000. This is five-sixths as much as the capital invested in manufacturing, and very slightly less than the capitalization of the net earnings of the steam railroads of the country. It is nearly twice the value of all the real estate, implements and machinery of all the farms devoted chiefly to producing cotton, fruit, rice, sugar, tobacco, vegetables and to general farming.

Of the 424,500,000 cattle known to be in the world, the United States has 74,200,000, or 17.5 per cent. British India has 20.9 per cent., but every other country has a much smaller fraction than the United States. Of the world's 609,800,000 sheep, the United States has 53,500,000, or 8.8 per cent. Argentina beats us with 19.7 per cent.; Australia, with 12.2 per cent., and European Russia with 9.7 per cent.

But when it comes to hogs the United States stands supreme and unapproachable. Of the world's 141,300,000 enumerated swine, the United States has 56,600,000, or 40.1 per cent. Germany ranks second, with 13.4 per cent.; Austria third, with 9 per cent., and European Russia, with 8.4 per cent.

In some other details also of the economics of meat we hold unquestioned supremacy. We have, of course, learned how to turn every scrap of the meat beast to some kind of use, and to an extraordinary degree we have cultivated the art of finding and packing all his edible parts. In 1900 we rejoiced in the possession of 93,502,000 animals available for slaughter. Their total live weight was 26,864,810,000 pounds, and their dressed weight was 16,549,921,000. From this there was a subtraction of bones and non-edible trimmings weighing 3,315,441,000 pounds, but to it was added a total of brains, tails and various inward parts classed as "extra edible" and weighing 2,636,409,000 pounds. Consequently the total weight of strictly edible meat, "dressed" and "extra," was 15,870,889,000 pounds.

We do not ourselves consume all this meat. About one-eighth of the production we export, and our surplus would feed either the United Kingdom or the German Empire for half a year. If foreign countries should refuse to take our meat products the throwing of the surplus upon the domestic market would be financially disastrous.

But this danger is not immediate or appalling, as the further figures show. Those thus far quoted give the impression by their vastness that we are a nation of rapacious meat eaters. In point

of fact, Australasians are the greatest meat eaters in the world, and the people of the United States rank second in per capita meat consumption. We are followed in the order named by Cuba, the United Kingdom, Germany, France, Denmark, Belgium and Sweden.

And now perhaps we shall perforce become so far infected with vegetarianism and Fletcherism that we shall drop to a yet lower rank. The price of meat is going up and apparently must stay up. In 1900, it seems, our per capita consumable supply of meat was only 59.3 per cent. of the per capita consumable supply of 1840. In 1880 it was only 87.8 per cent. of the per capita consumable supply of 1860, and in 1900 it was 74.8 per cent. of the per capita consumable supply of 1890. It is plain that we have seen our best days as a meat-eating people. The great cattle ranges can never again be what they were. Will our national energy now decline, or, as we resort more and more to cereals and bananas, shall we still be quite energetic enough and somewhat less given to ineffective buzzing and making a noise?

Postal Banks

One of the lessons of the late panic is the importance of establishing a system of postal banks in which anybody can safely invest a small amount. Other civilized countries have such banks, but the United States is behind the world in the development of its postal system. Various Postmaster-Generals have recommended postal banks, but Congress for some reason delays, just as it delays, apparently out of regard for express companies, to provide for the cheap delivery of packages weighing more than four pounds. In a case of panic like the present postal banks would be a resort which no one would be afraid of, and there would be no run on them. An even more important benefit would be that it would be possible in country regions, where there are no savings banks, to encourage economy and thrift. We commend the subject once more to the favorable attention of Congress. We are pleased to see that the Chamber of Commerce in this city has the subject before it for consideration.

A False Designation

To a number of papers which are using every opportunity to attack President Roosevelt it has occurred that they can attach odium to him by calling the late financial disturbance "the Roosevelt Panic." It is a rather brilliant idea, or would be if it were not so palpably the fact that it was not President Roosevelt's speeches or acts that brought on the panic, but the illegitimate financial methods of certain banks and trust companies. The New York Clearing House made a sharp investigation, found the cause, and applied a drastic remedy by compelling the withdrawal of officers and directors who had misused their positions to their own personal advantage. The Clearing House did not find Mr. Roosevelt to blame, but wholly these speculating trustees and officers. To call it the Roosevelt Panic is utterly without reason or truth. The cause was wholly within the banks themselves, and not in the least in any attack on their credit from Washington. . Indeed Secretary Cortelyou has done all that the Government can do to relieve the panic and has been the friend of the banks and of the depositors and the people. It is only ignorant people that can be misled by such misinterpretation of facts that are wide open to any one that will look.

Cuba Libre

That it is the intention of our Government to withdraw before very long from Cuba we do not fail to believe; but that it would not displease the first President of Cuba Libre if he were also to be the last would seem clear from a letter of a year ago which he has now allowed to see the light. Ex-President Palma says, speaking of his resignation and request for American intervention:

"It is enough to satisfy my conscience this conviction of having saved my beloved country from anarchy and its natural results of plunder and ruin. . . . That my attitude was immediately justified is proved by the sudden reestablishment of peace thru the moral and material influence of the Americans. It has always been my belief since I took an active participation in the ten years' war. The final aim of our noble and patriotic aspirations was not independence, but a stable government, capable of protecting the lives and properties, and of

guaranteeing the rights of all inhabitants of Cuba, natives and foreigners alike, and capable also to prevent liberty being polluted by anarchical armed disturbances.

"I do not hesitate to declare that it is a hundred times better for our beloved Cuba to be in a dependent political situation in which liberty is prevailing than in a republic independent of a sovereign but discredited and ruined by blasting periodical civil strifes."

Doubtless President Palma represents not a few stable Cubans, but we ought to give Cuba one more chance to see if it can govern itself.

It must not be thought that all the American missionaries in Korea are against the Japanese occupation. An extraordinary story was published that the Korean Young Men's Christian Association was active in rebellion. There was no truth in it; it was another association. The Rev. George H. Jones, of the American Methodist Mission, in a letter to Bishop Harris, published in Japan, says that the Christians have taken no part in the insurrections, and out of 210 Koreans killed or wounded in the late uprising, there was not one Christian. Mr. Jones says:

"The people take the new agreement in a very philosophical way. Some seem to think that they don't realize its significance, but they do very fully. They accept and are watching to see what the Marquis will do. That is all that is necessary. He will win them over to his side, for he always 'wins.'"

The Plan of Federation of our American Protestant Churches recommended by the Inter-Church Conference in 1905 provided that, when two-thirds of the constituent denominations had taken favorable action it should at once become operative. Such action has now been taken, and the first meeting of the "Federal Council of the Churches of Christ in America" will be held in December, 1908. There will be not less than thirty denominations taking part, with over 17,000,000 members. All great moral and religious questions will come within the range of its concern.

It is reported from St. Petersburg that many Russian officers have applied at the American Embassy for appointments as instructors in our army in preparation for a war between the United States and Japan. No doubt if it comes to the worst the Russian admirals and generals who are now in prison for incompetency and cowardice would be released on bail by the Czar for the purpose of showing us how to lick the Japanese.

Here is a new thing from Hawaii. The Hawaiian Board of Missions has established a kindergarten in the principal town of the island of Maui, and a Japanese saloon-keeper opposite the school has entered a protest against it on the ground that it disturbs his customers! He says they "cannot stand the behavior of the children on the opposite side of the street." That is delightful.

We do not wonder that the birthday message of the Emperor of Japan to his 110,000 subjects in Hawaii startled some who heard of it: He said:

"Should emergency arise offer yourselves courageously to your beloved country, and thus guard and maintain the prosperity of our imperial throne."

Yet that is a proper address, and we have no reason to imagine it was directed against an emergency with which we are concerned.

It is not strange that it is reported that the President's Message to Congress will recommend a modification of the Sherman Anti-Trust Law, for months ago he gave notice that he would ask Congress to repeal the law as far as it applies to railroads. Railroads were not in the mind of Congress when the law was enacted, and railroad combinations are often very good things, and their rates can be controlled by legislation.

We hope that the recommendation said to have been made by a Western professor, that Roosevelt should be king, will not be carried out. Whatever mistakes Roosevelt may have made in the exercise of his presidential power, he does not deserve to be reduced to the stately impotence of a European monarch.

The number of vehicles that past a point on Fifth avenue near Fifty-eighth street in twenty-four hours was 10,379, of which 7,010 were drawn by horses and 3,309 were automobiles. And all this change has arisen, practically, in five years.

BANKING ROOM OF THE COMMERCIAL NATIONAL BANK, OF CHICAGO.

One of Chicago's Great Banks

THE Commercial National Bank, of Chicago, which moved into its new offices at the northeast corner of Clark and Adams streets on October 14th, was chartered in 1865, with a capital of $200,000. Its capital now is $3,000,000; its surplus and undivided profits amount to $4,000,000, and it has $40,000,000 of deposits, ranking fourth in the list of Chicago's national banks and thirteenth in the list of those of the entire country. Its chief officers are George E. Roberts, president; Joseph T. Talbert, vice-president; Ralph Van Vechten, second vice-president; David Vernon, third vice-president. Franklin MacVeagh, the eminent merchant and advocate of civic reform, is chairman of the board. Among the other directors are Robert T. Lincoln, president of the Pullman Car Company; E. H. Gary, chairman of the United States Steel Corporation; Darius Miller, first vice-president of the Chicago, Burlington & Quincy Railroad Company; William V. Kelley, president of the American Steel Foundries Company; Charles F. Spalding, president of the Spalding Lumber Company, and William J. Chalmers, president of the Commercial National Safe Deposit Company.

There have been only four presidents —P. R. Westfall, Henry F. Eames, James H. Eckels, and Mr. Roberts. The latter recently resigned the important Federal position of Director of the Mint to take this office. Mr. Eames, a banker of great ability and high character, held the place for thirty-two years. The late Mr. Eckels, a banker of national reputation (formerly Comptroller of the Currency), served for nine years. N. K. Fairbank and Franklin MacVeagh entered the board in 1881, the late Jesse Spalding in 1885, and Mr. Lincoln in 1898. Among the directors in recent years have been Paul Morton, now president of the Equitable Life Assurance Society, and John C. McKeon, who retired from the office of vice-president to become second vice-president of the National Park Bank in New York.

The offices of which the bank took possession in October are situated in a

fine new building directly opposite to the building of the Federal Government. It was erected at a cost of about $3,500,000, and is entirely owned by the Commercial National Safe Deposit Company. Eighteen stories (260 feet) high, and an admirable example of the Italian Renaissance, it is one of the most imposing and attractive business structures in the city. The main banking-room, approached by a grand marble staircase, is Greek in the style of its decorations, spacious, excellently lighted, and carefully planned for the convenience of employees and the public. Here and in the officers' rooms an intelligently chosen color scheme has been followed in the use of Istrian marble, Caen stone, rare woods and furniture made from special designs. Armor plate, such as is used for modern battleships, is the chief material for the cash and safety deposit vaults, which are the largest of their kind in the world. In the bank's vault alone there are 225 tons of this, and the vestibule of this vault was forged out of one solid ingot.

Emergency Issues of Currency

DURING the last three weeks our need of emergency issues of taxed and guarded asset currency has been very clearly shown. The enactment of a bill upon the lines of last year's Fowler bill and the recommendations of the American Bankers' Association and the New York Chamber of Commerce will be one of the first duties of the new Congress. The Fowler bill (which was favorably reported in the House) and the Association's plan differ only in minor details. The Association's plan, as shown in the able report of Mr. A. Barton Hepburn, is as follows:

Any national bank which has been in active business for one year and which has a surplus equal to 20 per cent. of its capital, shall be authorized to issue, under rules and regulations determined by the Comptroller of the Currency, credit notes to the amount of 40 per cent. of its bond-secured notes, the same to be subject to a tax of 2½ per cent. per annum, and to be guarded by a reserve of 25 per cent.; also, to make a further issue of credit notes to an amount equal to 12½ per cent. of its capital, the same to be taxed at 5 per cent. per annum, and to be guarded by a reserve of 25 per cent.; provided that the total of credit notes and bond-secured notes shall not exceed the capital. The taxes are to be a guaranty fund for the redemption of the notes of failed banks and for the payment of the expenses of printing and redemption. Ample facilities for prompt redemption shall be provided.

In the Fowler bill the tax on the first emergency issue is 3 per cent. instead of 2½, and such issue must not exceed 25 per cent. of the capital. When that bill was reported, the greatest possible issue of 25 per cent. (taxed at 3 per cent.) would have been $213,000,000, and $106,500,000 at 5 per cent. could have been added.

Such credit currency would be issued only in time of great stringency, and would be withdrawn after the return of normal conditions. It would be perfectly safe and would serve the interests of the people rather than those of "Wall Street." The House committee asserted that it would "almost invariably prevent a panic and always avert a ruinous crisis." Credit issues of this kind are used in Germany, France and Canada. They would impart a little elasticity to the rigid volume of our currency, and authority for using them here should be granted before the end of the year.

....A seat on the New York Stock Exchange was sold last week for $60,000, the lowest price recorded since 1904. The highest price, $95,000, was paid nearly two years ago.

....The directors of the New York, New Haven & Hartford Railroad Company have decided to offer to stockholders at par $39,000,000 of 6 per cent. debenture bonds, convertible, after January 15th, 1923, into stock, dollar for dollar.

....It is predicted that the output of the petroleum field near Tampico, in Mexico, will soon exceed that of any of the oil fields in this country. The company in control owns about 1,000,000 acres of land and has options on 3,000,000 more.

....In a report issued on the 8th, the Government estimates the corn crop harvested this year at 2,553,732,000 bushels. This quantity has been exceeded in only two years. The same report estimates the potato crop at 292,407,000 bushels, against 308,038,000 last year, and the crop of tobacco at 645,213,000 pounds, against 682,429,000 in 1906.

Insurance

Insurance at Yale

THE course on insurance just announced by Yale University covers instruction given by means of lectures supplemented by collateral reading. The first half of the year is devoted to a study of life insurance. After showing the historical development of the business, the theory of such insurance is taken up. No attempt is made to go into the higher mathematics of the subject, but the principles are explained in a way comprehensible to the non-mathematical mind. When this is done, much stress is laid upon the practical problems connected with the business such as legal regulation, taxation, expenses, dividends, company management, and the relation in general of the business to the public. Most of the remainder of the year is given to a study of fire insurance, with special emphasis upon the problem of rates, rating associations, legal regulation, the fire loss and means of decreasing the burning ratio. Several lectures in conclusion are devoted to the particular problems connected with the accident, liability and miscellaneous forms of insurance. In addition to the regular work of the course, lectures are given each year by prominent insurance men on subjects which their practical contact with the business makes them especially fitted to treat. The course is designed primarily for the student who desires a general knowledge of the principles and practices of the business, that is, for the man who is going either into business or into the legal profession. The class is open to students regularly enrolled in the university and to others qualified to attend the course. The University Library contains full sets of the transactions of the various actuarial societies, files and current numbers of several of the leading insurance magazines and many books on insurance. To all students of the course the privileges of the library are extended where special investigations into the topics taken up in the course may be carried on. Dr. Lester W. Zartman is in charge of this department.

In Case of Fire Call the Firemen

CERTAIN of the suggestions of Deputy Fire Commissioner Wise of Brooklyn as to what to do in case of fire are deserving of careful consideration outside of the boroughs of Brooklyn and Queens, for which they were made. Among other things, he said:

"It strikes me as an opportune moment to call the attention of the public to the urgent necessity of quick action whenever a fire is discovered. It has become the habit of people, when they discover a blaze, to fight it themselves, and when they find that it is too much for them they then appeal to the fire department. I cannot impress too strongly the fact that the department is here for the fighting of fires, and that it is the duty of every one to call on this department from the very first, and then to go and fight the fire if so inclined.

"No plainer case in this connection can be cited than the Coney Island fire. After trying for almost half an hour to extinguish a blaze with which they were entirely unable to cope, those who discovered the fire finally appealed to the department, with the result that this department was called upon to cope with a fire of great dimensions. I personally know that the uniformed force did great work at Coney Island, for I was on the spot ten minutes after the alarm was turned in, and I know there would have been no such loss of property as occurred had an appeal been sent when the blaze was first discovered.

"Similar cases occur every day. When I first assumed office I had placards sent to practically every house in the city, notifying the residents where to find the nearest fire-key and fire-box, and yet I meet dozens of people who confess that they have never thought to look up their location. It is the duty of every man to know these facts and then call on the department the minute the emergency arises."

THE Mutual Reserve Life Insurance Company announces that it has been reinstated and its license to do business in the State of Mississippi renewed.

THE National Life Insurance Company of the United States of America, whose home office is in Chicago, has appointed Mr. S. C. Bolling to its agency force. Mr. Bolling will have charge of several of the Southern States. He is now in the field conducting an aggressive campaign.

The Independent

VOL. LXIII NEW YORK, THURSDAY, NOVEMBER 21, 1907 No. 3077

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Mr. Bryan's Position

Mr. Bryan gave to the public on the 15th a long statement concerning his attitude toward the Democratic Presidential nomination. He had refused, he said, to say anything about this at an earlier date because "sometimes a day will change the situation, and a few months may bring forward a new issue which will have an important bearing upon the availability of a candidate." A Presidential candidate should fit his party's platform, and platforms were made to fit the conditions existing when they were framed. Now, however, the elections having taken place, both those who opposed his nomination and those who favored it were entitled to know whether he would accept:

"Mr. Bryan will not ask for or seek a nomination, and he will not assume to decide the question of his availability. He has been so amply recompensed by his party for what he has done and for what he has endeavored to do that he cannot claim a nomination as a reward; neither should his ambition be considered, for he has had honors enough from his party to satisfy any reasonable ambition. The only question that ought to weigh with the party is whether the party can be strengthened and aided more by his nomination than by the nomination of some one else. If he can serve the party by being its candidate he will accept the commission and make the best fight he can. If, however, the choice falls upon another, he will not be disappointed or disgruntled. His availibility is a question to be decided not by him, not by a few leaders, not even by the leading newspapers that call themselves Democratic, but by the voters of the party, and to them he entrusts the decision of the question."

It was not true that he had been waiting to see who the Republican nominee would be. He had never felt that his position should be dependent upon the action taken by the Republican party. The Republicans must nominate a reformer, a standpatter, or one whose position on public questions was unknown. In any case, the Democratic party should fight for what it believed. If the rank and file desired him (Mr. Bryan) to make the race, he would make it, no matter who should be the Republican nominee. He had not been waiting to ascertain the chances of victory. The action of the party could not be made dependent upon the prospect of success, altho Democrats had reason to be encouraged because their principles had grown in popularity, their policies were praised by many who had denounced them a few years ago, and their party was more united than it had been for many years, while the Republican party was more divided. Democratic prospects now seemed excellent, but the fight must be made whether they were bright or gloomy:

"No man can ask for a nomination as a compliment if his nomination will not benefit the party, and no Democrat would be justified in refusing a nomination if his party demanded his services, and if the members of the party believe that Mr. Bryan's nomination will help the party, its principles and its policies, he will accept the nomination, whether the indications point to defeat or victory."

The next campaign, he continued, would be an appeal to the public conscience. Investigations had shown not only the corrupt use of large campaign funds, but that corporations which seek to convert the Government into a business asset were the only source from which the funds could be drawn:

"The Democratic party stands for the doctrine of equal rights to all, and special privileges to none, and therefore cannot promise favors to favor-seeking corporations. If it made such promises to the corporations, it would be guilty of duplicity, for it would have to betray the voters, as the Republican party has done in order to reward these corporations as the Republican party has rewarded them. The Democratic campaign must be carried on by volunteers who will work because they desire the triumph of Democratic ideas. We cannot hope to appeal to the sordid or to buy the purchasable, even if such a course would contribute toward Democratic success. No one should favor Mr. Bryan's nomination unless the party is willing to open its books and show where its contributions come from and for what the money is expended."

The national conscience had already been aroused, and a large majority of the voters had been educated to the necessity for real reform. It only remained for the Democratic party to convince the voters that it could be intrusted with the work of reform. Nothing would do more to convince the public than a refusal to negotiate with predatory wealth and an honest appeal by honest methods to the honest sentiment of the country.

The Financial Disturbance

A considerable reduction of working forces in the industries was reported last week, and the lack of currency was felt thruout the country. A few small banks suspended payment. Similar action was taken by a considerable number of commercial or manufacturing concerns. A large majority of these suspensions cannot properly be called failures, and it is expected that they will be of a temporary character. The extent of the disturbance which originated in New York was shown by the closing, on the 11th, of the Exchange at Rome. In Chicago, Denver, San Francisco, Pittsburg and other cities Clearing House certificates of small denominations (from $1 upward) were in circulation and were accepted by merchants generally from wage-earners and others. It was reported that the Government was dissatisfied on account of insufficient applications from New York banks for new circulation. There was also said to be complaint that these banks were not sufficiently liberal in shipping currency westward. The report was denied, however, and the complaint was shown to be unwarranted, as the New York banks had shipped $21,000,000 within a few days. It was asserted by some that banks of the interior in some places made excessive demands and were inclined to hoard their cash. Demand for Government bonds as a basis for additional circulation raised the price of the bonds, and it was difficult to obtain them. Therefore, at the end of the week, it was understood that the Government was considering the expediency of issuing $50,000,000 of Panama 2 per cents., which could be used for new circulation. The premium on currency rose to 4 per cent., but at the close of the week had fallen to 2½. Engagements of gold abroad amounted, up to Saturday, to about $68,000,000, of which $33,000,000 had been received. The "Oceanic" brought $8,000,000, and nearly $14,000,000 will arrive this week on the new "Mauretania." Mints are working overtime, coining gold. Negotiations with the Bank of France for $15,000,000 failed because the bank regarded a guarantee by our Government as essential, but realized that such a guarantee was out of the question. At the end of the week, the additional national bank circulation taken out amounted to $23,000,000. On Saturday, the 16th, the New York bank statement showed an increased deficit of reserve, the shortage having been enlarged from $51,924,000 to $53,666,000. But the reserve still exceeds $218,000,000. At a banquet in New York Secretary Cortelyou condemned the hoarding of money and urged that it be entrusted to the banks. The Governor of California called a special session of the Legislature, because of the financial situation. Governor Hughes, of New York, appointed an advisory commission of six eminent bankers to consider the question of further legislation. We refer to this elsewhere. Thruout the week, the purchase of stocks in odd lots, or small quantities, for investment, continued to excite comment. One house filled $6,000,000 worth of such orders. Official reports showed that the number of shareholders in some railroad companies had been doubled, with a considerable decrease of the average holding. For the New York Central, the increase in number was about 75 per

cent. A report that the Morgan interests had obtained control of the Morse coastwise steamship combination for a small sum was denied.——Reports during the week showed that many manufacturing concerns were reducing hours of work or closing temporarily. The Pennsylvania and other railroad companies announced a policy of reducing expenses. It was estimated that 50,000 men had been laid off in the iron and steel industry. Work upon expensive new plants was suspended. Carpet factories, knitting mills and ship yards were among the concerns sharply affected. But the Midvale Steel Company increased its force, the St. Paul road gave notice that it would hire 4,500 more men on its western extension, and the Steel Corporation resisted cancellation of orders, being confident of an approaching revival of activity.——It became known on the 17th that the Attorney-General of New York had applied for and obtained the appointment of receivers for six suspended institutions—the Jenkins Trust Company, Borough Bank, Brooklyn Bank and Williamsburg Trust Company, all of Brooklyn; the Hamilton Bank and the International Trust Company. This action was taken upon the report of the Superintendent of Banks. It is officially stated that evidence of both civil and criminal liability has been found in the Borough Bank and Jenkins Trust Company, where unlawful loans have been made.

Issues of Notes and Bonds

It was announced on Monday morning, the 18th, that the Government had decided to issue at once not only $50,000,000 of Panama 2 per cent. bonds but also $100,000,000 of $50 certificates of indebtedness, bearing interest at 3 per cent. and payable at the end of one year. There was published a letter from the President to Secretary Cortelyou, dated the 17th, in which he approved these issues, pointing out that the proceeds of the certificates or notes could be at once deposited by the Secretary "where the greatest need exists, and more especially in the West and South, where the crops have to be moved." He had assurance, he said, that the leaders of Congress were "considering a currency bill which would meet in permanent fashion the needs of the situation," and he believed this would be past at an early date. The remainder of the letter, as follows, was really intended for the public:

"What is most needed just at present is that our citizens should realize how fundamentally sound business conditions in this country are, and how absurd it is to permit themselves to get into a panic and create a stringency by hoarding their savings instead of trusting perfectly sound banks. There is no particle of risk involved in letting business take its natural course, and the people can help themselves and the country most by putting back into active circulation the money they are hoarding. The banks and trust companies are solvent. There is more currency in the country today than there was a month ago, when the supply was ample; $55,000,000 in gold has been imported, and the Government has deposited another $60,000,000. These are facts, and I appeal to the public to co-operate with us in restoring normal business conditions. The Government will see that people do not suffer if only the people themselves will act in a normal way. Crops are good and business conditions are sound, and we should put the money we have into circulation in order to meet the needs of our abounding prosperity.

"There is no analogy at all with the way things were in 1893. On November 30th of that year there was in the Treasury only $61,000,000 in gold. On November 14th of this year there was in the Treasury $904,000,000 in gold. Ten years ago the circulation per capita was $23.23. It is now $33.23. The steps that you now take, the ability of the Government to back them up and the fact that not a particle of risk is involved therein give the fullest guarantee of the sound condition of our Treasury. All that our people have to do now is to go ahead with their normal business in a normal fashion, and the whole difficulty disappears, and this end will be achieved at once if each man will act as he normally does act and as the real conditions of the country's business fully warrant his now acting."

Authority for the issue of the 3 per cent. notes is found in the act of June 13th, 1898, "To provide ways and means to meet war expenditures and for other purposes," which empowered the Secretary to borrow at 3 per cent., upon certificates payable in one year, "such sum or sums [not exceeding $100,000,000] as, in his judgment, may be necessary to meet public expenditures." The notes ($100,000,000) were formally offered to the public on the 18th. It is expected that the bonds will be used by the banks as basis for new circulation. The proceeds of the sale of the notes can be deposited

at once in the banks and will thus enlarge the available supply of currency. The President virtually asks those who have been hoarding money to meet the Government half way in measures for relief.

Death of Mr. Barney

Charles T. Barney, who recently retired, or was deposed, from the presidency of the Knickerbocker Trust Company, shot himself at his residence in New York, at about ten o'clock on the morning of the 14th. Being conscious for about three hours thereafter, he made his will and sought to arrange his affairs with respect to his interest in thirty-four corporations of which he was an officer or director. He then submitted to a surgical operation and died an hour later. The receivers of the Knickerbocker (which suspended on October 21st) at once stated that the company's condition furnished no evidence of fraud or embezzlement. Its loans to Mr. Barney were only $375,000. Two years ago he had a fortune of $9,000,00. His attorneys now report that at present values his estate exceeds all its obligations by $2,517,000. He had been greatly depressed by loss of prestige. For ten years he was president of the Knickerbocker, whose deposits rose in that time from $10,000,000 to $64,000,000, while the dividend on its stock was increased to 50 per cent. He was fifty-six years old and a graduate of Williams College. He leaves two sons (graduates of Yale), two married daughters, and a widow, who is a sister of the late William C. Whitney. For years he had been engaged in extensive and profitable real estate operations. A few hours after his death, an interview with his successor in the Knickerbocker, A. Foster Higgins, was published, in which he was characterized as an irreligious and immoral man, whose financial associations had been objectionable. This caused much indignation. A considerable part of the interview has been repudiated by Mr. Higgins. It is said that he will soon retire from the presidency. There is no official report as to the company's condition, but rumor says it will pay all claims and have something left. Among those embarrassed by its suspension are the missionaries in Asia, whose salaries are guaranteed by the New York branch of the Woman's Missionary Society of the Methodist Church. Checks on the Knickerbocker were sent to them a few weeks ago.

"In God We Trust"

The omission of the words "In God We Trust" from the new gold coins for which designs were made by the late Augustus St. Gaudens has drawn protests or expressions of regret from many clergymen and others. Resolutions of regret were adopted at a Presbyterian convention in Cincinnati, on the 14th, and on the same day a resolution of protest was adopted, by a vote of 131 to 81, in the convention of the Protestant Episcopal diocese of New York. President Roosevelt has published the following statement concerning his action in the matter:

"When the question of the new coinage came up we looked into the law and found there was no warrant therein for putting 'In God We Trust' on the coins. As the custom, altho without legal warrant, had grown up, however, I might have felt at liberty to keep the inscription had I approved of its being on the coinage. But as I did not approve of it, I did not direct that it should again be put on. Of course, the matter of the law is absolutely in the hands of Congress, and any direction of Congress in the matter will be immediately obeyed. At present, as I have said, there is no warrant in law for the inscription.

"My own feeling in the matter is due to my very firm conviction that to put such a motto on coins, or to use it in any kindred manner, not only does no good, but does positive harm, and is in effect irreverence, which comes dangerously close to sacrilege. A beautiful and solemn sentence such as the one in question should be treated and uttered only with that fine reverence which necessarily implies a certain exaltation of spirit. Any use which tends to cheapen it, and above all, any use which tends to secure its being treated in a spirit of levity, is from every standpoint profoundly to be regretted. It is a motto which it is indeed well to have inscribed on our great national monuments, in our temples of justice, in our legislative halls, and in buildings such as those at West Point and Annapolis—in short, wherever it will tend to arouse and inspire a lofty emotion in those who look thereon. But it seems to me eminently unwise to cheapen such a motto by use on coins, just as it would be to cheapen it by use on postage stamps or in advertisements.

"As regards its use on the coinage we have actual experience by which to go. In all my life I have never heard any human being speak

reverently of this motto on the coins, or show any signs of its having appealed to any high emotion in him, but I have literally hundreds of times heard it used as an occasion of, and incitement to, the sneering ridicule which it is above all things undesirable that so beautiful and exalted a phrase should excite. For example, thruout the long contest extending over several decades on the free coinage question, the existence of this motto on the coins was a constant source of jest and ridicule; and this was unavoidable. Every one must remember the innumerable cartoons and articles based on phrases like 'In God We Trust for the Eight Cents,' 'In God We Trust for the Short Weight,' 'In God We Trust for the Thirty-seven Cents We do not Pay,' and so forth and so forth.

"Surely I am well within bounds when I say that a use of the phrase which invites constant levity of this type is most undesirable. If Congress alters the law and directs me to replace on the coins the sentence in question, the direction will be immediately put into effect; but I very earnestly trust that the religious sentiment of the country, the spirit of reverence in the country, will prevent any such action being taken."

"Recognition of the Almighty God in some form on our coins" was suggested to Secretary Chase in 1861 by the Rev. M. R. Watkinson, of Ridleyville, Pa., and the Secretary directed that suitable mottoes be prepared. He selected the words "In God We Trust," and by authority of permissive legislation in 1864 and 1865 they were placed on the coins, the first to bear them being the two-cent piece. Authority was also given in the coinage act of 1873, which was not mandatory. The reference to such a motto in the act of 1873 was omitted in a subsequent revision of the Federal statutes.

Election Aftermath

Ex-Governor Beckham, of Kentucky, replies at length to Henry Watterson's explanation of Democratic defeat in that State, asserting that Watterson hurt his party by opposing the temperance movement and that he is seeking the seat in the Senate for which he (Beckham) was named at the Democratic primaries. At last accounts it was by no means certain that the Democrats would be able to elect a Senator. Now that Mr. Willson (Republican) has been elected Governor, ex-Governor Taylor has decided to return from exile and meet the charges against him relating to the assassination of Goebel, believing that he will be fairly treated in the courts. The fourth trial of Caleb Powers for complicity in that assassination is now in progress. Powers has been in jail, under indictment, for nearly eight years.——In San Francisco, William J. Burns, the famous detective and assistant of Prosecutor Heney, says that the casting of about 5,000 illegal votes at the recent election was prevented by himself and his agents. McCarthy and Ryan, the defeated candidates for Mayor, now publicly promise to assist Mayor Taylor. Pointing to the victory in the city, Mr. Heney urges the people of California to end the political domination of the Southern Pacific Railroad in the State.——In the Alabama House a general prohibition bill was past last week by a two-thirds majority.——In Massachusetts it is expected that about 6,000 election offices will be transferred from the Democratic party to the Independence League, whose candidate for Governor, Mr. Hisgen, received about 75,000 votes. The law says that these offices shall be held by representatives of the two leading parties on the vote for Governor. Mr. Whitney received 9,000 more votes than were cast for Hisgen, but these votes were given under three party designations, and the number of those given to him as the regular Democratic nominee fell 1,147 below Hisgen's total. The question will probably be taken to the courts. The offices are those of members of registration boards, election commissions, etc., and for service at primaries and elections those who hold them receive from $5 to $12 a day. The State ballot law commission and Boston excise board may be included.

A Central American Peace Conference

Last Thursday, at Washington, Secretary Root opened the Peace Conference of the delegates from the five Central American Republics. It will be remembered that thru the good offices of the United States and Mexico this Conference was convened, as it was thought that the quarrels that had been so prevalent in Central America during the past few years ought to be stopped, and peace be established before the Panama Canal is completed. Secretary Root took the bull by the

horns when he suggested that the time for talking has past, and that some definite and practical remedy must be provided to obtain peace in Central America:

"I will venture to suggest," said he, "that the all important thing for you to accomplish is that while you enter into agreements which will, I am sure, be framed with the most peaceful intentions and the most rigid sense of justice, you shall devise, also, some practical method of making it possible to secure the performance of these agreements. If an attempt be made to violate them, the responsibility must be fixed upon an individual."

Señor Creel followed with an interesting address, in which he said it was time for the Central American governments to spend their energies in making improvements at home instead of quarreling with their neighbors. The proposition which thus far is being most discussed is the creation of an arbitral tribunal to be composed of judges from each of the five States. It is proposed that this tribunal have special jurisdiction over questions of constitutional rights, and if any Power shall disregard the decisions of this tribunal the remaining Powers shall enforce compliance. President Roosevelt has already entertained the delegates at luncheon, and has urged them to do something practical. On Saturday Mr. Carnegie met them, and in the course of his conversation he said:

"If I had one prayer to utter—I do not ask for things in prayer, because there have been given me many things which I do not ask for and which I do not deserve—but if I had a prayer, I would pray to God to let you gentlemen representing the different countries unite in a sort of brotherhood, and that each one of you might take the other by the hand and say 'My brother.'"

This pleased the delegates so much that one of them said: "Mr. Carnegie, you have more love here" (pointing to his heart) "than you have money there" (pointing to his trousers pocket). Some annoyance has been caused in Washington because President Zelaya of Nicaragua, President Davilas of Honduras and President Figueroa of Salvador have issued an invitation for a meeting at Amapala, after the Washington Conference, of the five Central American States, for the purpose, it is said, of finishing up the work that may be left undone at Washington. The invitations have been refused by President Cabrera of Guatemala and President Vicquez of Costa Rica, as they feel that they cannot be a party to plans that seem to sap the importance of the Washington Conference now in progress.

The Kaiser in London

The reception of the Emperor of Germany on his visit to England was duly decorous if not widely enthusiastic. The German imperial yacht "Hohenzollern" made its landing at Portsmouth in the fog, so Admiral Beresford's fleet of twelve battleships, ten cruisers and twenty-four destroyers, furbished up for the occasion, was altogether invisible. On November 13th the Emperor and Empress were driven thru the streets of London, decorated with arches and lined with troops, to the Guildhall, where an address of welcome in a gold casket was presented to him. To the 800 dignitaries there assembled the Emperor spoke of his desire for peace, as he had on his previous visit in 1891:

"I said then, on this spot, that my aim was above all the maintenance of peace. History, I venture to hope, will do me justice, in that I have pursued this aim unswervingly ever since.

"The main prop and base for the peace of the world is the maintenance of the good relations between our two countries, and I will further strengthen them so far as lies in my power. The German nation's wishes coincide with mine.

"The future will then show a bright prospect, and commerce may develop among the nations who have learned to trust one another."

The facts that Emperor William looked haggard and sad and that four physicians, including Sir Felix Semon, the throat specialist, were in attendance upon him, gave renewed currency to the rumor of a serious disease. But it was officially announced that he had nothing worse than a temporary cold, and certainly his state of health did not interfere with his slaughter of the pheasants of Windsor on his usual wholesale scale. The degree of Doctor of Laws was conferred upon him by a delegation of officials from Oxford University. On November 16th Prince Charles of Bourbon was married to Princess Louise of Orleans at Wood Norton, Worcestershire, the country seat of the bride's brother, the Duke of Orleans, Pretender to the

Throne of France. The ceremony was performed by the Roman Catholic Bishop of Birmingham and the festivities were of royal magnificence. Forty members of royal families, relatives of the bride and groom, were present, including the King and Queen of Spain and Queen of Portugal, and four hundred other distinguished guests, but King Edward and Emperor William did not attend, as that would have been an offense to France. Prince Charles is the grandson of King Ferdinand II of Naples and Princess Louise is the youngest daughter of the Comte de Paris and great-granddaughter of Louis Philippe.

Italian Politics

The trial of Signor Nunzio Nasi, ex-Minister of Public Instruction, before the Senate sitting as a High Court of Justice, is creating great excitement in Italy, particularly among the Sicilians, who ardently support their representative and have manifested a willingness to proceed to violence in his defense. Signor Nuncio Nasi is charged with falsifying documents and defrauding the State Treasury. The chief support of the charges against him are the absurdly extravagant sums of money for traveling and personal expenses. Signor Ciccoti, formerly a university professor and Socialist Deputy, declared in his speech before the Senate that he was the first person to accuse Nasi, and charged him with the wholesale distribution of public money thruout Italy to establish a party which should raise him to the premiership. Signor Ciccoti's language was so violent that he was expelled from the hall by the ushers. Signor Nasi made an eloquent defense in a speech of five hours, denying all the accusations and insisting that he be judged as a minister, and that the duties and responsibilities inherent to that position be taken into consideration. He said the term traveling expenses included large sums of money used in the interests of the Government for political purposes because it was necessary to keep the matter secret. Certain individuals had been sent into Tripoli for the purpose of furthering the Government's policy of peaceful penetration, and the money given to them had been entered under "gifts for unknown persons." To have made these items public, he said, would have exposed Italy's foreign policy to criticism. Part of the money referred to had been used, he declared, as a subsidy to a Milan newspaper to support the policy of the Government in the matter of education. Other funds had been used for the relief of the family of a deceased Republican Deputy. It is reported that, if necessary to defend himself, Nasi will bring proof that the late Zanardeli wielded a large corruption fund. Signor Michael Lombardo, ex-Under Secretary of Finance, on trial for the same charges, declared that he merely carried out the orders of the Minister of Public Instruction.——The Anti-Clericals had things their own way in the general municipal elections at Rome for the first time since 1870. The Catholics of the Roman Union decided as a matter of tactics, since they were in hopeless minority, to entirely withdraw from the field, and did not contest the election. By this action they will throw the entire responsibility for the city government upon their opponents, and they expect to be in a better condition for renewing the conflict when they can criticise the mistakes committed by the dominant party.——*The Correspondenza Romana* protests against the complaint often made in America that the Church is controlled entirely by Italians. It says the assertion is very unjust, particularly now, when the highest post next to the Pope's is filled by a Spaniard, the General of the Jesuits is a German, and another German has just been appointed Nuncio at Munich, a post hitherto invariably filled by an Italian.

The Third Russian Duma

The third Russian Duma assembled at St. Petersburg on November 14th, and was inaugurated with the usual forms, altho with less state and none of popular interest and enthusiasm that characterized its predecessors. The members of the Duma were not received by the Czar, but assembled in the Tauride Palace, where Mr. Golubell, Vice-President of the Council of the Empire, accompanied by the Secretary of the Empire, Baron de Gyldenbandt, received them and read the imperial ukase convoking the Duma, and spoke as follows:

"His Majesty, the Emperor, has charged me with the high duty to bid the members of the Third Duma welcome in his name, and he implores God's blessing on the work before us, of establishing order and peace in our beloved Fatherland, of promoting the enlightenment and well-being of the peoples, of consolidating the new State organization, and of strengthening the great and indivisible Russian Empire."

Afterward the national hymn was sung and the oath of allegiance taken. The radical members, as before, remained outside the hall during these preliminaries, entering only to sign the oath. There was no contest for the Presidency, as it had been arranged by previous conference that an Octobrist should be elected, and accordingly Nicolai A. Khomyakoff, ex-Marshal of the Nobility of Smolensk, received 371 out of 380 votes cast at the first ballot. The new president is fifty-four years of age, and is a man of honor and ability. He is a poet and godson of Gogol. His chief political activity has hitherto been in the advocacy of Pan-Slavic ideas. He is reported to have said that it would be much better if Russia were rid of the Jews, despite their financial power, but that no action would be taken on this question by the present Duma. The new Duma is very different in its appearance and character, owing to the practical exclusion of the peasant and radical element. The Constitutional Democrats, or Cadets, who formed the dominant party in the other Dumas, are here reduced to a small minority. They will maintain their party organization, and will endeavor to co-operate with the Octobrists or Moderates in securing some needed and effective legislation. Almost the only hope that the people have in the present situation is that the Government, having obtained a Duma to suit, will work with it, and in that way parliamentary government may become thoroly established in Russia. The members of the extreme Right make no secret of their desire to see the old *régime* re-established, as it was before the recent efforts at revolution. In addressing the Absolutist members of the Duma, in conference at Moscow, Mr. Shmakoff said: "Remember you are going to St. Petersburg not to legislate in the Duma, but to destroy it." Mr. Purishkevich, vice-president of the League of the True Russian People and a notorious anti-Semite, declares that the radicals will not be allowed to speak at all, the cadets only will be given the floor to a limited extent, but will be excluded from committee work. The present Duma is divided roughly as follows among four groups: Monarchists of the Right, 195; Octobrists or Moderates, 128; Constitutional Democrats, 41; Socialists and Radicals, 28. The radical and progressive element was reduced by the application of the new Electoral Law, which cut down the representation of the cities, and, by a series of indirect elections by groups, the official and wealthy classes were given the advantage. Under the former law the peasants had a voting power in the electoral college of 2,535 as compared with 1,965 for the landowners, but the proportion is now more than reversed, it being 1,147 to 2,644. The Minister of Finance has submitted to the Duma the budget for 1908. According to it the total expenditures for the empire for next year are placed at $1,257,500,000, and the ordinary receipts at $1,159,000,000.

Prohibition in Finland

The prohibition movement is not confined to the United States. The Finnish Congress has past a law totally prohibiting the manufacture, sale, use and possession of alcoholic liquors in any form, including wine and beer. No exception is made in the use of wine in the communion service. Alcohol in all its forms can be kept for medical and mechanical purposes and for the use of Russian troops. No one may keep liquors in his house, unless he can prove that they were in his possession before the act was past. The police have full rights to search, and the penalties for the violation of the law range from $20 fine to penal servitude for three years. No compensation is to be allowed for loss of capital invested in breweries, distilleries or saloons. It is expected that the bill will be vetoed by the Czar. The new law establishing universal suffrage in Finland resulted in a very radical legislative body. The socialists number eighty, and there are nineteen women members, the first time that women have been elected to a national parliament.

Leading American Illustrators

Sixteen typical examples of their work selected from recent publications

PARRISH.

Maxfield Parrish's illustration from Kenneth Grahame's "Dream Days," published by the John Lane Co. Mr. Parrish was born in Philadelphia in 1870. He was a pupil of the Philadelphia Academy of Fine Arts and of Howard Pyle. He has received many medals for his painstaking work, which is characterized with striking originality and beautiful color effects. Home address, Windsor, Vt. Copyright, 1907, John Lane Co.

STEPHENS.

Alice Barber Stephens's illustration from Helen R. Martin's "His Courtship," published by The McClure Co. Mrs. Stephens was born in New Jersey in 1858. Her art education was obtained at the Philadelphia Academy of Fine Arts, the Philadelphia School of Design and at the Julian and Colarossi Academy in Paris. She has received many medals and prizes. Home address, Moylan, Pa. Copyright, 1907, McClure Co.

IVANOWSKI.

Sigismond De Ivanowski's illustration from Lawson's "Friday, the 13th," published by Doubleday, Page & Co. Mr. Ivanowski was born in Odessa, Russia, in 1872. He studied at the Imperial Academy of Fine Arts of St. Petersburg, and later at Munich and Paris. For a time he worked under Benjamin Constant and Jean Paul Laurens. He came to this country in 1902, and has achieved remarkable results as an illustrator. His work has been given an honored place in the leading magazines and he has illustrated many books. An exhibition of his paintings was held this month at Pratt Institute, Brooklyn. Copyright, 1907, Doubleday, Page & Co.

NEWELL.

Peter S. Newell's illustration from Myrtle Reed's "The Book of Clever Beasts," published by G. P. Putnam's Sons. He was born in Illinois, March 5, 1862. He studied at the Art Students' League. Home address, Leonia, N. J. Copyright, 1907, G. P. Putnam's Sons.

FISHER.

Harrison Fisher's illustration from "The Harrison Fisher Book," published by Charles Scribner's Sons. He was born in Brooklyn, N. Y., July 27, 1875, and studied in San Francisco. Served for several years as an illustrator on "The Saturday Evening "Post," and has contributed drawings to "McClure's," "Scribner's," etc. A frequent illustrator of books. Lives in New York. Copyright, 1907, Charles Scribner's Sons.

PYLE.

Howard Pyle's illustrations from Cabell's "Gallantry," published by Harper & Brothers. Mr. Pyle was born at Wilmington, Del., March 5, 1853. His work as an illustrator and painter has received medals at the Columbian Exposition, Chicago; Atlanta Exposition, Paris Exposition and the Pan-American Exposition, Buffalo. He lives at Wilmington. Copyright, 1907, by Harper & Brothers.

HERTER.

Albert Herter's illustration from new edition of Cable's "The Grandissimes," published by Charles Scribner's Sons. Mr. Herter was born in New York City in 1871. He was a pupil at the Art Students' League under Carroll Beckwith. He also studied with J. P. Laurens and Cormon in Paris. He was a medalist at Atlanta, Paris and Buffalo. He took the Lippincott prize at Philadelphia in 1897 and the Evans prize A. W. C. S. in 1899. He is a resident of this city. Copyright, 1907, Charles Scribner's Sons.

CLARK.

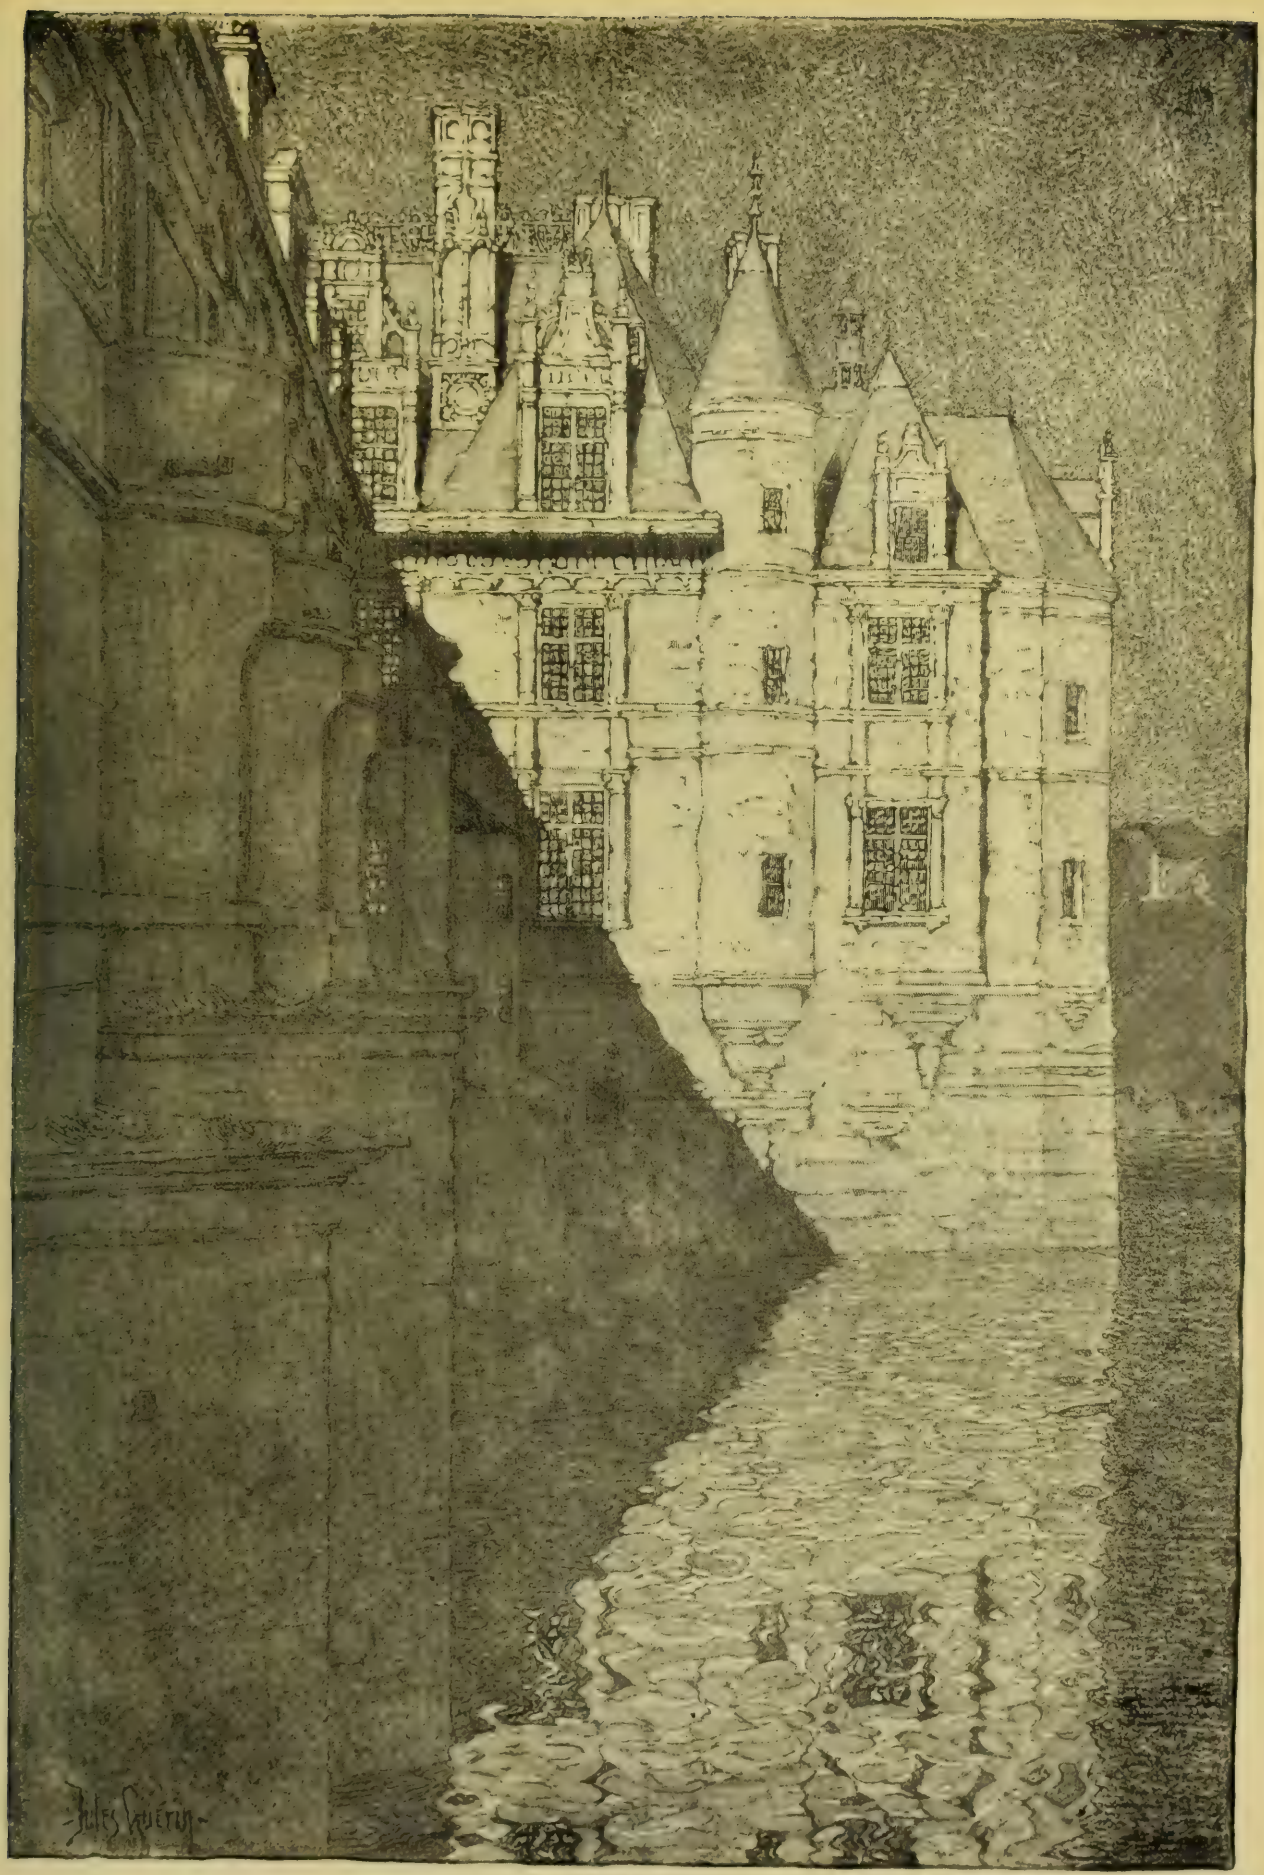
Walter Appleton Clark's illustration from "The Awakening of Helen Richie," published by Harper & Brothers. He was born at Worcester, Mass., June 24, 1876, and studied under H. Siddons Mowbray and W. M. Chase. His first published work appeared about 1896. In 1899 his first color work was used on "Scribner's." Mr. Clark was awarded medals at Paris and at the Pan-American Exposition. He died last year. Copyright, 1907, Harper & Brothers.

CRAWFORD.

Will Crawford's illustration from "Tittlebat Titmouse," published by Funk & Wagnalls. Mr. Crawford was born in Washington, D. C., in 1869. Studied at several different art clubs in Irvington, N. J.; Newark, N. J., and in New York. Has had representation in all the leading magazines. Lives in Jersey City, N. J. Copyright, 1907, Funk & Wagnalls.

CADY.

Harrison Cady's illustration from "The Cozy Lion," by Frances Hodgson Burnett, published by the Century Co. He was born at Gardner, Mass., in 1878. Self taught. First drew for newspapers in New York. Is now a regular contributor to "Life." Draws also for "The Century," "St. Nicholas," "Ladies' Home Journal," "Puck," "Judge." His book illustrations are popular. Mr. Cady lives in Brooklyn.
Copyright, 1907, The Century Co.



HUTT.

Henry Hutt's illustration from Paul Leicester Ford's "Warning to Lovers," published by Dodd, Mead & Co. He was born in Chicago, Ill., in 1875. Obtained his early art education in the Art Institute of Chicago. Began work as an illustrator in the West, but during recent years has contributed to the leading New York magazines, thru which the "Hutt Women" have attained a fame scarcely less than that of the "Gibson Girl." Resides in New York City. Copyright, 1907, Dodd, Mead & Co.

RELYEA.

Charles M. Relyea's illustration from Beatrice Mantle's "Grit: The Story of a Pagan," published by the Century Co. Mr. Relyea was born at Albany, N. Y., in 1863. His art education was acquired under Thomas Eakins and F. V. Du Mond. He lives at Rochelle Park, New Rochelle, N. Y. Copyright 1907, The Century Co.

GUERIN.

Jules Guerin's illustration from "The Châteaux of Touraine," by Maria Hornor Lansdale, published by the Century Co. He was born at St. Louis, Mo., in 1866, and was a pupil of Benjamin Constant in Paris. Medals have been given him at Chicago, St. Louis, etc. He lives in this city. Copyright, 1907, The Century Co., New York.

ANDERSON.

Karl Anderson's illustration from "Iole," by Robert Chambers, published by D. Appleton & Co. He was born at Oxford in 1874, studied in Paris and Holland, and was a pupil of the American Institute of Architects. Home address, New York City. Copyright, 1907, D. Appleton & Co.

O'NEILL.

Rose Cecile O'Neill's illustration from Mark Lee Luther's "The Crucible," published by the Macmillan Co. Mrs. O'Neill Wilson was born in Wilkesbarre, Pa. She has contributed drawings to "Life," "Harper's Monthly," "Bazar" and "Weekly," "Good Housekeeping," "Collier's," "Puck," and illustrated her own and her husband's novels. Home address, Day, Mo. Copyright, 1907, The Macmillan Co.

LEYENDECKER.

Joseph C. Leyendecker's illustration from "Iole," by Robert Chambers, published by D. Appleton & Co. He was born at Montabour, Germany, March 23, 1874. He was a pupil of the Julian Academy in Paris and of the American Institute of Architects. He lives in New York City. Copyright, 1907, D. Appleton & Co.

A Note on American Illustration

BY CHARLES H. CAFFIN

Author of "American Masters of Painting," "How to Study Pictures," etc.

AN evening newspaper recently published the complaint of a dramatist—presumably a not too successful one—that managers and "stars" are not looking for original plays, but for something along the lines of what has already proved a success. Whether this is true I am not prepared to say; but, if for managers we were to substitute publishers and editors, and for drama, illustration in books, magazines and papers, there would, I think, be some grounds for the complaint.

There was a time, and not so very long ago, when one could point with pride to the American magazine at least as representation of what was best in illustration. The publishers had surrounded themselves with groups of exceptionally able men, to whom all possible latitude of choice and treatment of subject was permitted, while the energy of the manufacturing staff was expended in perfecting the processes of reproduction. The result was that the monthly appearance of these one or two periodicals was a real artistic treat. They were hailed with enthusiasm by people of taste abroad, for their excellence was so far in advance of the best that was being produced along the same lines in Europe. In consequence Americans settled back into a complacent consciousness of their superiority, while the foreign publishers set to work to emulate it. The result is that today the tables are turned, and, on the whole, the better work is being produced abroad.

It is better in several respects. There is more originality, virility and variety in the character of foreign illustrations, and, where one reaches the top of the scale, far more technical skill is displayed in the processes of reproduction, whether in color or in black and white. It will be admitted, I think, by those who have studied the question, that the illustrative press-work of Germany at its best is superior to anything produced in this country. And the irony of the situation comes down to us when we find that the managers and foremen to whom in the first instance the superiority of the German work is due, are Americans, who learned their business in New York in the palmy days of American illustration. Nor have these men expatriated themselves for the sake of bigger salaries. It is an increase not of money that keeps them abroad, but of artistic opportunity. The conditions of production and the ideals of management are more favorable to honest, high class work. They will tell you so themselves. And by conditions they do not mean those which arise out of the different facts in relation to trade unionism. They allude to the prime factor, that not only is the best demanded of their shops, but that the bosses and the publishers are united in a fuller knowledge of what constitutes the best, and are inspired with a more single-minded purpose to secure it. To this end they allow time for the proper development of each stage of the process, and encourage every one of their workmen to take a personal pride in his particular share of the creativeness. From the highest to the lowest in the press rooms the men are working in the spirit of artists rather than mere artisans. It would be strange if under the impulse of knowledge and trained taste such honest efforts did not secure the best; whereas under our system of hustle and stress, the tendency of which is to reduce crafts-

manship to a system of soulless output, we have ceased to deserve the best and have grown to be satisfied with "good enough."

Moreover, just as the excellence of the foreign press-work is based upon encouragement of the personality of the individual craftsman, so the greater virility, variety and originality of foreign illustrations are due to the complete freedom permitted to the artists. They are not only allowed to be themselves, but every encouragement is given them to rely upon their own individuality of style and feeling. In our own country, however, an opposite tendency has been for several years apparent. I am not specifying names in this brief review of present-day illustration, or I could give an imposing list of artists whose work is admirable, tho many of them have been forced by the popularity which they have attained to go on and on producing work along the same groove of subject and manner. Accordingly what started with being originality has become stereotyped by repetition. For the editorial policy is rather to repeat or to imitate proved successes than to venture into untried paths. Hence, if a publisher does hit upon an artist with a distinctively personal quality that proves attractive to the public, straightway other publishers also try to get his services, or, failing this, encourage some form of imitation that seems to them "good enough."

A few years ago a brilliant black and white artist, attached to one of our weeklies, became convinced that he had exhausted his particular vein. There had been a rich deposit of ore in his conception of the American girl, her infatuated beau, the matchmaking mamma, and the papa who is permitted to pay the bills. He had extracted it with technical machinery of his own invention and produced an abundant and first-class output. But, as I say, he had come to the conclusion that this particular mine was worked out, and, being a clever man and artist, should have been a pretty good judge of the situation—at least, from the artistic point of view.

But there was another—the commercial. The very moment that he was prepared to abandon his used-up mine the publishers of another weekly, by the offer of a phenomenal price per drawing, induced him to go back and work over the dump heaps. His "new" series was little more than a rehash of old mechanical tricks without the freshness of invention that had originally invested them with artistic worth. But the phenomenal price per was advertised all over the country, and that part of the public—the vast majority—which has no scale of values except the dollar accepted it greedily as the real thing.

So the types that had once been vital reappeared as puppets, stuffed with sawdust, and moved their wooden limbs to the obvious jigging of the showman's strings. The artistic futility of this sort of thing has been admirably caricatured by Oliver Herford in a recent number of *Life*. In what he calls "the genteel art of illustration," he represents the girl and her beau as composed of various parts, fastened together, as in the cards that amuse our children, when the parts are given separately for the youngster to cut out and assemble into a figure. Then, in a series of scenes, he shows the figures, always with the same faces, but with their limbs variously disposed, in imitation of different familiar pictures of the girl and beau. No shrewder bit of pictorial satire could be imagined.

Meanwhile, in the days when the mine was generously productive, its success attracted other publishers to prospect along the same direction. They probably were of the opinion, expressed to me by an editor old in service, that everything in life comes back to the man and the woman—there must be a sex interest. At any rate, the publishers banked on this proposition and compelled its expression in illustration. But as the average grown person, who does not confine his experience to an office chair, knows that life presents many other vital problems besides those of sex, it was necessary to address the illustrations to the young people, who are still in the glamors of adolescence. So the "girl" has been exploited in season and out of season, in every conceivable condition of complacent inanity, musing on her own charms or consciously submitting them to the besotted stare of her square-jawed "beau." And, as repetition grows stale, the "sentiment" must

be flogged into a semblance of interest by technical exaggeration. The beau becomes more square and rigid, the girl's sweetness drawn out longer and longer, until figure and suggestion of life are buried in an avalanche of frou-frou. Finally, like the Cheshire cat, the original "girl and beau" have vanished except for the vacuity of their facial expression.

It may seem excessive to characterize as erotic the mass of "girl and beau" stuff to which our young people have for so long been treated by the publishers. But since there is never—or almost never—any suggestion in these drawings that the girl has, or would think it worth while to have, any mental or spiritual fascination; that it is simply her person and her toilette which she is always exploiting and upon which the sodden rapture of the beau is fastened, I do not think the expression over-strong.

But let us note another lucrative and popular vogue in illustration, which I choose to call the "kid in art." In the publisher's estimation it is second in value only to the "girl and beau" brand; perhaps even exceeds the latter, since it is supposed to appeal to persons of all age. Here again the origin was good. Certain illustrators represented the child with a poetry of feeling, delicate humor and tender imagination. But an undeserved fate overtook them. They created a vogue. The child is exploited until, to remedy the tediousness of reiteration, exaggeration is resorted to and the child becomes a kid, at first inconceivably cute, then unpleasantly precocious, and at last a veritable little imp of Satan. Meanwhile the circulation has grown apace, and thousands of little picture-lovers are hurried from simple innocence thru a quagmire of priggishness into an abyss of vulgarity, wherein to do wrong, to be a nuisance to others and to exult in being a little beast is held up for enthusiastic emulation. Again I may be wrong, but to me this vogue of the "kid in art" is immoral.

Or shall we turn to what may be termed the "sweater and breeches" or "belted and booted" brand of illustrative art? Once more, it had an honorable beginning in the imagination of men who pictured the old colonial times, or in the experience of those who had shared in Western life, or that of our soldiers and sailors. Later it appeared rather as a reaction from the "girl and beau" and the "kid in art," and was accordingly welcomed. Still later, it leapt to the front in response to the publisher's clamor for red blood in fiction, and, like other successes, was pushed to excess. It had to retain its hold by increase of strenuosity. Vigor becomes brutality, control of strength is flung aside, and the forms are heaped and tumbled upon the pages in incoherent blocks of unintelligible disarray.

However, the responsibility for this and the other vogues of illustration, and more that I could mention, rests primarily, in my opinion, not with the artists and the public, but with the publishers. The latter underrate the commonsense tests of the public, and consequently force down the artist to a meretricious standard. Not always, by any means, but far too frequently. With a little more taste and knowledge on their own part, and a little more belief in the sanity of the public, the standard and tone of our illustrations could readily—and, I venture to believe, not unprofitably—be raised. For that we have illustrators capable of bringing the art back to its level of some fifteen years ago is unquestionable.

New York City.

How Books  Are Made

BY EDWIN T. STIGER

Assistant to the Manager of the University Press

EACH year the American publishers place on the market something over 8,000 new publications, the editions of which range from the aristocratic few of the expensive limited editions to the hundreds of thousands of the "best sellers." Each one of these new books represents an individual effort on the part of the author and the publisher to place something new in a new way before the public, to turn out a book which some appreciable portion of the millions of book buying inhabitants of this country can be made to think that it wants.

Did it ever occur to you as a reader of a portion of this great output that the laying out and manufacture of this mass of reading matter calls for the employment of an immense force of professionally trained minds outside of the thousands who labor in the carrying out of the details arranged for them; that every new book which appears means the study and application of ideas stored away in the brain of some one man or some little group of men who are spending their lives in the work of producing books attractive to the purchaser, and that each of these men must have a general knowledge, at least, of all branches of work that enter into the making of a book, not only of the idiosyncrasies of the English language, with its shading of punctuation, of types and typographical eccentricities, of the technicalities of electrotyping, paper-making, photo-engraving, printing and bookbinding, but of every one of these and its related branches?

Here, then, is the story of the making of a book.

When a publisher receives a manuscript from an author he gives it out to one of his readers, one of a force upon which he relies for opinions as to the advisability of publishing or probable salability after publishing. These readers are generally persons who have been well trained in the merits or demerits of popularity or authority, and in spite of occasional errors of judgment inseparable from work of this nature, have developed exceptional ability in this line. If the manuscript appears hopeless for this particular publisher's use it will probably pass thru the hands of but one or two readers. If, however, it shows prospects of success, it will be placed before several of these experts, each of whom will deliver an opinion, and it will go for final consideration to the head of the editorial force or a member of the publishing firm. Let us consider that the manuscript has been accepted and the contract drawn up and signed by the author and the publisher. The next step is the sending of the manuscript to the head of the manufacturing department of the publishing house. This gentleman generally tries to talk the book over with the author, in an effort to include as many of his ideas in the production as may be possible considering the limits and the cost of manufacture. He is then ready to begin the building of the book.

Of course, if a new volume is to be added to a series which has already been begun, or if it is to be patterned after some book which has already been made, the plan of procedure is simple, the work to a great extent merely mechanical. If the book, however, must be constructed on lines of its own, the first thing to be done is to obtain a count of the number of words the manuscript contains. This is necessary as giving a gauge from which to determine the size of type and of the type page, and to arrive approximately at the number of pages the book will make. This counting is not as easy as it sounds, and it is quite an art to do it accurately, since manuscript will vary considerably in different parts, and often

the "copy," as the manuscript now becomes called, is made up of writing by different hands, or of magazine or newspaper extracts of varying sizes pasted or laid in. Then, too, the different sizes of types to be used must be considered, for long quotations or correspondence must be set in a different size from the text, and the estimator will also find that portions of the same manuscript will vary materially, according to the nature of the subject. For instance, in a novel, a part given up to broken or short conversation will carry more words to a page than a similar amount of longer worded description. The words having been counted, the next proceeding is to decide on the type and type page.

While in the selection of type there are many fonts from which to choose, most of them, except for the more ornamental styles often used for booklets and special gift books, narrow themselves down to adaptations of three or four faces, their variations being due to peculiarities in the cut of the letters belonging to one or the other of these few standard styles. Some of these adaptations will get more letters on a line of a given length, and some less, than others set in the same size of type. In addition to the changes of types the manufacturing man is allowed some leeway by the "leading," or blanks between the lines of type. Having decided whether the book is to be of approximately the size known by the book-buying public as "octavo" or "12mo," or some such designation, it is his work to settle upon a type and type page which will not run the book to such a length as to make its publishing too expensive, or, on the other hand, to make a book so small that the buyer will feel that he is not getting the worth of his money. In all of this he is bound down by the fact that his type page, whatever it is, must not be laid out contrary to certain proportions which the good taste of the past has made definite. After getting these matters worked out he sends the manuscript to the printer with instructions for a sample page to be set to confirm him in his decision, and often with a request to the printer to count the words and verify his estimate of the number of pages. Very often this sample page must be juggled, a line added, a fraction of an inch taken off, a page number put at the foot, a running head changed in style, or even an entirely new start made on an entirely different basis before an O. K. can be given. It might be said here that unless a manuscript offers unusual features a publisher does not necessarily ask the printer for an estimate of cost, for the manufacturing man has a schedule of the printer's prices and can figure this out for himself as closely as the printer himself could do it.

The sample page having finally been approved, the order is given to begin the work, the printer is told how many proofs will be required and where they are to be sent, and the last details about any irregularities to be met in the work are put in his hands. The printer starts his compositors to work, or, if the book is to be set by machine, arranges for the machines and operators who are to begin the composition, and the kind of progress that can be seen commences. Then follows the period of proofs and proofreading. The first proof, which is a galley proof, or one "pulled" (printed) on long slips of paper without any division into pages, is read and corrected several times before it leaves the printer's hands and is then read and marked for correction by the author and by some of the publisher's editorial force before its return to the printer. If the corrections required are many, it is customary to have further galley proofs, or "galley revises," sent out, so that the changes may be reduced to a minimum before the matter is made up into pages, when all corrections are apt to be more expensive to the publisher or author than if made in the galleys. Then, all the palpable errors having been corrected, and all the additions and excisions made which have up to that time been discovered by the author, the type is put into page form, the running heads and the page numbers added, and the proper sinkage allowed for the beginnings of chapters. More proofs follow, and perhaps page revises, before the final word is given that everything is correct and that electrotypes of the pages may now be made. Even then a plate proof is often required and oftentimes late corrections are sent to be made in the plates

themselves — an expensive proceeding, and one avoided whenever possible.

A word should here be said about this matter of corrections, for there is probably no one thing which causes as much friction between the author and the publisher, and the publisher and printer, as alterations from copy. The author, when he sees his work in type, naturally sees many things which escaped his notice in manuscript form. Moreover, there are often new developments of his subject or suggestions from friends brought to his notice, all of which he is anxious to include in his first edition. He cannot understand why just a few words added here or a line taken out there should, when repeated now and then, make such a seemingly excessive bill of errors. Such changes, however, which appear to him to be very slight, and which are so judging by their length, may require the changing of words and spaces thruout several lines, or, after paging, the readjustment of a number of pages. All of this takes a compositor's time, the printer has to pay the compositor for this time, and at the end of the work a considerable bill is rendered. If the author or editor will only remember that where a word or a sentence is taken out, another word or sentence as near the same length as possible should be inserted whenever it can be done, or if he can cut out enough old matter to allow space for new he may wish to add, much wear and tear of feelings might be saved.

The making of the electrotype plates, altho an intensely interesting process, need not be taken up in this article. It is enough to say of it that the type is pressed in page form into a waxen mold, that the mold is placed in a bath having copper in solution, that this copper is deposited on the mold by an electric current and chemical action, taking an exact impression of it, and that this copper shell, when backed with metal and trimmed to the required size, is ready for the printing press.

All this time, while the proofs are going back and forth, while the corrections are being made, and while the electrotypes are being produced, the manufacturing man is busily arranging the later details of the book. He is ordering the paper, seeing that it is delivered in time, arranging with the artist for illustrations if the book is to be embellished in that way, deciding upon the cover decoration and the binding, and perhaps even getting out partially finished books showing the binding and a few pages of printed matter from which the salesmen can take orders.

As soon as enough of the book is in type to insure accuracy as to the number of pages, or often merely taking the original estimate as a basis for the order, steps must be taken to have the paper on hand as soon as the electrotyping has been finished. When the size of the edition will permit it, the paper is generally made to order, a process requiring from two weeks up, according to the amount of business the paper mills are handling at the time. If the edition is small, or if such a paper is to be used as may readily be found in the stock regularly carried by a paper dealer, the paper is ordered from this stock, cutting it down to the proper size if the sheet required is smaller than the sizes ordinarily sold. The manufacturing man must decide upon the quality of the paper to be used, its size, weight and finish, where it is to be obtained, how much is to be paid for it, and how large a quantity is to be used. He must obtain samples from different mills, consider these in relation to the price asked, make his decision and place his order, and then, often the hardest work of all, follow up the paper men incessantly to make sure that it is on the spot when it is wanted. The type page being fixed, he allows for the proper margins, considers whether he will print eight, sixteen, thirty-two or sixty-four pages at one impression, and then figures the quantity by a scale which allows enough extra sheets for spoilage in the printing and binding. While all of this work may sound as a simple proposition, it is often far from that, for the paper must be chosen with some regard for the face of type which is to be used upon it, and it must very often be selected with a view toward making a too fat book thin and easy to hold, or toward padding out a small, insignificant book into something worth while to a prospective purchaser.

While the proofs are shuttling back

and forth and while the paper is being made, it is also time for this supervisor of the work to be closing in any of the illustrative and decorative portions of the book. If cuts are to print with the text, the drawings and the cuts must be made in advance, in order not to hold back the paging; if, however, the cuts are to print separately and are to be pasted in by the binder, the work may be carried on while the composition is being done, the manuscript having been given the artist to read in advance of its being sent to the printer, or an early set of proofs sent him, that he may choose the situations that appeal to him for illustration. In a general way it may be said that the illustrative processes are two in number, altho these branch out into infinity in their variations, and altho there are more than these two and their variations required in special work. The two in question, used in the general run of books sold at retail, are the line cut, or zinc etching, made from line drawings and drawings with solid blacks and whites, and the half tone, made from photographs and wash drawings. Both of these cuts, or engravings, are made by photography and chemical action, both may be reduced, or even enlarged to a certain degree, to any size proportional to the original subject, and both may be printed at the same time as the text pages, except for the fact that the finish of the paper must be adapted to the cuts. The line cut may be used on any paper whose surface is smooth enough to print without breaking the printed line, but the half tone, on account of its delicacy of line, may be used only on a coated paper or a paper of high finish. The printing of colored illustrations is simply the adaptation of one or the other of these two processes, breaking up the colors of a picture in such a way as to produce practically any of the colors of the spectrum—a complete art in itself and often carried out by printers who do no other kind of work, or else the arbitrary division of a picture into two or three colors and the printing of portions in each color, without regard to the fact that the combination of two certain colors will produce a third. Unless a book is so filled with cuts as to require a highly finished or a coated paper thruout, it is customary to print the cuts separately from the text.

Another of the artistic features to be looked after before the presswork has been completed is the designing of the cover and the making of the brass dies from which the binder stamps the design on the outside of the book. The artist to whom is delegated the work of making the cover design submits a scheme in its colors, usually painted on cloth or paper of the color suggested for use, so that an idea may be had of the general effect and a tentative estimate made of the cost. In general, the artist is held down to as few colors as possible, and is restricted in the use of gold and silver, on account of the extra cost of dies and stamping in the former case, and of precious gold and silver leaf in the latter. When the design is finally accepted it is given into the hands of the manufacturing man, who, determining the size of the cover and the thickness of the book, passes it along to the die cutter in order that the design or lettering may be cut in hard brass, from which any quantity of covers may be stamped or printed without showing any evidence of wear on the part of the die itself. Of late the cover inset has come into much vogue, this inset being generally an illustration printed on paper in one or more colors and pasted on the cover in relation to some part of the stamped design, thus giving an added attraction to the cover and making it more in keeping with the book, while at the same time holding down the cost.

Let us consider, then, that the electrotype plates are now ready for the press and that the paper is in the printer's hands. The book is ready to be printed. The publisher therefore tells the printer how large an edition he requires and the signal is given to begin the printing. Any one unacquainted with the work and going into a pressroom for the first time must be struck by the large number of presses seemingly lying idle when he has been given to understand that a pressroom is always a scene of whirring activity. This seeming quiet is on account of what is known as the "make ready"—the principle cause for expense in printing and the work which brings out the pressman's art and skill. This

is the labor required to get the eight, or sixteen, or thirty-two, or sixty-four pages ready to be printed. The pressman lays out his form on the bed of his press, using a large block upon which the electrotypes may be placed and fastened, or else a number of small blocks, one to a page, arranged in their proper positions by wooden or metal strips laid between the blocks—"furniture," as these are called. As type matter or plates can never be absolutely even on the top, it is necessary for the pressman to build up the low spots and cut down the impression where it is too black. After placing the form on press, therefore, he runs a trial sheet of paper thru the press, from which he is able to know where in the form his work of evening the impression is required. Then he starts this work, which is known as the "make ready," a labor which may require an hour or even two or three days, according to the character of the form or the quality of the work desired. Pieces of thin paper are pasted on the cylinder of the press in such positions as to touch certain spots in the form at the point where the cylinder carrying the sheet of paper to be printed meets the plates, thus increasing the strength of the impression at that point, while other pieces are cut in the right size and shape and pasted under the plate, between it and the block, to gain a similar end. The former method is known as "overlaying" and the latter as "underlaying." This same process is carried out in printing the illustrations, only to a greater degree and generally with more care. When the "make ready" has been finished, the sheets of blank paper are lifted up on the press and fed one by one onto the cylinder, which carries them in its revolution against the plates, after which they are deposited in a pile to be removed, printed again on the other side, counted and packed for shipment to the binder. Similar work to this is carried out for every form of the book until it is all printed, when the scene is shifted to the bindery.

The first step in the binding is the folding of the sheets. While this was generally done in the past by hand by girls working with a flat piece of smooth ivory or similar substance, it is now almost universally executed by ingenious machines which take the sheet of paper, cut it, fold it accurately, insert one folded sheet within another if necessary, and deliver the folded signatures, as each single folded sheet is called, ready for the next process. These signatures are next "gathered," either by hand or machinery, in the order in which they are to appear in the finished book, and they are then "collated," that is, verified, the collator making sure that all signatures are arranged in proper order and that none is missing. They are then sent to the sewing machines, which stitch the signatures together in one continuous row, making no division between the volumes, which have to be cut apart by hand. If the books are to have gilt tops it is here that this work comes in, the gilder placing a number of books in his press, squeezing them up very tightly, with the edge to be gilded uppermost, scraping this edge very smooth, painting on it a thin albumen size, and then laying on the thin gold leaf, which is burnished down to smooth brilliancy by a tool worked by the hand of the gilder. The sewed and gilded book then moves along to be rounded and backed; that is, to be given the circular effect shown on the back of the book and to have the edge of the back, where the sewing is, forced out by pressure to make a groove in which the covers may have play. A piece of coarse, tough cloth, reinforced by a pasted strip of paper, is glued on the back, the edges of the cloth overhanging the edges by an inch or so on each side, a flexible glue is smeared on the back to strengthen it and to hold the signatures more closely together, and the book is ready for the cover, which in all probability has been made while this other work was going on in order to save time at the end.

Altho machines are now generally used for the making of the cover itself, or "case," as it is called in the trade, they have simply adopted the method of the hand worker with more uniformity and speed. The plan of this work begins with the cutting of the stiff pasteboard into pieces of the proper size for each side, a similar cutting of the book cloth for the entire cover, the gluing of the inner surface of the cloth, the plac-

ing of the pieces of board in their proper positions and of a strip of paper down the back, and the turning over of the edges of the cloth upon the board to give a finished edge and strengthen the case. The case then goes to the stamper, who places the brass dies the publisher has supplied for the lettering and the design on a metal block, inks them with colored ink, or, if gold or some other foil is to be used, has this foil stuck on with a size to the cover, and prints the design or lettering on it with his stamping press. If foil is used the dies are hot stamped against the foil, and the waste foil which has not received the impression is rubbed off, collected and remelted. The book is then fitted into the case or cover, the blank pages at each end of the book which have been pasted on for this purpose are pasted back on the cover, and the book is finished. These pasted leaves, together with the reinforcing cloth, are all that hold the book to the cover in ordinary "edition work," as this style of binding is called, but that they are sufficient for all customary use is shown by the amount of hard usage one of these volumes will stand.

The books are now placed in a press and subjected to heavy pressure for a day or a night or more in order to set the mold, as one might say, and give them a proper chance to dry, after which they are packed in cases and shipped away to the market. In the selling of the product another department of the publishing house begins its work, while the manufacturing man gives a sigh of relief, comments perhaps to himself, perhaps to the printer or binder, on some details which had not worked out in just the way he had intended, and devotes his attention to the finishing of the next book on the publication list.

CAMBRIDGE, MASS.

The Rifted Veil

BY M. WOOLSEY STRYKER

AFTER the strife, the fever and the passion,
After the thorn, the toil, the troubled dream,
The carnal plight, the grief, the swaying fashion
Of mortal days—the great surprising gleam
Of the transcendent life! Beyond description
The opening vistas of the powers to be!
Who could wish back the fare and task Egyptian—
Recall the pilgrim of Eternity?
Loved faces crowding to the deathless meeting,
Loved hands put forth to draw the traveler in,
Dear voices heard again in tender greeting—
Past these vain shadows! No more night, no sin!
But Mercy's house, whence no found child shall wander,
Prevailing Love, that wielded staff and rod,
The heart's own story and strange way to ponder,
Emancipation, light, truth, joy, peace, God!

HAMILTON COLLEGE, CLINTON, N. Y.

A Review of the Important Books of the Year

IT really ought to be entitled a re-review, for the books here listed have been reviewed in THE INDEPENDENT in the year since our last Book Number or will be reviewed in a few weeks. This is simply an advanced stage in the process of book sifting which is one of the most important and difficult of our editorial duties. The first stage is the weekly selection of the books that are worth notice and the rejection of those that are trashy, objectionable or inferior. Even of those that are reserved for review, many are eventually crowded out. The books to be discussed are then sorted and assigned space intended to be roughly proportional to their interest, importance or novelty. But the publication of a thousand book notices, varying in length from a line of type to a page and a half, scattered thru fifty-two issues, does not give proper prominence to the comparatively few books of importance that appear during a year. For this purpose a brief general summary is necessary, a look back over the landscape to see what peaks—or at least hills—stand out most prominently. Besides the book lists contained in this issue, we published on August 1st a similar comparative survey of the educational books of the year, and on December 19th the juvenile, holiday and specially illustrated books are discussed. As a further guide to readers we have published about every other week an annotated list of the best authorities on various timely topics, these lists being printed in the advertising pages, so they can be cut out without injuring the body of the magazine.

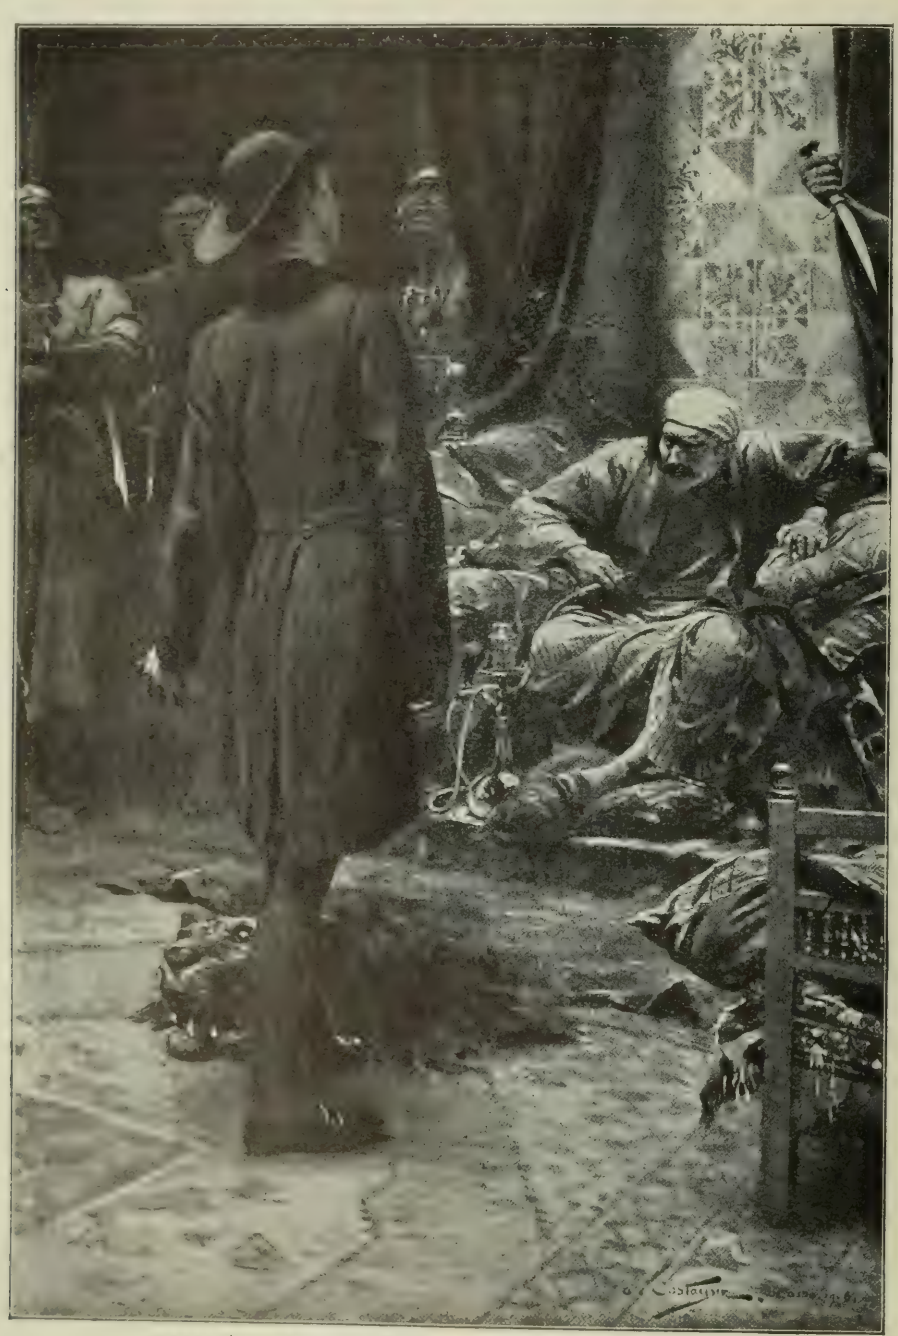
Fiction

The Fruit of the Tree. By Edith Wharton. Scribner. $1.50.
The Weavers. By Sir Gilbert Parker. Harper. $1.50.
The Stooping Lady. By Maurice Hewlett. Dodd, Mead. $1.50.
The Second Generation. By David Graham Phillips. Appleton. $1.50.
The Younger Set. By Robert Chambers. Appleton. $1.50.
The Country House. By John Galsworthy. Putnam. $1.50.
To Him That Hath. By Leroy Scott. Doubleday, Page. $1.50.
Madame De Treymes. By Edith Wharton. Scribner. $1.50.
Clem. By Edna Kenton. Century. $1.20.
The Sinner. By A. Fogazzaro. Putnam. $1.50.
Fraulein Schmidt and Mr. Anstruther. By the Author of "Elizabeth in Her German Garden." Scribner. $1.50.
Alice-for-Short. By William De Morgan. Holt. $1.50.
The Whirlwind. By Eden Phillpotts. McClure. $1.50.
Major Vigoureux. By Quiller-Couch. Scribner. $1.50.
The Helpmate. By May Sinclair. Holt. $1.50.
Mam' Linda. By Will N. Harben. Harper. $1.50.

There have been no new developments in fiction this year. If we except Sir Gilbert Parker's new version of Gordon's martyrdom at Khartum and Gladstone's neglect of him, even the illustrious dead have rested more quietly than usual beneath their monuments. The historical novelists have at last published all their correspondence and delivered up all the skeletons which time so kindly hides in the closets of the dead. To be sure some have attempted to reform the past of late, and notably Maurice Hewlett, who, in his latest novel, tries to inject the spirit of socialism into English high life of a hundred years ago. But the attempt is like retouching old pictures with modern paint. Undoubtedly the business of this generation is to destroy the selfishness of wealth and the brutality of all privileged classes, but there is no reason why Mr. Hewlett and others should destroy the family portraits of the race by meddling with the spirit of the Past as portrayed in history. We shall need the tone of time at least behind us later on when we get everything new established.

Another reason why there have been no sensational books published is because our popular writers have discovered no new social, political or industrial scandals to dramatize. All has been discovered and nearly everybody who is conspicuous enough to merit it has been disgraced. And come to think of it there is a curious limitation about fiction as a mode of expressing current life. When

a "problem" passes the first sensational stage of being a sort of dramatic discovery, it passes out of the hands of the novelists and becomes a question for the economists. Nothing is staler in fiction than the reiteration of the same problems, no matter how harrowing they are. This accounts for the rise and fall of the muckraking novelists. Their fame rests upon the phase of a situation which immediately passes out of reach of their staccato powers of demonstration. Meanwhile, it is certain that writers of this class are "wreckers" to the last, hurricane souls ready to sweep away the existing order, but not one of them is constructive. Take the case of Mr. David Graham Phillips. His novel is one of the best written of its class this year. So long as he wrote to prove the evil effects of wealth upon the children of rich parents, he expressed his ideas with power and a certain fierce distinction. But when he attempts to show how wealth may be disposed of for the good of society, he offers a Munchausen system of finance wearisome to read about. Robert Chambers's novel is another illustration of the same limitation in fiction. Choosing the same Second Generation of which Mr. Phillips writes so severely, he attempts to prove that it is on the up-grade in morals and manners. This argument is the weakness in his story, because it is out of place, and it is not sustained by the lives of the characters portrayed. What we really learn is that the younger women are healthier and more decent than the older ones, and that so far there is no change for the better in the mortality of morals among the men. What the result of these conflicting conditions will be lies beyond the province of the novelist. And the fact that Galsworthy attempts no such solution, but portrays with a humor that does not smile and a bitterness that does not relent the lack of virtue, intelligence and sympathy in the landed gentry of England makes his book more significant. He makes the demonstration of certain conditions and leaves society to make whatever corrections it is morally able to sustain. For the same reason Leroy Scott's book is far more important than its literary merit implies. It is a plain statement of eloquent facts which prove without argument that the relation of prosperous and respectable people to freed convicts is more criminal as a rule than the relations of the most hardened criminal is to them.



Frontispiece from Hewlett's "The Stooping Lady."

Mrs. Wharton's little story is as thin as her astral shape and should not be mentioned except to call attention to the fact that she has learned to begin where Henry James leaves off. If, however, you want a book by way of contrast in which every sentence stands up and kicks with its boots on for the ideas it represents, read what Clem has to say in Edna Kenton's story of "the best American society." It is not often that a heroine can hold on to a vigorous, half charming, half offensive personality in spite of the author's powers of dissection. But Clem survives so really that the reader is tempted in the end to grasp her hand in hearty congratulation for her honesty and pluck. In her fall novel Mrs. Wharton has two "live wires"—the questions of financial independence in marriage and of the permissibility of euthanasia, both likely to be actively discussed.

Allowing for the inevitable loss that must result thru even a good translation from the delicate, impassioned Italian into the sterner, less flexible English, Fogazzaro's novel is still a masterpiece. After reading it and the others of this famous Roman trilogy, one can see that even Marion Crawford's novels compare with them like clever copies do with original great pictures. After training her readers to regard her as a good-natured wife who keeps a witty eye upon

her "man of wrath," Elizabeth in Her German Garden now disconcerts us with a volume of letters from a certain fräulein to the man who jilts her. Apparently it is the heart's last gallant defense against love, and it is written with the author's usual charm. De Morgan's gives to literature a Rhenish flavor, and his last story is like a chalice of old wine reddened within by all the fine fires of life and beaded high with immortal love and courage. But probably the most effective, the most humanly splendid story of the year comes from May Sin-

DAVID CLARIDGE BEFORE PRINCE HARRIK.
From Parker's "The Weavers."

first story was written in the spirit and after the manner of Dickens; his second is written in imitation of his first. *Alice-for-Short* is disappointing after "Joseph Vance." Eden Phillpotts's last epic of the Dartmoor is beyond question the greatest of his angry masterpieces of that region. Quiller-Couch

clair. She has shed an altar light upon some obscure and difficult places in married life and made the way clearer to view for many.

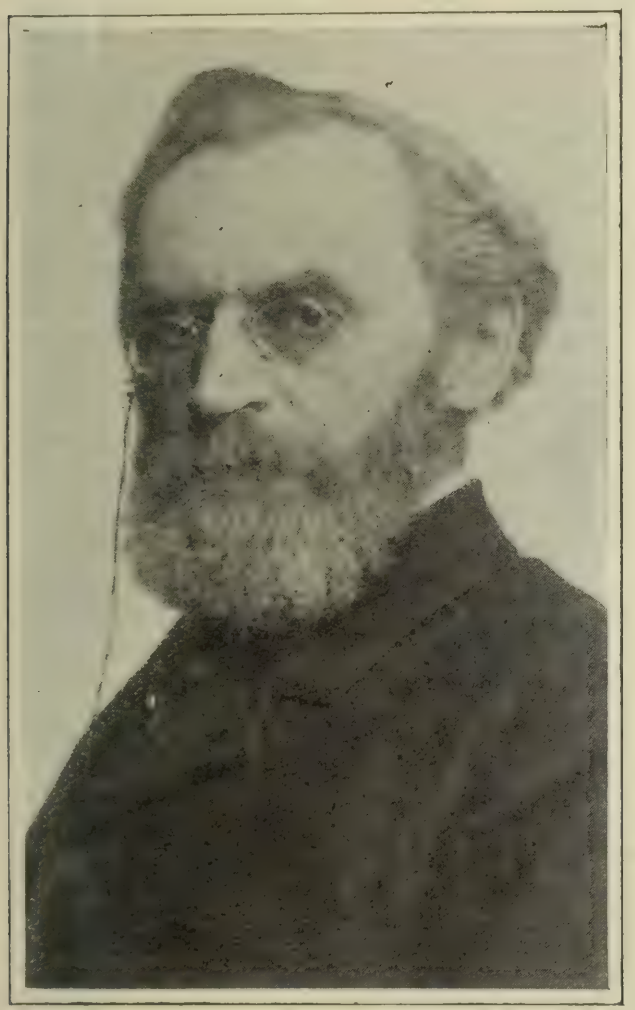
The year marks progress at last in Southern fiction. Some fairly good stories have been written, and one novelist at least has climbed out of the Civil

War cemeteries and has given us a splendid story, founded bravely upon the living issue of the day. Mr. Harben's novel is the most significant book that has appeared relating to the negro since Bishop Haygood wrote "Our Brother in Black." It is not a solution of the trouble, but an explanation with great wisdom and tenderness.

General Literature

Beside Still Waters. By A. C. Benson. Putnam. $1.25.
The Altar Fire. By A. C. Benson. Putnam. $1.50.
Shelburne Essays. Fourth Series. By P. E. More. Putnam. $1.25.
Balzac. By Ferdinand Brunetière. Lippincott. $1.25.
Shakespeare. By Walter Raleigh. Macmillan. 75c.
Walt Whitman. By Bliss Perry. Houghton, Mifflin. $1.50.
Life and Letters of Godkin. By Rollo Ogden. Macmillan. 2 vols. $4.00.
Life and Letters of Lafcadio Hearn. By Elizabeth Bisland. Houghton, Mifflin. 2 vols. $6.00.
English Literature from the Norman Conquest to Chaucer. By W. H. Schofield. Macmillan. $1.50.
The Arthur of the English Poets. By Howard Maynadier. Houghton, Mifflin.
The Text of Shakespeare. By T. R. Lounsbury. Scribner. $2.00.
Fire Divine. By R. W. Gilder. Century. $1.00.
Nineveh. By G. S. Viereck.
Jeanne d'Arc. Sappho and Phaon. By Percy Mackaye. Macmillan. $1.25 each.
Collected Works of Henrik Ibsen. Ed. by Wm. Archer. Scribner. 11 vols. $1.00 each.
John Bull's Other Island and *Major Barbara.* Brentano's. $1.50.
Poems and Plays. By W. B. Yeats. 2 vols. Macmillan. $1.75 each.

The stream of general literature seems to have run pretty low this year. There are books about literature and its makers in abundance. But outside of the novel the book that is itself literature even in intention—what our grandfathers would have called collectively *belles lettres*—is rare. It may be that the desire for information, for news, has momentarily got the better of us; that we are temporarily swamped by the flood of modern instance. But in any case the journalistic note in our current writing is more pronounced than the literary, and there are dozens of lives and letters to a single volume of essays, criticism—or even verse, which used once to be pretty equally the training school of critics and poets. In particular, the old-fashioned interpretative essay, the essay of Hazlitt and Lamb, which sought to present an impression rather than an observation of life, Mr. Benson appears to be sustaining very nearly single-handed. To his usual characteristics, with which the public is well acquainted by this time, his new volumes add a rather unexpected extension of scope. Mr. Benson has always stood for the life of contemplation, but he has never before attempted to trace so consistently and even so exhaustively the course and consequence of such a life in our own day. That there is something to the present sense a little finical, a little mawkish in the deliberate effort to withdraw oneself wholly from the influences of his time, however disagreeable some of those influences may be, and to live exclusively in the ideal and the beautiful, cannot be denied. And yet it is none the less desirable and fortunate that there should be some one to emphasize, even tho excessively, that neglected virtue of reflection which ought at least to temper and direct our frequently aimless or misdirected activity. For literary criticism Mr. More continues to perform something of the same service as Mr. Benson is doing for the personal essay, and with something of the same regularity and persistence. If anything, the latest series of his *Shelburne Essays* is the best he has yet published, not merely in choice of subject, but in mode of treatment as well. By this time Mr. More has got his philosophy of life sufficiently well in hand to use it rather as a means of orientating himself with reference to his subject than as an end in itself, as was noticeable in his earlier work, where his subject was often overtopped by speculative scaffolding. In this way there results a greater definiteness of outline, a clearer delineation of character and manners—in short, a nearer approach to literature, to which Mr. More's work begins to occupy a position remarkably like Sainte-Beuve's. Brunetière's *Balzac,* on the other hand, serves rather to illustrate the contrary inclination of a later school to disassociate the book from the author, and to reduce criticism to a more or less mechanical dissection and comparison of literary tendencies, as tho the book itself had a substantive value irrespective of experience or were indeed actually identical with it. It is essentially on the latter ground that Brunetière adjudges the palm to Balzac among novelists, and doubtful tho his conclusions may be, the considerations thru which he passes in the course of his discussion are by no means uninteresting or insignificant.



In the field intermediate between criticism and biography lies Professor Raleigh's *Shakespeare,* an excellent digest of the present state of knowledge and opinion with reference to the dramatist's life and work, and Mr. Perry's *Walt Whitman,* by all odds the most judicial and satisfactory account of that disconcerting genius yet published. Indeed, the manner in which Mr. Perry succeeds in keeping clear of the stumbling blocks with which the path of Whitman's biographer is plentifully beset, without allowing himself to be dazzled by the cross-lights of notoriety or exasperated by the perversity of the poet and his admirers, is no small achievement, tho at the same time a kind of indecision or hesitancy to pronounce a definitive judgment makes his book a little disappointing to a reader who looks to his biographer for his opinions as well as for his information.

In Mr. Ogden's *Godkin,* however, the critic begins to yield to the editor, or, rather, what criticism there is—and of such implicit criticism there may be not a little—consists in the selection of materials, in the artful posing of the subject, and in the admirable arrangement of moral lights and shadows. As so exhibited, Godkin appears *tout à fait un être politique,* in Napoleon's words—a being almost exclusively political. In this particular, in the spectacle of an honest man engaged in a lifelong struggle against corruption and abuse, lies the main interest of the biography for conscientious readers of whatever shade of political opinion, at the same time that his foreign birth gives his criticism of American institutions a freedom from habitual and conventional prejudices which is frequently very suggestive and instructive. Of quite a different sort, tho no less significant from another point of view, is the interest of Mrs. Bisland's *Lafcadio Hearn.* Not so ably edited perhaps, the book may be thought to suffer further by the isolation of the biographical portion, which is set off by itself in the manner of an introduction, instead of being interwoven, as usual in these cases, with the other and original material. About the character of the man, however, there can be no doubt. Impressionist, dreamer, *schwärmer,* he is the natural counterpart or pendant of a Godkin —an artificer of words rather than of things, a connoisseur of impressions rather than of deeds, a type of the artist and litterateur—and to such and the psychologist of genius particularly engrossing.

In the realm of literary as contrasted with that of personal biography, if so convenient a distinction may be made, there are two books of special importance. Professor Schofield's *English Literature from the Norman Conquest to Chaucer,* tho of less interest to the general reader than to the special student, is to the latter fairly indispensable, in spite of its decided unevenness, as a contribution to the history of a period which has never been treated either quite thoroly or satisfactorily. On the other hand, Mr. Maynadier's *Arthur,* despite some few errors, is the best popular account in the language of the growth and vicissitudes of the Arthurian legend, particularly with reference to its earlier development; while as a cross between these two varieties, Professor Lounsbury's *Text of Shakespeare,* with a rather misleading title, attempts an entertaining rehabilitation of the pedant Theobald as a Shakespearean scholar, in a mingling of biography, criticism and literary history.

Of original poetry and drama in any proper sense of the words, the manifestations have been singularly few. Mr. Gilder's volume we shall discuss later. Mr. Viereck has raised some little stir with his *Nineveh.* But with the exception of the amazing cleverness of this youthful verse there seems little promise in it. His present inspiration is essentially impotent. Undoubtedly, M. Mackaye's *Jeanne d'Arc* and *Sappho and Phaon* are picturesque and poetic dramas. In fact, they probably mark the high tide of poetry for the season. At the same time, for all their merits, they fall short of the dramatic ideal. In reading them in connection with the other printed plays of the twelvemonth one would be tempted to say that our generation is in danger of losing all dramatic sense; it seems no longer quite to know what drama is. For this reason Mr. Archer's definitive English edition of Ibsen is particularly timely, not only for the comprehensive view of that play-

wright which it present thru the introductions as well as in the rounded mass of his writing, but also for the example offered by one who, with all his faults, is nevertheless one of the great modern dramatic technicians. Shaw's new volume is doubly entitled to mention in this column because the plays are written to be read quite as much as to be seen, and the two satirical essays, "A Preface for Politicians," on the Irish question, and "First Aid to Critics," on the Salvation Army and poverty.

CARL SCHURZ.
From "Reminiscences of Carl Schurz."

History

The Inquisition of Spain. By Henry Charles Lea. 4 vols. Macmillan. $10.00.
History of European Diplomacy. Vol. II. By David J. Hill. Longmans. $5.00.
The Dawn of Modern Geography. Vol. III. By C. R. Beazley. Oxford. $6.75.
The Papacy in the Nineteenth Century. By Dr. F. Nielsen. 2 vols. Dutton. $7.50.
Cambridge Modern History. Vol. IV, The Thirty Years' War. Vol. X, The Restoration. Macmillan. $4.00 each.
Lectures on Modern History. By Lord Acton. Macmillan. $3.25.
Babylonian Expedition of University of Pennsylvania. Series A. Vol. IV, Part I, and Vol. XX, Part I. University of Pennsylvania. $6.00 each.
Researches in Sinai. By W. M. Flinders-Petrie. Dutton. $5.00.
Egyptological Researches. By W. Max Muller. Carnegie Institution. $2.75.
Venice. By P. G. Molmenti. Part. I, Middle Ages. Part II, Golden Age. McClurg. Each part in 2 vols. $5.00.
A History of England in Six Volumes. Vol. III. By H. W. C. Davis. Methuen.
The Political History of England. Vols. IV, V, VII. Longsmans. $2.60 per vol.
History of Modern England. By Herbert Paul. 5 vols. Macmillan. $2.50 each.
Borough Customs. Vol. II. Edited by Mary Bateson for the Seldon Society. London: Quaritch.
Economic Development of a Norfolk Manor. By Frances G. Davenport. Putnam. $3.00.
Richard III. By Sir C. R. Markham. Dutton. $3.50.
Lord Randolph Churchill. By Lord Rosebury. Harper. $2.25.
Correspondence of William Pitt. Macmillan. $6.00.
Life and Letters of the First Earl of Durham. By Stuart J. Reid. Longmans. $10.00.
Memoirs of Prince Chlodwig of Hohenlohe-Schillingsfuerst. Macmillan. $6.00.
Original Narratives of Early American History. The Northmen, Columbus and Cabot. Scribner. $3.00.
The American Colonies in the Seventeenth Century. By Herbert L. Osgood. 3 vols. Macmillan. $9.00.
English Colonies in America. Vols. IV and V. Holt. $3.50 each.
History of the United States. By E. McK. Avery. Vol. III. Burrows. $6.25.
Hart's American Nation. Vols. XVI-XXII. Harper. $2.00 each.
Twenty Years of the Republic. By Harry Thurston Peck. Dodd, Mead. $2.50.
Constitutional History of the State of New York. By C. Z. Lincoln. 5 vols. Rochester: Lawyers' Co-op. Co. $15.00.
The General Historie of Virginia, New England and the Summer Isles. By Captaine John Smith. 2 vols. Macmillan. $6.00.
Magellan's Voyage Around the World. By Antonio Pigafetta. Clark. $7.50.
The Trail Makers, Cabeza de Vaca, Champlain, Lasalle. Barnes. $1.00 per vol.
The Ohio River. By A. B. Hulbert. Putnam. $3.50.
In Olde Massachusetts. By C. B. Todd. Grafton's Historical Series. $1.50.
Documentary History of Reconstruction. Vol. I. By W. L. Fleming. Clark. $5.00.
War Government. By W. B. Weeden. Houghton. $2.50.
Civil War in the United States. By W. B. Wood and Major Edmunds. Methuen.
Life and Writings of Benjamin Franklin. By Albert H. Smyth. 10 vols. $30.00.
Robert E. Lee. By P. A. Bruce. *Judah P. Benjamin.* By Pierce Butler. American Crisis Biographies. Jacobs. $1.25 each.
Military Memories of a Confederate. By E. P. Alexander. Scribner. $4.00.
Reminiscences of Carl Schurz. 2 vols. McClure. $6.00.
Autobiography of Oliver Otis Howard. 2 vols. Baker & Taylor. $5.00.
Letters of Queen Victoria. 3 vols. Longmans. $15.00.

Mr. Henry Charles Lea, thru the completion of his *History of the Inquisition of Spain,* has at once gained for himself the headship in the historical production of the past year, and for American scholarship one of its proudest honors for all time. That an American gentleman, a scholar by inclination rather than profession, and a Protestant, should lead European historians in the history of Europe, and Catholic historians in the history of the Church, is a triumph of which much can legitimately be made. No other work of the year approaches this in significance, altho in the general

field of European history there have been some notable contributions. An American jurist has continued his work on the diplomacy of Europe; Mr. Beazley has completed his brilliant inventory of the geographic stock-in-trade of the Renaissance; a deplorable gap in the history of the papacy has been filled, and the Cambridge Modern History has extended into two more fields. More notable than this last work, as a memorial to Lord Acton, who conceived and planned it, is a volume of his lectures which will be nearly the whole literary output of one who was probably the greatest English historical scholar of his generation. Allied closely, in general interest, to the history of Europe, is the field of archæological exploration and report. Here, in three directions, the year has recorded research and discovery. Babylonia, Sinai and Egypt have all been brought a little closer to us as the result. McClurg has published two parts in four volumes of an excellent edition and translation of Molmenti's authoritative history of Venice.

The co-operative works on England, which we have noted in earlier surveys, continue to publish and to receive, in general, the approval of the public. The Methuen series, with its excellent critical apparatus and its chapters on the history of civilization, has added one volume; the Longmans series has advanced, in four volumes, from 1216 to 1660, with a single gap covering the period 1547-1603, upon which Mr. Pollard is still at work. As these works advance, covering the same ground, we begin to feel that we shall have at last a complete, detailed, well-balanced history of England. And this we have long desired. In a later period, Mr. Paul has completed his journalistic account of modern England, giving always a picturesque and interesting narrative of contemporary events, not always, it is true, without prejudice and bias, but possessing all the virtues of an honest account by an intelligent participant. The general works on England have not stopped or obscured the development of detailed narrative and institutional history. It is a source of gratification that before her death Mary Bateson had completed another of the tasks to which she was accustomed to apply her discerning judgment and enormous industry, and that a second of the more useful of these contributions is the work of an American woman.

In European biography the most interesting product is the attempt of Sir Clements R. Markham to rehabilitate that arch stage villain, Richard III. It is clear that much of the odium cast upon Richard was a part of the public policy of his successors, and eminently unjust. But Sir Clements has done his work of whitewashing so well that it invites suspicion. Lord Rosebery's Churchill is another attempt to reconstruct a character of doubtful significance, and is the more interesting because it follows the filial effort of Mr. Winston Spencer Churchill. American relations in the eighteenth century are made more clear by the publication of the correspondence of William Pitt by an American patriotic society, while nineteenth century Canadian affairs are much illumined by the needed biography of the Earl of Durham. On the continent of Europe the excitement caused by the diplomatic revelations of the memoirs of Prince von Hohenlohe-Schillingsfuerst is only just now subsiding.

American history continues, as usual, to invite writers and interest publishers. The series of *Narratives of Early American History,* which Mr. Jameson is editing with the approval of the American Historical Association, has given out four volumes and now announces a fifth on the Virginia settlements. The narratives in question are of common use and have never been as accessible as they now become. Colonial history in general has received full attention. Professor Osgood has completed his institutional survey of the seventeenth century, while the late John A. Doyle lived long enough to reach the end of his task. There is no fairer view of American colonial development than that contained in the five bulky volumes of Mr. Doyle. The third volume of Mr. Avery's ambitious history has been distributed. In more recent periods, Professor Hart's co-operative work has issued its volumes from XVI to XXII, and has now reached the years of reconstruction. The general average of the series continues high, while Professor Dunning's volume

on "Reconstruction" is probably the best brief discussion of the subject that we have. More recent still, Mr. Peck's *Twenty Years of the Republic* has been rescued from the magazines and carries a narrative down to 1905.

The flood of material on local history and special periods shows no sign of subsiding. Its average, happily, seems to be improving, so that when the next era of general histories shall come the task of the writer will be made easier than it now is or has been. The bright star among the local books is Mr. Lincoln's five-volume constitutional history of New York. Very slight deliberation will convince any one that American history can never be understood without a precedent understanding of the development of its constituent elements. But almost no serious effort has been given to the local task. Its rewards are slight. Its glory is insignificant. And so we give honor to this author and hope that he may be the precursor of a long line of devoted and laborious investigators of local constitutional history. Other important books on local topics are too numerous for this brief survey. They generally have strong inclination to the sumptuous in form, and often try to stimulate the purchaser's interest by appearing in limited edition. The interest in Captain John Smith has been revived by the Jamestown Exposition, and we find his *General Historie* among the reprints of the year. Magellan's circumnavigation of the globe has been recalled by a new translation of Pigafetta's journal of the voyage. The geographic discoveries of Cabeza de Vaca, Champlain and La Salle have been made more accessible, while Mr. Hulbert has continued his study of routes of travel. This last task, that of assembling the sources of information upon individual routes within the United States, is of exceeding importance in the explanation of the physical course of American development. Migration always follows the line of least resistance, and the settlement of the Western frontier until 1850 was almost exclusively controlled by the natural routes of the river valleys. Mr. A. B. Hulbert has already pre-empted a large portion of this field. His new volume on the Ohio River comes near to being a model of what such a book ought to be. The *Grafton Historical Series,* volumes of informal sketches of early life in Eastern towns and States, serve a useful purpose in arousing popular interest in their homes and ancestors.

Speaking broadly, there is now more interest in local history than in chronological periods of general history. Yet we are glad to record a few useful works of the latter sort. The Civil War and reconstruction years have not been overlooked. Indeed, our rapidly changing understanding of the causes and nature of secession, which is already far advanced among scholars, altho only begun among the public, will keep alive the scholarly investigation of this period for a long time. Professor Fleming has now issued the second volume of his *Documentary History of Reconstruction,* completing his work and affording material for the illustration of most of the points raised by law and economic fact in the South in the years after the war. Another writer has described the nature of government in war time, in both Federal and State administrations. He has shown how the power of the President expands when the necessities of war bring into existence his authority as commander-in-chief, and how the executives of the States are able to co-operate in the general work. An excellent English narrative of the military events of the Civil War has made it possible for us to revise some of our judgments in the light of recent dispassionate research.

Like Miss Bateson and Mr. Doyle, the late Albert H. Smyth had completed an important task before his death. His edition of the *Writings of Benjamin Franklin* is the leading contribution of the year to American biography. Mr. Smyth's work as editor was dignified and suitable, while the new papers which he unearthed were of considerable number and importance. Among the younger contemporaries of Franklin, Alexander Hamilton has received a new biography by a careful Scotch writer. Mr. Oliver has not, however, added to our knowledge of Hamilton, and his work is chiefly interesting because of its British point of view. More recent still, useful accounts of Robert E. Lee and Judah P. Benjamin have been published, and the interesting memoirs of Gen.

E. P. Alexander. In the field of autobiography three important contributions must be mentioned, altho they have been received too recently to have been reviewed; two of them, the reminiscences of General Howard and Carl Schurz, bearing especially on the Civil War period, and the third, the letters of

QUEEN VICTORIA IN 1855.
From "Letters of Queen Victoria."

Queen Victoria, having a double interest in its domesticity and diplomacy.

The historical works of the last year have invaded all the usual fields of interest. Of the unexpected and surprising there has been almost nothing. But one or two really great works have been completed, and the sum total makes the past year worthy, if not memorable.

Religion and Theology

A Hebrew and English Lexicon of the Old Testament. By Francis Brown, with the co-operation of S. R. Driver and Charles A. Briggs. Houghton, Mifflin & Co. $8.00.

Elias, Jahve, und Baal. Von H. Gunkel. Tübingen: J. C. B. Mohr.

Introduction to the Canonical Books of the Old Testament. By Karl Cornill. Translated by G. H. Box. Putnam's. $3.00.

The Religious Value of the Old Testament. By A. W. Vernon. Crowell. 90 cents net.

A Critical and Exegetical Commentary on the Psalms. By Charles A. Briggs and Emilie Grace Briggs. Scribner's. 2 vols. $3.00 each.

A Commentary on the Gospel of Matthew. By Willoughby C. Allen. Scribner's. $3.00.

The Fourth Gospel. By Ernest F. Scott. Scribner's. $2.00.

Luke, the Physician, the Author of the Third Gospel and the Acts of the Apostles. By A. Harnack. Translated by J. R. Wilkinson. Putnam's. $1.50.

Paulus und Jesus. Von Adolf Jülicher. Imported by G. E. Stechert & Co., N. Y. 13 cents.

The Gospel History and Its Transmission. By F. Crawford Burkitt. Scribner's. $2.25.

A Dictionary of Christ and the Gospels. Edited by James Hastings. Scribner's. Vol. I. $6.00.
The New Theology. By R. J. Campbell. Macmillan. $1.25.
The Substance of Faith Allied with Science. By Sir Oliver Lodge. Harper's. $1.00.
The Religious Conception of the World. By A. K. Rogers. Macmillan. $1.50.
Naturalism and Religion. By R. Otto. Translated by J. Arthur Thompson and Margaret R. Thompson. Putnam's. $1.50.
Through Man to God. By George A. Gordon. Houghton. $1.50.
A Genetic History of the New England Theology. By Frank Hugh Foster. University of Chicago Press. $2.00.
The Problem of Faith and Freedom in the Last Two Centuries. By John Oman. Armstrong. $2.75.
Christianity in the Modern World. By D. S. Cairns. Armstrong. $1.25.
Christianity and the Social Crisis. By Walter Rauschenbusch. Macmillan. $1.75.
The Social Message of the Modern Pulpit. By C. R. Brown. Scribner's. $1.25.
A History of the Reformation. By Thomas M. Lindsay. Scribner's. 2 vols. $5.00.
John Calvin. By Williston Walker. Putnam's. $1.35.
The Catholic Encyclopaedia. In 15 vols. $6.00 each. Vol. I: Aachen-Assize. Robert Appleton Company.
The Censorship of the Church of Rome. By G. H. Putnam. Putnam's. 2 vols. $5.00.
Lord Acton and His Circle. Edited by Abbot Gasquet. Longman's. $4.50.

Let the place of honor among the religious books of the year be given to a monument of patient toil and exact and searching scholarship, Professor Francis Brown's *Hebrew and English Lexicon of the Old Testament.* For over a score of years Dr. Brown and his collaborators, Dr. Briggs and Canon Driver, have worked at this revision of Gesenius, and they have produced a *Hilfsbuch* to Old Testament study which will place many generations of Biblical students under a heavy debt of gratitude to them. The work is far in advance of anything hitherto available, and while doubtless only the few will use it, its beneficient influence will be widely felt. Parts of this Lexicon have been appearing for the past sixteen years, and its successful completion is a notable event.

Among other books in Old Testament science mention should be made of Professor Gunkel's brief essay on Elijah, which is the only adequate treatment of that mighty prophet, from the modern point of view, with which we are familiar. It is an unpretentious volume, one of the *Religionsgeschichtliche Volksbücher,* but is one of the best examples of German critical scholarship. It may be hoped that an English translation will be made. The past year has seen the translation of Professor Cornill's *Introduction to the Old Testament,* which appeared first in German in 1891, and is a valuable aid on all questions of authorship, date and literary structure, and leads up to appreciation of the religious history of Israel.

A passionate assertion of the large and permanent *Religious Value of the Old Testament in the Light of Modern Knowledge* may be found in Professor Vernon's essay of that title. The author makes clear the disadvantages of the older view, which he regards as completely mistaken, and sets forth the reasons for his faith that the modern conception will result in worthier religious lessons from the literature of the ancient Hebrews. Dr. Briggs's name appears again as the author of an exhaustive, critical *Commentary on the Psalms,* which lays special stress on the metrical structure and its use in corrections of the text.

Passing to the New Testament, a thoro and sane *Commentary on Matthew* is provided by Dr. Willoughby C. Allen, which is notable especially for its painstaking interpretation of the Greek text and scholarly observations on the sources and structure of the Gospel. The most valuable treatise on the Gospel of John that has appeared in recent years, not forgetting several by authors widely known, is that of Mr. Ernest F. Scott. Date and authorship are not considered, but the more important questions of the aim and object of the book, the needs it was designed to meet and the difficulties and errors it was calculated to correct, are submitted to careful and sensible examination. This essay has been pronounced by Holtzmann one of the most valuable treatises in Biblical theology made by a recent writer. Mention should be made of Professor Harnack's skilful argument that *Luke the Physician* was the author of both the Third Gospel and the Acts, and another slight German treatise whose value is altogether out of proportion to its compass is Professor Jülicher's valiant defense of Paul as on the whole a true and faithful representative of the message of Jesus to the world.

The question of the origin, mutual relation, and historical value of the Gospels, and the history of their adoption into the canon, has received careful treatment in *The Gospel History and its Transmission,* by Professor Burkitt, of Cambridge, a ripe scholar and a man of

sound critical acumen. He contends for the priority of Mark, and attempts a construction of the framework of Christ's life according to the Marcan account. The *Dictionary of Christ and the Gospels*, by the editors of the well known "Dictionary of the Bible," is in many ways disappointing, at least in the first volume. Many of the articles do not at all meet the problems raised by modern scholarship.

Perhaps no religious book of the year has attracted so much attention as the Rev. R. J. Campbell's *New Theology*. Undoubtedly Mr. Campbell means well, is evangelical in spirit, and perceives much truth, but his writing lacks balance and his exaggerations of truth sometimes amount to falsehood. He is an earnest preacher, but possesses a heterogeneous mind and is a bit daft on the doctrine of immanence and on "psychic investigations." Another volume much discussed is Sir Oliver Lodge's catechetical endeavor to state religious belief in terms not inconsistent with modern science. The author has found himself in conflict both with representatives of science and with teachers of religion.

A significant volume in doctrinal theology is Professor Rogers's *Religious Conception of the World*, in which the author defends the religious and theistic view of the world with philosophic penetration and no small argumentative skill. The same general problem and point of view obtains in Professor Otto's *Religion and Naturalism*, which is in all ways a valuable work for those who experience difficulty in reconciling religious faith with scientific conceptions.

Dr. Gordon's helpful sermons are so largely doctrinal that they may be classed with other endeavors to explain and defend the truths of the Christian faith. The theology is Christocentric, its chief contention being that "the supreme path to God is thru the humanity of Jesus Christ." The *New England Theology* has found a worthy historian in Profesor Foster, whose story of the high debates, from Edwards to Park, is a notable contribution to the understanding of the nobler elements of America's life. All the great religious teachers of New England between the two mentioned find clear and sympathetic exposition in his pages. Another successful essay in the history of doctrine is Professor Oman's *Problem of Faith and Freedom*, in which he attempts to show, by a sketch of religious thought in the last two centuries, that faith and freedom are not mutually exclusive, but rather that true faith is impossible without fullest freedom, and that genuine freedom is the surest guarantee of real faith.

On the important and live topic of the relation of Christianity to social questions Professor Rauschenbusch's *Christianity and the Social Crisis* is deserving of special attention. The author urges a much closer co-operation between the Church and adherents of socialistic doctrine than usually obtains. A book dealing less with social theory, but very wisely and enthusiastically with problems of practical betterment, is Dr. Brown's Yale lectures on *The Social Message of the Modern Pulpit*. The need of moral leadership in social endeavor and the way to immediate and efficient helpfulness on the part of the parish clergyman are eloquently stated.

Professor Lindsay's *History of the Reformation* is taking its place as the standard English work on its important theme. The author is fair, comprehensive and accurate, and his work shows the benefit of access to archives not hitherto available. For its scope and purpose Prof. Williston Walker's biography of *John Calvin* is a model. Interest in the fourth centennial of the birth of the Genevan reformer renders the work timely.

The *Catholic Encyclopedia* is a notable undertaking, aiming to give an adequate and authoritative statement of the doctrine, history and institutions of the Catholic Church. It is on the whole a creditable work, with many excellent and scholarly articles, but marred by the presence of mediocre and medieval material and careless editing. Deserving of high commendation is Mr. Putnam's account of the *Censorship of the Church of Rome*, a scientific and impartial history of that terrible instrument of intellectual repression. Dom Gasquet's edition of the letters of Lord Acton, from his twenty-fourth to his thirtieth year, furnishes many interesting sidelights on

the history of English Catholicism in the fifteen years succeeding the Oxford movement, in which Acton was interested in liberal Catholic reviews. The volume is a useful supplement to the delightful and informing letters to Mary Gladstone.

Nearest the Pole. By Robert E. Peary. Doubleday. $4.40.
Fighting the Polar Ice. By Anthony Fiala. Doubleday. $3.80.
Four Centuries of the Panama Canal. By W. F. Johnson. Holt. $3.00.
Christian Science. By Mark Twain. Harper. $1.75.

The United States falls behind the other literary nations of the world in the production and consumption of many kinds of books, but there is one in which we are unrivaled. For encyclopedias, dictionaries, compendiums and popular scientific and technological works Americans have an insatiable appetite. The publications of the present year confirm this common observation, for they are especially rich in such books.

The completion of *Nelson's Encyclopedia* gives us a popular and up-to-date reference work, conveniently arranged, at a moderate price. The two first volumes of the *Cyclopedia of American Agriculture* are of the same form and quality as the veteran editor's "Cyclopedia of American Horticulture." It is thoroly scientific in its material, yet written in so plain and practical a style as to be of use on the farm as well as in the agricultural college. Professor Bailey has enlisted the services of almost every prominent American writer on agriculture, and has welded together their contributions with uncommon skill, so as to bring into convenient and comprehensible form for the first time the immense mass of facts resulting from the activity of the State experiment stations during the past quarter century. Dr. Wiley, of the Department of Agriculture at Washington, who is largely responsible for the pure food law and its workings, has compiled a dictionary of foods, and in this connection should be mentioned Professor Chittenden's report of his experiments at Yale on the science of nutrition and the art of chewing, which we discussed editorially on June 13th. On the history of painting and architecture we have two good works, comprehensive, interestingly written and handsomely illustrated.

Philosophy has come down from the clouds to common earth in the advent of pragmatism, a lively infant of unstable temperament and uncertain future, regarded as a nuisance by its elders because it will not keep quiet and behave properly and stop trying to smash anything within reach. Professors James and Schiller are respectively the American and British sponsors for it.

Until now the general reader has had no opportunity to become acquainted with the remarkable experimental work that is being done in zoölogy—the working out, testing and practical application of the laws of heredity and variation. Now, however, he has no longer an excuse for ignorance, for the three volumes by Professors Morgan, Jordan and Kellogg give authoritative and interesting expositions of this new knowledge. McCook's book on ants, etc., and Ditmars's on reptiles are in the more familiar lines of descriptive zoölogy.

For profound thought and power of generalization and abstract formulation no American scientist has equaled Willard Gibbs. His works contained the fundamental principles of the most fruitful lines of investigation in chemistry and physics, but they have been practically inaccessible to students until the issuance of the present complete edition. Professor Duncan, of the University of Kansas, has explained in a clear and interesting way many of the chemical processes used in the manufacture of common and uncommon things. Lowell's argument for the existence of irrigation systems in our nearest neighbor on the outside ring is the center of scientific controversy and popular interest.

Mr. Howells's idyllic picture of life in a socialistic Utopia forms an interesting contrast with Max Stirner's pugnacious assertion of unbridled individualism. Two very diverse views of American characteristics are given by an English Socialist and an Anglicized American; Mr. Wells has made hasty but not inaccurate pencil sketches of his trip to this country, Mr. James unscrews the front lens of his camera a trifle and so gets the hazy atmospheric effect now popular in artistic photography. Two books of polar exploration have appeared during the year, and we must not close the list without mentioning Johnson's *Four Centuries of the Panama Canal,* altogether the best book that has been written on Panama—thoro, comprehensive and readable.

And then there is Mark Twain's book on *Christian Science,* that does not seem to fit in anywhere. It cannot be classed as theology, or medicine, or fiction, altho it contains all these in spots. But it certainly is extremely funny—in spots.

Our Challenge

BY BENJAMIN C. MOOMAW

Or whether from the West or North
We hear the strident call,
That gold shall be the meed of worth,
There many be that fall—
That fall thus from the high estate
Where men are counted men,
Unto a fate degenerate,
Like fatlings in the pen.

Ye regions of the North and West
Have lured our ardent sons,
Have lured them from the simpler ways
And from the warmer suns,
Until the haste of myriad feet
Engulfs a million souls
In brazen clamor of the street
And coarseness of its goals.

This token has for ages been
The gospel that we prize,
That lo! our treasure shall be men
Rather than merchandise;
Shall be the noblest hero blood,
The flower of the race;
Shall be the purest womanhood,
Its ornament and grace.

Then listen while our challenge rings:
O why this feverish haste?
And why the gathering of things
That meaneth only waste?
For idle is the boast of power
And silent is the song
Where men are only held to be
The units of a throng.

The Book Trust and the Copyright Bill

BY W. P. CUTTER

[In the battle that has been actively waged during the last few years over the question of proper prices for books and methods of their publication and distribution, the general public which buys them, either individually or collectively, is, of course, the most concerned. It is therefore reassuring to find that both parties to the controversy have the interest of readers and book-buyers primarily at heart, opposed tho they are in their ideas of how these interests can be furthered. Mr. Cutter, as Secretary of the Library Copyright League, presents the case of the opposition to copyright law before the last Congress and Mr. Putnam replies in its defense.—EDITOR.]

THE American Book Trust was organized in February, 1901, by a committee of New York publishers, under the name of the American Publishers' Association, with the avowed object of "bettering the condition of the American book trade." It was claimed by the organizers that the booksellers of the country were making no money, on account of ruinous competition, and that by organizing these booksellers into an association to co-operate with the publishers' association, this competition might be eliminated, standard prices for books established, and every person or firm in the trade be benefited. Accordingly, these same New York publishers organized the American Booksellers' Association and the two associations at once adopted an agreement called the "net price system." The agreement prevented any of the booksellers from selling any "net" book at any discount from the standard price fixed by the publishers, but allowed a discount of 10 per cent. to libraries.

The effect of the agreement, which went into effect on May 1st, 1901, was at once evident. Book prices increased at once, in some instances as much as 30 per cent. The general public had no notice of the change, beyond the sudden increase in prices. The public libraries, whose purchases were increasing rapidly as a result of the Carnegie gifts, were seriously affected by the change, and an attempt was made by a committee of the American Library Association to obtain some concession from the trust. The attempt was unsuccessful, but agitation of the question brought out the fact that English editions of many of these books could be imported under the free list of the tariff act, at a price much less than the cost in this country. A Committee on Book Buying was appointed by the American Library Association, and frequent bulletins were issued, emphasizing this fact: their action resulted in increased importations.

As a necessary adjunct to the trust, a blacklist of dealers not upholding the "net" system was published, and the trust refused to sell to these firms at any price but the full price to the public. Of course, in an association made up of competing publishers, it was easy for any publisher, while agreeing to withhold supplies to these dealers, to sell to some "straw man," and by this method some of the blacklisted firms succeeded in obtaining books for sale. Some of the great department stores began to sell popular books at a price only slightly above the cost, and this sale interfered with the regular bookseller. In order to stop this sale, the trust tried various devices. In one case a publisher printed on his bills a statement that the publications of that firm were sold with the condition that they should be resold only at "net prices." In another case the publisher inserted a similar notice in every copy of the book sold. Suits in the courts were brought by the publishers to restrain a certain department store from cutting prices on books sold under these conditions. But the courts held that no such notice could prevent sale at any price, unless the publisher added a claim to the

title of the book when sold below the price fixed by the publisher. No buyer wished to purchase books without knowing whether he really bought them, and it was not to the interest of the publisher to affix such a notice to a book.

In the suits to which I have referred, the courts in their opinions brought out plainly the facts in the case, and in addition to a decision against the trust, called attention in no uncertain terms to the illegality of the agreement between the publishers and the booksellers, stating that it was in violation of the Sherman anti-trust law, as in restraint of trade or commerce between the several States.

At about the time that these suits were decided, and while appeals were pending in the higher courts, it seems to have occurred to the attorneys of some of the publishers that it might be well to suggest the necessity of a new copyright law, and that in this law they might find some remedy for the awkward position in which they were placed by these decisions. At any rate, such legislation was suggested. There seemed to be a general consensus of opinion that certain provisions of the existing copyright laws were vague, that the law was difficult to construe and administer, and that a limited revision would be for the public good.

The Senate Committee on Patents, therefore, as a result of a paragraph in the message of the President suggesting the necessity of such revision, called on the Librarian of Congress to draft a copyright measure which would remedy any defects in existing law. In order to have the fullest information from those interested, the Librarian called together a meeting of delegates from every organization which would seem to be interested. As the general public is not organized, it had no representative. There were thirty-six representatives of the various publishing interests, twenty representatives of authors, composers and artists, two representatives from the National Educational Association, and two from the American Library Association. There was no lack of legal talent, no less than nine representatives of bar associations being present, in addition to the special counsel of the various publishing interests.

These delegates could have, of course, no status except that of advisers. After three protracted meetings, the opinions of all present were combined into a bill, and this bill, entitled "A Bill to amend and consolidate the Acts respecting Copyright," was introduced into both Houses on May 31st, 1906. Up to this time few persons were aware of the provisions of the bill, and, indeed, few knew that any revision was intended.

The bill as introduced was, as might be expected, extreme in its provisions for the protection of the publishing interests, and left out of consideration the rights of the consumer. In its first section, it so defined copyright as to give the publisher the control of prices for all time, thus in effect repealing the Sherman law as applied to book publishing. It cut off the privilege of importation by individuals, by requiring the consent of the copyright proprietor. It limited the importation by libraries by forbidding the importation of foreign editions of the works of an American author. It left out any requirement for the printing of a copyright date, thus paving the way for all kinds of frauds in the way of sale of out-of-date literature. It introduced a penal clause, providing for imprisonment in addition to fine for infringement. It allowed attorney's fees to a publisher who gained a suit for infringement, but did not allow them in case the defendant won the suit. It provided that makers of perforated rolls for playing pianos, and manufacturers of graphophone rolls and discs, might not use the music of a composer without his consent. In fact, it covered every point which would allow of an unrestricted monopoly by the publishers.

The Committees on Patents offered to hold joint hearings, the first of these to be on June 6th, and such a hearing was held, open to the public. Notwithstanding the short time since the bill was introduced, there was decided opposition to the measure, and much complaint of the short notice. The committees, therefore, resolved not to attempt to pass the bill during that session, and agreed to have a second hearing in December.

The December hearing was well attended. The publishers had enlisted the

services of several well known authors, composers and artists. The demand for the protection of the struggling bookseller was changed to a demand for the protection of the poor author. Three prominent publishers had several opportunities to speak, one of them being present in four different capacities, as an author, a publisher, a special pleader for the music publishers and the trustee of a library. But the opposition was even stronger. Every large public library in the country, with a few exceptions, was represented by the Library Copyright League. The independent manufacturers of devices for reproducing music were represented by inventors, manufacturers, dealers and attorneys. The arguments were strenuous, impassioned and almost interminable. For four days the committees listened in patience to the disputants, frequently interjecting pertinent questions.

Since the hearings, the committees have had frequent sessions. Every provision of the bill has been scrutinized and discussed at great length. The result is worthy the attention of those who are continually criticizing the motives of our national legislators. With two exceptions every trust measure has been eliminated from the bill, and on one of these, the clause concerning mechanical reproduction of music, the Senate Committee is divided, and the House Committee has adopted a compromise. New bills, differing from the first bill in nearly every page, have been introduced in both Houses, and a report on them has been made, as well as a minority report from the Senate Committee on the musical provisions.

Only one feature of the new bills will directly affect the general public. Consent of the copyright proprietor must be obtained before a foreign edition of a copyrighted book may be imported. There may well be a difference of opinion with reference to this section. It is in the nature of protection, and is really a tariff measure, substituting absolute prohibition for a prohibitive duty. The English copyright law does not contain such a prohibition; it is put where it rightly belongs, in the tariff regulations. It seems doubtful whether Congress will consent to any modification of tariff provisions, even when contained in a copyright bill.

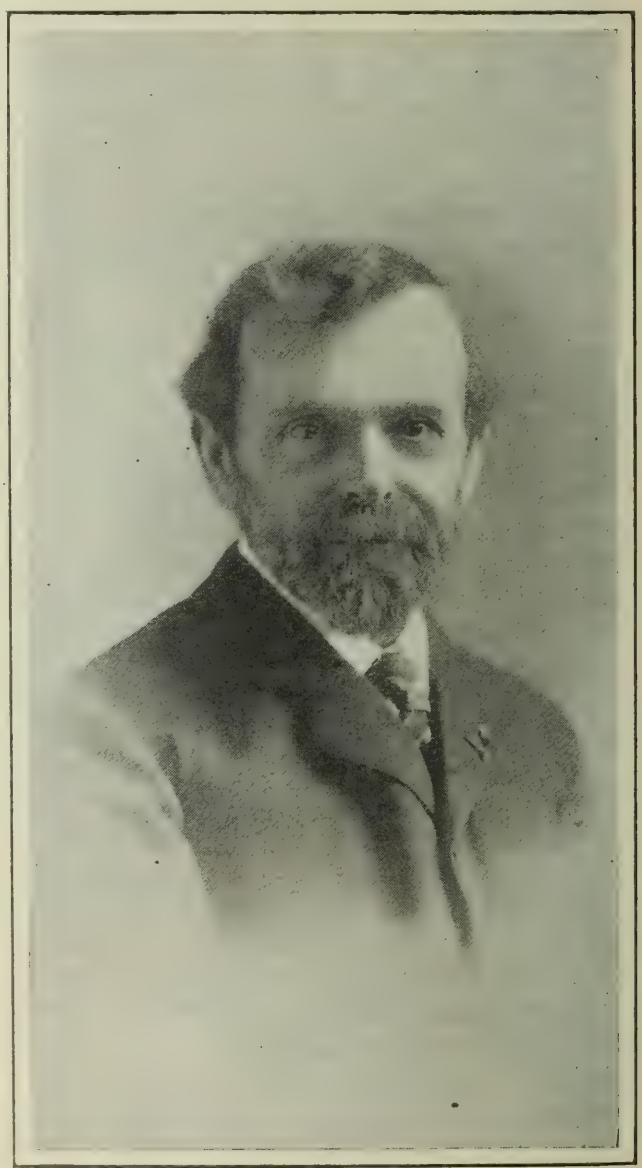
The coming Congress will undoubtedly pass a copyright bill of some kind. The members of the Senate and House Committees on Patents have nearly all been re-elected, and probably the composition of these committees will not materially change. There is therefore little doubt that the bill as reported from these committees will be substantially the same as that reported during the last Congress, except that some agreement must be reached on the musical copyright question.

It is interesting to note that the American Publishers' Association, confronted by decisions which clearly indicated a danger of suit against its members for illegal combination, has changed the "agreement" which upheld the "net price system" to a "recommendation" to its members to uphold the system. This is in effect only a change of name. The movement for monopolistic control of book prices is now to be extended over the whole world. The International Publishers' Conference, at its next meeting at Madrid, will undoubtedly agree to sell only to those dealers who will uphold prices, and will make arrangements, either open or secret, to so adjust prices as to do away with the advantages to be gained by the importation of foreign editions. One can easily see that there will only be needed a "holding company" (with an office in Jersey City) to complete the plan.

NORTHAMPTON, MASS.

A Publisher's Defense

BY GEORGE HAVEN PUTNAM



[Mr. Putnam is the senior member of the firm of G. P. Putnam's Sons and is the Secretary of "The American Publishers' Copyright League" and an authority on copyright. He has published much on books and their making.—EDITOR.]

IN his article in THE INDEPENDENT, which I have been given an opportunity of examining, Mr. W. P. Cutter, who writes as secretary of an organization called the Library Copyright League, confuses two entirely different matters. The apparent purpose of his paper is to make clear his opinion of the character of certain of the provisions in the pending copyright bill. In connection with this copyright matter, he undertakes, however, to criticise the operations of the American Publishers' Association, which he describes (quite inaccurately) as a "book trust."

The American Publishers' Association has taken no part in the shaping of the pending copyright bill, and bears no responsibility in regard to any of its provisions. The purpose of the publishers who organized this association some six years back, was to take such measures as might be found practicable to prevent the booksellers of the country from being crowded out of business. The publishers knew that it was essential for the interests of the producers of books (authors and publishers) that an adequate machinery should be maintained for bringing books to the attention of American readers throughout our widely scattered communities, and they judged also that the public at large had a very direct literary and educational interest in any measures that might further the economic distribution of books.

They realized that the continued existence of the American bookseller was being seriously threatened by competition of a very special character on the part of dealers who were using books simply as advertisements for the pushing of their wares, and that, unless it might prove practicable to check this undermining of the book trade, the American bookseller would be driven out of existence, or at least his service to the producer of literature, on the one hand, and to the community, on the other, must be very materially lessened.

The association has nothing to do with

GEORGE HAVEN PUTNAM.

the fixing of the prices at which books are published, and its operations have had no influence whatsoever in raising these prices. Each publisher within the association fixes the prices of his own books, and these publishers are compet-

ing with each other now just as actively as before the existence of the association in regard to the amount of literature that can be sold for a given price, and in regard also to the quality and character of the manufacturing of their several publications.

It is the fact that during the past few years there has been an advance in the prices of books, and it is doubtless the case that there is going to be in the near future a more considerable advance. This difference is, however, due not to any combination or scheming on the part of the publishers, but to the higher royalties demanded by the author, and to the increased cost of book manufacturing caused by the higher wages paid for shorter working days and by the advance in the cost of all book material; and the price of books has not as yet been advanced in proportion to this increase in the cost of their production. It is also the fact that it was some years after the beginning of the operations of the Publishers' Association before any advance was made in the published prices of books. The advances that were then arrived at, due chiefly to the causes above specified, were but few in proportion to the whole number of the publications of each year. There has also been no increase in the prices of the long series of books classed as standards, which were on the catalogs at the time of the organization of the association.

Mr. Cutter has evidently written hastily, and without reference to his own records, in stating that the publishers have, since the organization of their association, restricted to 10 per cent. the discount given to libraries. Such a statement is inaccurate and misleading. In the first place this restriction applied to none but new copyrighted books; while, secondly, on the classes of fiction and books for children, which constituted by far the largest proportion of the books purchased by the libraries, the discount, in place of being limited to 10 per cent., ranged from 25 to 33⅓ per cent., according to the quantities purchased.

The aim of the Publishers' Association has been simply and consistently this—to bring about an arrangement or understanding by means of which the announced or catalog price of the book, upon which is based the royalty paid to the author, should be an honest price, upon the uniformity of which the buyers in all parts of the country could depend. This being the case, it should be clear that such an association ought not to be confused with a "trust" which controls an article like, for instance, quinine. The purpose of the manufacturers of quinine, a purpose which was for some years successfully carried out, was to raise the price of quinine. They agreed with each other that quinine should not be sold below certain fixed rates, and they were able to maintain such agreement.

The publishers have made no such agreement for books, and have no such understanding.

Mr. Cutter makes reference to certain *obiter dicta* of the judges in the Scribner and Bobbs-Merrill cases, but has curiously omitted to make any reference to the all-important decision of the Court of Appeals of this State.

This court took the ground that the producer of a copyrighted work has the right to control the conditions under which it may be sold and under which it may be resold. Judge Gray, of the Court of Appeals, uses the words:

Public policy "commends the conduct of business in such a way as to serve all consumers alike"; and further, "one of the cardinal and chief principles of the plan adopted is the establishing of a uniform price by proprietors which necessitates the service thruout the United States of all persons alike."

Justice Van Brunt sums up his opinion of this issue as follows:

> "I do not see why a seller of property in respect to which he has a monopoly, cannot impose such condition as to its resale as he sees fit."

Unless or until the United States Supreme Court overrules this judgment of the Court of Appeals, the decision will hold good that producers of copyrighted property and their assigns have a right to fix the prices and to control such prices when fixed. This right has, I may mention, never been questioned in any country but the United States, and it is merely an accident that it comes into question here.

Certain laws, such as the Sherman Trust law, enacted for an entirely differ-

ent purpose, and aimed at combinations which did have for their purpose joint action for raising the price of certain commodities, have been interpreted as affecting the business relations of publishers and booksellers. Even such interpretation cannot, however, in any way make legitimate the application of the term "book trust" to the very necessary work of the Publishers' Association, a work which concerns not only the interests of authors, publishers and booksellers, but those of the whole of the community that has to do with the buying of books.

In no country other than the United States has any question arisen in regard to the right of the producers of books, authors and publishers, to fix and to maintain the prices and the selling conditions. The Book Trade Association of Germany, for instance, representing the interests of publishers, authors and booksellers, has maintained such a system, giving absolute control over selling conditions, thru a term of nearly four centuries. As a result, the reading public of Germany has today better facilities than exist in any other country for the examination and the purchase, in the smallest towns thruout the land, of current and standard publications, and these publications are, under a system of fixt prices, sold for less money than is practicable in a market where there is no such effective trade organization.

The heated imagination of Mr. Cutter finds apprehension in connection with a convention that is to be held in Madrid next year, of the International Association of Publishers. He dreads lest this convention may institute a gigantic monopoly, having for its purpose the increase to consumers of the prices of books. His mind should be relieved to learn that, during the fifteen years of the existence of the International Publishers' Association (in which term five previous conventions have been held), no consideration whatsoever has been given to the prices of books. These have been left, as before the organization of the association, to be determined by the individual publishers working in competition with each other. The association has, however, been able to do much to further international publishing arrangements. Under such arrangements, an important portion of the first cost of the production of books, which are constituted to meet worldwide requirements, namely, the cost of authorship, of research, of illustrations, etc., is divided between the several markets for which editions are prepared. Such division has enabled the books to be furnished to the buyers in each market at a lower price than would have been possible if the entire original outlay had to be borne by one edition. From this has resulted, for a large number of international publications, series and individual books, a material advantage for the consumer. Such division of cost and lessening of prices is, however, possible only under a strict limitation of markets, and an absolute control of each market by the producers, namely, the authors and the publishers. Such control is assured by the copyright laws of Europe.

The publishers who have taken part in the shaping of the pending copyright bill are represented by the Publishers' Copyright League. They are practically the same men who came together in 1886 for the purpose of reorganizing a copyright association that had, with some intervals, been working for nearly half a century for furthering the recognition in this country of literary property. The more direct purpose of the Copyright League was to extend the protection of American copyright to transatlantic authors, and to secure, in so doing, recognition for American authors in foreign countries.

The present statute dates from May 1891, and went into effect in July, 1891. The responsibility for the original bill of 1886 rested in the main with the authors and publishers of the Copyright League. Their draft was, however, very largely modified by the representatives of certain of the manufacturing interests, who succeeded in making manufacturing in this country a condition of American copyright. This condition was assented to by the authors and publishers because otherwise it would not have been practicable to secure from a protectionist Congress the enactment of the all-important international provisions of the bill. It was pointed out at the time, however,

by protectionists no less than by free traders, that protection had no logical connection with copyright, and that protective provisions were not germane to a copyright statute.

Germany, France and Italy are controlled by what is called a protectionist policy, but in those countries the interests concerned with the manufacturing of books are referred, for such protection as they require, to the committee having charge of tariff. They have not been allowed to have anything to say in regard to the provisions of copyright.

During the last hours of the session of 1891 certain interpolations were made in the bill which, so far from being germane to the principles of copyright, were very directly opposed to copyright. The provisions then inserted (it may be said, surreptitiously inserted) had not had the advantage of consideration or discussion in the preceding conferences — conferences which had extended over a period of five years; and they were, in large part, inconsistent with other provisions of the bill and with copyright itself. Certain of these provisions imposed fresh manufacturing restrictions, while another clause, which has since come into continued discussion, conceded to libraries, incorporated and unincorporated associations of one kind or another, and even to individuals, with practically no restriction, the privilege of importing, without reference to the permission of the owner of the copyright, copies of copyrighted books. The first clause of the Act of 1891 provides (as is provided in all the preceding United States copyright acts, and in all the copyright acts of other countries) that the producer (author, etc.) shall have "the sole liberty of printing, publishing, vending, etc.," the work produced. The later section above referred to, in direct contradiction of this exclusive control, leaves the market open and permits the copyright to be infringed by practically any parties who may desire to import transatlantic editions of said work. The pending copyright bill, as drafted, brings forward from the existing law this provision for a practically unrestricted importation.

A serious difficulty with the work of these copyright conferences, a difficulty which is largely responsible for the unsatisfactory result of this work, was the fact that their membership included so large a number of representatives of interests opposed to copyright, either directly or indirectly: Reprinters who desired to extend their opportunities for appropriating literary productions; dealers in works of art and of music who wanted to utilize freely the designs and the compositions of foreigners; librarians and others who have found it a convenience to be freed from the restrictions of copyright law; labor unions which thought it important to impose increased manufacturing restrictions on copyrighted articles. These groups constituted possibly the larger, and certainly the more active element in the conferences, and they secured much the larger portion of the time allotted for discussion and for hearing. It is only in the United States that interests like these are permitted to take part in the shaping of copyright law.

The arguments for the confirmation in the new act of the importing provision of the statute of 1891 were arguments which might have been used, and which in fact had very largely been used, against any system of copyright. It is very frequently a convenience to have the privilege of "appropriating" the property, whether in goods or in rights, of other people. It may easily be an inconvenience to be called upon to respect or to give consideration to the property rights of producers or of their assigns.

Mr. Cutter repeats in his present paper a statement that had been made by himself and his associates more than once at the conferences, to the effect that "the English law does not contain any such prohibition," *i. e.*, for the importation of copies of a copyrighted work.

This statement is based upon an entire misapprehension both as to the wording of the British act and as to its operation. The British act gives to the owner of the copyright the "sole and exclusive liberty of printing, multiplying and vending," and the same right that is given to the producer (the author) belongs, in like manner, to the assign of the producer the publisher.

If Mr. Cutter should undertake to bring into England copies of a Continental (say a Tauchnitz) edition of a

work that had secured copyright in England, or of an American edition of such work, he would very promptly find, thru the action of the authorities at Liverpool or at Southampton, that, excepting with the permission of the owner of the copyright, no such importation could be made.

I am here speaking with direct knowledge and experience of such attempts at the importation into England of foreign editions of English copyrighted books, including editions which were "authorized" for their own markets, but not for Great Britain. The English publisher who has purchased the British copyright of a work has secured under the law the exclusive control of said work for the British territory.

The authors and the publishers, in their work in regard to the pending bill, have been doing what seemed to them practicable, as they did twenty years ago with the earlier bill, to bring American copyright law into line with the copyright laws of other civilized states. The special conditions obtaining in this country will doubtless make it necessary to retain in the present law the provisions (inconsistent as such provisions are with the principles of copyright) under which American manufacture is made a condition. The authors and the publishers object, however, to having these manufacturing restrictions increased by such further conditions as have been proposed by the manufacturing groups in the conferences.

The authors and the publishers also object to having the copyright market of the United States placed in any different conditions in regard to copyright from those obtaining in other markets which are protected by copyright law. When an English publisher has secured, under assignment from the author, the publishing control of a book for Great Britain, he is in a position to prevent any other copies of that copyrighted book from coming into Great Britain during the term of copyright.

The American publisher secures for his copyrighted book, under the existing law, and will secure under the proposed law, no such control of the American market, which is left open to the sales of the English edition of such book.

A market that cannot be controlled is worth less money than one of which the control can be assigned, and the authors are, therefore, interested with the publishers in securing in the revised law a return to the wording of the statute back of 1891, under which the author or his assign is left in exclusive control.

The book-buying public has also a direct business interest in the matter. There are many books of which a publisher is prepared to undertake the production of American editions only when he can be assured of the control of the market that he has purchased. If such control cannot be assured and the book is not undertaken in an edition suited for the special requirements of American readers, a large number of these readers fail to have knowledge of the existence of the book or to secure service from it. The readers who have to purchase their copies are obliged to take these in the transatlantic edition, which is, as a rule, not so well suited for American requirements, and which is usually higher in price than an edition printed on this side.

The pending statute marks in certain ways an advance over the existing law, principally in the matter of securing a longer copyright term and a more consistent application of penalties for infringement. There are certain other respects, however, which, with the space at my command, I cannot here specify, in which the provisions proposed are decidedly unsatisfactory. On the ground more particularly, however, of the proposed increase in manufacturing restrictions, and of the proposed confirmation of the freedom to import copyright books, the authors and publishers are not prepared to give their approval to the bill in its present form.

Mr. Cutter needs to clear his mind in regard to the meaning of the term "protection." When, in the years preceding 1891, we were working to secure attention from Congress for an international copyright bill, we found that not a few of the Congressmen were ready to assume that we were asking for a "protection" for the author similar to that which was asked for by the manufacturers of steel or of quinine. We were compelled to make clear to these Congressmen, as we should be glad to be able to make clear to

librarians and others today, that the protection desired by the author is simply the protection of the courts and of the policeman—that is to say, some assurance from the Government that the property that he has produced would not be appropriated, either in whole or in part, by others. The two kinds of "protection" are as much alike as the spring of the year and the spring of a watch.

If an author is not to be allowed the exclusive control, which is given to him in form at least by copyright law, and if he cannot assign such exclusive control to his business representative, the value of his property is impaired and may be undermined altogether. His production ought to be of service to the community, but it can be made of effective service only if his business representative, the publisher, is assured, under the law, of "protection" for the property investment that he is making in the venture.

Privilege nearly always spells injustice, and a privilege to certain classes of American citizens or residents, librarians or other individuals, who happen to have European correspondents, of being freed from restrictions in regard to copyrighted material, by which are bound their fellow-citizens who may not possess European connections, and of exercising such privilege at the expense of American producers and their assigns, constitutes an injustice in more ways than one, and an injustice which brings detriment not only to authors, publishers and booksellers, but to the community as a whole. It is this kind of inequitable privilege that Mr. Cutter and his associates desire to perpetuate and extend.

NEW YORK CITY.

To License Novelists

BY MRS. L. H. HARRIS

EVERY novelist should be required to hold a license certifying to the decency of his imagination and to his sense of moral responsibility to society before allowing his books to be sold. Some very distinguished writers of fiction, beyond reproach as to their own characters, are utterly lacking in this kind of integrity. We protect the wrong things, we insure the author's interests with a copyright, and place no tariff at all upon the corruption which his books may contain. It is time to copyright the virtues in our young people at least by protecting them against the bad effects of some popular novels.

A license is required of every saloon-keeper, yet is there a saloon that is likely to exert a more degrading influence this year than a certain novel mentioned as one of the "six best selling books" in England? Everybody knows definitely what a saloon is and may keep out if he chooses, but this novel is heralded in the London *Times*, for example, as a "dainty romance." And the author is praised for having surpassed all former achievements in "poetic sentiment" and "admirable descriptive power." A saint might buy it upon such a recommendation. As a matter of fact, "Sapho" is an innocent pastoral by the side of it, altho far superior to it in literary merit. The "daintiness" of the romance consists in the silk-fine, flesh-colored, skin-tight terms the author uses to present her characters to the reader. The "poetic sentiment" refers to an exchange of feelings between a married woman, who happens to be an "Excellency," and an unmarried man whom she corrupts with that singularly good conscience which a certain class of women maintain at the very nadir of their moral natures. The "admirable descriptive powers" are employed in the laying of questionable scenes with sumptuous splendor. And we form some idea of how far the broad mind is sometimes from the right mind in the preface the author addresses to her "American readers" (for the book is now circulating in this country from a highly respectable house). Referring to her heroine, she explains that the lady

is "beyond the ordinary laws of morality." Now, it is very difficult to get "beyond the ordinary laws of morality." They are the best laws we have evolved so far, Scripture-marked and homespun, but it is about the easiest thing imaginable for such writers to create characters that live far below them. And there should be some means by which society might protect itself from them. A book need not be literally too obscene to go thru the mails before it becomes dangerous. This one is written in the prettiest possible language, with a highly perfumed frankincense of virtue, and with a crying tenderness calculated to bring tears to the eyes of any innocent young girl, and to convince her that to be "beyond the ordinary laws of morality" is a grand state of being.

It is easier to become highly cultured, splendidly intelligent and magnificently devoid of prejudices than it is to hold sternly rigid ideas about right and wrong; not that we do not know the difference, but there is something narrow and invincible about righteousness which we lack the courage to risk. We have confounded it with bigotry, because bigots think they have copyrighted it. Meanwhile, what we really need is fewer laws of the kind we have and more of the kind we have not got. The official who forbade the production of one of Bernard Shaw's plays in New York was an extremist in the right direction. Nobody ever learned anything to the credit of human nature from Bernard Shaw, however much he may have learned that is bad and clever. And just now we are particularly in need of the other kind of information. The trouble with the good censor was he did not have the right kind of law to back him. He attempted to suppress the symptom rather than the disease; Mr. Shaw's plays instead of Mr. Shaw. When an evil is to be corrected, the proper way is to catch the father of it by the scruff of the neck—legally, of course—and deal with him in the usual emphatic manner. Nothing is more wholesome for the community or more healing to a perverted spirit like Mr. Shaw's. It insures silence if not repent-

ance. And the fact that a man is born with a genius for backbiting his kind is the sorriest reason in the world for tolerating him. New York in particular is sadly in need of a ducking stool, or house of correction, for some of its most popular authors and playwrights.

Naturally, a few novelists would experience grave disadvantages under the license law, and quite a number would cease to be novelists at all. Still others might lose in popularity because they would not be permitted to produce such diabolically interesting books as they do now. But the best story writers would have no difficulty in obtaining licenses, because, as a rule, they do not deal in sex occultism or the undercurrents of the merely physical life, which is such a damaging feature in the objectionable "popular" fiction. Winston Churchill and Owen Wister, for example, would be entitled to licenses in spite of the fact that Mr. Churchill knows too much, dramatically speaking, about methods of political graft. Margaret Deland would be equally fortunate, because in her reformation of Helena Richie she proves that she knows how to persecute a woman suffering from moral anemia into a state of rigid virtue. But Edith Wharton would be "conditioned." Mrs. Wharton has a noble mind and a literary manner which indicates the presence in her of a great white soul, to say nothing of her good intentions, but her heroines are not always credits to the sex or suitable persons to be decorated with so much fine writing. William Dean Howells and a few others would be permitted to say what they pleased without the formality of a license. But Henry James would be forced to explain what he really means, and this would end his literary career, for nobody would read Mr. James's books if his meaning was clear. It would be so commonplace. Upton Sinclair would get his license provided he signed a pledge not to discuss foodstuffs, and provided that he established a "fresh air camp" for the benefit of his readers in each novel. Jack London would be restricted to short stories of the Adamic period and would be compelled to pay Dr. Young for the use of the good doctor's dogs in "The Call of the Wild." David Graham Phillips would not only get a license, but he would be required by the same to produce at least one novel a year and to contribute 90 per cent. of his royalties to the realization of the financial scheme outlined in "The Second Generation." Joel Chandler Harris would get a life certificate for bringing good luck to the whole world with his rabbit-foot genius, and Will Harben would have a blue ribbon attached to his license, which would entitle him to flirt his literary coat tails in the face of that Greater New York which does not yet recognize him as the inspired interpreter of the saddest and poorest because his message is so simple and so naturally delivered. But there is another Southern writer who would doubtless be deprived of her pen and be exiled. So far this author's popularity has depended on her knowing exactly how to write masterpieces for sentimental young girls who are morbidly in love without the assurance of a real lover. The character of her last book may be inferred from the following details, mentioned to indicate the class of novelists that would be excluded by the license system: The heroine is blind, and may therefore be pardoned for meeting the hero in his bedroom wearing her night robe with a thrilling red kimono thrown over it, but the author ought not to be excused for taking advantage of the young lady's affliction to produce a too vivid impression upon the young man, or for suggesting a train of reflection to her boarding school readers that they would not otherwise have had. The minister in the book is called "Satan"—doubtless by the same inverted kind of reasoning which caused her to represent one of the most dissolute men of his century as a persecuted saint in a former story. And the real hero is introduced to the reader too drunk to stand alone, just to show how quickly the author can sober him with a "shower bath," which she does at once. The description she gives of his recovered style and beauty immediately afterward will make the eyes of her young readers shine with admiration. And it is just possible that in their simplicity they may think that the extraordinary sobering effects of the bath are due to the fact that the author makes him take it with his trousers on.

However, it may be worse than useless to protest at this stage of things. Evidently God has not yet created man—only his preface and a few experimental faculties. But in a thousand years or so the man in the old Adam will begin to show. Then we shall know that a thing is right if it is good for us, and that it is wrong if it is bad for us, no matter how lovely it looks or how beautiful it sounds. Then we shall know better than we do now whom to put in the penitentiary. The fellow who steals because he is hungry will be cared for, but the author, artist or teacher who poisons the mind of another with an evil suggestion had better have a millstone hung about his neck.

NASHVILLE, TENN.

The Results of the Second Hague Conference

BY BARON D'ESTOURNELLES DE CONSTANT

[Baron d'Estournelles, whose previous articles on Peace in THE INDEPENDENT our readers will remember, is the leading authority on Internationalism in France. He is President Fondateur of "Conciliation Internationale," a member of The Hague Court, and with his colleagues, Bourgeois and Renault, was a delegate from France to both the First and Second Hague Conferences.—EDITOR.]

DURING the first two months of the Conference I was continually saying and writing that it would be a great deception, that it would consecrate the largest portion of its time to the amelioration rather than to the prevention of war. In this way I tried to recall to the Conference the requirements of public opinion; it was my duty and it was in the interest of our work. The Conference had, in fact, begun with the discussion of things relatively secondary, in accordance with the instructions the delegates had received from their governments. But, later on, during the last two months, it awoke, emancipated itself, was in every respect worthy of admiration—this justice I am bound to render to it. Gradually its ambition was aroused, and at length it devoted its energies spontaneously to the second part of its task, that is to say, to the principal program, which it had not anticipated and which it was now obliged to improvise in its conscience. In order to arrive at this stage it was necessary that it should become, in some sort, a new assembly, a more independent assembly, a true moral person, living not only by virtue of the orders which each delegate received from his distant government, but also living its own proper life; it was necessary that it should become not solely an assembly of official representatives from all the states, but the collective representation of humanity.

I cannot in a few lines explain this important phenomenon. I have spoken elsewhere of the potent and benevolent action exercised by M. Léon Bourgeois. I shall have something more to say of it, but today I can only direct attention to the fact that certain functionaries, certain ambassadors who had attained the summit of their career, found at The Hague an opportunity of rising still higher and of bettering and improving one another by the most generous and fruitful of rivalries. And for this very reason, after four months of intense and often excessive and ungrateful labor, all the delegates separated with a mixture of joy and sorrow, glad to be free to see again their country and their homes, but deeply affected by the thought that they were leaving a field of new action in which the seed had been so well sown. The seed, it is true, is still underground, to the great satisfaction of the skeptics, but it will germinate even quicker still than that which was a subject of such

mockery in 1899, and which did not at that time appear to have a better chance of successful growth.

The general deception of public opinion is explained by two motives, both to the honor of the Conference.

First, it was not able to discuss the limitation of armaments. This question was not, in fact, on its program. The Conference could not study it, and no international assembly will ever be able to study it until it is the object of preliminary and national study in all the countries interested. A national study first, an international discussion afterward. I have never ceased for a moment to insist on this, and notably in my report to the Interparliamentary Conference of London in 1906. If the Conference had gone beyond this natural order it would have come to nothing; it therefore did well to recall to governments their duty and then to pass on to other questions.

I will add that, whatever may be said to the contrary, the discussion on this question of limitation has not been useless, and, as far as I am concerned, my conscience is tranquil on this subject, for the more it is discussed, as long as it is declared that arbitration must first be organized, the more must the cause of international justice be necessarily served; it is a means of emphasizing more strongly the urgency of this organization. If the Conference had not been obliged to put aside the limitation of armaments it would have been less energetic, perhaps, in seeking a compensation in the study of arbitration.

Secondly, the Conference lasted four months, and yet the results it has achieved have been hardly apparent. That is its greatest merit. An assembly representing the world must surely be congratulated on having preferred the ungrateful preparation of durable solutions to delusive immediate solutions. Who is there, then, that can believe this labor of four months to be lost labor? The Conference has preferred the satisfaction of duty accomplished to the eulogies of the press, always on the lookout for sensational news, and, in the present case, disappointed. Its confidence in the future was so well assured that it did not fear to dictate to the governments themselves the line of conduct they should have to follow. Enlightened by the difficulties of its own task, it has given them its experience as an example. It declared by a solemn decision that it limited its rôle to an action purely transitory, and that a Third Conference was necessary, and that after the Third Conference many others should ensue. Thus, of its own volition, it transformed its exceptional reunion into a simple session —the normal, regular, automatic session of a Parliament of Humanity. It did not fear to add to this declaration a recommendation not less essential—it demanded that the next session should be prepared at least two years in advance.

Is not this a brilliant testimony of confidence? A step forward on the road of universal progress?

How is it possible, moreover, not to admire, as a true revelation, the fact that three hundred delegates from all the states of the world have been able to discuss during four months the gravest, the most delicate questions, questions which no one ventures to touch upon even in a national assembly, and which for this reason were absolutely new? Yet they discussed them in all their details, discussed them thoroly, with all the vivacity, all the passion, which such subjects entailed, but, nevertheless, without at any time the slightest disorder, the slightest difficulty arising during the discussion. What a clinching argument this is to the objections of those so-called statesmen who claim that the greatest interests of the world are exactly those which must be most carefully excluded from public discussion!

But, outside the great moral and preparatory results of the Second Conference of The Hague, I could cite a very large number of immediate results that are appreciable. Among the fourteen conventions elaborated and finally signed will be found very numerous dispositions tending to render war at once rarer and more difficult, and at the same time less inhuman. That is something, and I will return to it some other day.

The plan of a court of arbitration was studied at great length and finally elaborated. In the course of the discussion an entirely new principle, that of the moral equality of states, was brought

forward. Now, it must surely be admitted that this principle would of itself have merited the examination of a Peace Conference. If it has not been entirely resolved, it is, at least, of great consequence that it has been freely and openly discussed. The governments will in their turn have to study it, and as a logical result, to name the judges of the court. The Conference could not and ought not to take upon itself the solution of this problem. It has laid it down in all its terms; the governments will, in their turn, have to take action.

As to obligatory arbitration, is it nothing, then, to have affirmed its principle as an incontestable progress discussed only in its application? And does any one think that this solemn affirmation is to remain negligible in the eyes of the world, and that the different peoples will not have it recorded, so that they may be able to recall it to their governments at the proper moment? And, besides, as to the question of application itself, thirty-five states out of forty-four have declared themselves ready to favor a general treaty of obligatory arbitration. Quite a mechanism of admirable simplification has been provided and accepted which permits all the states to be inscribed on a central tableau, and to replace by this simple formality an entire inextricable multitude of treaties, all differing from one another. This alone constitutes an innovation in every way worthy of the twentieth century. Who, then, will dare to claim that this agreement of the thirty-five liberal states of the world is without importance, on the pretext that a minority of the Conference refused to accept it, or, at least, to affirm it by a general convention which that minority would alone have refrained from signing?

What does this prove? Simply this fact: The majority exists; it reckons more than three-fourths of the states. The minority took upon itself to prevent this agreement, but, in doing so, it has emphasized and strengthened it; on the other hand, it has laid bare the opposition of some states—or, more correctly, of a single state, Germany—dragging along with it in its resistance a great power, Austria, with Turkey, Rumania, Greece, Bulgaria, Belgium, Luxembourg and Switzerland.

Yet, and I wish to repeat it, the representative of Germany was careful to state that he stood apart only with regard to the application, but that, as to the principle, he was a partisan of obligatory arbitration.

Thus the world was divided into two camps of very unequal importance. On one side was the mass of the states of the world, great and small, representing progress; on the other, Germany, representing the opposition, but an opposition already hesitating and pleading extenuating circumstances. If we recall the Germany of 1899 and if we note its progress since that epoch, we shall not be very much mistaken in predicting that, between now and the Third Conference, its progress will be even still more rapid and remarkable. Certainly, Germany has advanced very far from her position in 1899; she is still backward in relation to the other Powers, but she will soon wish to catch up with the majority. This will be the result of the Conference of 1907, and particularly the work of the majority, which will have determined the general progress. But for it we should be absorbed in the platonic adoration of the memories of 1899. Today we have thirty-five states out of forty-four demanding the convention of obligatory arbitration which we have drawn up and voted, and which we have only to sign. Even that is something, is it not?

The Americans, in that fine and peaceful discussion of several months, have been splendid, and the youngest of all was certainly my eminent friend, Mr. Choate, who defended, with all the force of his authority and talent, the work of the majority against the criticisms of Baron Marschall. He lost his case, say the ignorant, since the opposition triumphed. Not so; he won it, since he reduced the opposition to its simplest expression, not to say to a simple question of ciphers. "We are thirty-five," he said, "and you? I could count your numbers on a single hand." These words told and will remain. Humanity will not let itself be stopped by a minority of a few votes; or, rather, the minority will be converted.

General Porter, as a faithful soldier, has fought valiantly also: "I have enlisted for the war," said he, "and I will go

on even to the end." He had the satisfaction of obtaining an almost unanimous vote from the Conference and of preventing governments from having recourse henceforth to force for the recovery of debts from a state. It is a result that reflects much honor on the United States and that must give satisfaction to everybody.

I should have liked to say something of the services of Mr. Scott, Mr. Hill, Mr. Buchanan, Mr. Butler, and also of the able representatives of the other republics of America—Mexico, Brazil, Peru, Chile, Argentina, etc., but time does not permit it. I must content myself with declaring that America, as I have been constantly predicting for many years, has, beyond any doubt, saved the Conference. But for America the Conference was lost, cut in two, or, rather, would never have existed.

Thanks to America, a very important article was voted: Article 48, which authorizes governments, in case of disputes, to address the bureau of The Hague directly and demand or propose arbitration. This mechanism has not been even noticed by the press, and yet it will be amply sufficient to put all the resources of arbitration in motion. Previously, when two states had a ground of quarrel, they were obliged to agree together to submit the question to arbitration. And such an agreement between two governments whose relations have become envenomed is almost impossible. Today it is in the power of one of them to make its offer openly, and thus force the second state to accept or decline that offer in presence of public opinion. It is a very great progress, altho it may appear almost imperceptible, and henceforth a state that sincerely wishes to avoid war can reply to its aggressor: "*I appeal to the judges of The Hague!*"

Do you believe that the aggressor will be able to answer, "I care nothing for justice," without raising against him the entire public opinion of the world?

To conclude with a brief summary, the Second Conference of The Hague lasted four months, not because it did not effect anything, but because it found an immense field of labor before it. It has been a simple session between the First and Third Conferences, and it is the very modesty of its rôle that in my eyes constitutes the grandeur of its work. It has been only the continuation of the First Conference and the preparation for the Third. It has, in fine, demonstrated the possibility of creating a universal Parliament by its own life and by the very length and regularity of its action.

PARIS, FRANCE.

Arrested Development in Teachers

BY SANFORD BELL

[Professor Bell is in charge of the Department of Education in the University of Colorado. Our readers will remember his articles "The Significance of Activity in Child Life" and "Influence of Men and Women Teachers," which we published a few years ago.—EDITOR.]

THE teaching profession, like every other, is narrowing in its effects upon those who choose it as a life work. This is partly the fault of the profession and partly the fault of the teacher. Every profession is characterized by the specific work which it is its purpose to do. This work naturally involves a set of habits that covers its scope. A profession is learned when this set of habits is mastered. Apprenticeship is over when the technic of the profession becomes automatic. Every profession finds its justification in its service to life needs. Since life is progressive, professions must advance. The set of habits which comprehends the practice of any profession at one time will be inadequate to it at a later time. Every profession, therefore, must have the at-

titude of holding on to those things that are established as good, plus a readiness to give up the obsolete and acquire the new, which growth demands and advanced insight reveals.

This attitude, which is the salvation of any profession, is likewise the salvation of any member of that profession. It is perfectly natural for the set of habits that constitutes the routine work of any profession, or, for that matter, of any kind of work, to become fixt or stereotyped upon any individual who wishes to master the profession. In fact, it is the only way in which he can master it. Skill in any of the arts, useful or fine, is ability to perform the activities involved automatically. The ambition of most people who take up a work carries them no further than the mastery of enough of these activities to get along with. Then the natural conservatism of the habits tends to arrest his further development. In this way every calling in life is narrowing. In another way the work of the calling so absorbs and monopolizes the attention and effort of the individual as to be incompatible with further development. It it but a small percentage of individuals who have chosen any particular line of work who really continue to grow. Lack of ambition, personal initiative and vigor to overcome the natural inertia of the set of habits causes arrest of development of the majority. They literally "get into a fix." This general misfortune incident upon all professions becomes aggravated when the profession itself is particularly narrowing. Unfortunately, the teaching profession comes under this last category.

Teachers have to deal with children in a more or less autocratic and dictatorial way, and this attitude carries over into society. They deal with immature minds in a sort of guiding and patronizing way and unconsciously become mentors and monitors of adults. They have to stand in judgment upon their pupils and hold them responsible for their conduct, and cannot easily help assuming a similar attitude toward the public. They are narrowed by the restraints which they have to impose upon children.

The teacher further injures herself and her profession by living too excluded a life. She does not mix enough with her people. She does not know intimately enough people and life conditions as they are. She doesn't know "men and measures." What she knows of the community is chiefly what she gets from the children and the gossip of her boarding-house. She cannot afford to know her people indirectly, any more than she can afford to have them know her indirectly. It is just as unsafe for her to judge the community by the impressions which she gets from the children as it is to allow the community to judge her by the impressions which she receives from them. Besides this, she needs the humanizing of disposition which is to be had by mixing freely with people in any station of life, and is to be had only by mixing. She needs contact with adults as an antidote for some of the effects that necessarily come from so much contact with children. She needs to know how the people of the community look at things (including herself), what their prevailing ideals are, what their scale of values is. She needs to give the people a chance to know her by direct impression. She must know them in order to serve them effectively; they must know her in order that they may judge her intelligently, kindly and sympathetically.

She needs to get with people who have what she hasn't and haven't what she has.

It is particularly unsafe for her to allow the community to make up its opinion of her thru the reports of the children. Pupils are very whimsical, even more so than adults, and their opinion fluctuates with their feelings which are largely governed by the indulgence or severity of the teacher. This spending more of her time with people is not at all incompatible with her work. She will do her work better for not devoting too much time to *it,* if she will devote more of it to her people. When she becomes as concerned about her personal standing with the different members of her community, as the lawyer is about his, she will use all of the legitimate means at her disposal to see that it is what it should be.

The teacher as a rule allows her work to distort her sense of perspective. She is too devoted to the details of her daily program. The specific problems of

Room 5 or District Number 2 have no such claims upon a teacher as to justify her in losing sight of the larger life of which the school is but a part. She will do her specific problems much better in the long run, by keeping herself constantly in touch with the influences that count for broad and liberal culture.

If every teacher were liberally educated before she began her work as a teacher, the contracting influences of the profession would not so victimize her. The ideal preparation for any teacher is a complete college course in the liberal arts supplemented by the best special training such as our best Normal schools and departments of education in Universities give. This kind of training would develop and make permanent so many big interests that her growth after entering the profession would be assured.

It would naturally be expected that teachers as a class would be good readers; that they would read a great deal, and read effectively. On the other hand, my own extended observation and the testimonies of a great many librarians, convince me that the opposite is true. Teachers do not read much, they do not read comprehensively, nor effectively. They do not compare favorably in this respect with lawyers, physicians, ministers or intelligent business men. They are as a class mind-bound by their specific routine work. They are unjustly oppressed by the ideal that most Normal schools persistently advocate to the effect that lesson plans and special preparations are to be made for each recitation. In the first place such a thing is absolutely impossible as a general practice. It is incompatible with the number of recitations which the majority of teachers have. It would be a waste of time if it were possible. These Normal school and college teachers don't do it. I've been there both as a student and as a teacher. That is not the thing that is most needed in the teaching world today on the side of preparation. It is positively foolish to spend much time upon such details and intensive work at the expense of broad reading and general culture.

Teachers read too slowly. They read by inches. They get so accustomed to text-book speed in their general work that they become a victim of the habit and schedule their own reading according to the same speed. I have known thousands of teachers to be satisfied with reading the two reading circle books adopted in their State as their portion of outside reading for the year. And the method of reading these books is in the main positively ridiculous. Months are spent upon books that ought to be devoured in a single evening. Again it is the text-book method which has become established by a misdirected worship of thoroness. There are plenty of instances in which thoroness is not a virtue. Some books ought to be mastered by the text-book method, but not all, not even a majority.

The teacher should read more; she should read rapidly, comprehensively, sympathetically, understandingly. Some few things she should read exhaustively. She should read what she likes, that is, she should read things that satisfy her soul-hungers, things that appeal to her dominant interest, for it is thru them, if at all, that she is to become cultured. Matthew Arnold's idea of culture is that it is familiarity with the best that the race has thought, felt and done. The biographies that have been written are among the most valuable literature of the world. As there are representative men, there are representative books. Among the latter I would mention the five great literary Bibles as the greatest. They are the Bible, "The Iliad," "The Divine Comedy," Shakespeare's dramas and Goethe's "Faust." I am tempted to add "The Comédie Humaine," but will leave that for the verdict of time. I believe that any individual who will read these five Bibles understandingly will receive the essence of the world's best culture. We all ought to be familiar with the best biographies of the great men who have so materially contributed to the world's culture; with the great historical novels, such as "Aspasia," "Cloister and the Hearth," "Ivanhoe," "Tale of Two Cities," "War and Peace," "Les Miserables," "Quo Vadis," "Last Days of Pompeii," etc., with our Browning, Tennyson, Schiller, Ibsen and our own American poets; with the great novelists such as Scott, Lytton, Thackeray, Dickens, George Eliot, Ebers, Hugo, Balzac, Cooper, Tolstoy; at least with these.

Some critics will wonder at the selection of this list, which includes without discrimination writers of the first, second and third class. But I'm looking at it from the standpoint of culture and not of literary criticism, from the standpoint of the teacher's overview and not from that of the critic's specialty.

A word about the method of reading may be pertinent here. Most teachers will at first think that it is impossible for them to do the reading which I have suggested. It will be, if they continue to read after the method which I have severely criticised above. But if they read as our best readers do, as all of our scholars do, and as every one finally can, they will soon see that my suggestions are perfectly sane and possible.

The same method of rapid reading with a high degree of concentration should obtain in our high schools. Instead of spending from six weeks to three months upon a single play and having the pupils become disgusted with it thru fatigue, our high-school classes should move rapidly but thoughtfully and sympathetically thru all of the plays, one after another, in that length of time, recurring to some few for relatively exhaustive study. Some should be known exhaustively, all sympathetically. I visited a high-school class last winter that was studying "Hamlet." The class had spent three months on the play, and a number of the students had not read the play thru. They were trying to find out if Hamlet were insane. They might have studied their teacher. The kind of work which she was trying to do is entirely out of place in any high school. It belongs in the university, if it belongs anywhere. She was a half-baked collegian trying to use the methods of her professor of English. The mind, at any stage of its development, should cover large areas in any subject before it tries to focus its abilities upon small parts of it. These suggestions will apply to all of the general reading which a teacher should do.

The teacher's opportunities for culture are not and should not be limited to literature. If she have a predilection to music or painting or any other of the fine arts, or if she be a naturalist, these may largely, but cannot wholly, take the place of reading. Indeed it is to be recommended that her reading be supplemented by at least one of the other fine arts. Familiarity with the masterpieces of music and painting is almost as necessary to culture as familiarity with the masterpieces of literature. No honest soul will ever read anything merely for the sake of exploiting it, or because it is considered "proper"; all reading should be done for the genuine cultural effect which it has upon the reader. And the reading herein suggested will give any teacher such an overview that she cannot suffer from the contracting influences of her profession.

BOULDER, COL.

Peace and War

BY TIMOTHY THOMAS FORTUNE

LISTEN! The heavens quake,
As God's live lightnings shake
The mountain and the lake;

And crumbling empires fall,
Wrapping the human wall
In Death's enshrouding pall!

The floods will come again
On mountain and in plain
And pierce the earth with rain;

And Christ, condemned to fame
And life of death and shame,
Remains in all the same;

But there has come a day
When God, in Life's highway,
Stands and says: *"Live! Pray! Slay!"*

RED BANK, N. J.

The Independent

A Weekly Magazine. Entered at the New York Post Office as Second-Class Mail Matter

Publisher, Clarence W. Bowen

Owner, The Estate of Henry C. Bowen

130 Fulton Street, New York

TERMS OF SUBSCRIPTION, PAYABLE IN ADVANCE

One Year, $2.00. Single Copies, 10 Cents

Single Copies over six months old twenty-five cents. Postage to any Foreign Country in the Postal Union, $1.75 a year extra. To Canada $1.00 extra.

Order for the change of an address should be received one week before change is to take effect; the old as well as the new address should be given.

Persons desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, in that case, hold ourselves responsible for their return. Authors should preserve a copy.

The Panic: Causes and Remedies

WE should keep in mind the direct and immediate causes of this panic which has been accompanied by so much distress and loss in a rich and prosperous country. Factories are shutting down and great corporations are discharging thousands of workmen. This depression—which may deepen and be prolonged, or may soon give way to a revival of activity—follows sharply upon days of record output in our greatest industries, the largest monthly product of pig iron, the highest total of railroad earnings, the Steel Corporation's most profitable quarter, the largest gains for three months in the Fall River cotton mills. Whether it shall linger thru the cold season or shall speedily be displaced by a return of the former conditions, the responsibility should be placed where it belongs.

If the clumsy speculators who sought to corner the stock of a comparatively obscure copper mining company on the curb market in New York had not owned a national bank and been associated with other speculators and third-rate financiers who were permitted to own national banks, there would have been no panic. There would be no panic now, altho other tendencies and causes might eventually have made one. There was nothing in the pitiful collapse itself of that petty corner to convulse the great banking institutions of New York and shake the entire financial credit system of the United States. But the Heinzes owned a national bank, and it was forced, tho actually solvent, to ask for help. Morse and the Thomases owned national banks, and upon these suspicion fell, spreading rapidly to other institutions, believed to be related intimately or remotely, by various associations, with those who controlled the original objects of distrust.

Substantially all of the banks and trust companies in New York were solvent. Two or three small institutions may be excepted. There is as yet no evidence that the Knickerbocker Trust Company cannot pay in full and have something over. As a rule, the banks of the entire country were sound, altho a considerable number of them have been forced by runs and lack of currency to suspend. All these suspensions, all the hardship and loss, the depression of industries, the enforced idleness of wage-earners, are traced directly to the control of a few of the smaller national banks in New York by reckless speculators. A following cause was the lack of proper legal regulation and restriction for the banking business of the trust companies.

Remedies for the local and immediate causes should be considered first. Such men as these speculators were well known to be should not be permitted to own national banks and preside over their affairs. Ownership and management of national banks in New York by such persons could easily have been prevented, and can be prevented hereafter, by the powerful influence of the allied banks in the Clearing House Association. We do not think this will be denied. Ought not that influence to have been exerted for the exclusion of these speculators? Let the prevailing paralysis of credit, the exhausting runs, the depression of industry, be an answer. Who will say that the same great extra-legal power should not be used hereafter to keep the smaller banks of New York in safe hands, and that similar associations elsewhere should not guard their banking institutions in the same way? The cost of a failure to use this power effectively and continuously is enormous.

New laws for the trust companies, compelling the keeping of adequate reserves against demand deposits and restricting their loan practice, are sorely needed in New York, and probably in

other States. This is another remedy clearly pointed out by the part which great trust companies, carrying on an extensive banking business under broad charters and without the restrictions of national banks, have played in the panic. Governor Hughes's new advisory commission will undoubtedly recommend the changes which are required and to which we directed attention some time ago. Evidently there has been a lack in New York of earnest and searching official examination of banks and trust companies by State authority. Proof of this appears to be shown in the conditions which caused the Attorney-General's action with respect to six small institutions on Saturday last. We are confident, however, that the new Superintendent of Banks, Mr. Williams, is both competent and trustworthy. It remains to be seen whether the legislation required for the proper regulation of the trust companies' banking business can be obtained at Albany.

This consideration of remedies to be applied at New York, it should be remembered, is of interest thruout the country, because New York is the heart of the financial organism of the United States. Some people in the interior, who were laughing at the "Wall Street panic" three weeks ago, see this clearly now.

We have spoken of local remedies for the direct and immediate causes of this deplorable disturbance. Another needed remedy, for national rather than for local application, and one that would serve either to prevent a credit panic or promptly to check such a disturbance, is provision for emergency issues of national bank currency, carefully guarded and controlled by a sufficient tax. Our currency system is a kind of patchwork. It is admitted to be far from perfection, but this is not the time for urging that it be reorganized thoroly from the foundations. It is well for us to bear in mind that it is defective and to consider the arguments for and against such propositions as the one for a central bank of issue, in support of which much can be said. But the New York Chamber of Commerce committee in its admirable report, altho it recommended the establishment of such a bank as a measure of reform, realized that such action was not at present feasible and sought rather to promote the issue of emergency circulation under the present system. Eventually, the entire question of national currency reconstruction should be considered by a competent commission, but at the present time public attention should not be diverted from the simple and practical project for providing additional safe currency in time of financial stress.

The country is now forced to use a kind of emergency currency, in the form of Clearing House loan certificates and cashiers' checks, but these are only of local utility and are of doubtful legality when used outside of transactions between banks. The national banks should be authorized to issue, in times of exceptional strain, additional circulating notes upon the security of their assets plus a reserve of 25 per cent., to an amount, say, equal to half their paid-in capital. The Bankers' Association plan says 40 per cent. of their bond-secured circulation, with a possible later issue equal to 12½ per cent. of their capital. These emergency notes would be taxed, to compel retirement of them after the exceptional demand ceases. Some propose a tax of 3 per cent.; ex-Secretary Shaw now suggests 5 per cent. Opponents assert that authority to issue such notes would cause permanent inflation, because the banks would keep the notes out. The object of the tax is to force retirement by making it unprofitable to keep them out, and the tax should be high enough to have this effect under normal financial conditions, without being so high as to prevent issue in time of great need.

The limit might be only 25 per cent. of capital, or even a smaller percentage. Suppose that it had been possible two or three weeks ago, for the national banks to issue promptly $100,000,000 of additional and perfectly safe circulating notes so taxed that they would surely be withdrawn after a return of normal conditions. The relief would have been great and immediate. Such provision for elasticity has been made in Germany, where the emergency issues are of great service. Authority for them should be given here. Relief will be afforded by the issue of 3 per cent. certificates, but the Government would not have found it necessary or expedient to borrow $100,-

000,000 now if the banks had had power to put out an additional $100,000,000 of taxed circulating notes.

We have considered direct and immediate causes of the panic, with the practical remedies which the facts suggest. Underlying causes, more or less remote, of an extremely vulnerable financial situation—such as a world-wide stringency, the exposure of offences in corporation finance, the pessimistic predictions of indicted capitalists, unwise legislation of States, and the long decline of securities —were not within the scope of the present discussion.

Mr. Bryan's Candidacy

At a very proper moment, close after the November elections, Mr. Bryan has declared that he will be a candidate for the Democratic nomination to the Presidency. He announces it in an editorial in *The Commoner,* which is couched in terms generally admirable and creditable to him.

He says he will not ask or seek a nomination, but he is in the hands of the people. If they want him he will stand for them. He does not ask—he will not ask —what are the chances of election. If the chances are against him he is just as ready to stand as if all signs were favorable. We suppose he has been defeated twice, and he can stand it again; yet the position taken is to his credit.

He does not impose himself upon the people. If they prefer another man he will cordially support him; but he demands that the platform be one of reforms, and that the candidate fit the platform. He does not pretend that he will cordially support a conservative man or platform. We notice that in an interview he declares that, in the Republican party, Knox and Cannon and Fairbanks and Hughes are no reformers. There are plenty in the Democratic party of whom he would say the same. Indeed he did say as much of Judge Parker before his nomination in 1904, and he gave him only enough support to save his own regularity as a Democrat. He not only presumes that there will be a radical reform platform, but he demands that the organization of the party be in harmony with the platform and be composed of "men whose political records will invite confidence and give assurance that victory, if won, will not be a barren victory." This warns off the Parkers and the bankers who managed the last campaign, and it makes one suspect that he fears, if he is not selected, that the candidate will be less of a reformer than the one the Republicans will choose.

But what are the reforms which Mr. Bryan has in mind? He does not tell us. Indeed he does say that the issues may be very different in 1908 from what they are now. We wish he had used less general terms, but his haziness is politically wise. His attitude of late toward the financial disturbance and its treatment has been as unsettling and dangerous as was his attitude when he was fighting for unlimited silver coinage.

The last paragraphs of his letter are given to what we recognize as a real contribution to political purity. He demands that full accounts be published of the financial doings of the Democratic Committee. He would have published a complete list of the sources of the campaign funds received, and an account of their expenditures, so that rich corporations may not be tempted to purchase favorable legislation and so that the corruption and bribery of voters may not be sanctioned. And he challenges the Republican party to conduct its campaign in this open and honest way. That is not a bad proposition, even tho he doubtless believes that such an agreement would be to the benefit of the Democratic party because the tariff lords and the great corporations have inclined to the Republican party. To be sure, the Democratic party has not lacked its millionaire Belmonts and its Tammany corruption funds, but we sincerely wish that this challenge might be accepted. Some of our States require candidates to make oath to the expenditures they have personally made for their election, and a much more extensive and drastic rule would be healthy. The English law on bribery deserves consideration here. The exposure of the contributions of insurance companies to political campaigns calls attention to the evil, and we thank Mr. Bryan for proposing the challenge. We hope the two committees will not conveniently forget it.

Mr. Bryan is an honest man. The people like him personally. He frankly tells what he believes, and urges what he thinks is right. He has learned something in eight years, and if he should be selected and then elected, which latter we do not expect, we do not believe the country would suffer any great injury. His financial vagaries would be restrained by Congress, and the coming session will amend the Sherman law so that it cannot be used for illegitimate persecution of corporations.

On the whole, Mr. Bryan's announcement is notable for its evident moral tone, for its skilled avoidance of definite issues, and for its challenge for purity in the conduct of the coming campaign. He makes himself the foremost, as he is the first candidate of his party, and he warns off from the field all other candidates who fail to come up to his standard of what he regards as reform. And he gives good notice to the journals and politicians who oppose him that they are not to make the nomination, but that it is in the hands of the common people, with whom he identifies himself.

Women and Bad Books

It would seem that Eve was created so Adam could have somebody to blame when things went wrong. At least a glance into the past and around us shows that the sons of Adam have usually utilized their helpmeets for this purpose. An example of this is the accusation, promulgated by a British clergyman, echoed by an American, and now floating thru the newspapers, that women are responsible for an alleged decadence of the moral tone of literature. The charge is a double one, that several recent novels of flagrant immodesty were written by women and circulate widely among women.

This charge is very amusing, because women are at the same time vociferously denounced for ruining English literature by imposing upon it their own narrow standards of propriety. For years we have heard it said that no "strong realistic and virile" writing was possible so long as no book could be published without the *imprimatur* of "the young girl." Poets have struck work on the ground that unless they were allowed to treat "certain phases" of life as they saw them they would let the world starve for good poetry. Novelists, contrasting their barren fields with the rank vegetation of their French rivals, have demanded the right to use the same rich fertilizer for their own crops. Short-story writers have been cursing their fate for having to spend their lives producing "lady-like literature," in this way throwing upon the air of their studies the language which they were not permitted to put into the "old-maid magazines" from which they derived their support. And now the women are responsible for what few excursions have been made of late into forbidden fields. It is always that way. Whenever there is anything the matter with Church or State, art or literature *cherchez la femme.* Man is always trying to prove that the power not himself that makes for mischief is woman.

We do not wish to diminish the responsibilities of women in literature or anything else; on the contrary, we would rather increase them. But common justice requires that their actual influence for good as well as evil will be taken into account. The reason why a drunken woman on the street excites more attention and disgust than a drunken man is because women are as a rule more temperate than men. If a few women authors are condemned for violating the code of decency in literature, the great majority of women readers must be commended for having established that code.

Where there are the most women readers there the standard of purity is highest. In America the readers of books and periodicals are predominantly women, and here we find a body of clean literature such as the world has never seen elsewhere or before. A large part of the fiction of any other language is untranslatable into English without expurgation. We cannot go back very far in our own literature without getting into the mire. No ancient literature is so free from obscenity as our modern, except perhaps the Chinese. (In China the women do not read at all, but that is no argument, the Chinese being notorious exceptions to all rules.)

The illustrated and story magazines

which form such a large part of popular reading in America are comparatively few and insignificant in other countries. They are, both in their faults and virtues, the product of feminine taste, because the first essential of their existence is that they bear advertising into the homes. A larger proportion of women than men have been trained to read good literature in our high schools, and they have more time and taste for it afterward. The public libraries are chiefly patronized by women, and naturally pay too little attention to the needs of men. Books of poetry, essays, criticism, nature study, biography, religion, art, history and sociology, old and new—all that can be classed as *belles lettres*—find the chief sale and circulation among women. The publisher of a suitable book can count on the women's clubs absorbing his first edition.

Of course, we must allow for the tendency to exaggerate the amount of serious reading done by women, because they are apt to make a fuss about it. A man who is addicted to reading poetry keeps it to himself, as tho it were the morphine habit. His best friend may not suspect it. But a woman, when she wants to read poetry, will organize a club and put a card in the paper, stating how many verses she will read on Wednesday afternoon. Women are naturally co-operative and gregarious, men individualistic and solitary in their habits.

This leaving of literature to the ladies has had undeniably some deleterious effects, but increase of coarseness is not one of them, notwithstanding that a few authoresses have tried to prove their emancipation by cutting capers. The curious thing about this sensual fiction from feminine pens is that it always portrays passion from the masculine standpoint. A year or two ago there appeared a novel, tropical in its scene as well as its emotions, in which the male note was so dominant as to cause comment by many of its reviewers, and they did not take it back when it was disclosed that the masculine pseudonym concealed a feminine author. The same adoption of the point of view of the opposite sex is almost always observable in feminine love poetry. The "Sonnets from the Portuguese" is the most conspicuous exception. The history of literature is as full as a Shakespeare play of examples of women successfully masquerading as men—George Eliot, George Sand, Currer Bell, Charles Egbert Craddock, etc.—but there are very few instances of the opposite. The late William Sharp's long literary career as Fiona Macleod is the first that occurs to us. Then there was an Englishman who wrote "An Englishwoman's Love Letters," but he was suspected from the first. On the stage, too, the assumption of male rôles by women is more commonly successful than the reverse. If it be true, as is often said, that the portrayal of masculine character and motives is generally more truthful in the novels of women than of woman's nature in the fiction of men, it would bear upon the same side, indicating perhaps that man is the easier to understand or that women have a deeper insight and sympathy for an alien personality. Unfortunately, as we say, the writings of the women who have outstepped the conventional limits in their portrayal of passion have not rendered any service to psychology by disclosing the secrets of their sex. What they have written men could write if they dared and wanted to. The only result of their breaking of the taboo is, therefore, an addition to the number of books that every gentleman's library should not contain and of the poems that no child should know.

Menander Once More

We lately gave our readers the earliest possible account of the discovery of portions of Menander's plays, the most important literary discovery of late days. We gave a translation of a very pretty fragment of a comedy, all that was then published. We now add some further facts which have since been given to the world by M. Croiset, editor of the papyrus leaves.

All classical critics make Menander the chief of comedians, quite the equal of Aristophanes, and Terence only second. But until this last discovery only a few lines of Menander were in existence, while Terence was well represented. "Whom the gods love die young," was

first said by Menander, and after him by Plautus, Wordsworth and Byron.

He was the friend of Epicurus and disciple of Theophrastus. He was drowned bathing in the Piræus at the age of fifty-two. A statue in the Vatican represents him as squint-eyed, with a full figure, a strong nose, his forehead marked with wrinkles, and with heavy cheeks.

It was in an obscure village near the Nile, the ancient Aphroditopolis the Less, that M. Gustave Lefebvre found,

MENANDER.
Museum Pius Clem., Rome.

with a lot of rubbish of papers of accounts, some rolls of papyrus, carrying in Greek letters the name of Menander. They comprised four large fragments of his comedies in thirty-four pages. The fine writing was photographed and thus submitted to M. Maurice Croiset, Professor of Greek in the College de France, and what we know of it is due to M. Croiset.

Of the four fragments the first is quite imperfect. We have the list of personages, a summary of the comedy, and some lines of the first scene, enough to tell us that the play is "The Hero."

The second is nearly complete. We have the principal scenes in all their development. It is "The Epitrepontes," or "Arbitration." It is from this play that we gave a good part of one scene last week.

Pamphile, daughter of Smikrines, of good family, has been violated in the course of one of those drunken religious fêtes in which great liberty was allowed, by an unknown young man, whose ring she holds. To conceal her error her infant is exposed with the ring and other ornaments by which its origin can be recognized. The child is found by a shepherd, Daos, as the story was given in our last issue. Daos passes the child over to a charcoal-seller, Syriskos, but keeps the jewels. It is Smikrines, the father of Pamphile, and grandfather of the child, who as arbitrator gives the jewels to Syriskos, by which the child can be later identified. Pamphile hides her shame and marries Charisios. But a slave of Charisios gets possession of the ring, recognizes it as having belonged to Pamphile, and accuses her to her husband. But he loves her, and appreciates the circumstances of her fall, and does not quite repudiate her; but, as an expression of his jealousy, he takes up with an attractive lute player. All the while he is sad and regrets Pamphile. The lute-player, who has a kind heart, perceives his feelings and tries to reconcile the two. At first she pretends to be the mother of the infant which was abandoned; and while Charisios is troubled that he is held in relations with a courtesan lute-player, she gets possession of the ring from the slave, shows it to Charisios, who recognizes it as his own ring, which he had given away on the night of the religious fête. The lute-player tells him that the ring never belonged to her, but to Pamphile, his own wife, and that he is the father of his wife's child.

The third fragment belongs to a comedy called "The Perikeiromene," or "The Woman whose Hair was Cut Off." The story can be made out from this fragment and certain others found by Messrs. Grenfell and Hunt. It is again a story of two infants that had been ex-

posed, a brother and a sister. When they grow up, adopted in different homes, the brother meets and courts his sister, who had been adopted by Polemon, but Polemon happens to see them and in his anger he cuts off her hair. Of course in the end each is suitably married and it turns out that the father of the children is the one who has managed to get them both happily mated.

The plot of the fourth play, of which we have the three first acts complete, is more complicated. Its title is "The Woman of Samos." In it, once more, there is an adopted child, and the Samian woman, who cares for it, and its mother are in turn angrily driven out from their homes, but in the end all is explained and the young folks properly wedded.

The value of these fragments for the study of Greek literary art is immense. They allow us to see with what delicacy Menander expresses a great variety of sentiments, and fits his language to the position of his characters, whether peasants, soldiers, slaves or gentlemen, and in reading the dialogs which the poet has put in their mouths we recognize the justice of the high encomium of the Latin critic Quintilian.

What Makes a Christian State?

THE name of God in its Constitution does not make a nation Christian. The name of God on a coin does not in the least sanctify the pocket that holds it or the mint or the state that stamps it. It is the people, nothing else than the numbers and the controlling spirit of the people, that makes a nation Christian.

It is the outcry against the removal of the motto, "In God We Trust," from the gold coinage which gives occasion to this fundamental statement. By order of the President, for a reason which he does not satisfactorily explain, he has directed the words removed. He defends his action on the ground that they give occasion for flippant or irreverent jokes not consistent with their serious meaning. People will joke irreverently on the most solemn subjects, but we do not believe it had occurred to many that this minute inscription had given occasion for profane remarks. For most people here in the East, on the rare occasions when a gold coin comes into their possession, if they happen to see the motto they have been pleased with it. It expresses what most of our people feel ought to be their sentiment. For that reason, seeing that there was no objection to the words, we think it would have been quite as well to leave them undisturbed.

And yet the teaching of religion is no business of the state. So long as no objection was made to opening sessions of the public schools with reading of Scripture and prayer, so long as all the people preferred it so, it was well to continue the practise. But just as soon as objection was made, and we were assured that it favored one religious sect as against another, we willingly gave it up. We knew that this practise did not make the state or the children Christians. We further knew that it was the business of the Church to foster Christianity, not of the nation, which must comprise many who are not Christians, but who have equal rights with those who are. It did not hurt our consciences; we only felt the enhanced obligation of the Church to make its children and its citizens Christians.

It is much so—except that it is a very much smaller matter—with our coinage. Most of our people believe in God, and a great many of them "trust" in him. But we will trust him no less if we omit the golden inscription. The omission may make it a little clearer to our minds that words and forms and visible show are no part of religion. The words may even be omitted in the very interest of religion, as President Roosevelt declares was his intention.

In such a case as this of the failure to stamp the name of God on a gold coin there are two parties to be considered. One is the people, whose religious sentiments are concerned, and the other is God himself, who may be supposed and often is supposed, to be injured and wronged by the failure to do him visible honor. If we are not mistaken, the entire influence of all visible and stately and honorific forms of worship is, or should be, directed wholly to creating the due religious sentiment and purpose in the breast of the worshiper, and not to please or propitiate God. Sacred mottoes, solemn music, processionals and re-

cessionals, garments of embroidered praise, the smoke of incense, or equally the holy tones and the "Amen" shouts that accentuate rude prayer, and as well the spires that point an upward finger, are all fitted or meant to influence men by directing them to God. They must not be considered as any part of a courtesy toward God. Does God care for etiquet? Must a worshiper approach him as he would an earthly ruler, in fine clothes and with a special form of address? It is solely "in spirit and in truth" that he is to be approached, and he asks no politeness of form, no courtesy of reverential access, no blazonry of Scripture texts, no chromatics of color or tone. We should keep this bottom truth in mind in everything that concerns religion, that all formality of utterance or inscription, all simple or ornate mode of worship, all ceremony or show, is purely adventitious, however useful it may be made, and that the one only essential thing that makes a nation Christian is that its people be Christian; and that, if we are Christians, or if ours is a Christian Church or a Christian nation, it is unimportant that we make a visible show of our religion, but that it is of the utmost importance that in our hearts we practise the Christian spirit toward God and man, and that individually we do our utmost to teach all men the same spirit and purpose. Accordingly we are but little concerned that the words are dropt from the coins. We have larger things at heart.

The Book of Judges

One should not be misled by the title of the seventh book of the Old Testament. Its heroes do not correspond at all to the judges of our own time, but to our generals and naval captains. They were men of great prowess in foray and war, but to no one of them is attributed a single judicial or governmental act. Ephraem, the Syrian, described the book more accurately in his title, "The Book of the Deliverers of Israel."

Judges is neglected by many persons because it is full of violence and blood. It seems to read like a story of savages rather than like an account of the doings of the people of the Lord. One who turns to the Bible for gentle comfort and the subduing of his spirit is apt to feel that he will do better to confine himself to the Gospel of John, leaving unread the pages that are devoted to Jephthah and Gideon. Beyond question there is much slaughter and cruelty recorded in the book of Judges. The sixth verse of the book tells of the cutting off of a man's thumbs and great toes, who had himself done the like by seventy of his enemies. It is in Judges we read of Ehud's assassination of Eglon by a thrust of the sword that buried the hilt in the Moabite's flesh, of Jael's murder of sleeping Sisera by hammer and tent pin, of Abimelech's slaughter of seventy of his brothers on one stone, and Jephthah's sacrifice of the beautiful daughter who came dancing in innocent joy to meet him. It must be admitted that Judges is not a book whereby to cultivate the finer feelings.

There are virtues also, however, which fairness compels one to find in these chapters. Courage is one of them, and a quick, if rude, sense of honor. There were other men of size in those days besides Samson, men who did not hesitate to defend their rights against tremendous odds, and who won victories over superior foes by sheer might of will and grit. The story of Barak and Deborah, who gathered the scattered clans of mountain folk and put to rout a trained army of chariots and horsemen, is one of the most magnificent in literature. Gideon is the classic example of a man who believes in himself and is not afraid, and the world will never suffer the removal of his name from the list of the heroes of faith. There is a certain intensity about this rude book, a quick coupling of thought and action, a sense of the worth and prowess of brave leadership, which give it high rating among the Scriptures profitable for instruction.

One who desires to study the history of Israel from the modern point of view would do well to begin with Judges. Of course, one can read of earlier times in the preceding books, but those books are more highly colored by the beliefs and opinions of later days, and it is difficult to discern just what elements are primitive and what are the product of the developed life of later centuries. Many a

reader of the Bible is attributing unconsciously to Abraham and Moses doctrines and sentiments which had their origin seven or eight centuries after Moses's time. It is indeed difficult to avoid so doing, since the accounts of the Mosaic age, especially those which most impress us, were written in a later period. Judges is the first book of the Bible in which, for chapter after chapter, we continue to read narratives very nearly contemporary with the events they describe. The Song of Deborah, as almost all scholars agree, was composed when the stirring battle it relates was fresh in memory. Its eager lines, glorying in the contest, praising the willing warriors and cursing the cowardly stay-at-homes, were written by one who shared the thrill of the patriotic clansmen as they fought for their homes and their liberty. One who has mastered that song, as any patient reader may do with the help of such a commentary as that of Professor Moore, has laid a foundation for the study of Hebrew history which will prove of incalculable value.

Judges is equally important for the study of Hebrew religion. The difficulty of the average reader in trying to grasp the significance of Old Testament faith is that he does not get his eyes open to its development and growth. It seems to be all perfect at the start, its knowledge of God as pure and high in Genesis as in the Psalms, and its regulations for conduct and worship entirely formulated at the outset. But if one read carefully the book of Judges, he will perceive that Hebrew piety, at the beginning, and even at the time of the conquest of Canaan, was very rude and imperfect. Gideon melts up the golden earrings of the Midianites and makes an ephod, a molten image, in sincere devotion to Jehovah. The Danites find a graven and molten image, an ephod and teraphim, and carry them off as a great prize to their new sanctuary in the north. Jephthah feels that he is compelled to sacrifice his daughter, because of his vow to God. Such deeds were not apostasy, but the best even the leaders knew at that day, and appreciation of this fact opens the way for an understanding of the long, slow process by which the higher faith of the more spiritual portions of the Old Testament came to be. The result of such study is usually higher valuation of Hebrew religion and of the book which contains the story of its growth.

It should also be said that no one who desires to be well informed can afford to remain ignorant of the Book of Judges. The two lessons afforded by the Sunday school course hardly present enough of the book to satisfy the demands of general culture. Our literature is full of references to Samson and Delilah, Gideon and Jephthah, Deborah and Sisera.

The word *shibboleth,* which has its explanation in Judges, is of daily occurrence. The general student, therefore, as well as the student of Hebrew history and religion, must turn to this faithful record of the crude and cruel days of Israel's colonial period, and in some respects there is no book in the Bible which better rewards examination.

An Internal Waterway System

THE internal waterway system is naturally and should be considered national. We notice that many of those who are discussing such a system identify it with a waterway from Chicago to New Orleans, with its branches running up the valleys that feed the Mississippi. The working out of a complete project would include another line of improvements reaching from Chicago to New York. The Mississippi system should receive the heartiest sympathy and co-operation from the East; but the Eastern line of canals should receive the same co-operative good will from the West. Nor can we afford the slightest degree of jealousy concerning any advantage that might accrue to Canada. While we are making of the Gulf of Mexico an American Mediterranean, we cannot afford to depreciate the importance of the Great Lakes system to Eastern commerce. In other words, the Gulf route should be part of a general program of improvement for the whole United States. It is important that the great Northwest be connected with the Gulf, thru the Mississippi; but it is equally important that its connection with New York and Boston shall not be tapped, or its commerce in this direction be disturbed. The waterway system should reach both South and East, and in each direction should be held to be of equal importance.

Canada understands this, and is doing her best to shorten routes and to improve waterways between the West and her Eastern ports. The system of Great Lakes has natural outlets to the Atlantic Coast. One of these connects Lake Erie with the Ohio River at Pittsburg. This line naturally draws, or will draw when it is finished, a large amount of coal and iron traffic. A Canadian project, quite as important to us as to our neighbors, is the completion of a waterway system from the eastern end of Georgian Bay to the north shore of Lake Ontario, by way of Lake Simcoe.

When this route is completed it will constitute a waterway system several hundred miles shorter than by the way of the Welland Canal. It would cut out the necessity of crossing Lake Erie at all. Starting at Lake Superior and passing thru the Sault locks; thence by the way of the Straits of Mackinac, and Lake Huron, and the Georgian Bay, into Lake Ontario. We have then only to finish our barge canal from Oswego to Troy to connect that city with Chicago and Duluth. It needs no argument to show the immense advantage of such a great waterway system for the whole East. In fact Canada is crowding the matter as fast as possible. Our share in the projest is very simple as well as very essential. We have got to see commerce drafted away from us, or we must cooperate in the most generous spirit. Mr. O. S. Foster, one of the most enterprising of our up-State manufacturers, concludes a recent article on the subject by saying: "I must emphasize the fact that this system of Great Lakes, with the proposed outlet to the Atlantic Coast, mated or supplemented by the Mississippi Valley system, would constitute the one greatest transportation plant in the world." He will not allow the great railroad system, including the New York Central and the Pennsylvania, as comparable. But we have to consider that large class of products that can be transported by water at low tariff, in this way relieving the railroads of their congestion.

At the opening of the great lock, in the chain of the waterways from Lake Huron to Lake Ontario, where the Trent Valley lowers its waters toward the waters of Lake Simcoe, Mr. Lemieux, Minister of Labor for Canada, asserted that Canada was well on the way to furnish "a second great channel of trade" between the whole East and the whole West. The great system includes fourteen huge locks of steel and concrete, each one lowering boats forty-eight feet. This Trent canal system has been the ambition of Canada for over fifty years, and is now hurrying toward completion. Mr. Lemieux boasted that Canada would soon make history much more rapidly than she had done; and that the gigantic work, almost unknown by the world outside, would revolutionize continental commerce. It would, he assured his hearers, secure for Canada "the supremacy of the Great Lakes." This, he added, was the true road for national progress; infinitely better than militarism. The problem for us is, Shall we co-operate with Canada in this magnificent movement?

The present year at least has seen some activity, on the part of New York State, in digging the $101,000,000 barge canal. So far as this canal is concerned, there was a tremendous up-State majority against its construction. But we are sure of the facts when we say that this majority would have stood just the other way if the vote had been for a ship canal. The farmers and manufacturers were then, and are now, practically unanimous for a water route that will carry lake vessels, without breaking bulk, from Lake Ontario to New York City. It was not less than was demanded by the vote, but more. To the proposition that the east end be hurried to a first completion, we believe there will be very little opposition. Adopt the depth and width agreed on by the commissioners, and we could make Oswego to Troy inside of three years. This part of the canal, it has been estimated by competent engineers, will cost less than thirty millions. The work of dredging the Hudson would belong to the national Government.

At all events we have to choose between some such scheme as is here outlined and leaving Canada to secure what she desires, absolute supremacy of the Lake system. Shall we allow the whole of the Western traffic, as it reaches Lake Ontario, to be deflected to Montreal, or shall we, by a wise and generous cooperation, secure our share of such com-

merce? New York City can certainly have but one reply. Meanwhile such a system will influence greatly the prosperity of the upper part of the State. It will help to distribute population; and all along the route water power will be available, for sale at low rates for farm work —for heating and for lighting as well as for traction and direct service in the fields. As we are rapidly reaching the end of the coal era, we cannot look with indifference upon the substitution of any power that can be made available on our farms. Governor Deneen, of Illinois, in his recent message, says that "The water power will be worth nearly the entire cost of the waterway thru the State." The lands reclaimed will also be worth a large fraction of such expense.

"From New York to New Orleans," is a cry honorable to the American people. It is a project worthy of national energy. Carried out as it must and will be, in cooperation with Canada, it involves a new phase of internationalism. It binds the Atlantic to the Gulf, across the continent, thru the natural traffic routes, improved to meet the demands of the age; while a vast network of laterals will remain for the future to develop. Finally it leaves us ready for a new passage, by the Panama Canal, to the Pacific. A vast new chapter is opening in the history of continental commerce.

Yale's Victory

Yale defeated Princeton at New Haven last Saturday by a score of 12 to 10 in one of the most sensational football contests of history. At the end of the first half the score stood 10 to 0 in favor of Princeton, but in the second half the Yale team literally swept their opponents from the field and scored two touchdowns. The new rules, which encourage the open style of play, and which consequently put a greater premium on skill and speed than on mere beef and brute strength, made the game of intense interest. The contest was a spectacle worth going miles to see, not only because of the presence of 35,000 spectators, and because of the successful struggle of a beaten team in snatching victory from defeat, but because of the friendly rivalry exhibited between the Yale and Princeton supporters. After the game was over the entire Yale undergraduate body rushed on the field, put their heroes upon their shoulders and headed by the band started the gigantic serpentine dance. But above the hubbub of delight the Princeton crowd arose on the east stand and with bared heads sang "Old Nassau," the finest of all the college hymns. The Yale dance stopped, and as with one impulse the Yale thousands marched over to the Princeton stands and cheered their rivals. The cheer was returned by Princeton with an unmistakable genuineness. This friendly spirit is in marked contrast to the bitterness that has existed between some other colleges. In a recent game between Princeton and Pennsylvania the opponents tore the colors from their rivals' clothes, and the end of the game was marked with several personal encounters. The test of sportsmanship lies in the friendly relations of the contestants, and Mr. Carnegie was right when he told the Princeton undergraduates last year that the more you play a game with opponents the more you ought to like them.

The Third Duma

The Third Duma has begun its sessions, and may its career be longer than those of the Dumas which preceded it! Its basis of representation was arbitrarily fixt by the Czar, who has thus cleared out the peasants and the democrats, and has given control to the landholders and the conservatives. But even so we cannot assume that these aristocrats will be utterly submissive to the Crown. It was not the common people, but the lords of land, that extorted the Magna Charta in England at a time when the common people did not count. Perhaps the attempt at reform thru the mujiks and the factory workmen was too sharp and sudden for such a nation as Russia, and the process must be more gradual and educative. This Duma will itself be something of a restraining and a progressive power; and much as we must regret the violence with which two Dumas which better represented the entire people were dissolved, we do not wholly despair of some relief from the administrative cruelty and oppression which have so long existed in Russia, and which have provoked responsive violence and assassination. The civilized world looks in horror on the tyranny of

the Czar's administration of Russia, and the Belgian King's administration of the Kongo.

Sir Oliver Lodge on Immortality.

It is not by any means a matter of congratulation that Sir Oliver Lodge is arguing for the immortality of the soul clad in some sort of a permanent spiritual body, basing it in large part on the facts, real or claimed, of telepathy, clairvoyance, multiple personality, "possession," etc. He accepts the claim that a "discarnate personality"—that is, a deceased person—in order to put itself in communication with a living person must avail itself of a physical body. The phenomena of materialization, he says, indicate that it must construct for itself, or take possession of a body by which it establishes relations between spirit and matter. He imagines that the spirit which possessed a body during seventy years of human life may take a temporary incarnation for seventy minutes or seventy seconds. It seems to be in this direction that he looks for proof that the soul survives the body, and that it then takes on, or can take on, a new impalpable body, quite different from this physical body whose elements are wholly dissipated after death and never come together again. We doubt this kind of argument. It is fine, if the ultimate proof comes of materialization, as the psychical research people believe; but the evidence is by no means satisfactory as yet, and if the evidence should finally fall to pieces the crash would carry with it the faith based on it. We have had previous experience of baseless proofs of religious truth. We fear such helpers.

A National Chinese Language

China is full of dialects and patois. The Bible has been translated into Easy Wenli and High Wenli and Mandarin and various other styles of speech. But now a system of public school education has been established, and it is required that Mandarin be taught in all public schools. This means that in time the patois will disappear, and only Mandarin be recognized as legitimate. But how shall it be written? Over sixty years ago the experiment was tried at Amoy of writing the local dialects with Roman letters, and the dialects of Swatau and Ningpo were subsequently reduced to writing in the same way, a purely phonetic system, and recently the same has been done with the dialects of Fuchau and Kienning. The result has been perfectly satisfactory, altho it has required the aid of diacritic marks to give the "tones" or sing-song sounds. The same Romanization ought to be applied to the Mandarin. It takes months to get a moderate command of the Chinese characters, while the purely phonetic Roman letters can be learned in a week. We presume this will in the end be accomplished; but what a pity that the Chinese children should have an easy road to reading, while our children have the worst spelt language on earth.

In our issue of June 27th we published an article from Ghent, Belgium, describing how that city had added trained dogs to the police force, and thus brought about a very appreciable diminution of crime in the city. This seems to have suggested to the New York Police Department a similar idea, for the other day five Belgian sheep dogs were imported to be used along sparsely settled beats in outlying city precincts. This experiment is promising and will be watched with much interest.

The representatives of the five little Central American republics are in a peace conference in Washington, and Secretary Root gave them a pretty sharp reminder when he told them that they must not only come to an agreement, but must see to it that the performance of such an agreement must be secured. An agreement is nothing if its violation is not prevented. But who is to prevent it? Possibly the United States and Mexico. Those states need—or some of them need—somebody to protect the peace.

A very important result of the Republican victory in Kentucky is that the former Governor Taylor can return from Indiana to the State from which he fled and be fairly tried on the charge of conspiracy for the murder of Goebel. That he was guilty there is little reason to believe, but party spirit ran so high that a fair trial was impossible.

Financial

Governor Hughes's Banking Commission

REALIZING the need of additional legislation for the safeguarding of the people's interests in the banking institutions operating under State charters and laws, Governor Hughes appointed, last week, an advisory commission of six bankers to collate facts, receive suggestions, and then to express the views which they may entertain as to the following question: "What, if any, changes are advisable in the laws of the State relating to the incorporation, conduct of business, and supervision of banks and trust companies?" The members of the commission are as follows:

A. Barton Hepburn, President of the Chase National Bank. He was State Superintendent of Banks from 1880 to 1883, United States Bank Examiner for New York from 1888 to 1892, and Comptroller of the Currency in the following year. The recent report of the Currency Commission of the American Bankers' Association upon emergency issues was made by him.

Edwin S. Marston, President of the Farmers' Loan and Trust Company.

Edward W. Sheldon, President of the United States Trust Company.

Algernon S. Frissell, President of the Fifth Avenue Bank for twenty years past. He is also a trustee of the Greenwich Savings Bank.

Stephen Baker, President of the Manhattan Company (a State bank), trustee of the Bowery Savings Bank, and a director of the Bankers' Trust Company.

Andrew Miller, President of the Dry Dock Savings Institution.

These are practical bankers of high character and exceptional experience. It is a well-balanced commission, containing one representative of national banks, two of trust companies, two of State banks, and one of savings banks. The Governor's selections have been heartily approved by financial interests, and emphatically, it may be observed, by Thomas F. Ryan, of the Morton Trust Company, who warmly commends the Governor and says that the commissioners "stand for all that is conservative and can be depended upon to recommend legislation which will not only strengthen the institutions created by the State to receive the deposits of the people, but also insure public confidence, so necessary to those banks and trust companies."

We said three weeks ago that the banking business of the trust companies should be subjected to the restrictions and safeguards required for the banks of the New York Clearing House Association, and that a cash reserve of 25 per cent. against their demand deposits (which are said to exceed $700,000,000) was not too much. Undoubtedly, the commission's most important recommendations will relate to trust company reserves and investments, and its aim will probably be to harmonize the safeguards for State institutions with those provided for national banks. The needed legislation would remove certain causes of danger and promote a union of all the city's great banking institutions in the Clearing House Association, whose conservative influence would thereby be greatly strengthened and whose weekly reports would then adequately set forth local financial conditions.

Insurance

The Importance of Making Plans in Life

ONCE there was a man who did not believe with Dr. Johnson and Omar that it is of little use to form plans in life. He was born of poor but honest parents and as he grew up he dreamed dreams and had visions just as we all do. At school he improved all the opportunities he had and waited impatiently for the place he resolved to make for himself in the greater world of business for which he realized his school life was but preparation. He laid his plans to make something of himself while the other boys were idling. When the proper time came he obtained a situation in a dry goods house. He went to work with enthusiasm and did well what his hands found to do. He never stopped to inquire if the work given him was his particular work but in all things he did his best and went on planning what he would do when he had larger opportunity. He became a salesman and, step by step, he rose, of course, into the place about which he had previously thought carefully. And as he rose his ideas developed. Sometimes he enlarged his plans with added knowledge. He looked about him and he saw that marriages had been instituted among men. Taking things as he found them, and as they were, without railing against the mutability of earthly things, and enlarging upon their shortcomings by some planning in which he was aided and abetted by Cupid, he found a girl who made him an excellent wife. With marriage naturally came new plans. He built himself a house and in his home life he found sweet solace for the grinding cares of his growing business. He loved his wife and he wished to prove his love by providing for her when he could no longer work for her, and so he took out life insurance in her behalf. When his family grew he realized that his responsibility had also grown and he added to his life insurance according to his ability. He found that it *was* of use to form plans in life and that not all schemes of life are illusory. He found that the business that in the course of time he built up could not have been conducted without thinking things out and providing against the unexpected. He lived a simple life but he got much out of it by planning ahead. And when, in the course of time, he died the insurance that he carried kept his memory as a sweet legacy and also made an estate for his widow and her children. If it did not make them rich at least it kept the wolf from their door, which is, of course, the province of life insurance about which every man with or without dependents ought to know and of it take advantage. It is so simple a matter that many men overlook it.

THE policy-holders' committee of the Mutual Reserve Life Insurance Company, which met at New Orleans on November 16th, issued the following statement, viz.:

"Policy-holders representing over one million dollars' face value of policies in the Mutual Reserve Life Insurance Company of New York have appointed a committee to take proper steps to ascertain the financial condition of the company, and to assert the rights of the policy-holders.

"The committee intends to employ able counsel in New York to obtain relief for policy-holders, or apply for a receiver for the company. Those wishing to join in the movement to right the wrongs done them are invited to contribute one-half of 1 per cent. of the face value of their policies to the necessary fund, and send their names and addresses, date and number of policies, and amount of assessments paid to the Secretary of the committee."

The opinion prevails among the members of the committee that the company's basis of settlement as now maintained is illegal and to the disadvantage of the policy holders.

(*Continued from page* 1269.)

than thirty years in farm mortgages (selling the mortgages themselves or debentures secured by them), and which repeats the statement already familiar to its patrons that "no investor" in its securities "during that period has lost a dollar or suffered a day's delay in the payment of either principal or interest," adding that $40,000,000 in principal and interest has been returned to the investor, upon an investment of over $30,000,000.

The Independent

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Political Topics

At an open meeting of the Civic Forum in New York, on the 20th, Justice David J. Brewer, of the Supreme Court, speaking upon the subject of "Public Office," said that the original plan of the first Constitutional Convention, making the term of a President seven years, with no re-election, ought to have been adopted:

"At the last moment, just before the convention adjourned, this scheme was changed, without apparent reason, to the present system of a four years' term, with the possibility of re-election. In the judgment of many, of whom I am one, this change was a mistake.

"In the light of history this has been shown to be true. Were it in force today we should not now have the spectacle of our strenuous President playing a game of hide and seek with the American people."

The following passage in his speech was regarded as more favorable to Governor Hughes than to the President:

"We choose the man to be for that term a ruler, ruling, of course, in accordance with Constitutional provisions. He may be impulsive, enthusiastic, strenuous, exhibiting a dramatic and spectacular life, or calm and self-poised in administration; but no one doubts that President Roosevelt or Governor Hughes is a ruler."

When he was asked, on the following day, whether he cared to say anything more on this subject, Justice Brewer remarked that there was no reason why the speech should have attracted special attention:

"There is nothing remarkable about what I said. Many people seem to think there is something behind the lines, but there is nothing. Everybody knows that the country is guessing as to what Mr. Roosevelt is going to do; and if the term of the Presidency were definite that would not be so. Those who like the President see nothing in the speech, while those who do not like him see a good deal in it."

Some time ago, Justice Brewer publicly expressed his desire that Secretary Taft should be nominated. Commenting upon the speech, Mr. Bryan says that a four years' term is long enough for a good President and too long for a bad one.——It became known on the 24th that the President had taken steps to prevent Federal office-holders from attending political conventions as delegates advocating his re-nomination. Newspaper correspondents were permitted to read a letter written by him on the 19th and addressed to the heads of Departments. While no authorized copies were given to the press, the correspondents published the following as a substantially correct report of what the President wrote:

"My Dear ———: It has been called to my attention that certain office-holders under your Department have been proposing to attain election as delegates to the national convention with a view to advocating my renomination or proposing my endorsement by State conventions. This must not be. You will notify such office-holders as may be necessary that their acceptance of election as delegates for this purpose, or the advocacy of such renomination, will be regarded as a serious violation of official propriety and will be dealt with accordingly."

It is asserted that this warning was given on account of the recent political activity of office-holders in the Southern States. ——Mr. Bryan has been informed that the Democratic delegates from Iowa will vote for his nomination or be at his disposal. He called upon the President on the 23d and was with him half an hour. Speaking in Indiana on the 19th, he asserted that the Democrats could not "fail this time." The Republicans would not, he continued, be aided in 1908, as they had been in past years, by great contributions from corporations. Mr. Roosevelt's

popularity and the success of his Administration were due to his espousal of Democratic principles.——Parts of an address delivered at the annual banquet of the New York Chamber of Commerce by ex-Senator Spooner, who is now counsel for E. H. Harriman, have been regarded by the press as indicating an unfavorable attitude toward the President and his policies, altho the President's name was not mentioned.——The act past last winter by the New York Legislature, providing for a recount of the votes cast at the Mayoralty election in New York City in 1905, has been pronounced unconstitutional by the State's court of last resort, no one of the judges dissenting. The act was designed to end the contest over the office held by Mayor McClellan and claimed by William R. Hearst. Governor Hughes recommended that provision for a recount be made. The court says the act is unconstitutional because it "provides for an original canvass of the ballots by others than the bipartisan boards of canvassers prescribed by the Constitution; because, as a judicial determination of title to office it fails to accord to McClellan his right to trial by jury, and also for the reason that it implies the right of the Legislature to legislate a man into office." It adds that the whole question can be tried and determined in the quo warranto suit brought by Mr. Hearst and now pending.

The Financial Disturbance

Some progress was made, during last week, toward a restoration of normal conditions in business and finance. Thruout the week there was great interest in the Treasury's issue of 3 per cent. notes. At first it was thought by many that it would give little relief, because for the purchase of the notes the banks must use cash, of which they had a scant supply. The Treasury expected that the hoards of individuals would be brought forward, but at the end of the week it was seen that offerings of this kind were small, and that many individual bidders were looking for the money to bank deposits rather than to sums already withdrawn from banks and locked up elsewhere. A group of New York banks offered, on the 20th, to take $20,000,000 of the notes, upon certain conditions relating to the deposit of the purchase money. St. Louis banks were ready to take $12,000,000; Chicago bids were small; Philadelphia's fell below $400,000; individuals at Cincinnati asked for $350,000, and the bids in San Francisco, Boston and Baltimore were, in each case, less than $500,000. Owing mainly to uncertainty as to the disposal of the notes, but partly to demands from banks and individuals for cash to use in buying them, the premium on currency did not disappear. At New York it rose from 2¼ on Monday to 3 on Tuesday, fell to 1¾ on Wednesday, advanced to 3 on Thursday, declined on Friday to 1½, and was lower still on Saturday, owing to favorable developments concerning the new notes, to the arrival of $13,000,000 in gold on the "Mauretania," and to the prospect of obtaining $20,000,000 in gold from Paris. For the first time in a year, the Bank of France had parted with gold ($2,000,000) for New York, and it was understood that additional sums, up to $20,000,000, could be obtained there (for a slight premium) on American commercial paper supported by first-class French indorsement. An interesting transaction in currency was the purchase (by previous agreement) of the gate receipts at the Yale-Harvard football game of the 23d by a Boston banker at a premium of a little more than 3½ per cent. Uncertainty as to terms for the new notes was removed on Saturday morning, following conferences (on the 22d) between Mr. Morgan and the President and Secretary Cortelyou. Announcement was made that the Treasury would permit 75 per cent. of the purchase money to remain in the banks as a Government deposit, for which the banks might furnish bonds of the savings bank class as security; that new circulation to the full amount of the notes would be granted at once (upon the security of the notes), and that the Treasury would distribute the remaining 25 per cent. of the money where it was most needed, probably selecting banks whose limit of circulation is exhausted, in order that they may be enabled to take out more. Notice was given that the Treasury would, so far as possible, prevent the sale of notes to individuals who would draw cash from

banks to pay for them. It was understood that very few of the notes would be issued to individuals. The attempt to draw out hoarded money appeared to have been unsuccessful. This policy was severely criticised by opponents of the Administration and by some political supporters of it, who asserted that the Government had surrendered to the banks, which would gain large profits (with an investment of 25 per cent. in cash) in interest on the notes and upon the deposited 75 per cent. of the purchase money. It was pointed out, however, that the desired temporary increase of circulation was assured and that the notes must soon be retired. There was found in the Treasury vaults $162,000,000 in bank notes which lacked only the signatures. This discovery facilitates a prompt issue of the new circulation.—— At the end of the week it was said that the Chicago banks might resume unrestricted payments of cash within ten days. They have been able to acquire and keep large reserves, while those of the New York banks (which have sent $84,000,000 to the interior) have fallen $54,000,000 below the legal requirements. A report to the State of Illinois on the 20th showed that the Chicago banks had increased their cash reserve until it exceeded by $2,500,000 even the reserve reported on August 20th, which was the largest held up to that time. Their present reserve (about $102,000,000) is 30 per cent. of deposits, while the New York reserve has fallen to 20 per cent. This was pointed out by some who resented published assertions that the New York banks were hoarding cash, and who declared that the offenders in this respect were banks in the interior. At a meeting of the insurance commissioners of a dozen States, it was agreed that the insurance companies should be allowed to use the security prices of December 31st, 1906, instead of the prevailing lower prices, as a basis for a valuation of their assets in their forthcoming annual reports.

Depression of Industries

Few reductions of wages were reported, but a great many manufacturing concerns reduced their working time, and a considerable number shut down for two or three weeks, or to January 1st. Wage reductions of 10 per cent. were ordered by the Thomas Iron Company, of Easton, Pa., and at the iron furnaces of Phillipsburg, N. J. A smaller reduction was made by two of the Michigan copper mining companies. At the Bethlehem Steel Works, 7,000 were idle, and 4,000 at the factories of the Lackawanna Steel Company. Thruout New England there was a large reduction of hours or days per week by manufacturers of shoes, woolen goods, plush, rubber shoes, etc. At Lowell, the Bigelow Carpet Company closed for ten days. Two factories of the United States Rubber Company shut down until January 1st. Half-time was the rule at the Fairbanks Scale Company's works. Silk mills at York, Pa., closed for two weeks; a large cotton factory at Pawtucket was at work only four days in a week; a thousand cigar makers at Tampa, Fla., were laid off. These may serve as examples; we cannot publish a full list. But at the end of the week there were some signs of revival. Several Pittsburg factories that had been closed were opened again, and $2,000,000 of new business improved the condition of the embarrassed Westinghouse Electric Companies. At a dinner given by Chairman Gary, of the Steel Corporation, to fifty representatives of the iron and steel industry, it was agreed that fundamental conditions were sound, that the recession was only temporary, and that there should be no cutting of prices. On the 23d, two weeks' wages (said to be about $15,000,000), were paid in the Pittsburg district, the greater part of this sum being distributed in the form of Clearing House checks, which are accepted in that city even by conductors on the street railways. It is estimated that not less than $5,000,000 has been hoarded there by foreign workmen, many of whom are now returning to Europe.

Affairs of Certain Banks

In New York, the Twelfth Ward Bank and the Terminal Bank, which suspended in the last week of October, opened again for business. Confidence in their condition was shown by new deposits of considerable sums. One of the smaller savings banks, which had suspended for thirty days, during the

time allowed by the legal notice required from depositors, resumed business and received fresh deposits. More than half of the notices given by depositors to the New York savings banks have already been revoked, and it is expected that only a few of those outstanding will be used. A committee of the directors of the Knickerbocker Trust Company proposes that depositors shall take half their money in instalments (during fifteen months) and half in bonds of the company, at 4 per cent., payable in three years.——Owing to the discovery of criminal transactions in the affairs of the group of small banks and trust companies in Brooklyn now in the hands of receivers, four men have been indicted for grand larceny and forgery. These are Howard Maxwell, recently president of the Borough Bank; A. D. Campbell, cashier of the same, and William Gow, director of the bank and organizer of the allied International Trust Company. They have surrendered all their property to the bank. The charges relate to excessive loans, misleading reports, loans upon inadequate security, and unlawful temporary use of certain deposited funds, rather than to embezzlement or theft. The money claims of the bank are said to have been satisfied, and the institution is said to be solvent. The indictment of several other men is expected. Testimony has been taken by the grand jury concerning the affairs of two other small trust companies (also suspended), whose funds were used in the business of a stock brokerage house conducted by the chief officers of the two institutions.

Cuba and Porto Rico

The census enumeration of the Cuban people having been completed, Governor Magoon has been urged by some to fix dates for the municipal and national elections. Only one of the four parties—the Liberal faction led by José Miguel Gomez—asks for an early date. It would have the municipal and the national elections held on the same day, and not later than February. The Zayas faction of the Liberals, the old Moderates, and the Independents (led by General Mario Menocal) are willing that the elections shall be held later. Some think the municipal elections will take place in April and the national election a few months afterward. ——There were labor riots in Havana on the 21st, masons on strike attacking non-union men who had taken their places. One of the latter was killed. That evening, the police, under orders from Judge Miyeres, arrested more than 200 men at a meeting of the Labor Federative Committee. Among those in custody are Emilio Sanchez, president of the committee, and the president of the railway employees' union. The charge against all is "unlawful association for criminal purposes."——In the case of the Federation of Labor against certain railroad officers, who were accused of bringing strike-breakers to Havana from this country, under contract, the prosecution has been unsuccessful, and several witnesses who testified against the railroad officers have been arrested for perjury. ——Regis Henri Post, Governor of Porto Rico, reached Washington last week, having been summoned by the President in order that he might in person answer charges concerning his address, in September, to the district superintendents of schools. Since the publication of these charges—to which reference was made in THE INDEPENDENT of October 31st—there has been an official investigation.

The Suffragettes

The members of the Liberal Cabinet, in their campaign thruout the country, have been made exceedingly uncomfortable thru the organized distraction and interruption by the militant women suffragists or "Suffragettes," as they are commonly called. In all the meetings of the Government there have been demands for the fulfillment of the promises of the party to extend the suffrage to all adults irrespective of sex. The interrupters have generally been ejected with little difficulty and disorder, but at Leeds, when Herbert Gladstone, Secretary of State for Home Affairs, was speaking, the Suffragettes and their male allies offered opposition, and a free fight took place, which put a stop to the meeting. In Birmingham, a suffrage meeting in charge of the women was dispersed by university students, who threw tubes of hydrogen sulfid and dead mice on the speakers' platform. The man-

agers of the Liberal party have decided to exclude all women from political meetings at which Cabinet officers are to speak. The agitation has taken a new form by the demonstrations in the police courts of all the important cities. Whenever a female prisoner is brought to the bar a woman arises in the audience and denounces her trial under a law which she had no part in making. A mass meeting of the Men's League for Women Suffrage will be held in Queen's Hall, London, early in December, at which Willoughby H. Dickinson, M. P., Earl Russell, Canon Hecks, Rev. R. J. Campbell and Israel Zangwill will speak.

German Affairs

Emperor William is reported to have received much benefit from his residence in Highcliffe, England, and the operation for catarrhal trouble on the internal ear may be indefinitely postponed. ——Prince von Bülow, the Imperial Chancellor, has cleared himself of all connection with the scandal involving Count Kuno von Moltke and Prince Philip zu Eulenberg, in the case of criminal libel brought against Adolf Brandt, a pamphleteer. The Prince took the stand and swore that he had no abnormal tendencies or vicious habits. Prince zu Eulenburg appeared and gave similar testimony in regard to himself. Brandt withdrew his charges and was sentenced to eighteen months' imprisonment.—— Cardinal Fischer, Roman Catholic Archbishop of Cologne, has withdrawn his order prohibiting Catholic students from attending the lectures of Professor Schrörs at Bonn University. The order was issued in his efforts to enforce the Papal Encyclical against Modernism, but the Prussian Minister of Education held that it was an interference with state affairs.——The estimates of the Government for the expenses of 1908 have been presented to the Reichstag. The estimate for the Prussian army has been increased $1,800,000, and an appropriation of $7,660,000 is to be made for improved fortifications. To carry out the Government's naval program $15,000,000 more will be required than in 1907. The naval appropriation altogether will be $85,000,000, which will be increased until 1912, when it will reach $97,500,000. The plan is to begin each year the construction of three new battleships as large as the British "Dreadnought" and a 19,000 ton armored cruiser. If this is kept up Germany by 1919 will have 38 first-class battleships, of which 24 will be of this class. The annual appropriation for submarines is $1,700,000. For the experiment in the construction of airships after the model of Count Zeppelin, $535,000 will be expended. The Kaiser Wilhelm Canal is to be widened at a cost of $5,000,000, to provide for the increase in size of naval and commercial vessels. The estimate for the Colonial Office also shows an increase. Herr Dernburg, the Colonial Secretary, has returned from a three months' trip to German East Africa, and is planning to introduce administrative reforms and measures for the improved treatment of natives and the development of the rich natural resources of the country. He expects this colony soon to be self-supporting, and in time to offer inducements to German emigrants. In German Southwest Africa, recently in rebellion, $6,000,000 will be spent next year for the military administration. The breeding of sheep, Angora goats and ostriches is to be encouraged in order to render the colony self-supporting. The schools for training young men for the colonial service and foreign commerce will be better supported and made more efficient and extensive.

Temperance Reform in Europe

In Germany efforts are being made by Minister of Justice Schönstadt to check excessive drinking by students thru the influence of the alumni. The *Verein Alter Herren,* an organization of former corps students, has past resolutions condemning the practice of compulsory beer drinking, which is a universal custom in the corps or fraternities. The Kaiser has endeavored without much success to turn the attention of university students to athletic sports by introducing tennis, baseball and football, but he is a stanch supporter of the corps and their ancient customs, as shown in his speech to the students at Bonn in 1891, when he said:

"It is my firm conviction that every youth who enters a beer-drinking and dueling club will receive the true direction of his life from the spirit prevailing there. . . . I hope that you will always take delight in handling the dueling-blade."

Professor Forel and other temperance leaders have petitioned the Prussian Government to provide separate cars on the State railroads for intoxicated persons or for abstainers on Saturday and Sunday nights, so the latter can travel in peace.——When the British Parliament reassembles the Government will introduce its temperance bill, which is understood to be of a radical character. It is expected that local option and some form of the Gothenburg or dispensary system will be included, putting the control or management of the liquor traffic in the hands of municipalities and local authorities. To check the habit of drinking among women it is proposed to prohibit grocers from handling liquors. The National United Temperance Council has petitioned the Government to take action against the numerous clubs, which sell liquor to their members at all hours in unlimited quantities for consumption on or off the premises, and yet are not required to have any license or submit to the restrictions imposed upon the public houses. The Brewers' Society claims that their interests represent $955,000,000 capital, which should not be destroyed without compensation, and that the liquor trade now supports the navy and a large part of the army, which cost would fall upon the taxpayer if the business were interfered with.——The Finnish Diet, as we have before reported, has past a very stringent prohibition law, which, however, is unlikely to receive the approval of the Czar. The mere possession of liquors of any kind is punishable by fine or imprisonment. A vessel carrying a cargo of liquors may be confiscated, and in case they are being conveyed by wagon, the vehicle, horse and harness are forfeited to the Government.

The Excommunicated Italian Priests

First the Pope, in his Syllabus and Encyclical, gathered a long list of heresies from Catholic writers, and condemned the authors as Modernists. Then certain Italian liberal priests wrote an anonymous book in protest and reply. Next the Pope launched his excommunication against all those who had written or aided in writing the protest, and forbade it to be read, under penalty of excommunication. But they refuse to be excommunicated. *L'Italie,* a French Catholic journal in Rome, prints an interview with one of the authors of the book, and asks him how they take the excommunication. The reply is interesting as showing the somewhat shifty course to which, in a case of persecution, men are driven. He was asked if he had said mass since reading the excommunication. "Why not?" said he; "the excommunication does not worry me. The Encyclical is not an infallible document, simply directive, and deserves respect, but the respondents had a perfect right to correct its errors. In the Encyclical the Pope accuses us of errors we have never held, charged against books he has never read. The decision against us is of an angry and misjudging verdict and is a nullity. The decree has no value, since it is based on a false and erroneous examination, and is a stroke of lightning that hits nobody. He has named nobody, and conscience is tranquil. If in conscience I believe the Pope ill-informed, deceived by his *entourage,* and that thus he excommunicates me unjustly, then I consider the act as not done, and I continue to say mass and consider myself still a member of the Church I love and which I honor more than do those intriguers who surround the Pope and misinform him. We appeal from the Pope misinformed to the Pope better informed. His passionate sentence against us is plainly unjust, since the Pope attributes to us doctrines and ideas which we have never dreamed of holding. Thus the excommunication does not touch us. Our conscience is at peace, and we shall say mass every day and follow it with a prayer for the Pope, that the Lord will clear his mind and free him from those enemies who surround him and abuse his good faith. He is in the condition of the Emperor of Germany, who was surrounded by that *camarilla* and did not know that he was governed by them, but who has now been delivered by one man's courage from their control. So

we pray for some one who will plunge the Pope into a Pool of Siloam, where the angel will cleanse him of the prejudices against the Modernists from which he suffers."

The Crisis in Portugal

It appears that the patience and meekness with which the dictatorship of the Premier, Senhor Franco, has been borne is nearing its end and a revolution is threatened which may depose the King or even sweep away the dynasty. The imminence of the danger is not determinable because the Government exercises a strict censorship, even opening private letters, and many of the opposition newspapers have been suspended. The existence of an extensive plot against the Government was disclosed by a bomb explosion in Lisbon, in which two persons were killed and a third seriously injured. The three men, two physicians of high standing and a naval officer, were engaged in the manufacture of bombs of which several hundred were found in the building after the explosion. The police made a large number of arrests, suppressed the papers and threatened the political leaders with deportation to Africa in case they encouraged an outbreak. It appears that the Conservatives have joined hands with the Republicans in threatening the establishment of a republic in case parliamentary government is not restored. The Crown Prince, Luiz Phillipe, Duke of Braganza, is said to have remonstrated with his father over the continuance of the administrative dictatorship claiming that it was turning Portugal into a hotbed of Republicans and Anarchists and endangering his heritage. King Carlos is reported to have become furiously angry and banished the young Crown Prince to the Villa Vicoso, a royal residence isolated in a forest a hundred miles from Lisbon. The King recently declared that the action of the Government was necessary to put an end to the impotence and disorder of Parliament and that he had entire confidence in Premier Franco, who would continue to govern the country until the moment was opportune for the election of a new Cortes to be held. This he was confident would approve the action that had been taken during the recess. The King has granted many favors to the army and it is believed to be loyal to him. The navy, however, is reported to be on the eve of mutiny. Senhor Franco dissolved the Cortes by a royal decree on May 12th. According to the constitution the call for another national assembly should have been issued within six months, but he has allowed the period to elapse without such an announcement. From a financial point of view, the administration of Franco appears to have been a success, as he has reduced the year's deficit from $6,000,000 to $2,000,000, without increasing the taxation, chiefly by abolishing sinecures and other unnecessary expenses, which may account for the violence of the opposition against him in certain quarters. The Government has issued the following official denial of the published reports:

"The fantastic rumors concerning members of the royal family, the attitude of the military forces and political leaders, as well as the stories of an outbreak against order, are absolutely without foundation."

The New Duma

The organization of the Duma shows the relative strength of the different opposing parties, and proves that it is on the whole decidedly Conservative; no Constitutional Democrats were elected among the officials of the House or members of the President's Council. The reactionary I. P. Sazanovitch, of Mohilev, was elected Secretary, and as First and Second Vice-Presidents, Prince Vladimir Wodkonsky and Baron von Meyendorf, a German professor of the Baltic Province, were chosen by a vote of 263 of 402. The Constitutional Democratic nominee received 133 votes, and the Social Democrats refused to take part in the election. In committee of eighteen, which prepared the reply to the address from the Throne, however, six members of the Opposition were appointed. The address was as follows:

"Most Gracious Sire: Your Imperial Majesty has deigned to greet the members of the third Duma and to invoke the Almighty's blessing on the legislative work before us. We, therefore, take the liberty to express personally to your Imperial Majesty our feelings of gratitude to the supreme head of Russia and our thanks for the right of popular representation granted to Russia and secured by the fundamental laws of the empire.

"Have confidence in us, sire. We wish to devote all our ability, knowledge and experience to strengthening the form of government, which was given new life by the Imperial will in the manifesto of October 30th, 1905, to pacify the Fatherland, to assure respect for the laws, to develop popular education, to promote the general welfare, to be a buttress for the greatness and power of indivisible Russia and thereby to justify the confidence reposed in us by his Majesty and the Fatherland."

Some encouragement is derived from the fact that it avoids the use of the word "autocrat" and alludes to the permanent establishment of representative government in Russia, but it indicates no further desire or intention of further reforms in government. The Reactionaries in debate assumed a very bitter tone, declaring that the Constitutional Democrats were not to be admitted to official positions in the Duma, because the loyalists refused to work beside Czar-slayers. The Minister of Justice has demanded that the Duma surrender one of the Constitutional Democratic leaders, Mr. Kolubiakan, to be tried for treason, because of a speech he made in Samara last May. The last Duma emphatically refused to surrender any of its members to the Department of Justice.——A complete settlement has been effected between Japan and Russia of the financial matters connected with war thru the payment of a draft for $24,302,200 by the Russian Ambassador in London to the Japanese Ambassador. According to the Treaty of Portsmouth, each Government agreed to pay the other all the expenses for the maintenance of its prisoners during the war. Japan presented a bill against Russia for about $75,000,000, and Russia a clam of $40,000,000 for the maintenance of Japanese prisoners. The draft represents the balance as settled during the negotiations which have taken place since between the two Powers. This payment will assist in relieving the financial stringency, because the Bank of Russia may pay in gold.——Repeated mutinies are reported from Vladivostok among both the soldiers and the marines. The sappers and marines who revolted on October 29th and attempted to run away to Japan with two torpedo boat destroyers have been tried and condemned, and it is reported that 189 have been hanged. The mutiny was incited by four girls who went on board one of the destroyers, and so aroused the feelings of the marines that they hoisted the red flag and opened fire on the Admiralty. The destroyer was struck by a shell from a fort, and many of those on board, including the four girls, were killed by it.

Railroad Strike in India

The engineers of the East Indian Railroad, two thousand miles long, have struck in demand of better pay and less work. The engineers are mostly Europeans, but they were joined by the natives of the traffic staff. The important section of the road from Calcutta to Allahabad is practically tied up, and Simla is isolated, no letters, papers or passengers arriving there for two days. At Asansol, Bengal, the junction of the East Indian & Bengal Nagpur Railroad, where six thousand passengers were stranded, the strikers resorted to violence and the cars were looted. Steamers are unable to sail from Calcutta because they could get neither coal nor cargo. The prices of provisions are rising rapidly, and in view of the famine conditions prevailing in the interior the situation is alarming. The strike may revive the unrest among the natives which the Government was congratulating itself upon having suppressed thru the seizure of the prominent agitators and the passage of a bill against seditious meetings. This measure empowers provincial authorities to prohibit by proclamation the holding of any public meetings without written permission under penalty of fine or imprisonment. So far it has not been necessary to put this into effect. Believing that the agitation had died down the Government released Lajpat Rai and Ajit Singh, who have been confined in a fort at Mandalay. Mr. A. C. Banerjee, a Calcutta barrister, who was on trial for sedition, apologized to the Government and promised to be more careful in his utterances in the future. The approaching session of the Indian National Congress will be held at Surat instead of at Nagpur, in which there have been some disorders. It is expected that the Congress will not have a seditious tone, but will devote itself to the promotion of the legitimate forms of the Swadeshi movement for the encouragement of native industries.

The Necessity for Currency Reform

BY FRANK A. VANDERLIP

[Mr. Vanderlip, formerly Assistant Secretary of the Treasury and now vice-president of the National City Bank, of New York, has been a prominent member of the New York Chamber of Commerce's Committee on Currency and of the Currency Commission of the American Bankers' Association, whose recommendations concerning emergency issues of taxed circulating notes may be accepted as the basis of legislation.—EDITOR.]

A COMFORTABLE man is apt to be an optimist. A prosperous man is naturally averse to changes. Such a man is likely to be well satisfied with conditions as they exist. He looks with skepticism upon suggestions that would tend to bring into the situation new factors or new conditions. Bankers as a rule are regarded as typically comfortable and prosperous citizens, and perhaps it is small wonder that they are slow to recognize serious defects in the conditions surrounding them. At least, it is a fact that in the history of American finance, unless spurred to action by some great and immediate necessity, there has rarely been a time when bankers have given effective consideration to questions of banking or currency. There are in our laws few important enactments in relation to money that have not followed and in a large measure been the outgrowth of some financial calamity. The Bank of the United States was rechartered as a result of the monetary chaos in which the country found itself at the end of the War of 1812. The existing sub-treasury system was devised because State banks allowed their notes so to depreciate that the banks became unsafe depositaries for public funds. The Civil War was responsible for the greenback and for the national bank note.

FRANK A. VANDERLIP.

In financial legislation we have been opportunists. We have rarely done anything until forced to do it by misfortune. It is not that we have been extraordinarily conservative, but rather that we have been inactive whenever conditions permitted us to remain inactive. If financial depression or panic pressed us to a point where legislation became im-

perative, we then legislated with more haste than wisdom.

The experiences of the recent past should certainly result in financial legislation during the next Congress. A canvass of the opinions of bankers up to a month ago would have left doubt whether or not there is any currency problem. Certainly there were many successful bankers who said there was not. They said our currency was as good as gold, and that no one ever had to consider whether any note was better or worse than another, for all are equally certain of redemption in gold. They said that there was no lack of currency in a country that has been able to increase its gold stock in ten years from five hundred million dollars to more than one billion and a half. So it appeared that, at the start of any discussion on the currency, there would be doubt thrown on the very existence of a currency problem. The recent events have convinced practically all thoughtful men that something must soon be done to remedy our currency laws.

A physician counting the pulse-beat and taking the temperature of a patient may foretell with certainty an impending crisis in the patient's physical welfare. A temperature of 103 with a corresponding quickening of the pulse-beat means that the patient is in danger and that the cause of that danger must be removed, or sooner or later serious results may ensue. Let me tell you that alternating periods of 100 per cent. and 2 per cent. money in Wall Street are just as certain indications of a deranged financial system as is the register of 103 degrees in a clinical thermometer a sure indication of physical disorder. Serious results may not immediately follow in either case, but if the evidences of derangement repeatedly occur, it is only a question of time when, in both instances, unfortunate results will follow.

The physician who finds the pulse-beat too rapid does not necessarily locate the difficulty in the wrist of the patient for the reason that it is there he finds the evidence that something is wrong; nor would there be more logic in saying that, because we have seen periods of 100 per cent. money in Wall Street, the seat of the difficulty must be in Wall Street and the remedy should be applied there. The trouble is not with Wall Street; it is fundamental and is inherently related to our unscientific currency laws.

Periods of excessively high rates for money, recurring seasons of stringency following each demand for funds with which to move the crops, other periods of superabundance, of gorged bank vaults and interest rates falling to a point where the return on a loan is hardly worth the expense of making it—all these things are significant signs of our imperfect financial system. They point, I believe, with absolute certainty toward organic weakness. The fundamental causes which lead at one time to manifestations of high rates and at another to abnormally low rates, that bring periods of stringency followed almost in a day by periods in which funds accumulate more rapidly than they can be wisely employed—the fundamental causes of such changes are dangerous to permanent prosperity. Just as surely as temperature and pulse-beat may become physical danger signals that the wise man should promptly recognize, just so surely we are receiving periodical warnings in the abnormal register of the pulse of Wall Street money rates, and in the alternating periods of currency stringency and currency redundancy that may be observed at all the money centers.

If we sit smugly by and say that we are satisfied with the measure of prosperity which we are having, and that we think we shall go on very well with things as they are, then sooner or later we shall come to another period that is not satisfactory. We shall come to another period such as has preceded the enactment of most of the important existing financial legislation. Then we are likely, in great haste and with little consideration, to enact legislation which might better be undertaken before the necessity for it becomes painfully evident.

I believe there is the gravest need for legislation which will provide a scientific system of bank-note currency. I believe, too, that the responsibility for such legislation lies heavily upon all bankers. Congress is not alone to blame if we are lacking in wise currency laws. If financial leaders are utterly oblivious to the necessity for such laws; if bankers, even after they come to the conclusion that

legislation is desirable, are unable to reach an agreement as to what sort of legislation is expedient, it is with poor grace that those financial leaders and those bankers blame Congress for failing to enact wise laws.

There is no association of bankers upon whom the responsibility for a clear understanding of the currency problem falls with so much force as it does upon the bankers of New York. The bankers of New York will hardly deny that the financial center of the country is there. With leadership come grave responsibilities.

New York is the financial center. New York bankers ought to accept the financial leadership. They ought to have well-considered opinions upon the currency. The financial portion of a whole country looks to New York for this leadership. For New York bankers to say that anything practical in the way of suggestions must, for political reasons, come from some other quarter, is but a cheap way of escaping responsibility. For the financial leaders of New York to say that the popular prejudice against Wall Street is so great as to prevent their voices being effectively heard, and that it is useless for them to devote thought to a problem the solution of which must, because of political exigencies, come from some other place, is to offer but lame excuses for failure to do their duty.

I believe there is little force in these protestations behind which New York bankers modestly step into the background. Their proper place is at the front in a currency discussion. Financial leaders should be leaders in fact, altho in truth not a few of them have given less earnest consideration to the great national question of the currency than they have to any one of dozens of corporate underwritings or reorganizations.

I believe the country is ready to accept the leadership of New York if New York will accept the responsibilities of her position. If New York bankers will study the currency problem until they are ready to bring forth a plan which they believe is the best for the whole country—a plan which is not narrow and provincial, a plan free from personal and local bias—then the judgment of New York bankers will be received by the rest of the country with respect and consideration.

If the officers of the institutions represented in the membership of the New York State Bankers' Association will reach substantial agreement in regard to what constitutes the currency problem, agreement as to what are the principles underlying its correct solution, and what forms of legislative enactment will be wise from the point of view of the whole country, I am perfectly confident that the whole country will soon come into hearty accord with that opinion. The principal reason that New York has been unable to influence the public opinion of the country on financial matters has been that New York bankers have had no well-considered conclusions. They have not accepted the responsibilities of leadership. They have failed to give the subject the consideration it merits. They have reached no agreement in regard to the course which ought to be followed.

The country believes that when there is real need for legislation that need will be recognized by the leaders of finance. If the bankers of New York would once clearly recognize the need, that fact alone would go a long way toward making the country see the necessity for action. New York bankers may think it is easier to temporize, but the country looks to New York in this instance to accept the responsibilities of leadership. It looks to New York to recognize the necessity for legislation if urgency exists. It expects New York bankers with unanimity to point out a course that, with the welfare of the whole country in mind, will be the wisest to follow.

If greater financial disaster should ever come because we have failed to enact proper legislation, the blame for that disaster will lie against the bankers of New York more directly than against any other group of people. The bankers of New York, more than any others, have a duty imposed upon them—the duty of leadership. They cannot escape the responsibilities of leadership. The country will some day understand that the financial leaders have thus far failed to measure up to this responsibility. If that failure ever stands out clearly against a background of financial dis-

turbance, the fact will not be helpful to New York's pre-eminence.

To my mind we have been in a lethargy of success. We heard pæans of prosperity sweetly sung on every side. Unexampled totals marked the measure of every phase of industrial and commercial life. We have engaged in expenditures of capital on a scale so vast that it makes the financial operations of other days seem petty by comparison. Labor was never before so fully or so profitably employed. Business was never more active. And so, some of us say, there surely can be nothing wrong with a situation that gives such evidence of health and growth.

Truly it is a magnificent organization of business which we have. With the health and vigor of the business condition impressed upon us, it is difficult to understand that an occasional irregularity of the financial pulse-beat may be an important warning. The pulse-beat of abnormal money rates in Wall Street, rates that are abnormally low or abnormally high, have recurred and past, and it is easy to believe that they mean nothing serious. It is, perhaps, hard to believe that a brief period of overflowing bank vaults might in the end work toward serious disorganization of this magnificent fabric of business. We see undue accumulations of currency at the financial centers; we see banks that must pay interest on these swollen deposits reloan the money with nervous haste at any return, no matter how low; we know that funds in this way may some day become tied up so that there may be greatest difficulty in liquidating the loans to meet an unexpected demand, but it does not seem to come with much force to the average banker that the legitimate result of such a situation may be financial disaster.

Even tho a clinical thermometer registers a degree or so too high a temperature, a strong man may think it a matter which in his strength he may disregard, and so the business community seems to rest in the security of an all-pervading prosperity, while the vast financial work of the day continues to be performed by machinery devised two-score years ago to fit a then abnormal situation. The free and normal development of our banking system has been prevented by prohibitions which had their birth in the financial exigencies of the Civil War. In every other field of activity we have recognized that new conditions made new machinery desirable, but the machinery of banking has not been permitted to develop so as to keep pace with the growth of the work it has to do.

With the increase in the volume of business done in the United States, and with the growth of the value of the annual product of soil and factories, the margin between the maximum and minimum need for currency has widened. That margin between the greatest amount of currency likely to be needed at one period and the least amount likely to be needed at another has probably doubled in the last ten or fifteen years as a result of our development.

At the present time there is reason for believing that the country at certain seasons requires $150,000,000 more currency to transact its business than is required at other seasons. Now, remember I am writing of currency, not of credit. To meet this fluctuating demand for currency there is absolutely no provision in our laws. Our bank notes increase or decrease in volume as a result of the fluctuation in the market price of Government bonds, and there is practically no relation between that price and the current demand for currency. Our banks are permitted to give freely to their customers credits in the shape of deposits, but when a customer wants to convert that credit into the form of a circulating note he can only be accommodated by taking from the vaults of the bank its reserve money.

I believe the first principle to recognize is that there is not an essential difference between a bank credit in the form of a deposit and a bank credit in the form of currency. Certain safeguards must be thrown around a circulating note that are not required for the protection of a deposit, but with that exception in view, this principle stands, I believe, as perhaps the most important one to recognize in a currency discussion —that there is not an essential difference between a bank note and a bank deposit, and that the customer of a bank ought,

under satisfactory safeguards, to be able to convert one into the other at will.

One other principle that has been totally lost sight of in half the discussions of the currency is the principle that adequate redemption facilities are a certain bar to an over-issue of circulating notes. People talk of the country being flooded with an asset currency. With adequate redemption facilities such a thing is inconceivable. Let any student of the currency question keep in mind the idea of providing absolutely adequate redemption facilities, so that a bank note will never stay in circulation a day beyond the time when a bank credit is no longer preferred in that form rather than in the form of a deposit, and half the difficulties of the inquiry are at once cleared away.

This is, of course, no place for a thoro discussion of the currency question. I have no plan to propose. The one thing that I want to urge is the importance of providing a scientific bank-note currency if we wish an indefinite continuance of prosperity.

New York City.

The Decline in High Grade Securities

BY JOHN MOODY

[Mr. Moody, formerly a banker, has for some years been widely known as a publisher and as an author of works on financial and economic questions. He is the editor and publisher of "Moody's Manual of Railroad and Corporation Securities," and among his books are "The Art of Wise Investing" and "The Truth About the Trusts."—Editor.]

THE extraordinary decline in security prices in Wall Street during the past year or two, in the face of expanding business, increasing earnings and rising commodity prices practically everywhere, brings into exceptionally clear relief the fact that, in the study of investment values, something of far-reaching importance outside of the particular investments themselves must be examined and reckoned with by the intending investor. Very large sums of money are annually lost, and much of the carefully accumulated savings of the country is unwisely invested, because of lack of attention to this particular fact. Investors may make ever so careful a study of the particular property in which they mean to invest; they may get the best advice as to the proper legal standing of the bond or stock; they may, if it be a railroad, carefully consider, either directly or with the aid of experts, the efficiency of management, the equity in the property, the financial record, surplus, margin of safety above charges, and all of the other hundred and one things that go to add to or detract from the standing or security of a given enterprise; in short, they may leave not a stone unturned in their examination of the property and every test applied may be satisfactorily met, and yet, in spite of it all, they may find, as investors of the entire country have been finding during the past two years, their principal growing beautifully less as the seasons go by.

To illustrate, let us take a case in point—that of the New York Central 3½ per cent. bonds. These bonds, issued ten years ago, are a first mortgage on the main lines and many valuable branches of the New York Central Railroad system. They are absolutely secured as to principal, the property under them being worth many times the amount of the mortgage, and being also of steadily increasing value, and furthermore, sure to grow still more valuable, probably to a fabulous degree, very long before the bonds mature. The property back of the bond issue is far more valuable in every sense of the word than it was five years ago; the net income or profits of the road five years ago were ten times the amount needed to pay the interest on these bonds; this year the profits were nearly twelve times the amount needed. And yet at the present time a one-thou-

sand-dollar bond of this series can be bought for less than $860, while five years ago the same bond brought $1,100.

This change in value, it should be borne in mind, has not been brought about by any deterioration in the property or any falling away in income, for, as is pointed out above, there has been a vast increase in the value of the property, in surplus, in earnings and in everything which goes to augment the tangible property itself. Therefore the decline cannot be accounted for as the decline in many active securities on the stock market is largely accounted for. The bonds are in such a superior position that even a very radical falling off in earnings could not affect their price to any real extent. They are, in fact, so well secured that they stand above the vicissitudes of declining earnings, increasing costs, legislative troubles or even hard times; and even should the country go thru a prolonged and severe industrial depression, a bond of this type could not suffer in position or security, nor could any changes in price which it might experience be accounted for by such occurrences.

The same condition obtains with all of the highest grade securities, whether they be steam railroad, public utility, industrial, municipal or government issues. They are all down in price from 10 per cent. to 25 per cent. of their values of a few years ago, and yet are apparently, in the vast majority of cases, backed up with more and better security than ever before. Take government securities, for instance. English Consols are today selling far below the figures of ten years ago, and yet no sane man will undertake to say that the credit of the British Government is not as good today as it was a decade ago. Look at New York City bonds. Certainly the credit of the Greater City is fully as good as it was a few years back. And yet the prices of its corporate stocks and bonds have suffered very severe declines since 1903. Only five or six years ago practically all municipal issues of standing in the Eastern States were selling on a 4 per cent. basis or less, but today countless cities and towns are finding it necessary to pay from 5 to 6 per cent. for their money on long-time obligations. So we find it over the entire field of high grade investments.

We must therefore look for a general cause which is affecting the values of this particular class of securities. And let it first of all be remembered that this cause is not the one which is so glibly past along today by the unthinking multitude, that it is simply a part of the vast decline in all Wall Street securities, brought about by over speculation, "high finance." political agitation, etc. For the declines in the highest grade securities are not matters of recent occurrence. They have been existent for several years. One year ago. when all the speculative stocks and inferior investments were at the top notch and selling at figures far beyond the prices of five years back, and in many instances from 60 per cent. to 80 per cent. higher than they are today, the high grade bonds were nearly. if not quite, as low in price as they are now. For example, the New York Central 3½ per cent. bonds, mentioned above, which are selling at 88 today, were 92 a year ago, as against 112 five years ago. Pennsylvania Railroad Convertible 4s, selling at 102 today, were 104 a year ago, as compared with 113½ five years ago. Baltimore & Ohio Prior Lien 3½s, selling at 90 today, were 92 a year ago, having fallen from a high figure of 97 in 1902. In other words, directly in the face of the great bull movement in stocks and speculative bonds, which began in 1904 and culminated in 1906, all the higher grade securities were steadily declining. All bonds such as those legal for savings banks, estates and institutions in the East; all the issues which are regarded from the bond dealers' point of view, as "choice," and which are continuously sought for by the most discriminating investors, were all well along in their declines when the stocks and inferior securities were advancing with leaps and bounds.

On the surface this fact may look puzzling to many people; but of course the reason is not far to seek. It is entirely wrapped up with the money market. In other words, the prices of really high grade securities are mainly measured, not by earnings, not by fluctuations in surplus, or by any other specific facts of this kind, but by the prevailing rates for

money. If money is in demand, interest rates of course rise, and such securities fall; when money is not greatly in demand and interest rates fall, these securities will rise again. As a consequence, therefore, in any period of great prosperity, when industry is expanding, prices rising, credit extending and extraordinary industrial activity exists, we always witness a decline in "gilt-edged" bonds and stocks. On the other hand, when the reverse conditions appear, and trade and industry are contracting with prices falling, money becomes a drug in the market and the prices of these high grade securities tend to rise. And this is why it is probably safe to say now that even should we be facing a prolonged industrial depression, with trade decreasing, mills curtailing their outputs or closing, and commodity prices falling, we will, nevertheless, see such securities as suggested steadily increasing in value instead of the reverse.

It will be seen, then, that the primary study for the conservative investor (the man who wishes to eliminate risks and avoid speculation as far as possible) is the money market. Having satisfied himself by the usual methods as to the absolute safety and security of a given investment and ascertained to a certainty that it is in the class of those securities which have so much and such valuable property back of them that there is always present a very large margin of safety—having done this, he must at once turn his attention to general conditions; he must know something about the money markets of the world.

Many will, of course, contend that whether a man speculates or invests, he must, in any event, study the money market, and that the recent disturbances in Wall Street are proof of this. All of which is true. But it should not be forgotten that the relationship of the speculative security to the money market is essentially different from the relationship of the high grade bond or stock. The price of the speculative security is affected first of all by earnings or profits, and while the Union Pacific common stock was mounting in price from $80 per share in 1903 to $190 per share in 1906, as a result of a practical doubling of the company's net profits, the 4 per cent. first mortgage bonds of the company were declining steadily from about 104, until this year they have fallen below 94. And this double movement has been at the same time going on in all the active quotable securities of the great corporations, railroad or other. The 5 per cent. first mortgage bonds of the Steel Corporation declined from 115 to less than par, while the preferred stock of that corporation was rising from $50 to $110 per share, and the common stock from $10 to $50 per share. The explanation of this is, in simple terms, that while the changes in the prices of the bonds were the direct result of the price of money in the markets of the world and nothing else, the changes in the prices of the stocks were, as far as the rises were concerned, chiefly a result of increased or increasing earnings. Of course this does not mean to say that the prices reached by many speculative stocks last year were justified by the earnings, but, nevertheless, the bases of the upward movement were either earnings as reported or as predicted. The later declines, however, of the speculative securities were not occasioned by the interest rate in the same sense that the declines of high grade bonds were so occasioned; but the enormous declines in the stock markets, finally running into panicky conditions and carrying everything down to absurdly low figures, have been caused, not by the mere fact that money was commanding 6 per cent. or more over long periods (the factor which affected the high grade bonds), but because of the vast over-extension of credit, inflation, a generally "toppy" condition and a speculative mania in both this country and Europe, all of which has been coupled with our own unsatisfactory banking system, making it almost impossible to relieve a distressing monetary situation when it imperatively demands relief.

Thus, reviewing the situation as a whole, we find that the real investors in this country's resources and enterprises have, during the past few years, been going thru a rather discouraging experience. First, those who, since 1902 or 1903, have been investing in the highest class issues of bonds and stocks, have been having the unpleasant experience of seeing their investments slowly but

surely shrink in value, with the result that, in most cases, the person who invested $1,000 at 4 per cent. in 1902 has seen his investment undergo a shrinkage of 20 per cent. or more, so that he can get but $800 or less for his bond today. On the other hand, the less conservative investor who in 1902 or 1903 bought stocks or speculative bonds has had, first, the felicity of seeing his principal nearly double itself in many cases, and second (unless he got out at the top, and most never do), the dismay of witnessing his investment rapidly shrink to far less than its original value.

It might be contended that on this showing the high grade investments have really proven themselves to be, from the investor's standpoint, low grade, and that the lower grade or speculative securities have worked out in many cases with a higher grade result. But this is unsound reasoning. While the holder of the well secured bond has faced a very serious decline, he has not failed to receive his interest, and is more certain of it today in most cases than ever before. It is true that over a long period he has not been able to sell out and get his money back, but now that financial troubles are upon the country and a setback in general business seems apparent, he can look calmly to the future, for a setback in business must surely bring, in a reasonably short time, a much lower rate for money, and with the lowering of the rate there is bound to result an equivalent appreciation in the market price of his investment.

On the other hand, the holder of the speculative security, where he has not already become panic stricken and sold out at the bottom in the sudden and spectacular crumbling of prices, cannot face an industrial setback with anything like the same equanimity, as, aside from the money rate factor, which will, of course, have its favorable effect on his holdings, he must also reckon with the question of earnings. Earnings directly affect the standing and value of his securities, and, of course, an industrial setback is certain to be accompanied by a decline in the earnings of the large corporations. Therefore, he must scan the horizon with the greatest care, and while the extraordinary prices reached this year are illogically low, and a normal rebound is sure to follow, the stockholders' path is naturally not strewn with roses. Should a moderate industrial depression occur, the high grade bondholder can feel perfectly secure; earnings need not worry him and dullness in trade will tend to benefit him. The low grade holder, however, while being helped by easy money, will at the same time be menaced by falling profits.

New York City.

Money Famine: Its Cause and Cure

BY FRANCIS R. MORISON

Of the Citizens Savings and Trust Company, Cleveland, Ohio.

THERE is a popular misconception quite generally entertained concerning what is commonly known as money. For example, people are accustomed to say: "Mr. Smith has a great deal of money." Now, as a matter of fact, Mr. Smith may not possess a large amount of money in the strict sense of the word, but he owns property or investments which are the equivalent of money. Money is aptly called the "circulating medium." It corresponds to the blood in the animal physiology. The United States Government is the source of this life-bearing medium, coining gold and silver in its mints, issuing gold and silver certificates or authorizing national banknotes; while every bank and trust company, no matter where located, is like an artery providing the means for its complete circulation.

Money is most useful when passing

freely from one possessor to another in the discharge of current obligations. It is then performing its proper function and renders possible the normal transactions of business.

The multiplicity of functions which a certain sum of money may serve in the course of a business day is shown by the following simple illustration: A business man draws from his bank a certain amount of currency, which he uses in paying his employees, who in turn use it to pay their grocery bills, meat bills, rents and other expenses. The grocer and other dealers who thus receive the money deposit it in the various banking institutions patronized by them and it begins its beneficent work anew. Thus in a few hours this money has past thru many hands and has discharged as many obligations.

In the history of the world many common articles have been made to represent currency. For example: bits of leather, bark from trees, pieces of tin, bronze, as well as gold and silver, have served as circulating media for nations and peoples. In Italy at one time salt was used as legal tender and the word salary is traced to the fact that when a man was paid in those ancient days for his services he received salt. Cattle have been used for money; and in the early history of our country, tobacco served a like purpose.

The simplification of money as a representative of values has been the constant object of financial legislation. Yet, even in the most civilized countries at the present time, it is very much like other commodities. Like grain, it might be practically all removed from one locality to another, producing a plethora in one place and a dearth in another. But a fairly even distribution of the currency in circulation is maintained by reason of the interest rates, which rise where money is scarce and which fall where it is plentiful.

Just at the present time the available money supply thruout the entire country has been reduced to a point below the requirements of commerce and trade, because of some definite condition which financial authorities are quite generally agreed is due to the fact that it is being hoarded instead of being allowed to circulate freely.

J. J. Hill says: "There is nothing in the actual business conditions of the country to cause or to account for the financial stress everywhere so severely felt. The crops are good, and until money began to disappear prices were higher than for many years. Business as a whole is sound at the core. Neither is there an insufficient volume of money in the country. A year ago there was enough for all current needs. The trouble clearly comes from the hoarding of money."

President Woodward, chairman of the New York Clearing House Committee, says: "Everything in New York is getting smoother and smoother every hour. If people will calm down and get over their senseless frenzy of hoarding money everything will be well."

The injustice of keeping money in a vault, or hiding it in some secret place, is amply proven by the fact that there is in circulation only a little more than $32 in currency for each individual inhabitant of the United States. If, therefore, each person should hide away $32 there actually would be not a dollar of the circulating medium left for the purposes of commerce. When, therefore, an individual takes from the regular channels of circulation $1,600, we will say, and hides it in a vault or some supposedly safe place, he is depriving the commerce of the country of the per capita share of fifty persons. A reliable New York financial journal says: "The editor knows of a single instance of hoarding which has involved the deposits of no less than $50,000 dollars in cash, which has been placed in a safe deposit vault —the contribution of three individuals whose fears have overcome their judgment."

The hoarding of money just at this season of the year is doing an irreparable damage. The farmer is just at this time marketing the greater portion of his annual product. In many cases his produce is perishable. In other cases, he is unable to hold his crop during the winter season or even during a portion of the winter, because of the fact that he is not provided with adequate storage

facilities. Moreover, he may be seriously cramped financially as a result of even a slight delay in realizing upon his crop.

The country is now actually suffering because of the inability of its facilities to handle its wealth. From the standpoints of patriotism, humanity and self-interest it is the duty of everybody to assume his share of the responsibility in overcoming this untoward condition.

The best and quickest remedy for our present commercial ills is for every individual who is hoarding money to return it to its usual employment. For, currency must be made immediately available. It must be kept moving. It should not stagnate. It is therefore as much the part of every citizen to put his surplus money to proper uses as it would be for every able-bodied man to respond to draft for military service. For it is in this way only that money will be made to again appear in circulation and a normal situation be brought about in the country.

The Secretary of the Treasury, George B. Cortelyou, at the very beginning of our present difficulties, said: "I believe that if the money hoarded were at once put back in the channels of trade, there would be, within twenty-four hours, an almost complete resumption of business."

It is absolute foolishness to lose faith in banks. It is a sign of misanthropy which should be no more indulged in than should those signs of insanity by which the courts are guided in depriving men of their freedom. The fact is that the depositors of a sound banking institution are the best secured creditors in the country, because every deposit is a first lien on the entire assets of the institution. The prime requirement of a safe bank or trust company is adequate capital and surplus, which must be entirely exhausted before the depositors can lose one dollar. The next matter of consideration is that of management. This is a question of men, their financial responsibility and integrity—matters which can be easily determined by a little careful investigation.

If, however, patriotism and safety were the only arguments against hoarding money we might expect that some persons would argue self-preservation as the first law of nature and prefer that their money be held under their own protection. But the interest paid by savings banks and other financial institutions should be taken into consideration; and in this connection it is interesting to note that money deposited at compound interest will double in from seventeen to twenty-five years, according to the rate of interest, which varies in different localities. Then, again, there is the risk of losing money which is kept in an office safe or in some supposedly secret hiding place. Almost daily the newspapers contain reports of cases where persons have lost their hard-earned savings thru the folly of keeping their money in their homes. But the bank and trust company assume the responsibility for the safety of all funds entrusted to their care, and it is the mission of these institutions to accumulate the small savings of thousands of depositors and employ the aggregate in those channels of commerce and manufacturing where absolute safety is assured. One lesson which the present financial situation has taught is the danger of speculation on the part of the inexperienced.

In this connection it might be well to speak a word about a point which has never received the consideration which it deserves, viz.: That in speculating a man, aside from the danger of loss, impairs his faculties for the transaction of his own particular line of business. Take, for example, the business or professional man whose duties demand undivided attention and a clear head. Now suppose that this man has invested his money in various stocks. We see him at the breakfast table scanning with feverish anxiety the financial columns of his newspaper. Later in the day perhaps we find him in the office of his stock broker watching the changes being made with lightning rapidity on the boards or holding in trembling fingers the tape as it issues from the ticker. Any experienced banker can tell you of many instances where bright, progressive men, with brilliant futures before them, have failed because their vitality was sapped by the fever of speculation. Let the small investor forego the possible profits of speculation and escape its peril. Let him be satisfied with a reasonable return for his money.

It is gratifying to witness the general

confidence on the part of the public in the financial institutions of the country and in the men who conduct their affairs. As a single instance of this confidence may be mentioned the fact that the Chicago Federation of Labor recently expressed its confidence in the banks; and many individual labor unions have taken positive action of the same kind. This growing faith in the minds of the people is a most important factor in unraveling the tangle of the present situation. It is public confidence that will cure the ills and fill the arteries of commerce with the blood of life.

CLEVELAND, OHIO.

The Jeweled Chain

BY ANNETTE KOHN

The Emerald Cup.

Awake, O Earth, from dream and sleep,
Put on thy veil of green,
Unlock the waters of the deep,
Wear thou thy bridal sheen,
Wear, wear thy bridal sheen.

Violets open their blue eyes,
The dogwood glows in light,
The daffodils look to the skies,
The apple-trees flush white,
The apple-trees wear white.

Within the glens and hidden dells,
There breathes the breath of life;
All thru the greening forest swells
A note with music rife,
With sweetest music rife.

Awake, O Earth, to joy and Spring,
Arise for Love is near—
Awake, my heart, and dance and sing,
For Love with Spring is here,
For Love and Spring are here.

Opal Fires.

The summer burns thru mead and dale,
A voice comes from the sea,
Sweet winds blow over hill and vale,
And all are calling me,
Are calling, calling me.

The mighty forces of the earth
Now all their strength reveal;
The seed of Spring has come to birth,
And sends my soul appeal,
Unto my soul appeal.

O Summer noon of Love divine,
I feel thy mystic spell—
I clasp thee to this heart of mine,
That in me thou shalt dwell,
Forever in me dwell.

For what in heaven or earth like thee,
Thou summer sun of Love,
Here, here and now, men worship thee,
An angel from above,
Thou angel from above.

The Ruby Chalice.

The harvest's in, the cup runs o'er,
Drink, drink, the wine that's near,
Ere sear brown leaves fall at thy door;
The fill of joy is here,
Joy's fill, its fill is here.

What Spring hath sown and Summer borne,
In Autumn's lap doth lie;
The colors of the rosy morn,
More deep in sunset sky,
Make deep the sunset sky.

The linked fires burn swift and low
Round Autumn's ruby head,
The braided band above her brow,
Falls loosely thread by thread,
Falls loosely, every thread.

So fill thy garner and thy store,
Fill full for hour of need;
For thou wilt want Love more and more,
As swift the hours shall speed,
As swiftly they shall speed.

Diamond Sprays.

Beneath the winter's freezing breath,
The icy rivers run,
The world lies naked, stark in death,
Wan are the moon and sun,
All wan the moon and sun.

The wolves howl through the long, long night,
All voiceless is the day,
The birds have flown to lands of light,
The woodland world's away,
Its world is all away.

Where now, O Spring, thy violet chain?
Where, Summer, thy rose crown?
The grapes of Autumn glowed in vain,
The green leaves dust are grown,
All dust the leaves are grown.

The rains in pity come and weep,
The winds moan loud and sigh
For Beauty in its last long sleep,
For Life that could but die,
For Love that could but die.

The Sapphire Chain.

But yet the cycle's not complete—
Love has a word to say;
Death's but the gate to life more sweet,
Spring dawns again alway,
Spring comes—Love comes ALWAY!

NEW YORK CITY.

New Aspects of American Immigration

BY HERBERT FRANCIS SHERWOOD

[Under the provisions of the Immigration Law passed by Congress last winter, a commission of nine, consisting of three Senators, three Congressmen and three others, was appointed to make a thoro investigation of the subject of American immigration. Six members of this commission spent the summer in Europe. The investigation in Europe is just being concluded. Practically all the Continental countries were visited. One member also visited Syria. Mr. Sherwood, who is a special writer on the staff of the New York *Tribune*, and who has been for several years a student of immigration, accompanied the sub-committee of the commission in the capacity of a journalist and student. He desires it understood that any statement of opinion or of conclusion is his own. The commission, not having completed its work, has not reached its final conclusions.—EDITOR.]

PRACTICALLY all the European governments are opposed to emigration. It robs the country of material for military service and for the cultivation of the land. As the United States does not permit men and women who are not of good physique and possessed of sane minds, or who are likely to become public charges, to enter the country, a weeding process is going on which is leaving the less desirable at home. The result of the exodus in all the countries from which emigrants are coming in large numbers, has been that

THE SUB-COMMITTEE ON ITS WAY TO EUROPE,
Reading from left to right: Senator W. P. Dillingham (Chairman), Congressman W. S. Bennet, Congressman J. L. Burnett, Senator A. C. Latimer, Congressman B. F. Howell and William R. Wheeler.

DINNER TIME IN THE STEERAGE OF THE STEAMER WHICH CARRIED THE COMMISSION TO EUROPE.

The picture illustrates the clashing of the Italian and United States laws. The United States requires tables in the third class. Italy specifies that Italians shall be fed in messes.

the wage of unskilled labor has risen, until now, in most cases, it is doubled. In other words, where a man once earned 20 cents a day he now would earn 40, if he were not in the United States receiving from $1.25 to $1.60 for a shorter day's toil. In the agricultural sections of Southern Italy, in Austria, Hungary, Greece and Syria, the wage of farm labor has risen. Thus emigration has been a benefit to the peasant in two ways. It has given him supplies of money from abroad and it has provided him with better wages at home.

Barring Turkey, whose ruler has forbidden it, none of these countries is in a position arbitrarily to forbid emigration. To do so would be to restrict the freedom of movement of their citizens, which, in some cases, is guaranteed by their constitutions.

The population of Italy, according to Adolfo Rossi, one of the Italian Commissioners of Emigration, and one of the best informed men in the world on the subject, who made this statement to the writer, is decreasing at the rate of 250,000 a year because of emigration. About one million of her citizens annually leave the country bound for the United States, South America and the neighboring European countries. Of this number, perhaps 250,000, or one-quarter, return at the end of the labor season. As the normal addition to the population is only about 500,000, Italy is losing from her working force at the rate of a quarter of a million a year. There was a time when it was difficult to support her population and the country, economically, was overcrowded. That time has past and Italy is seeking means to restrict emigration, without violating the provision of her constitution, which guarantees freedom of movement.

It is the custom of the steamship companies transporting Italian emigrants to secure their passengers thru agents with

whom they have contracts, somewhat after the manner that life insurance is written in this country. The agent, who enters into the contract, employs subagents in different communities to sell

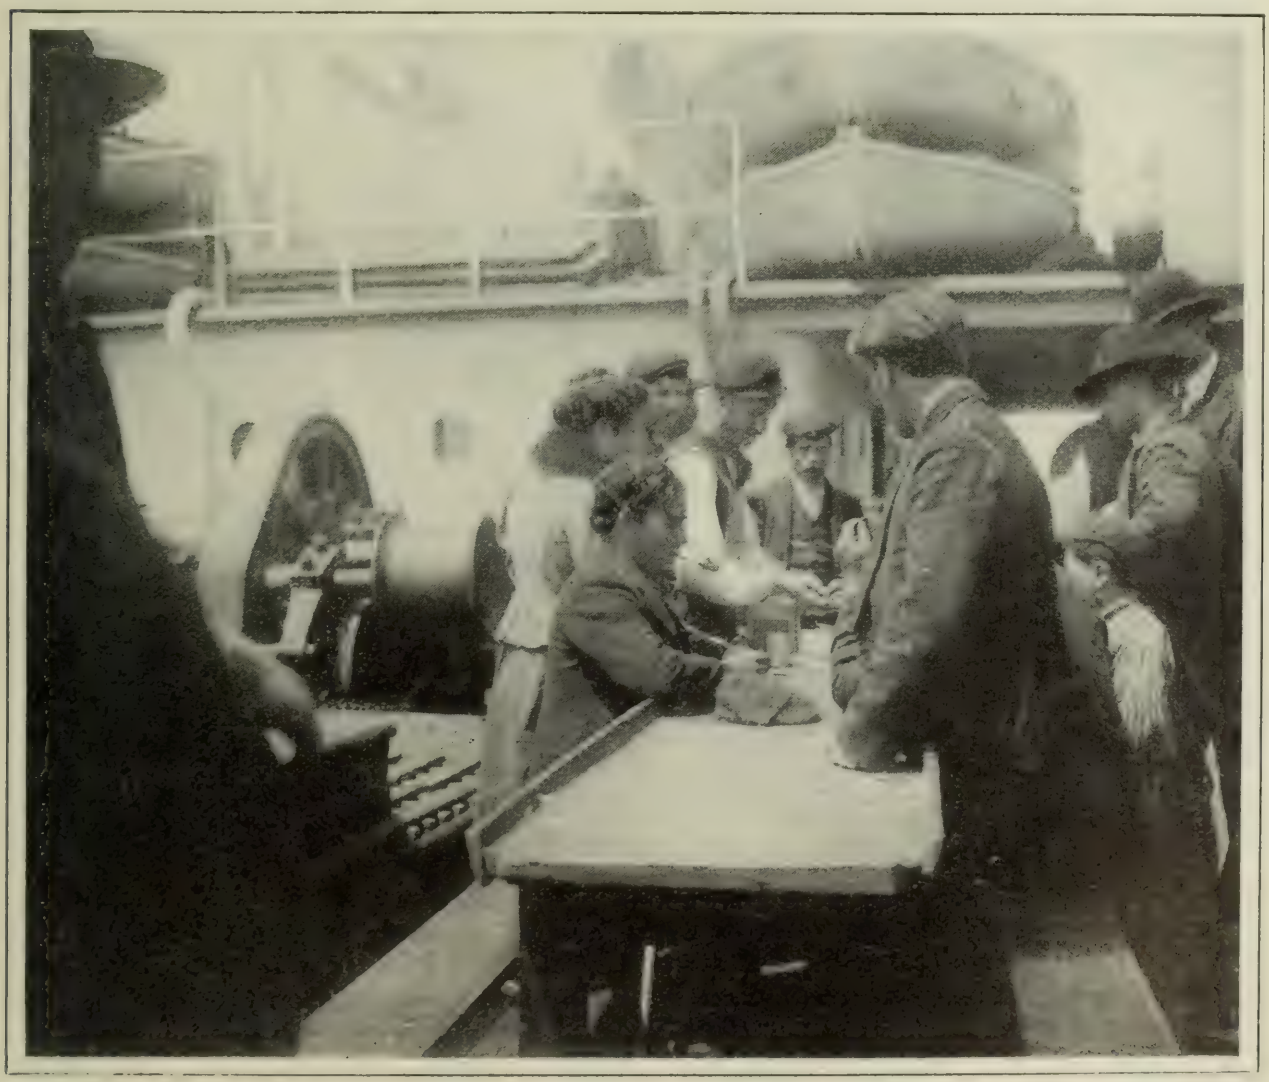
goes into so much detail regarding the subject of emigration as Italy. So paternal is the national government in its relations with its emigrating wards that in many cases it may be said they have

THE IMMIGRANTS' ONLY DINING TABLE ON THIS STEAMER IS THE DECK.

tickets on a commission basis. The Italian law limits the number of these subagents to one for each steamship line in a *mandamento,* or political division containing from twelve to fifteen villages. There are about 12,000 scattered thru Italy selling steamship tickets. An emigration bill is now before the Italian Parliament to reduce the number of subagents to one in each *circondario,* or political division containing from twenty-five to forty villages. This will cut down the total number in the country to about 6,000. Neither they nor representatives are to be permitted to go about the territory assigned to them to solicit business.

No country in the world in its laws

more than the comforts of home while *en route.* From the moment they become possible migrants to another country until they set foot on foreign soil, they are under the protection of the emigration laws. A book of 112 pages is required to contain the laws and bylaws. These go into such detail that not only do they provide for the establishment of the third-class steamship rates by the government officials, but the place at table on the steamship is specified at which shall sit the Italian commissioner who accompanies each vessel carrying Italian emigrants.



In some details the Italian and American laws clash. The Italian law, for instance, prescribes that the third-

class passengers shall be divided into messes of six. One of the mess is expected to secure from the galley the food for his group. Nothing is said about tables. The American law requires tables and seats.

On the steamer on which we crossed to Naples the third-class passengers were obliged to eat in groups, as required by the Italian law, there being one receptacle for the group for each kind of food. On the pleasant days they sat about the portion of the deck reserved for them, picnic fashion.

Under the Italian law the dormitory system of berthing the third-class passengers is recognized. The requirement under the Italian law is that there shall be a compartment for men and another for women. The United States laws require that there shall be separate compartments for men traveling alone, for unmarried women and for families, the portion of the ship where the men traveling alone shall be berthed being specifically set forth. The chief point of conflict lies in the requirement of the American statute that "berths . . . shall be separated from each other by partitions as berths ordinarily are separated." Obviously a steamship company has to make a choice as to the laws which it shall obey. There are reasons why it should obey the Italian rather than the American. Italy furnishes the passengers and sends a commissioner on each steamer to see that the laws are obeyed.

A source of stimulation to emigration in Italy is the insurance companies, which, for the sum of ten francs, or $2 American, will insure to the emigrant the return of the money he has spent to go to another country if he is rejected

THE ONLY TABLE IN THE THIRD CLASS OF THE STEAMER WHICH CARRIED THE COMMISSION TO EUROPE.

and pay to his family a specified sum if he loses his life. The proposed law will make it necessary for these insurance companies to receive authorization from the Government for the conduct of their business and to deposit a suitable sum of money as a guarantee of observance of the laws.

In view of the yearly influx of $10,000,000 from America, Austria is passive in her attitude toward emigration. Austria has no specific emigration laws, but a bill drawn and introduced into the Reichsrat two or three years ago, paternal in character and aimed at the protection of the emigrant, may be past in the course of the next two or three years.

Hungary's desire to strengthen herself as a nation and retain her laborers is the reason for the hostile attitude which the Magyar government manifests toward emigration. It seems curious that a country that would come to some sort of an understanding with a foreign steamship company for the transportation of emigrants, and whose minor officials take extreme measures to enforce it, should be at the same time hostile to emigration. It is explained in this wise: The people insist on going. Their emigration cannot be arbitrarily checked. Therefore Hungary endeavors to guide the stream of human beings in such a way as to build up the commerce of Fiume, her only port, and help in her aim of making this port a rival of Trieste, Austria's neighboring and chief port. Unfortunately for the poor Hungarian emigrant, Fiume, being on the Adriatic, is a much longer journey from New York than are the North Sea ports. Therefore he frequently attempts to go by the latter route. Everywhere in Hungary one who is looking for information regarding emigration hears tales of emigrants being stopped at the borders by Hungarian officials and directed to go to Fiume; of the confiscation of tickets for the North Sea route, and, even of the opening of mail which appears to contain prepaid steamship tickets. One dislikes to believe such tales, but they are heard so frequently and agree so exactly in detail, that one is constrained to conclude that Hungary acts toward her people in this respect in rather a rough manner. It is hardly necessary after the above to say that Hungary has laws regarding emigration. Turkey forbids all emigration. In Turkey, laws sometimes work the same way that New York laws regarding disorderly houses do. They furnish levers for extorting money from those upon whom they bear. A Syrian with a pound Turkish in his hand can board an emigrant steamer without any difficulty. That is the recognized tariff for looking the other way.

Rumania is an exception to the rule among European countries. She is delighted in having an emigration, for within her borders are more Jews in proportion to the population than are to be found in any other country on the globe —and the Jew is the only emigrant from Rumania. Rumania loves the Jew so little that he is refused citizenship and is described in her laws as an alien residing under her protection. She requires of him military service, but refuses him political rights. Once she promised to recognize the sacrifices which had been made in war by the Jews by making them citizens. When the list of those who were thus to be rewarded for their patriotism was made public it was discovered that it was a sort of posthumous honor, for the eight hundred names on the list were of men who had been killed in battle, and the honor did not descend to their children. The Rumanian Jew is literally a man without a country. Once he crosses the border he is not permitted to return. This is especially trying to the emigrant, for the countries bordering Rumania thru which he must pass on his way to the coast are hostile to him also, and, therefore, if his way is not properly paved with cash, and he is rejected, his lot is a trying one.

When the sub-committee of the Commission was in Rumania it was noised abroad that it was seeking emigrants and would pay their way to America. The Jews thronged about the party, threw them petitions and, trying to kiss their hands, besought them to take the supplicants across the Atlantic. A large proportion of the Jews of Rumania are so poverty stricken that their only hope of escape to a better land is the prepaid ticket contributed by some more fortunate friend on the western shore of the Atlantic or in England.

A knowledge of the number of immigrants who are returning to Europe is essential to a fair estimate of the effect of immigration on this country. Up to the present time little attention has been paid to the statistics of returning aliens. Judging from what was learned this summer the percentage of those who return to Europe is greater than is generally imagined. While returning to America I learned that the ship on which I was traveling was carrying back to Europe each trip in the third class one-half the number of passengers transported to America. In a pinch the vessel could accommodate 1,400 immigrants. The average number of passengers in the third class eastbound on the four voyages for which I secured figures ranged between 463 and 917, the average being 666. The captain of the ship stated that those returning to Europe were less healthy in appearance than those westbound.

Another point for investigation is the effect of American labor conditions upon the health of the immigrant. On the steamer on which the Commisison went to Naples were 300-odd third-class passengers. Of this number, 68, or more than one-fifth, were going home because of illness. Twelve were suffering from pulmonary ailments. The disease in nearly every one of the twelve cases was said to be tuberculosis. The ship's physician stated that there were several cases of the disease in the third class on each eastward voyage, and added that it was his opinion that the Italians in America tried to subsist upon the diet

CONGRESSMAN BENNET AND MRS. BENNET AND ADOLFO ROSSI, ITALIAN COMMISSIONER OF EMIGRATION, IN CALABRIA STUDYING SOURCES OF EMIGRATION.

A HOUSE IN KRASICA, CROATIA, BUILT WITH MONEY EARNED IN AMERICA.

they had been accustomed to at home, and that it was insufficient to meet the drain upon their stock of vitality under the labor conditions of their new dwelling place. I have talked with American physicians practising among Italians. They support this opinion. In a number of places in Italy from which immigrants come it was learned that former residents returned from America suffering from this disease. It was stated on good authority that as many as twenty-five had returned in one year to one Sicilian town for the purpose of recovering from the "white plague."

Are criminals coming to the United States and how do they get in without detection? While in Syracuse, Sicily, I became acquainted with an unusually intelligent youth, whose business of selling antiquities had brought him in contact with Americans and caused him to learn the English language. A prominent New York banker had met him, and, attracted by his qualities, had invited him to come to America to study. The youth inquired very particularly of me regarding life in New York, and then said he had thought of coming, but was afraid of the Black Hand operators in the American metropolis. This was in the land popularly supposed by Americans to be infested with brigands and the *home* of the Black Hand. At Palermo it was learned that, in the course of the last ten years, while the population of the city has doubled, the criminal population has actually been cut in half. The chief crime was that now practised so extensively by Italian criminals in this country. The natural inference is that some of Palermo's criminals have emigrated to America. Cases were found of Calabrians who had been threatened by the Black Hand in New York and had sacrificed good positions in order to return home, where they felt safe.

The national government of Italy appears to be sincerely endeavoring to prevent Italians of criminal propensities from reaching America. In issuing passports to departing citizens care is taken to see that the wishes of the country to which they are going are respected, and none is supposed to be given to a person who has a criminal record to go to the United States. There are loopholes, however. The officials of small communities perhaps might be willing to stretch a point in connection with the granting of a passport in favor of a person whose presence in their baliwicks was annoying. Apparently passports are issued to persons who have criminal records to go to Canada. It is not difficult to imagine a person with a Canadian destination leaving the train somewhere between New York and Canada, or returning over the border. Moreover, it is not impossible for an Italian to ship as a member of the crew of a merchant vessel bound for the United States and desert at the American port. Merchant vessels are not watched by the Italian emigration officials, nor are they the subjects of strict observation by immigration officials in the United States. Such vessels have been known to sail away from Italian ports with crews numbering twenty or thirty more than when they returned.

Referring to the amount of money which immigrants are sending back to their old homes, and the uses which are being made of it there, I may say that I traveled thru the sections from which immigrants come, and in many places were to be seen evidences of this phenomenon. In Sicily one heard everywhere of changed conditions of living because of the influx of money, and one saw houses and shrines erected by means provided from this same source. In some villages, where once three or four families lived in one house, each family had a house to itself. On the walls of a church in Gesso, Sicily, which had been partially burned, hung a list of the subscriptions made toward the restoration of the edifice. When one read upon the sheet an unfamiliar Sicilian name and following it, "Pleasantville, N. J.," one began to realize more definitely than before what emigration meant to the home land.

A sojourn in America, according to the testimony of some of the officials and employers whom I met, is beneficial in its effect upon the lives of the people.

"The life in another country does them a great deal of good," said an Italian official in Sicily, referring to the emigrants. "When they return, their horizons have been broadened and they benefit Italy."

In Krosno, Galicia, I talked with a half dozen men employed in the oil works there, who had been in the United States. To the manager of the works I put the question, "Who are the better workmen, those who have been in America, or those who have not?" He replied that he preferred the former.

Lack of space forbids the enumeration of the towns in Calabria, Sicily, Croatia, Galicia and Syria in which new houses constructed by the fruits of labor in America were seen. Strange as it may seem, Syria appeared to have many more of these houses in proportion to its population than any other country. America is helping men in other parts of the world to satisfy desires for material things, but, better still, is helping men to discover their latent powers.

New York City.

DAVID JAYNE HILL.

It has just been announced that Mr. Hill, now United States Minister to the Netherlands, will succeed Mr. Charlemagne Tower as Ambassador to Germany when Mr. Tower retires, early next year. Mr. Hill's appointment to his new post is in the nature of a promotion, and follows Secretary Root's policy of recognizing meritorious service.

Dr. Hill is well known as an educator, writer and diplomat. His education was received at Bucknell University, where he was valedictorian of his class in 1874, thus refuting the prevalent idea that valedictorians are never subsequently heard of. Upon his graduation he was appointed an instructor at his alma mater, and three years afterward was given the chair of rhetoric there, and was in 1879 elected president of the institution. In 1888 he was called to the presidency of the University of Rochester, where his administration, which continued until 1896, was marked by great success.

He became Assistant Secretary of State in 1898, remaining at that post until 1903, during most of Secretary Hay's administration and in 1899 he is said to have been the connecting link between the American delegation to the First Hague Conference and the administration. The knowledge that he acquired of the peace movement at that time was of great use to him last summer, when he was a member of the American delegation to the Second Hague Conference and rendered such valuable service.

Dr. Hill has been a prolific writer of pamphlets and books, both in English and German, on international law. Perhaps his most important publication has been his "History of Diplomacy in the International Development of Europe," the second volume of which is just out. He is a member of the American Historical Association and other learned societies. He is also a member of the Authors' and Century clubs of New York, and of the Metropolitan and Cosmos clubs of Washington.

Thanksgiving

BY JAMES TERRY WHITE

WITHIN our hearts what happy mem'ries well
Today, and a new thankfulness compel!
The bygone years return with only their
Remembered tenderness, and, unaware
Of age and change, the old-time love retell.

But while we feast, we cannot quite dispel
Regret for lost ones whom we love so well.
Yet why thus grieve? There is no vacant chair
Within our hearts.

Ah! friends, does not this constant love foretell
A future greeting for each last farewell?
Even today we tread the Heavenly stair,
And now their Immortality we share,
If our beloved ones thus ever dwell
Within our hearts.

NEW YORK CITY.

The Lipari Islands

BY "ROSSANA"

["Rossana" is the *nom de plume* of a very distinguished Italian woman whose articles have lately appeared and been much discussed in the Italian press.—EDITOR.]

IN the southern part of the Tyrrhenian Sea, between Calabria and Sicily, lies the Lipari group of islands called in ancient times Æolian, because, according to a legend, they were the abode of Æolus, god of the winds, to whom were attributed the rapid and frequent changes of the atmospheric currents.

The group is composed of seven islands, Stromboli, Panaria, Salina, Filicuri, Alicuri, Vulcano and Lipari. From this last, the largest of all, the archipelago and the neighboring ten small islets take their name. Stromboli and Vulcano are subject to frequent eruptions, but the other islands, like the empty tomb of an ancient divinity, are wrapt in silence, and present a spectacle of wild and savage beauty never to be forgotten. Enormous walls of tufa, riven mountains of lava, scoriæ and masses of reddish stones cover the spent volcanoes; black, shining points of rock project here and there, and the traces of lava currents which flowed down to the sea are still visible; from mysterious mouths rush forth mineral waters whose sulphurous vapors whiten and decompose the tufa and lava as in the solfatara of Pozzuoli, giving forth a metallic but not unpleasant odor.

Among the picturesque spots of Italy and Switzerland there is none which can offer a more impressive picture than these ramparts, gently sloping to the sea; these hills rising abruptly to a hight of 2,000 feet; these broken crests glittering and shining in the sun where the thousand sparkles of the pumice shine like diamonds; these fertile slopes of extinct volcanoes that produce the best of oil and wine.

The visitor to these islands must re-

nounce all hope of comfortable traveling, and must resign himself to slow journeys on donkeys, but in compensation, from the waters of San Calogero to the Campo Bianco and the Capo Castagno, there is a continuous succession of marvelous scenes, a panorama in which the hills, the sea and the fruitful slopes have a peculiar charm, recalling the shores of Gennesaret and the land of Palestine.

Built on three spent volcanic cones that idly mirror themselves in the sea below stands the town of Lipari, formerly famous for its mines of alum, which it owed to the volcanic nature of the soil, and to the abundance of thermal springs. One slope of the islands is steep and precipitous, the other shaded by the dark green carob and the graceful vine that produces the fragrant malmsey. Below is the Campo Bianco, so called from the white pumice it contains, and which is exported to all Europe. Crouching near it is the ancient town of Liparus, often devastated by Etruscan pirates, but still existing in virtue of its famous temple. For centuries the town carried on commerce with the world in malmsey wine, raisins, figs, oil, pumice, sulfur, aluminum and dried fish, sources of wealth which justified its name of Liparus, *i. e.*, fat.

Even in the days of imperial Rome Lipari was set apart for political criminals, and at the present time there are within its castle 560 prisoners from every part of the Italian peninsula. On a precipitous rock, rising abruptly from the sea above cliffs of basalt, stands the ancient Norman fortress, dismantled and partly ruined, but still menacing in appearance. It is approached by a vaulted passage with pointed arches of wonderful architecture and imposing effect. Imagine a city shaken by earthquakes or half destroyed by time, a second Pompeii, where the ruined walls and arches, the rough roadways and strata of stones and pebbles make walking difficult; a dead city where watchful armed sentries still keep guard, and you have the present aspect of the Castle of Lipari. Within the ruined cavernous structure are vast halls now used as dormitories, and on the remains of the ancient glacis is a group of miserable buildings with absurd little windows, doors and staircases where the better conducted prisoners may hire a separate lodging.

The island contains four churches and the ancient Cathedral of Lipari, now all closed but well preserved within, and rich in paintings, among which are an altar front by Alibrando, of Messina; a Madonna Immaculata, by Barbera, of Barcelona, and an Assumption, by Russo. The existence of these churches proves the long sojourn of the Jesuits and Franciscan fathers in the island. The cathedral is of considerable importance from an artistic point of view, and its wonderful sacristy is adorned with exquisitely carved woodwork. But the steps leading up to the churches are all broken, worn by time, and injured by the ravages of men. The doors, without hinges and burnt, have been mended here and there, and furnished with iron bars to protect their treasures of silver; the fallen belfries, and walls only half repaired and ill-kept, are in complete harmony with that place of desolation and punishment, where the detritus of humanity is collected and compelled to a life in community. What ample facilities for the student of criminality! Here he might write present-day essays on social questions and criminal law, for here are gathered all classes of error, misdemeanor and mental suffering, the course of which he might observe with prophetic eye.

How do these 560 unfortunate people live?

A company of infantry, a platoon of police, another of marines, a police officer, a marshal and two brigadiers are stationed here to prevent escape; in other respects the prisoners are left to themselves, to their own instincts and vices.

At 7 a. m. sounds the reveille which calls them to rise; then each man makes his own bed under the surveillance of an official whose business it is to see that no one carries away his bedclothes. At midday is the distribution of the massetta, *i. e.*, the half franc given by the government to each prisoner for his keep. Half a dozen soldiers with fixt bayonets, and as many policemen armed with revolvers, are drawn up in a little room on the ground floor of an ancient

tower. Here there are no seats or other furniture except a rough table on which lie the 560 half francs. The brigadier calls the roll, and each in turn passes before the table, and having received his allowance passes out by another little door opposite to that by which he entered. Thus theft, violence and rebellion are impossible. Grave or smiling, frowning or sarcastic, they go on one after the other, a procession that impresses the spectator as one of the most wretched and repulsive that the human race can offer. A faint spark of feeling is shown at the hour for the distribution of the letters. Some faces grow earnest and grave; some eyes are dimmed; an eager curiosity shows itself in some countenances to hear news from the Continent. A tall, fair young man with catlike movements goes apart from his companions to read a long letter just handed to him, while the rest, disappointed or irritated, go away laughing noisily.

For the rest of the day they are quite free. Those who wish to work may do so freely. Many are employed in the pumice quarries and in the mills near the port, where they can earn three francs a day; but of what use is it? They have no sense of economy or order, tho there are rare exceptions who send money to their families or to the women whom nearly all of them have deserted on the pavements of cities. One alone, a Roman, has succeeded, by means of his savings, in opening a goldsmith's shop, and having left the quarries where he earned his money, he does fine work for the islanders. A saddler has taken a room in a street of the town, and when he is not drunk he works by amusing the passersby with his jokes and by showing a little mouse that he keeps in a cage. A Neapolitan acts as a hawker, and offers to the public with his native gaiety a variety of objects; an electrical umbrella, kitchen utensils, hats, but especially he deals in the shoes which have been given to the prisoners that they may not go barefoot, but which they sell regularly every three months. Another interesting figure is a native of the Abruzzi. He is a schoolmaster, but quite deaf. For the modest sum of one franc per month he teaches reading and writing to those boys who wish to learn. Watching him at work the words of the poet seem applicable:

*"La faccia sua era faccia di uom giusto,
Tanta benigna anca di fuor la pelle;
Ed'un serpente tutto l'altro fusto."

He is said to be unsurpassed in the astuteness with which he plans clever financial strokes, but always patient and gentle he spends his days in a kind of cell under a flight of steps, putting thru the elementary classes twenty-two little boys who profit by his deafness to make a frightful noise unchecked.

Other prisoners are employed as servants in private families, especially in the houses of the numerous Frenchmen who come to work the pumice quarries; others are barbers, shoemakers, bakers, laborers or fishermen, and are dispersed thru the streets, doing their work amidst the contempt and distrust of the islanders, avoided by all, and never hearing a loving voice or a word of kindness. They are only familiar with commands and reproofs, and the invectives of their companions. Barefoot, dirty, ill-clad, with fierce eyes and rough hair, they work, but with hatred and wrath, and almost fury. In the evening when work is over, they nearly all drink and gamble until at the hour of Ave Maria, when, reeling along, imprecating and swearing, they go to the Castle, where they pass the night on a sack filled with straw.

In the midst of such horrible surroundings, the result of evil deeds and moral misery, passions and vices flourish with a repulsive luxuriance. Here the usurer and swindler thrive, living on the evil gains they make from the devotees of games of chance. For every six soldi that they advance to their infatuated victims they extort four, and for every ten they charge six. So that the gamblers, mostly quarrymen and mill workers, have generally lost all their weekly earnings before they are due.

Statistics of the various departments show that the Venetians are the most peaceable; they work no more than will enable them to become intoxicated, then they throw themselves on their beds and stay there quietly until they are sober again.

The Calabrians and Sicilians are the

*His face seemed to be the face of a good man, so benignant was its expression, but the rest of his body was that of a serpent.—Dante, Inf. xvii, 10.

worst as regards thieving, stealing whatever they can, so that it is always among them that the police first make search when anything is missing from the dormitories or infirmaries.

The Romans and the people of the Romagna are the most violent; the knife is to them what brandy is to the Venetian. On holiday afternoons many of them are arrested on the glacis, whither they resort for fencing with knives, an exercise in which they display amazing dexterity.

The Neapolitans organize bands for petty theft, cheating, etc., and they practice the camorra with a boldness and authority that win for them the respect of their companions. They are generally lazy, yet they lavishly spend their ill-gotten gains. Some do no work whatever, profiting by their low speculations and the exaction of a species of blackmail. Slovenly, dirty in the extreme, they lounge in the sunshine, in the streets and on the benches at the port, or they lie in a lethargy on the heaped-up stones of the old fortress, only rousing themselves for a fight or a quarrel. This crew, collected within the narrow bounds of that ruined Castle which presents such a melancholy contrast with the enchanting panorama spread by Nature at its foot—this degenerate, unwashed crew kept at the expense of the State, now and then makes merry, especially when one of its members marries.

The free inhabitants of Lipari are constantly on the watch against the "coatti" (as the prisoners are called); they are never weary of protesting against such sojourners being sent among them, and they instil into the minds of their sons and daughters contempt for these intruders. Yet from Calabria and Sicily there come to this beautiful island many unfortunate women in the expectation or hope of finding husbands in some of the younger prisoners, who are permitted to marry and have families, provided they are always in the fortress at night. When such unions take place they are celebrated with much noisy mirth. No marriage could be more sad and humiliating than one of these, without any bond of sentiment or morality—a marriage contracted amid jeers, sarcasms and noisy jokes that might have emanated from one of the circles of Dante's Inferno, tragic and yet not without a comic side. These unions seldom last long, for when the husband has finished his term he goes away, abandoning his wife, thus proving his great depravity. "Here," said the officer who accompanied me, "is a university for crime, for besides their daily and isolated delinquencies, these men are continually thinking of and concocting the 'lucky hits' they will make when their time here has expired." They nearly all relapse; after a short time among their fellow men they fall again into crime and the Law sends them here again, condemned under a new sentence.

Can nothing be done to rescue the young men of from twenty to thirty years of age, who are contaminated by the evil example of old men hardened in vice and wickedness? Why should all their energies be wasted instead of being turned to good account?

If this great Norman fortress overlooking the sea, this ruined abode of misery where the owl makes her nest and where 560 men spend their days in idleness, could be transformed into a wide plain surrounded by simple and sanitary buildings, including a schoolhouse and a hospital, there would be no better institution for the education and amelioration of these delinquents.

If a wide road were to be made from the cathedral to Monte Sant' Angelo, and if the lava and scoriæ of the extinct volcano should be planted with vines, olives and mulberry trees, should vegetable gardens be laid out and wells sunk and this mass of degraded humanity formed into an agricultural colony, would not its reformation be possible?

Would not this be a worthy task for modern civilization?

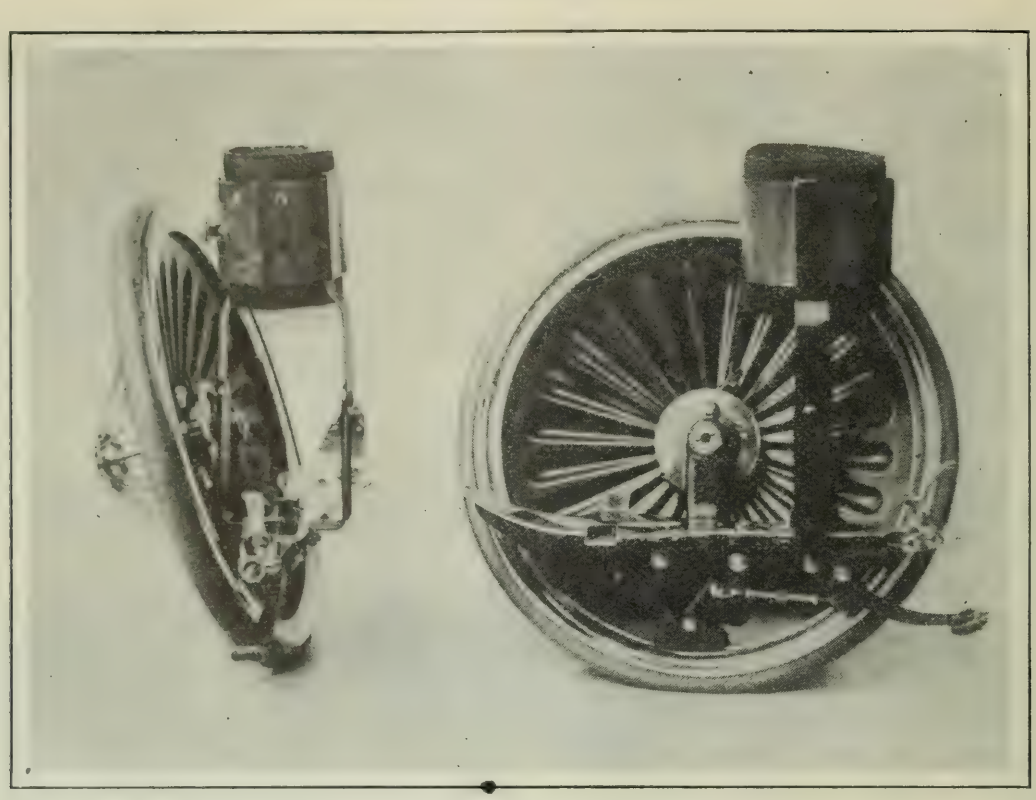
ROME, ITALY.

Walking Wheels

BY MAX A. R. BRUNNER

FROM the pictures we see that the wheels to be described herewith are quite different from the common roller skates, and cannot be classed as such from the standpoint of construction and application. They owe their origin to the conviction that it should be possible, in spite of all previous failures, to transfer the movement of the skater on ice upon roads which are fairy even. Of course, in the endeavor to find a suitable form for such a walking wheel, the great difficulty is in obtaining the necessary stability and safety while keeping the weight as small as possible.

The apparatus for each foot consists of one wheel placed in an inclined position, so that the foot finds space within the wheel itsef, a little below the hub. However, there is no tilting momentum upon the leg, and the vertical steel struts serve only to give the person a firmer stand. One wheel is used on each foot, so as to make it possible to walk upon uneven ground and around curves.



The connection between tires and hub is made by a sheet of thin steel, in which ribs and spokes are embossed to give it great strength. The position of the foot is such that the person may balance himself by tilting back and forth. The forward movement is effected by alternate pushing and pulling, but so the wheels always remain in contact with the ground. In standing still a kind of check in the interior acts upon the hub. When going down a slope brakes can be applied, of which one slides upon the ground like a shoe; the other acts upon the inner tire. The exterior diameter of the wheel is 13 inches, which is sufficient even for large feet. The weight is $3\frac{1}{2}$ pounds per wheel.

The brake is applied by placing the foot forward, so that the spur in the rear, seen in the cut, comes in contact with the road, and thus retards the speed at once. This sliding brake works well on macadam roads, but it is not sufficient on asphalt. For this purpose another brake is provided, which is fitted to the other wheel. Here by tilting the foot a brake shoe within the tire is applied, which acts upon the periphery of the wheel. This is done by means of pulleys and wedges, as can be seen from the cut.

WALKING WHEELS.

Learning this art is a rather simple

DETAILS OF WALKING WHEELS.

matter, especially if one has some practice in skating. The trials already made have proved the practical usefulness of these walking wheels. For the first models pneumatic tires have been used, which, however, were not satisfactory, as they are too elastic. Unlike bicycles or automobiles, a solid support is necessary in this case for the frequent strokes, while pneumatic tires give way too much to the pushing motion and are a waste of power. All new models are fitted with solid rubber. Small motors may be put within the wheels if desired.

The fastening on the foot is similar to the method used with skates, the sole and heel being clamped by screws or levers. Vertical steel struts help to give a firm hold on the calf, around which a wide strap can be tied. Great attention is paid to securing light weight and yet great strength.

All moving parts are fitted with dust-proof oil-holding bearings. The inventor is a Swiss engineer, who is often seen walking on the wheels in his hilly country.

BERLIN, GERMANY.

We Thank Thee, Lord!

BY HENRY COYLE

WE thank Thee, Lord, for spring's glad hours,
For summer's sunshine, birds and flowers,
  Full harvests, and good cheer;
For autumn's rainbow hues and glow,
And winter's mantle white of snow—
  For blessings thru the year!

For food and raiment and increase
Of harvest plenty, and for peace;
  For pleasure, joy and grief;
For toil and pain, for care and loss,
For sleep, for strength to bear life's cross,
  For kind and glad relief—

For liberty and Fatherland,
For a united household band,
  For all our needs supplied;
Oh, God, our Father, we today
Give thanks for all; and thee we pray
  With us still to abide!

BOSTON, MASS.

The Hague Conference From the Inside

BY SALVATORE CORTESI

[Señor Cortesi, who has been THE INDEPENDENT'S Rome correspondent for a number of years, was detailed by the Associated Press to cover The Hague Conference, and was in daily communication with all its leading delegates.—EDITOR.]

AFTER having been four months and a half at The Hague, following the proceedings and developments of the Peace Conference, day by day—indeed, moment by moment—I think it my duty to speak with absolute frankness about that important historical event. One might write a volume—in fact, several, interesting to the student of international law, or the jurist, or the politician, and others explaining the attudes taken by the different countries according to national interests, or to single aspiration, or on behalf of a collective policy followed by a group of Powers. All this would be very attractive and readable, but it can be done in future articles, while what the public really wishes to know at the present moment is what they should believe with regard to the Conference taken as a whole. And it is just on this point that I claim the liberty of speaking with rude frankness.

The Conference was a complete failure, a colossal fiasco, for all those who had imagined that it would take such resolutions or agree to such treaties and conventions as would change the present organization of the world, if not from one day to another, at least in a near future.

These people expected that the limitation of armaments would be imposed, that compulsory arbitration, in the form of a world-embracing treaty, would be enforced by the Conference, as if this assembly were a kind of Parliament in a Constitutional State; they already dreamed, if not the suppression of barriers between State and State, at least the preservation of the present territorial *status quo* by universal consent, which, once willingly agreed upon by all the interested parties, would, of course, lead to the suppression of war as long as the agreement lasted. Therefore it is no surprise that all these people, who expected what no Conference, composed of no matter what men, could attain in our days, proclaim loudly the bankruptcy of the institution due to the initiative of Emperor Nicholas II in 1898.

But this is not the natural, reasonable or practical way of looking at the Hague Conference, both with regard to its significance and the results attained. There is cause for satisfaction that the actual Conference realized a notable progress over that of 1899, unanimously recognizing and proclaiming the principle of obligatory arbitration. Indeed from this recognition it is justifiable to hope that the Third Conference will give a concrete and definite form to a world agreement, destined to eliminate all international questions from the fatal justice of a recourse to arms, all, without exception, including those which are now excluded even in very wide arbitration treaties, such as that of The Hague between Italy and Argentine, and between Italy and Mexico—that is, those which touch the "national honor," the "vital interests" and the "independence" of the country. Oh! the great potency of a phrase! Do not all wars conceal just those questions of national honor, which in many cases are nothing but questions of pride?

According to M. Nelidoff the "Second Peace Conference will remain in the history of humanity," because of the provisions agreed upon to make the effects of war less disastrous, but I dare to affirm that the Conference will remain in history for a higher and more important reason, to wit, for having been the first real step toward a Parliament of the whole world, without distinction of nationality, race, religion or form of government, and for having offered the possibility to the most enlightened men of every country to meet, discuss, know each other, and express opinions, which must undoubtedly produce in due time the desired fruits. The following, for instance, is the interesting way in which

Mr. Tsudzuki, the head of the Japanese delegation, a man who would do honor to any country, summarized his view of the Conference, in a letter addressed to Mr. W. T. Stead, and kindly communicated to me by the latter:

"It has always been my firm conviction that the fundamental ideas which animate human beings are everywhere identical; that what we call national characteristics are nothing more than transient phenomena, caused by different historical circumstances having acted in the past on one and the same substratum. I go further and maintain that racial differences are only skin deep. We have a celebrated verse that says that ice, snow, hail and rain, so different from each other in form, make one indistinguishable mass of water when they flow together in a river afterward. I am of opinion that a great deal of international complications, broils, and troubles, are greatly due to the fact that people are ordinarily more struck by the differences of others in external appearances from their own and do not take the trouble to dive below the surface in search of the substratum common to all. I am not at all inclined to what is usually called by the name of internationalism, but I firmly believe that the boundaries which history and geography have circumscribed around each small group of humanity must not serve as impassable barriers against mutual sympathy and the good understanding of different peoples and races. In other words, I firmly believe that patriotism and humanitarianism are two ideas quite akin to and compatible with each other. The denser the bonds of mutual intimacy between the peoples become, so much the better will they understand each other, so much the stronger will become the ties which bind them to the common cause of peace and civilization, and so much the more vivid the universal consciousness that humanity has a common mission to fulfill."

If from the Far East we pass to the near West we find Baron d'Estournelles de Constant defending compulsory general arbitration in a noble speech, delivered before the delegates, of which I quote the following passage:

"Let us not be discouraged by the difficulties which are our *raison d'etre*. The real way to resolve the question is to discuss it. Let us discuss it without prejudice. Do not believe that there are differences between us. There are, on the contrary, identical interests on the subject. There are not two points of view, that of Germany, for example, or that of France, or that of America; there is only the point of view of the past and of the future. We discuss a question which is not to be resolved, but which is already resolved, definitely settled years ago by several States.

"I will take the example and the pledges given in Europe by Italy, Spain, Holland, Sweden, Norway, Denmark, etc.; but it will be said that these States have not the neighbors or the difficulties which might divide other Powers. These difficulties may come up, and have not prevented Italy, whose diplomatic prudence and experience are undeniable, from binding herself to obligatory arbitration, by formal treaties, without taking possible objections into consideration. Where will be found a more categoric compilation of obligatory arbitration than in the first article of one of these treaties?" It runs:

"'The high contracting parties engage to submit to the Permanent Arbitration Court of The Hague, according to the Convention of July 29th, 1899, all the differences, no matter of what nature, which may arise between the two States, and which cannot be resolved by the way of diplomacy, and also, in the case that the differences had their origin from events before the conclusion of the present Convention (Treaty between Italy and Denmark, December 16th, 1905).'

"But we will leave Italy and take our examples outside of Europe, among those new peoples of whom it is no longer permissible, today, to be ignorant of the economic, intellectual, moral and political development. It will be objected that Americans have no past! In fact, their experience is short, but it counts double, and their experience, after all, of what is it the result? All the States of the American continent, twenty years ago irreconcilable, have today signed between themselves obligatory arbitration treaties without reserve. And what treaties! Listen to the articles of that of the Argentine Republic with Paraguay and Uruguay: 'The Powers engage to submit to arbitration all the contentions, whatever their nature or from whatever cause they may spring,' etc.

"The recent treaty of September 7th, 1905, between Brazil and the Argentine Republic, declares that the signing Powers engage to submit to arbitration all disputes which cannot be resolved by direct negotiations; of course, it is understood that these treaties contain a clause affirming respect for the Constitution of each State, but you know that Brazil has inserted in her Constitution itself the principle of arbitration. Are these to be considered only as insufficient germs or ephemeral symptoms? Can we forget all the efforts of North America and of President Roosevelt himself in the same field? I do not insist; facts speak louder than words. They will soon be known to all and considered as the model for the modern world."

These words, as well as those uttered by the majority of the delegates in support of the most important questions debated during the Second Conference, should be repeated and popularized by all the press which has faith in the progress of man, and in the possibility of establishing permanent and universal peace. Only in this way will it be possible to form the education of the people at large, going from the ruling class to the

peasant, from the diplomatist to the workingman, and including even the military element, which will exercise a tremendous and irresistible influence, capable of carrying thru, in a Third Conference, a practical application thruout the world of a satisfactory system of compulsory arbitration.

THE HAGUE, HOLLAND.

Working for the Friendless

BY KATE BARNARD

[Those who attended some months ago the National Conference of Charities and Correction at Minneapolis reported that no speaker there made a deeper impression than Miss Kate Barnard. We accordingly asked her to send some of her personal experiences and the following letter is the result. Miss Barnard is now Commissioner of Charities of Oklahoma.—EDITOR].

WHEN THE INDEPENDENT asks me to write of personal experience it mentions a most distasteful subject, for my life experience has been such that if dwelt upon 'twould

KATE BARNARD.

make me bitter. And, again, I hardly believe that in a world where there is so much of suffering, ignorance and vice, one should take any time to dwell much upon their own small self; it smacks somewhat of egotism—and an egotistical person seems as absurd to me as a grain of sand would be if it rose from its place on the shores of the ocean to proclaim that it was the greatest, grandest, noblest and most interesting grain of sand on the whole beach. But since you ask for something "personal" I would tell you this: My mother died when I was so young that I cannot even remember her face. With her death the light on my pathway of life was blown out. Can you now understand why I am interested in the orphan child? The life of the little boy or girl who has no mother reminds me very much of the winter time, when the leaves fall from the boughs and leave the trees standing specter-like and bare; when the dead boughs crack under your feet like the bones of dry skeletons; when the wind sighs and whistles and moans around the gables of your house; when the sun veils its face in far-off misty clouds; when gusts of icy wind blow clouds of blinding snow into your face, and the whole aspect of nature is drear, cold and dismal—this is the picture of winter—and winter is the only synonym of a motherless child life. And because I have suffered this winter, I hope to devote my life to such work as will bring a little of the cheer of spring into the darkened lives of those unfortunates who are to follow me in the civilization we are building down here. And so it happens that I am interested in the motherless little ones.

My father, when I was about fourteen, lost his fortune, and we moved to Oklahoma and bought a home in a southern section of Oklahoma City, but the resident section moved north, and then it was a strange thing happened which opened my eyes to a new view of life. The well-to-do people gradually

moved out from the district around our home and the poor began to take possession of their dwellings, and because they were poor several families occupied each house, where heretofore one family had lived, and a whole family, with their many little ones, would be found living in a single room, crowded and huddled together, with no chance for privacy or a bath; where if one child lay sick of contagion the rest of the family must live, eat and sleep in this room, breathing the same germ-laden atmosphere, thus forced to spread the malady, and out of these crowded pest-ridden "homes" came the strangest children I ever saw—peaked and poor and thin and sallow; little, old, weazened, pinched and drawn; children who shivered from the lack of clothing on the cold winter day; children whose bare feet protruded thru their remnant of threadbare shoes; little children who drifted around, hungry, cold, uncared for, unloved, drifted past my door—drifted thru our boasted civilization—drifted by our tall church steeples, with their silent pulpits, just like the old dry autumn leaves drift and shiver on the winter breeze—dead things, drifting around together.

I watched these children till my heart ached and I was compelled to cry out in their behalf, and the result of my cry was the United Charities of Oklahoma City, an organization which I gave free headquarters in my own home and of which I was matron for two years, an association which has assisted over two thousand destitute and worthy poor.

But charity work soon led me into a higher conception of the duties of life than the giving out of a biscuit or bun. What the people need is that class of legislation, well enforced, which will protect the weaker man against the strong and give him a better opportunity in the battle of life. My study of the poor from daily contact with every phase of their life leads me to conviction that the American nation must protect her children, even tho this borders on paternalism. The only way to stamp out poverty, with its resultant degradation and crime, is to begin with the children, and insure them an industrial as well as an intellectual education. I would see the States take a child away from a parent that was too poor to educate it, and give this child an education, with plain food and plain clothing, educate him to the sixth grade, then teach him a trade. If necessary, let the child work in a State institution for three years; give its free service to the State as a recompense for the money, care and time which the State had expended on the child. In this way we might stop child labor, stamp out ignorance, lessen crime, and insure to the State strong, robust, intelligent, energetic men, and when the child is twenty-two years of age it would have returned its debt to the State, and the State could return the child to the parents. Something or other must be done to safeguard the child along these lines, and to limit an influx of foreign immigration each year to the number which our nation can readily assimilate.

My work among the poor led me into a study of sociology and political economy, with the conclusions which I have just given you. I decided to devote my time to securing such legislation as would tend to carry out my line of thought.

Of course you know I am the new State Commisioner of Charities of Oklahoma, and in this capacity I will exercise a large influence on the criminal class. I am led to believe that all humanity is naturally good, if given certain environments. An individual cannot be otherwise than bad until human nature has grown much stronger than we find it today; therefore I shall be most patient with what I am pleased to call my unfortunate brothers and shall endeavor to make our jails and penitentiaries houses of reform, our insane asylum a hospital, and our poorhouses the least objectionable possible.

My life's experience is simply that of a Western girl reared to luxury; suddenly thrown into the bottom of the financial abyss, where the struggle is tooth and nail for bread; raised to fair affluence again, whose terrific experience brought personal sorrow and with it a new ideal and a strong desire to be of such true service to my fellow men that those who come after me will not be subjected to the hardships which I have known. To this end I dedicate my life.

I hope by my example to show what any girl from the commonest walks of life can do for suffering humanity if she will really, earnestly try.

Oklahoma City, Okla.

Literature

The Weavers*

Sir Gilbert Parker is at pains to warn the reader in a prefatory note that "this book is not an historical novel," otherwise we might have believed that the hero was "Chinese" Gordon under a Quaker hat, and that the chief villain in it was a very distinguished English statesman. The scene changes from a quiet Quaker village in England to the palace of Prince Kaid in Egypt and along the Nile, then back to England. And it is this return from the desert to home and honors which saves the book from being an historical romance—history having recorded quite a different sequel. David Claridge, a young Friend of more brilliant origin than he imagined, is the hero and chief weaver of the strands of fate. He receives a kind of spirit rather than spiritual call to Egypt thru some occult communication with a relative who had been murdered there. He follows the call and becomes chief adviser to the Prince Pasha. In this capacity it is difficult to say whether the author meant him to represent Joseph of the Old Testament or Gordon, the martyr of Kartum. Probably he had both characters in mind. If so, one is at a loss to account for the commonplace brass-band hero in the closing chapters.

The statement has been made that "for mere surge of interest and excitement" the book outranks "The Right of Way." As a matter of fact, it does not compare with that novel either in manner or meaning. The one thing lacking is the "surge." The author depicts situations out of which great tides of emotions should arise, and they do not. The whole conception is as dead as any mummy in Egypt, the chief difference being that it is embalmed in an excellent literary style. Apparently Sir Gilbert belongs to that class of writers who, still in the prime of life intellectually, have lost some quality of the spirit which renders it difficult, if not impossible, for them to produce the illusion of life. They get the very look of it, but not the *life* of it. Parker's trouble may be that he knows from practice so exactly how to write a story that he gets on with it too well without the thing we call inspiration—that God's breath which makes the difference between life and the lack of it. So Parker innocently counterfeits love, honor, hate, vengeance and ambition with mere literary formulas. The very characters in the tale are too obviously at the author's services. They are not inevitable, but are simply the butlers and maids in waiting to his imagination needed only to announce other characters equally dumb but for the words put in their mouths.

Moreover, after reading Hichens's stories of the Arabs and of the desert, Parker's descriptions of both are dull and geographical rather than dramatic. The explanation is that the latter is too normal, too sturdily bred to a certain righteousness of the mind, to be sufficiently decadent in imagination to interpret this burned-out end of the world, its lust-scarred, famine-marked humanity.

*The Weavers. By Sir Gilbert Parker. New York: Harper Brothers. $1.50.

College Presidents on Modern Problems*

As Mr. James Bryce pointed out in "The American Commonwealth," college presidents in America are distinguished from their colleagues in Western Europe by their activity in molding public opinion. The lectures in these two volumes by two university presidents, Butler of Columbia and Hadley of Yale, all dealing with the working of democratic institutions in America, and first delivered before general audiences, are illustrations of this beneficent activity.

The president of Columbia uses a style more polished, more suitable for presentation in book form, than that of the

*True and False Democracy. *By Nicholas Murray Butler.* New York: The Macmillan Company. $1.00.

Standards of Public Morality. *By Arthur Twining Hadley.* New York: The Macmillan Company. $1.00.

president of Yale, whose "manner of treatment and choice of illustrations show that his lectures were originally intended for the platform rather than for the printed page." But the simpler style, the sharp-shooting of the shorter sentences, compensates by bringing the reader closer to the writer's personality, for the absence of that artistic pleasure which the carelessly wrought essay affords.

Both of these heads of universities have a reassuring faith in the outcome of our political democracy, tho neither is dim-eyed to the dangers, palpable and impalpable, of our machine politics. President Hadley says:

"I am no pessimist. I do not see anything which warrants the fear that we shall repeat in the near future the experience of Athens or Rome—unless it be the mistaken complacency of those optimists who think that we can repeat the mistakes of Athens and Rome without incurring the penalties."

In both books the same diagnosis is given of the origin of the political machine controlled by a boss: namely, the system of checks and balances established by the Constitution. If a Governor and Legislature, being in disagreement, can bring law-making and office-filling to a deadlock, and if judges, who are our most potent law-makers, can interpret laws according to personal whims, our government is unworkable. But if those members of a party who hold office must obey the behests of the party convention and the party leaders, then harmony can be secured and progress achieved. "Party machinery has appeared to be a necessity for getting the work of the government done continuously and regularly."

The leader of a party should be a statesman; in actual fact he is generally a "boss." To transform the leader from "boss" to statesman Doctors Butler and Hadley have different remedies. The former relies upon punishing him at the polls when his nominations are bad and perfecting civil service reforms so as to dry up the sources of his funds. Recent revelations of the subsidies which the Prince of Darkness, the ruler of Tenderloin districts, makes to the dominant political party in Chicago and in New York, and of the lavish size of "Yellow Dog funds" contributed by corporations, make that remedy, good in itself, to appear somewhat Lilliputian. President Hadley recommends for its curative properties, and with an enthusiasm which is unique in these pages, the system of direct primaries. "I do not know any field of effort," he says, "which is more promising for a man who wants to do political service . . . than the development of the direct primary or of some similar means which will give the average voter the best chance of expressing his views before the nomination." Since the stronghold of the "boss" is the convention, this remedy might prove more potent, tho the "boss" has hitherto shown himself so resourceful in escaping the nets that were set to catch him that experience alone will demonstrate whether the direct primary will prove his undoing.

While asserting their fidelity to democratic rule so far as it has extended, both these presidents show some nervous alarm about the threatened extension of the sphere of democracy. Each declares that equality and liberty are incompatible. "Liberty leads directly to inequality, based upon the natural differences of capacity and application among men. Equality, on the other hand, in any economic sense, is attainable only by the suppression in some degree of liberty." Therefore, in their reasoning, equality we must forego. But is equality of opportunity, the demand of today, at all incompatible with liberty?

Perhaps President Butler, being a personal friend of President Roosevelt, approves a somewhat wider extension of the State power than President Hadley, who has long been prominent as an unterrified defender of an individualism which is becoming old-fashioned. Columbia sees a cure for "what is properly called exploitation" in the development of an understanding of what property is public and assigning the care of such property to the Government. Undertakings partly public in character he would allow private corporations to initiate under State rules.

But Yale would object to so much extension of governmental power. It appeals to the leaders of industrial corporations to be faithful to the public side of their obligations; it trusts to "the voluntary development of the sense of trusteeship." Since President Hadley wrote these words events have falsified his con-

fidence that "the business community of today recognizes that the president and directors of a corporation have a fiduciary relation both to their stockholders and to their creditors." That quartet of financiers who looted the Chicago & Alton Railroad of twenty-three million dollars, and the group of traction magnates, recently exposed, who have drained the treasury of the Metropolitan Street Railway Company, still stand unshaken in the business community. No club has expelled them from membership; no board of trade or chamber of commerce purged itself of their presence.

When we examine the attitude of these college presidents to the newer problems which are arising, we discern why the influence of the scholar as publicist is so limited. He is timid before new problems, anxious to conserve things as they are, reluctant to step forward, an excellent exponent and critic of accepted institutions, a sworn foe of those pleading for acceptance. So wedded is President Butler to government by the strong hand, so suspicious of the folly and the incapacity of the people, that he goes so far as to say that "It is primarily the President and the Supreme Court who speak the people's maturest mind." The President we might admit, but the Supreme Court! To neither writer does it occur that perhaps their predictions of the disastrous result of extending the power of the people over parts of the field of industry might be disproven by experiment exactly as the predictions of the disasters of political democracy have been disproven.

Plays of Our Forefathers

When Professor Gayley wrote his introduction to the comprehensive volume, "Representative English Comedies," he had considerable to say about the miracle and mystery plays in their relation to the development of English comedy. Soon after, in the now defunct *International Quarterly,* he published several exhaustive chapters on the cycles of secular religious dramas, discussing their inter-relation and their essential differences, both as to scope and as to rhyme scheme. This activity on the part of Professor Gayley seems to have been but a preparatory for the handsome book just issued, which bears the title, *Plays of Our Forefathers**—a title somewhat lacking in definiteness, however picturesque in possibilities.

Between the publication of this and of his former "Representative English Comedies" there appeared in England a most staggering example of research work in the shape of E. K. Chambers's two volumes on "The Medieval Stage," which took up minor points of detail regarding the liturgical drama and its offshoots, and which hounded obscurity to its lair with copious footnotes and varied translations. As a reference work, it is hard to exceed this for completeness, but its interest is for the specialist alone.

This fact Professor Gayley graciously recognizes; he pays due deference to the assiduous scholarship of Mr. Chambers, at the same time seeking to popularize his own work. The result is a peculiar blend of familiar style with the scholar's integrity. The book lacks vividness, tho the material may be all there; its details are not concentrated so as to show successive stages of development in their proper proportions; it does not leave in the mind of the layman a definite understanding of the social significance underlying the birth of our present-day drama from the church service.

Particularly interesting, when given in detail, is the description of that literary transformation which took place in the change from *trope* to cycle; this was carried on by a process of accretion and assimilation, where a slight interpolation during the religious service became in the end a full-grown secular drama. In this matter of distinctness, therefore, Professor Gayley has let his popular object escape him. He is too prone to lay stress on technicalities, where, in many cases, he is but recasting, in lighter form, what Mr. Chambers has already done. The medieval drama of the church depended for its life upon vital social needs. To the lay reader this aspect is more necessary than an exposition of the metrical arrangements, thru which a slight agreement between texts may be seen.

Such erring on the side of scholarship

*Plays of Our Forefathers. *By Charles Mills Gayley.* New York: Duffield & Co. $3.50.

in one way adds to the value of Professor Gayley's book, which is a notable contribution. We only wish to emphasize that in another respect he lost an opportunity. Both as to breadth of view and richness of illustrative material his new volume shows distinction. On the human side it has not done full justice to the subject. There might have been a more thoro discussion of the guilds into whose hands the religious drama finally fell; there might have been a more extended exposé given of the reasons which forced the drama from the church and from the clergy into the churchyard, thence into the street—from the altar to the pageant wagon.

Diffuseness, nevertheless, will not prevent this book from being hailed far and above any other work heretofore accessible for the non-specialist, unless we except A. W. Pollard's "English Miracle Plays." Miss Katharine Lee Bates's "The Religious Drama" is too slight in outline; Dr. Davidson's "Studies in the English Miracle Plays" too purely a dissertation for a doctor's degree. Such foreign authorities as Du Meril, Froning, Milchsack, De Julleville and others are inaccessible for general purposes. And, as we have said, Chambers is too thoro. So that Professor Gayley, by his *Plays of Our Forefathers,* fills a gap. He takes for granted that these chapters will be used as a key; that the reader will follow up references to the cycles with actual comparison and investigation.

The Wingless Victory*

An Ibsen plot set in a Thomas Hardy environment—this is the briefest characterization that can be given of M. P. Willcocks's novel, *The Wingless Victory,* The combination is, on the whole, an effective one, for the author has undoubted talent. The story grips the imagination and the attention, altho—nay, because—its hero is but a poor, weak, groping, erring human brother, and its heroine its least attractive figure, for she, unlike the man and the rustics and fisherfolk of the English coast, unlike the atmosphere, social and physical, gloomy tho that be, claims temperamental relationship with more than one of Ibsen's heroines. *The Wingless Victory* is a good, because an uncommonly apt, title, and yet the story might as well, and as aptly, have been frankly called "An Enemy of the People." The physician, a poor, everyday country practitioner, lacking physical comeliness as he lacks eminence of mind or ability, seeks to win the love of the woman who has married him by distinguishing himself; there is here an inversion of the situation in "Madame Bovary," where it is the woman who attempts to push her insignificant husband into professional prominence. Somehow or other this novel suggests many comparisons by its very merits. Having decided that the village needs a sanitary water supply, the physician finds himself opposed by all its notables, and bows at last to superior force, consenting to a half-way measure that, he knows beforehand will prove in vain. Meanwhile his wife, vaguely pursuing a vague ideal, drifts farther away from him, seeking a man worthy of her hazy standard. The deserted husband fights the battle to the bitter end, an unheroic hero, whose victory is wingless, indeed, but all the greater for that. We so rarely recognize the worth of those who faithfully serve us, we prefer to acclaim those who make us serve them.

The background and the minor characters that people the story are capitally drawn. The narrowness, intolerance and uncharitableness of these folk, relieved by a single ray of romance, but intensified by the somber passion of the "other woman," call for the use of grays, which are the prevailing tones of the story, light being introduced only by considerable variation of the shading.

*The Wingless Victory. By M. P. Willcocks. New York: John Lane. $1.50

Prevention of Child Ills

The world is learning very thoroly the lesson that it is better to keep children from being ill, or becoming deformed, than to try to cure them after pathological incidents have happened. The two books before us are very fair samples of the body of literature that has arisen for popular education as to the care of children, before they have become ill or developed deformity, and it is especially the portions of the books which treat of

prophylaxis that are popularly interesting. The fact that the book on the care of children[1] comes to us almost directly from the clinic of Professor Heubner at Berlin, who is recognized to be one of the best living authorities on children's diseases, is of itself sufficient to demonstrate at once its thoroness and its up-to-dateness. The chapter of the book that is most valuable is that on respiratory diseases, in which the author makes it very clear, that there is very much more danger of children contracting respiratory diseases, whenever they stay for any length of time in crowded ill-ventilated places than there is for adults.

Dr. Lovett has now for many years been considered one of our best American authorities on the subject of spinal diseases and spinal deformities in children.[2] His views on the subject deserve to be in the hands of all those who, as educators and charity workers, are interested in the prevention of child deformity. He emphasizes the fact that curvatures of the spine are due to defective position in the schoolroom, but also and especially to various sensory defects. Unequal hearing, for instance, by causing a tilting or twisting of the head may result in lateral curvature. Unequal vision may act in similar fashion. Defective vision may also have such a result. Inequality in the length of the limb or the occurrence of flat foot in one foot may have a similar consequence. All these are practical details with which educators and those who have charge of children in institutions should be familiar.

The Cambridge Modern History. Vol. X. The Restoration. New York: The Macmillan Co. 1907. $4.00.

The tenth bulky volume of the *Cambridge Modern History,* which has now won its place everywhere as the most reliable, if not the most readable, depository of facts on history since the Reformation, bears the title of *The Restoration,* and covers a period of about four decades after the overthrow of Napoleon. The names of the scholars co-operating in the production of the volume warrant the conclusion that as far as accuracy and good temper are concerned the book will take rank immediately with its predecessors in the same series, and ought to crowd many superfluous compilations off the shelves of the serious searcher for historical fact. Mr. Alison Phillips contributes the chapters on the Congresses of the Powers, Greece and the Balkan Peninsula, and Mehemet Ali; Professor Bourgeois writes with his usual firmness on the Restoration in France and the Orleans Monarchy; Spain's distinguished historian, Professor Altamira, takes the reader with skill and precision thru the wearisome details of his country's complicated history from the restoration of 1812 to the dictatorship of Narvaez; Mr. Kirkpatrick tells the story of Spanish dominions and independence in America; Professor Pollard recounts the history of the Germanic confederation (1815-1840); and Great Britain is committed to the care of some younger but able English scholars. In the organization and presentation of materials the volume is like its predecessors. Every library should have it, and the busy scholar who wants facts, not eloquent fiction, will secure it for reference, but no one will read it over his evening pipe. In this regard it cannot be esteemed an equal to the French co-operative work, the "Histoire Générale," which is always lucid and sometimes interesting.

Ancient Society. By Lewis Henry Morgan. New York: Holt & Co. $1.50.

It is a well deserved tribute to the memory of Dr. Lewis H. Morgan that Holt & Co. find it necessary to bring out a new and cheap edition of his great work on *Ancient Society,* published for the first time thirty years ago. It is true that the reviewer for a very respectable New York paper treated it as a "recent" volume; but every student of historical sociology for the last quarter of a century has treasured it as one of most original and permanent contributions ever made to the explanation of the evolution of human society. Scholars abroad, even more than in America, have

[1] The Mother's Nursery Guide for the Care of the Baby in Health and in Sickness. *By Setrak G. Eghian, A.B., M.D.* New York: G. P. Putnam's Sons. $1.00.

[2] Internal Curvature of the Spine and Round Shoulders. *By Robert W. Lovett, M.D...* Philadelphia: Blakiston's Son & Co. $1.75.

appreciated its significance and used its data and conclusions in many ways perhaps not contemplated by Dr. Morgan. This is no place to pass under review the conclusions of so old a work whose author has been dead for more than twenty years, but it seems appropriate now to note for the newer generation some events in the life of that remarkable man. Morgan was born in 1818 and for a time practiced law in Rochester. While a young man he went to live among the Iroquois, studied their laws, government and daily life, and published, in 1851, a still famous work of high scientific value on "The League of the Iroquois." Some years later he visited the Ojibway Indians, and, struck by the similarity existing between their institutions and those of the Iroquois, he set out on a wide and deep research into social origins which resulted in the present volume on *Ancient Society*. Its most important influence was to demolish the doctrine of special dispensation in the way of institutions and to clear the ground for a natural history of society.

The Enemy at Trafalgar. An Account of the Battle from Eye Witnesses' Narratives and Letters and Despatches from the French and Spanish Fleets. By Edward Fraser. New York: E. P. Dutton & Co. $3.50.

The centenary of England's greatest naval victory and the *entente cordiale* which now exists between England and France and Spain are both celebrated in this volume on Trafalgar, which is compiled from the personal accounts given of the battle by naval officers on French and Spanish vessels. An interesting comparison is made by Mr. Fraser between the casualties in Admiral Togo's battle in the Sea of Japan, in the recent Russo-Japanese War and those of the Battle of Trafalgar. In October, 1805, Great Britain had 1,609 killed and wounded; while Admiral Togo's victory cost the Japanese 537 in casualties. On the side of the vanquished, the French and Spanish, in 1805, lost 6,933 in killed, drowned and wounded; while the losses of the Russians a century later were estimated at from 7,000 to 12,000. Taking the losses of the Russians as being nearer the smaller than the larger estimate it will be seen that notwithstanding the enormous advances that had been made in the construction of battleships and in the deadly destructiveness of the engines of war, there was no great disparity between the aggregate losses of the great naval battles of 1805 and 1905. Napoleon's reception of the news of Trafalgar and his reported suggestion that had Paul Jones survived to his full term of years, France would have had an admiral, and Nelson a worthy antagonist, opens an interesting realm of surmise to the admirers of the great Scotch-American adventurer. *The Enemy at Trafalgar* is a fine example of modern printing. It is well and fully illustrated with portraits of the French and Spanish heroes of Trafalgar, with camp and harbor scenes, and with plans of the line of battle.

Huck's Synopsis of the First Three Gospels Arranged for English Readers. By Ross L. Finney. New York: Eaton & Mains. $1.00.

The Harmonies of the Gospels in common use, both Riddle's, Robinson's and that of Stevens and Burton, are out of date and misleading, for the reason that they include the Fourth Gospel and construct their framework according to it, whereas it is now generally agreed that the Fourth Gospel, whatever its date and authorship, should be studied as a distinct work. Mr. Finney and his publishers are therefore to be highly commended for preparing an English edition of Huck's valuable *Synopse*, which is a Greek Harmony, in wide use in Germany, having been designed as an aid to Holtzmann's *Hand-Commentar*. Huck follows the order of Mark, and, as is the prevailing opinion, treats it as the earliest and original Gospel. One reading this *Synopsis* sees quickly that Mark and a collection of speeches were worked together in a different manner by Matthew and Luke, and that both introduced new material. This is decidedly the best Harmony for historical study, and its wide use would promote greatly the knowledge of the New Testament. Mr. Finney has followed the second edition of Huck, and has simply substituted the English of the American Revised Version for the Greek of the German volume.

Janus in Modern Life. By W. M. Flinders Petrie. New York: G. B. Putnam's Sons. $1.00.

It is a pity when scholars who have won a position of authority in one subject write books on other subjects that show an imperfection of knowledge and a crudity of reasoning which they themselves would be the first to condemn in their chosen field. Dr. Petrie commands respectful attention when he writes upon archeology, but when he turns to sociology, the subject of this little book, he writes as an amateur and must be weighed dispassionately. The crudity of his teaching is illustrated by such statements as the following: "The compulsory entry of all the master employers into unions would no doubt be a step very welcome to modern unionism." Imagine Mr. Samuel Gompers demanding that the president of the Manufacturers' Association be compelled to affiliate that association with the American Federation of Labor! "The ground landlord who is so much abused has little to do with high rents." Be it remembered that in New York the value of the ground on an average is double the value of the building erected upon it. Again, "The most disastrous as well as immoral kind of taxation will be that proposed as additional upon all permanent investments under the guise of 'unearned income.'" By the imposition of such a graduated tax on the incomes of those who "toil not, neither do they spin," Dr. Petrie foresees the destruction of British shipping and manufacture, the exodus of "persons living on fixed income," and "a grave moral detriment to the community." Horrors! London County Council stock "stands at a lower price than India stock," which shows that all the risks of financial ruin in India "are thought less than the risk of the bad faith of the London County Council." This is, of course, due to the naughty socialistic tendencies of that infamous Council, tho it is at least curious that British consols, unsmirched by such tendencies, have also touched the lowest point in recent history. Dear money the world over may account for the high price of the securities of reactionary governments, but clearly a progressive government which must pay dear for its loans is only reaping the reward of its social sins! After denouncing government interference thru many pages, our author propounds his grand remedy, which involves "the free support for all children" which the finest 2½ per cent. of the population, both mentally and physically, "may create after they reach the age of twenty-five and the compulsory celibacy of the worst 2½ per cent., except on condition that the women accept sterilization by surgical operation. This is certainly a startling proposal from one who is enraged at the "tyranny" of trade unions.

The Nemesis of Nations. By William Romaine Paterson. New York: E. P. Dutton & Co. $3.00.

The rise and fall of nations "thru the majestic sweep of the ages" has always furnished a fruitful theme for philosophers and inspired Gibbon to write one of the noblest and enduring monuments in the long record of historiography. Now comes Mr. Paterson—sometime pupil of Dr. Caird, master of Balliol and that ripe classical scholar, Professor Gilbert Murray—and presents at the bar of historical judgment an eloquent volume on *The Nemesis of Nations*—Hindustan, Babylon, Greece and Rome. It is no common piece of work dreamed out without labor—but betrays on every page an intimate acquaintance with the best modern literature on antiquity and also with the original sources themselves. The argument of the book is strangely familiar to the reviewer—who once had the pleasure of sitting at the feet of Dr. Caird for a too brief period and also of speaking with many men who knew and loved Thomas Hill Green. Somewhere at the heart of the eternal movement of things sits justice weighing nations. Let our author speak: "Babylon was great. She used science, but she abused humanity. She invented sun-dials but forgot to regulate the hours of labor." The ethics of the Greeks "are full of elaborate discussions about justice, but no amount of casuistry will convince us that the treatment of Athenian slaves was just"—the culture of Athens was bought at too high a price. "A great mass of human beings sunk in slavery and living in slums where human life must have been at least as degraded as it is in Shoreditch, Hoxton and other parts of modern London can have possessed no national interests; the peril of

the State was not theirs." The spirit of Hegal still lives; justice alone saves nations from being swallowed up in "the wreck of matter and crush of worlds." Whether this view of *The Nemesis of Nations* is a fancy woven in the heart and brain of the thinker or springs inexorably from the inherent nature of things—students will differ—but whoever reads Mr. Paterson's book will be a wiser and more chastened man.

Slavery in Cuba, 1511-1868. By Hubert H. S. Aimes. New York: G. P. Putnam's Sons. $1.50.

Excepting certain spots in equatorial Africa and some of the real estate of the King of the Belgians, the question of slavery is not the burning issue that perturbed our hardy ancestors during three-quarters of the last century. Organized slavery exists now only in history, but it has made interesting history, and the Cuban chapter contributed by Dr. Aimes in this volume is excellent reading. Like most men who can read Spanish archives in the original, the author's views of Spanish methods are a trifle more lenient than those of the man in the street. But there are always two sides to a story, and on page 33, where he says: "It has often been asserted that the license enjoyed during the English occupation was the cause of the awakening and economic development of Cuba. The claim can be accepted as one instance of Anglo-Saxon self-glorification," his use of the word "license," instead of the more suitable word "liberty," is not altogether assuring evidence of that strict impartiality which should distinguish the true historian. Also when he states that the plans for betterment had been "conceived long before in the minds of both French and Spanish rulers," this in no way lessens the fact that the English promptly *did* the thing, and if they had not it might have continued getting "conceived" by a long succession of rulers. On the whole, it can be heartily said that Dr. Aimes has gathered, compiled and dressed into acceptable form an exhaustive chapter of institutional history. He has also done it under a system that makes reference easy and verification available. It is not altogether certain, however, that the accountancy method of the appendices deserves place as a pattern for close imitation when dealing with a human article. They are compact and convincing as an invoice, and, like an invoice, they give the price in cash and credit, for class and age by cargo, selection, or picked lot, also the official total import of muleque, mulecon, creole and ladino from 1511 to 1865, the gross total over all being 527,828. The index is particularly well arranged, copious and accessible. The bibliography gives upward of 250 references, which are classified under subheading and their degree of subject importance noted in margin.

Ancient Chronology. Part I. By Olaf A. Toffteen, Ph.D. 8vo., pp. xix, 302. Chicago: University of Chicago Press. $2.50.

That there are those who take an interest in the most intricate questions of ancient chronology is something to be thankful for, because, while no studies are more difficult, on account of the paucity of confused material, chronology lies at the basis of correct history. Dr. Toffteen is Professor of Semitic Languages and Old Testament Literature in the Western Theological Seminary, Presbyterian, of Allegheny City, Pa.; and we we may naturally expect him to take very few liberties with the biblical chronology. Indeed, he treats the early history of Genesis with great respect, altho we observe that he does say that Serug of the Genesis patriarchs, represents not Sargon I, who lived about 2500 B. C., but the Sargon dynasty. Most of the work is devoted to the Babylonian and Egyptian monuments and their data, and the study is very thoro, altho it is impossible that his conclusions should agree with those of any previous scholar. He has no patience with the extreme dates that were familiar some years ago. The earliest Egyptian dynasty begins 3285 B. C., about the time of the earliest monuments of Babylonia. A Semitic people, he agrees with Meyer, were in Babylonia from the earliest historical times, and the invasion which gave rise to the Hammurabi dynasty in Babylon he supposes to have come from the Syrian north and not from Arabia. The treatment of monumental sources is careful, and the general conclusions do not contradict the more sane and conservative scholars, to whose investigations he has added much that is of value.

Christmas Numbers of British Periodicals. The London Graphic (50 cents). Illustrated London News (50 cents). Pears' Annual (35 cents). Black and White (50 cents). Holly Leaves (50 cents). Sketch (50 cents). Gentlewoman (50 cents). Lady's Pictorial (50 cents). Le Figaro Illustré (French or English text, $1.00). Art Annual (75 cents). New York: The International News Co.

Two British Christmas institutions at least have not yet taken root in this country, and we have to depend upon the Old Country for our supply. We make our own plum pudding now and grow our own holly, but we still import our fairy pantomimes and "Grand Christmas Double Numbers." Our illustrated weeklies put on a little extra holiday decoration, but the English add big and gorgeous "presentation pictures," reminding one of the bundle of chromos that used to be given as premiums to new subscribers to periodicals which usually died with the third issue. These pictures run up to 20 by 27 inches in size; not so artistic jobs of color printing as the French and Germans do, but not so bad as some that we do. Those of *Pear's Annual* are perhaps the best of the lot, *Figaro* being regarded as *hors concours*. Colored illustrations are also freely inspersed among the stories, sketches and humor characteristic of the Christmas season.

Literary Notes

....A sumptuous Goupil volume of royal quarto size on the art and life of Florence, in the Renaissance, will be published in January by Manzi, Joyant & Co., Paris and New York. It will contain 70 illustrations, 10 of them color-facsimiles. The edition is limited to 500 copies and is sold at $62.50 and $125.00.

....A most delightful book is *Character and Comedy* by E. V. Lucas (Macmillan, $1.25). The first part consists of pleasant little essays of a Lamblike gentleness and humor, but the best of the book is the second part, "Life's Little Difficulties," in which by means of life-like letters the tiny social tragedies of small places are told with exquisite dexterity and good nature.

....Charles Scribner's Sons issue Sidney Lanier's *Hymns of the Marshes* in an exquisite volume, illustrated with beautiful photogravures, which bring before the reader the very feeling and "fellowship" of "the live oak, the marsh and the main." We see "the marsh-grass in serial shivers and shades." These wonderful poems, the chief and choicest of which was first published in THE INDEPENDENT, could hardly have a more attractive setting. The price is $2.00.

....The November issue of the *Annals of the American Academy of Political and Social Science* is devoted to the discussion of the work of the church in social progress and betterment. There are thirteen practical and timely articles on the Social Work of the Salvation Army: A Criticism, "The Church and the Working Man," "The Social Work of a Suburban Church," The Christian Settlement," and others of equal interest to those who recognize the work of the church as a social force of undoubted efficiency, but capable of vital improvement. (Philadelphia, 50 cents.)

Pebbles

THE new diabolo is neither so enervating as tiddledewinks nor so mentally exhausting as pigs in clover. That's why they like it in Paris.—*Steinway Bulletin.*

DICKY—You don't believe that story about Little Red Riding Hood an' the wolf, do you?

Kitty—Course I do.

Dicky—Well, if you'll jist write to President Roosevelt an' ask him about it he'll tell you it's a fake.—*Chicago Tribune.*

"ARE you troubled with cockroaches or other insects about your premises, ma'm?" inquired the man with the pack, who had succeeded in gaining an audience with the mistress of the mansion.

"No, sir!" she said, glaring at him. "We are NOT troubled by cockroaches or other insects!"

"Don't mind 'em, hey?" he rejoined cheerfully, shouldering his pack again. "Well, there's nothing like getting used to one's afflictions. Good-day, ma'm."—*Chicago Tribune.*

A FLATTERING ILLUSION.

"I THANK you for the flowers you sent," she said,
And then she pouted, blushed, and dropped her head.
"Forgive me for the words I spoke last night;
The flowers have sweetly proved that you are right."
Then I forgave her, took her hand in mine,
Sealed her forgiveness with the old, old sign;
And as we wandered thru the dim-lit bowers,
I wondered who had really sent the flowers.
—*New York Tribune.*

How much a man is like his shoes!
For instance, both a soul may lose.
Both have been tanned; both are made tight,
By cobblers both get left and right.
Both need a mate to be complete,
And both are made to go on feet.
They both need healing; oft are sold,
And both in time will turn to mold.
When shoes wear out, they're mended new;
When men wear out, they're men dead too.
Both have their ties, and both incline,
When polished, in the world to shine.
And both peg out; now would you choose
To be a man, or be his shoes?
—*The Hackley.*

130 Fulton Street, New York

TERMS OF SUBSCRIPTION, PAYABLE IN ADVANCE
One Year, $2.00. Single Copies, 10 Cents

Single Copies over six months old twenty-five cents. Postage to any Foreign Country in the Postal Union, $1.75 a year extra.. To Canada $1.00 extra.

Order for the change of an address should be received one week before change is to take effect; the old as well as the new address should be given.

Persons desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, in that case, hold ourselves responsible for their return. Authors should preserve a copy.

After the Panic

THERE are indications that the country is recovering, slowly but surely, from the shock of the financial panic. These are seen not so much in the condition of the industries and of trade as in the resumption of business by banks that suspended payment, in the attitude of depositors toward these institutions, and in the reduction of the premium upon currency. A restoration of confidence should be hastened in all legitimate ways. The country was prosperous six weeks ago; its prosperity should be in evidence now. Its banks and great corporations are solvent. Its currency is sound and the soundness of it is not menaced.

If our people are led to believe that this panic was due to deep-seated causes from the shocking effect of which they could not escape, the depressing financial disturbance will be prolonged. While we have not ignored certain causes of stringency and of a vulnerable financial situation, we have held that the direct and immediate causes of the panic should be steadily borne in mind. We believe that it is possible for the American people, despite those more remote and world-wide causes of monetary stringency, to restore speedily now the condition of general prosperity which prevailed at the beginning of October; but not, however, if they are led to think that this panic is like that of 1893 or that of 1873, and that depression must be of long duration. If they come to believe that depression of industries and trade must drag along for a year or two, their belief will make it continue.

Why should the known immediate causes of the disturbance be ignored by such men as ex-Secretary Gage? In a published statement he asserts that the disturbance in New York—the beginning of all the trouble—was due to the demands of the interior upon New York banks for money to move the crops. These banks, he says, were "forced to turn upon their borrowers," and "all the phenomena of shock, fright and panic were the result." This, he argues, was inevitable, on account of a defective system of currency, the preceding destruction of capital in the Boer and Japanese wars and the San Francisco earthquake, and the absorption of capital in construction thruout the civilized world. He completely ignores the Heinzes, Morse, the Thomases and the late Mr. Barney, as well as the effect of the sudden ousting of these men from their banks in New York, an effect which soon spread thru the country, causing runs upon banks by frightened depositors and the hoarding of currency by them and by many of the banks themselves.

Ex-Secretary Shaw, in a recent public address, likened this panic to the one of 1893, saying that it was "precipitated in precisely the same way." Confidence had been destroyed, he continued, by persons whom he did not name, just as it was destroyed in that earlier time by Mr. Cleveland's declarations about greenbacks, the tariff, and the purchase of silver. Mr. Shaw is the president of a New York trust company, and must be familiar with the actual events which started the panic.

It is these events which the people should consider, because intelligent consideration of them will show the short path back to the former conditions. That is to say, the path will be short if they will think it is and so make it short. If they are taught now that we must have such a dragging depression and such hard times as followed the panic of 1893, because there were causes of this panic as serious and deep-seated as those of that disturbance, then they will make the path a long one, continuing to hoard their currency and otherwise to prevent a revival of confidence. The destruction of capital in recent wars and the absorption of capital by fixed investments in various enterprises during a period of

great industrial activity throuout the civilized world, with the scarcity of loanable funds resulting therefrom, are interesting topics, but discussion of them should not obscure the direct causes of the present trouble, nor should our people be induced to believe that on account of that destruction and absorption they are now on the threshold of a long period of hard times. It will be better for all of us if we stick now to the recent and known facts and permit ourselves to be guided by what they teach. We want to regain the prosperity we had, and which we deserved to have, at the beginning of October.

Let us look at the course of events. It was a time of "record" outputs in the leading manufacturing industries, great railroad traffic and earnings, good dividends, large crops, and unchecked activity. When the disturbance began in New York, in the middle of the month, was there any sign of weakness or timidity elsewhere? Even after the ousting of the Heinzes, Morse and the Thomases from their national banks, the forced retirement of Barney, and the beginning of the runs on New York banks and trust companies, the West and South laughed at the "Wall Street flurry." Their leading journals pointed proudly at the soundness and excellent condition of those parts of the country. And there was warrant for that. But financial panic spreads rapidly. The runs in New York were soon followed by runs elsewhere, even on the Pacific Coast. Currency was hoarded and locked up by frightened people everywhere, and the machinery of business was clogged.

Our people should be led to believe there was no good reason for their action, which is the truth; not that a panic was due and had to be and must now be followed by partial paralysis. They should see that the cause of general disturbance was fright in New York. And influential men who well know what the causes of that fright were should explain them to the public, with the authority of their names. They should not seek to make the Boer War or President Roosevelt responsible, nor should they discourage the timid, now beginning to regain confidence, by asserting that this is a repetition of 1893, with all that such a repetition implies.

It is true that our people, or a great many of them, would not have been frightened so easily and quickly if the rascality of managing financiers in the life insurance companies, the trunk railroads, the New York street railways, and some of the great Trusts, had not been exposed by official investigation; if great capitalists and employers like Mr. Hill had not been predicting the approach of hard times; if various capitalists whose operations had been interrupted by official inquiry or indictment had not in their gloomy forecasts professed to see national ruin at hand. But it is also true that there was no adequate cause for their fright. Let us hope that all of them will speedily find this out, that the hoarded currency will soon be doing its appointed work, and that those who have suffered undeservedly by reason of this disturbance will use their influence intelligently to procure those reforms, by legislation and otherwise, which the events of the last few weeks suggest.

Causes of Financial Crises

THE marvelous complexity of modern society is in nothing better shown than in the enormous number of contributory causes of the great credit crises that culminate in such panics as the one which the financial world is now passing thru. There are causes intellectual and moral, causes economic, causes political. In addition there are causes of a purely social character which are not unworthy of attention.

The economic causes are well understood by intelligent and well-informed persons. When such persons hear men who ought to know better attribute the October panic to President Roosevelt they do not imagine that any large proportion of those who spread such a philosophy are dense enough to believe it. They attribute the phenomenon to a habit which civilization has not yet wholly eradicated, of saying things that are not so for political purposes. The economic cause of a credit crisis is an over-capitalization of future or speculative enterprises, which draws heavily upon the

stores of actual capital and which is often accompanied by some serious curtailment of the accumulation of actual capital necessary to carry on vast and expanding undertakings.

Back of the failure to accumulate actual capital with sufficient rapidity to sustain an ever-enlarging volume of credit, lie the moral, social and political causes to which we make reference. Of political causes, those crises in the affairs of nations that precipitate war are the most serious. The crisis and industrial depression that began in 1873 were hastened by the appalling destruction of capital in the Franco-Prussian War. That the crisis of 1907 has been to some moderate extent affected by a similar destruction of capital in the war between Russia and Japan is probably true.

The moral causes, to a great extent, play their part in aggravating what otherwise, tho inevitable, might be less disastrous and distressing. Unadorned and undisguised dishonesty is chief among the factors of this crisis. It undermines confidence of man in man and in the stability of the financial institutions that men create, and thereby leaves the minds of investors and depositors unprotected against the host of fears that in any hour of stress tend to convert the normally rational person into a merely panic-stricken animal.

There are, however, other moral causes, and they are closely interwoven with social causes. These have been very much in evidence in the last five or six years and they may have played a contributory part in hastening the events of recent weeks. Not many times since the history of civilized man began has the expenditure of all classes from the immensely rich down to the relatively poor been so reckless, so ridiculous and so wasteful from an economic point of view. The old Roman writers tell us of the orgies that culminated in such wanton squanderings of wealth as Tremachio's famous dinner, but at Newport and in New York social functions probably more costly, and certainly more imbecile, have not infrequently been witnessed—and reported—in recent years.

Such waste of the wherewithal from which the funds of productive capital might be increased are not, however, in their aggregate amount so formidable in themselves. The mischief that they do lies rather in the widespread vulgarizing of taste and in the insidious sapping of the moral fiber of an entire people thru whose veins runs the contagion of sensational example. Modern methods of production, sanely guided, could easily provide the necessaries of life, the substantial comforts that we require for pleasant living, a reasonable gratification of taste and not a few luxuries. They are not adequate to "set up" every man, woman and child in the vainglorious race of each to outdo all his fellow mortals in idiotic, nauseating and demoralizing display. There is no reason to suppose that they will be adequate for such an achievement for ten thousand years to come.

At the root, then, of all the absurd and wicked wastefulness whereby we curtail the needful stores of productive capital without really getting anything to show for our folly, is that weak yielding of human nature to the insidious forms of social pressure. We lack the strong, clear-visioned, sane individualism which would make each one of us study his own real needs, his own personal potentialities and aptitudes, and live his own life as a reasonable, healthy being should. The social instinct is necessary to the well-being of the race, and the world has a mighty task before it to make the social instinct do all the work that we require of it. But in the world of human interests, as in that of the physical forces, safety and progress depend upon a balance of differing and opposing powers. There is a social solidarity that furthers worthy interests, but there is also the social solidarity of the mob, of the fad, fashion and contagion-ridden populace, which is destructive not only of the best things in life, but also of all that individuality which in the last analysis is life itself.

The Way of the Nominee

GOVERNOR HUGHES is doubtless human, and he cannot but be pleased at the approval the people give his administration as Governor, and of his indifference to political ambition. And yet we do not believe him indifferent; he simply believes it his duty to attend to his present business and to take no single step

toward any higher honor. As to the Presidency he is as silent as if he never heard of it. He knows people are talking about his chances for it, but not a finger does he lift, not a breath does he lisp. He sends no missionaries to Georgia or Texas to capture delegates to the Convention. He gives not a word or a wink to the committeemen who are making slates for the New York delegation. They may go for whom they please; they will not be instructed by him. He leaves the choice to the people.

So does Mr. Bryan. He says he does. He asks for no nomination that does not come automatically to him as representing the policies the people desire. He will make his own advanced platform, and if the people like that platform and him standing in public evidence upon it and will come and capture him on his platform, he will lift their standard. Like Hughes he asks no one to support him, but unlike Hughes he declares that he waits to be asked, that he is ready to be a candidate, and his every action and attitude and utterance is that of a willing sacrifice anxious to be offered on his country's highest altar. It is in that view that he proclaims his decisions on such questions as will help his ambition, and he travels the country speaking on matters of national interest. Here his attitude is the reverse of that of Mr. Hughes, who makes speeches enough, but who studiously avoids every question except those that concern the internal affairs of the State of New York, and the general duties of the citizen to good and honest government. We make no criticism of the conduct of Mr. Bryan as an avowed candidate for the Presidency, for to desire and seek the Presidency is a worthy ambition, and no illegitimate method attaches to Mr. Bryan's open and honest canvass for it; but there is a certain self-respecting decency in Governor Hughes's attitude of absolute silent reserve which inspires approval and admiration.

Mr. Roosevelt himself has also been made a candidate by his superserviceable friends, and he, too, remains silent and seeks no delegations in his support. Long ago he declared that he would not be a candidate for a third term, meaning, as every one understood him, and as he doubtless meant, and meant to be understood, a second elected term, for he was not elected as President for his first term. Doubtless he would like to have the people desire him to run again, but he has said his word, and has made it known that he desires Secretary Taft to be his successor. Justice Brewer, in an address the other day, seemed to give the President a rap for allowing the people to doubt what would be his attitude toward a re-election; but we do not see that he is obliged to repeat and repeat his refusal every time some meddlesome flatterer whispers aloud that Roosevelt is the choice of the people.

The only other avowed and proclaimed candidate is Mr. Taft, and he now leads the Republican race as Mr. Bryan does the Democratic. But on the Democratic side there is no second, not another man prominently named; hardly Judge Gray, or Colonel Watterson, Mr. Cleveland, or either Johnson. On the Republican side a half dozen "favorite sons" do not refuse consent; but Secretary Taft leads them all, with, we think, Governor Hughes a rising second, who may be first. Mr. Taft is absent, but is hastening home as fast as possible, and must be counted as one who, like Bryan, seeks the honor, and not, like Hughes, as one who gives no sign of ambition for it. That he would prefer the highest Judicial to the highest Executive position we believe, but he has been persuaded to be a candidate for the Presidency, and he will honorably ask for the nomination. Among the chances in his favor stand first his recognized fitness for it, the success and wisdom of his policy in charge of our colonial possessions, and then the recognition by the Catholic vote of his embassy to the Pope in relation to the purchase of the Friars' lands, and his treatment of their claims there and in Cuba. Against him is the judicial decision which offends the labor unions, and also his relation to the Brownsville matter, altho we presume he would be able, if nominated, after leaving the Cabinet, to explain that matter to what ought to be the satisfaction of the colored vote, which is now very strongly against him as well as against President Roosevelt. Whether the fact that he is regarded as President Roosevelt's candidate and heir apparent will help or hurt him most is not yet clear.

As things now look the likelihood is that the next President will not be Mr. Bryan, but that it will be either Mr. Taft or Mr. Hughes, with a growing probability in favor of the latter. Whichever of the three it will be, we shall have for our Chief Magistrate a man of noble spirit, of whom the Republic may well be proud; and four years, or eight years after, Mr. Roosevelt will not be too old to be seeking a third term. Is not Mr. Cannon a candidate, who, at his inauguration, would be seventy-three, and is not ex-President Cleveland favorably mentioned, who is less than a year younger?

Monolithic Architecture

EVER since man left his cave temples hewn out of the solid rock his buildings have almost always been put together of small pieces. He has worked as a child plays with blocks, piling brick on brick or stone on stone, and fastening together sticks and steel. Now he is experimenting with a new material, reinforced concrete, combining the strength of steel with the solidity of stone, and he can construct a building as he conceives it, in its entirety, not as an accumulation of insignificant components. The house is a whole, one solid block of stone, hollowed with convenient chambers. If it tips over on one side by the subsidence of its foundation, it is simply set up again.

It will be interesting to see what the architects will do with this new and plastic material that has been thrust into their hands. They have been freed from their old formulas. They are no longer bound to pillar and beam. Their structural ornamentation becomes ridiculous when the structure to be accentuated no longer exists. So long as they had merely a steel upright to deal with they could surround it with a veneer of marble or plaster veined like marble, and pretend that it was nothing new and alarming, nothing but a Greek pillar which nobody could deny was good art. So did the Greek architects in their day, imitating woodwork in stone and making their pillars like tree trunks.

For architects are timid creatures. When they progress it is by walking backward, keeping their eyes fixed on the past. When they have an opportunity to do something new they dodge it and cling to the old and familiar. Not long ago, in one of the most expensive of our public buildings, we saw a huge bronze electrolier that was a bundle of anachronisms. The electric bulbs, instead of hanging down as they should, were stuck on top of imitation candles made of porcelain; these were mounted on globes, obviously pseudo kerosene oil reservoirs, and connected by coiled tubes, originally designed for gas, while below the support projected the handle of the primitive torch. It constituted a complete history of the art of illumination from the earliest times to the present, but it was fit for nowhere but an archeological museum. It is because of this atavistic obsession that architects make us libraries with no places to store books or to deliver them, churches where we cannot hear or see the minister, and post offices where the clerks work in the dark and handle the mails by hand.

Now we do not want to have to wear hand-me-downs forever, so we welcome this new material, which may effect a revolution in architecture if it can be kept under the influence of utilitarianism long enough to develop its own natural forms. If the academician gets his hands on it he will spoil its fair façade by sticking on fake pilasters and arches. The great advantage of concrete from the artistic point of view is, as we have said, that it is not composed of little pieces, yet we see already walls where the mortar lines are carefully marked in to simulate blocks of stone. The true aim, on the contrary, should be to give the impression of unity, to show that the edifice was cast, not built up. The decoration should be of the same character; molded cornices and belts, glazed tiles and mosaics of colored clay. It was such surfaces that inspired the Byzantine and Moorish architects to develop their inlaid work and low relief. The forms or molds into which the concrete is poured can be ornamented or plain surfaced, and the tiles to be embedded in the wall can be pasted on the inside of the forms arranged in the desired design. Instead of chiseled stone, prepared by long and expesive handwork, we have molded stone,

more sensitive to the artist's will. Who knows but we may get an American school of Della Robbias?

The cheapness and ease with which decoration with sculptural forms can be secured in concrete will doubtless lead to grotesque exuberance in some cases, but it will be a welcome reaction from the commonplace and conventional to which we have been tied. So far even the hastily and economically constructed factories and warehouses are a delight to the eye, because of the simple lines, massive surfaces and neutral gray tints, following more nearly than any other the Mission style, as they should, for this was of adobe derivation. Reinforced concrete is a partnership of surprising suitability. Thin steel rods or bands, twisted or notched, are stretched thru the boxes into which the concrete is poured, and the two together are stronger than the sum of their separate strengths, for to the compression strength of the cement is added the tensile strength of the steel. The two materials expand and contract together, so there is no breaking by change of temperature. It is startling to our eyes, accustomed to wood and stone, to see the thin floors stretching from wall to wall with no beams beneath, sheer pent roofs without brackets or pillars, and balconies with no visible means of support.

Thomas A. Edison has worked out a method by which a house can be cast complete in one day. The forms or molds are made of iron, nickel-plated. These are set up, with steam and water pipes, electric wires, bathtubs and window casings, all complete; then the concrete is mixed by machinery and pumped in, and after a week the molds are taken off, ready to use for the next house. He estimates that his model dwelling house, nine rooms, three stories and cellar, richly decorated inside and out with molded designs, can be put up for about a thousand dollars. The walls are from six inches to a foot thick, so it is cool in summer and warm in winter, and you can build a bonfire on the parlor floor any time you choose. Reinforced concrete has a lower fire risk than other construction, and the San Francisco disaster proved that it could stand earthquakes.

From an artistic as well as a utilitarian point of view its chief advantage is its adaptability. A building should be designed from the inside outward. Instead of putting up an ancient or medieval edifice and housing in it more or less comfortably a modern institution or industry, this should first form its own commodious apartments, and then the consequent exterior made as attractive as possible. It is better to be a clam, forming its own shell, than a hermit crab borrowing a misfit lodging.

Who Wrote the Last Encyclical?

When the news of Luther's revolt reached Rome, Leo X said that it was a quarrel of monks. In our own day Cardinal Mermillod, of Geneva, past a remark of a like trend: "Whenever the Vatican sends forth an anathema, if you wish to know its origin seek the monk."

And now it is leaking out that the recent Encyclical is a fresh proof of the correctness of that statement. In great part it is the work of three monks, the Jesuit Billot, professor of dogmatic theology at the Roman College, aided by two Franciscans, Pere Pie de Langoyne and Padre Bonaventura Marrani—that is, a Frenchman and an Italian. The historical part alone is credited to a Roman prelate, Mgr. Umberto Benigni. In a letter to his clergy, the present bishop of Orleans, France, quotes Billot as having said of himself: "For twenty years I have lectured, my pupils know not that there is any biblical question." The Encyclical marks a victory of the Jesuits and Franciscans over the Dominicans.

When Patriarch of Venice, Cardinal Sarto was a strong friend of the Dominicans. Elected Pope on August 4th, the feast of St. Dominic, Pius X became more friendly, chiefly because of his liking for the Master General, Cormier, and of his appreciation of the erudition of Lagrange, the founder of the Dominican school of biblical studies at Jerusalem. The Jesuits, however, who were the real power in Rome during Leo XIII's declining years, felt hurt at the sight of their ancient enemies overtopping themselves. The old quarrels on Grace between the two orders were

started afresh on Leo's accession and have not as yet become extinct. These added fuel to the Jesuit hate. In their turn, the Franciscans will never forgive the Dominicans of Jerusalem for destroying their legends of the Holy Land. With neat, precise inscriptions the sons of St. Francis had marked off the acts and words of Jesus, "Here God became man," "Here Christ was born," etc. These claims the Dominicans attacked and rejected all of them, save the solitary exception of the place of the crucifixion.

Other orders, following in the wake of the Franciscans, claimed various sites in the drama of the Founder of Christianity. The Little Sisters of the Poor have the House of Nazareth, where the Annunciation took place; the White Fathers of the African Mission the house of Zacharias, in which was first heard the "Magnificat"; the Carmelites the mountain whence was heard the "Our Father"; the Assumptionists the cave in which repentant Peter hid after denying his Master. Now a Papal Bull of long standing has made Palestine the special preserve of the Franciscans, for whose sake Leo XIII ordered a collection to be taken up thruout Christendom on Good Friday—a collection indeed more honored in the breach than in the observance. No doubt the above mentioned inroads on their reservation hurt the finances of the Franciscans. But the Dominican attack left them without a plausible plea. Hence they became willing seconds to the Jesuits in evening up matters with the hated upholders of the Inquisition. Specially was this the case after Lepidi, the Dominican Master of the Sacred Palace, tacitly approved the work of Canon Ulysses Chevalier, which pulled all to pieces the legend of the Holy House of Loreto—a Franciscan sinecure also. The legend runs to the effect that angels carried the home of the Holy Family from Nazareth to Loreto, a small village near Ancona.

War was on. The first effort was a secret police, created by the Jesuits in France, to spy upon Dominicans, who, after the law dispersing the congregations, had to live apart. Among the spies were penitents who for their souls' good called on the Black Friars in their homes and strove to gain their confidence. The first outcome was a detailed account of all that had been gathered. This, the work of the Jesuits, was sent not to the proper canonical authority, viz., the Congregation of Bishops and Regulars, but to the Jesuit Cardinal, Steinhuber, Prefect of the Index, who died a short while age. Steinhuber passed it on to the Pope, who demanded further reports. Then every French Dominican, in any wise suspect, had for three months an *angel guardian,* who spied on all his doings and sayings. Again a full report was sent Romeward. Meanwhile, in the Eternal City itself a system of espionage was kept up over the Dominicans, specially of Lepidi, who finally lost his head at a special meeting, held in the Vatican by the Pope's orders, of a society called after St. Jerome. Its purpose is to popularize the reading of the Gospels and devotional books. A caustic remark called forth by the underhandedness of his enemies put Lepidi in their power.

All this time two Jesuits, Delattre and Fontaine, were attacking the writings of Lagrange. A string of propositions taken from the "Methode Historique" of this learned Dominican were laid before the Inquisition. His order saved him, however.

Now came the Encyclical. It declares that the duty of naming the Roman Censor belongs to the Master of the Sacred Palaces, who is always a Dominican, now Lepidi. But it winds up thus:

> "Finally we affirm and declare that the title of Censor has no value and can never be adduced to give credit to the private opinions of the persons who hold it,"

a rap at Lepidi's tacit approval of Chevalier's attack on the Holy House of Loreto.

Still another feature of the Encyclical is a heavy blow to the Dominicans. Religious superiors are admonished "of their solemn duty never to allow anything to be published by any of their subjects without permission from themselves *and from the Ordinary.*" This robs the Dominicans, as well as the other orders, of their exemption from episcopal control. It does not, however, affect the Jesuits, because the formula *"etiam Societatis Jesu"* (including also the Society

of Jesus) is omitted. Whenever a favor is granted by Rome to the religious orders, the Jesuits claim to be among them, but when a prohibition or disfavor is pronounced, then the wily sons of Loyola are not religious, but merely clerks regular, and therefore escape.

So Modernism—a word coined by the Jesuit review, *La Civilta Cattolica*—is condemned; not wholly from any great zeal in behalf of truth, but largely to register in pontifical language monkish rivalries. Catholic authors and scholars know these secret bickerings, and will probably attach as little importance to the Encyclical as they do to the warrings and squabbles of monks—the constant disgrace of Catholicism.

It may not be useless to add some results unexpectedly wrought by the Encyclical.

Cardinal Fischer, Archbishop of Cologne, has forbidden Catholic students to attend the lectures at the University of Baden of Professor Schroers, accused of modernism, and the rector of the university has been summoned to Berlin to consult the authorities about it.

In England, the ex-Jesuit, Tyrrell, published in the *Times* a severe criticism upon it. Rome has now formally excommunicated him and has ordered the Bishop of Southwark, in whose diocese, at Clapham, Tyrrell lives, to carry out the sentence.

Wilfrid Ward, the writer of the "Life of Cardinal Wiseman," and now engaged upon a "Catholic Life of Cardinal Newman," has either resigned or is about to resign the editorship of the *Dublin Review,* the Catholic quarterly of Great Britain.

In France, Dr. Baudrillat, rector of the Catholic Institute, Paris, in order to have its students secure the privileges required by a circular of M. Briand, July 8th, 1907, applied to Rome for permission to allow his students to follow the required courses at the Sorbonne. Rome, thru Cardinal del Valle, granted the permission for such courses as would not hazard the faith or morals of the students. Practically this sets aside the Encyclical for the Catholic institutes of France. But M. Pasquier, the rector of the Catholic Institute of Angers, has rushed into print and denounced the action of his colleague at Paris as treason. But Angers has no government school authorized to grant such privileges. Hence these tears. Furthermore, a great French scholar is engaged on a profound criticism of the Encyclical. He will give several months to it and will publish it only when satisfied that his answer is thoro and fit to take a prominent place in the history of the Church.

From Germany comes the report, thru the columns of *Der Merkur,* of the Suabian land, that a dignified answer is in preparation. It will be a joint production and will express the consensus of the Catholic intellect of Germany anent the Encyclical.

In Italy, a volume of two hundred pages, an attempt at a complete refutation, has just appeared. Its title is "The Program of the Modernists: A Reply to the Encyclical." No doubt it is from the same coterie who wrote *"Che noi Vogliamo,"* which Murray, of London, has just brought out in English under the title, "What We Want."

Are the scholars of the Catholic Church in America the only ones to be silent?

Christmas in the Public Schools

We saw last week a flood of pious tears because the President had dropt the motto "In God We Trust" from the gold coins, and we should not be a whit surprised if Congress put it back. This week the laments begin because the school authorities of this city forbid Christmas songs and celebrations in the public schools. They seem to think that the good Lord is grievously insulted and injured. We have more than once said, in previous years, on reading the complaints in Hebrew journals, that it is a wrong and outrage that in our schools the tens of thousands of Jewish children should be required to unite in singing songs in honor of Christ's birth. We have known cases in which this was required of children the majority of whom were Jews. We cannot imagine Jesus Christ demanding such honor of them. The defense is, that ours is a Christian country, and that if Jews don't want to submit to our Christian ways they can stay in Russia. That is of the essence of sectarian arrogance. Their fathers had

the same right to come here that our fathers had. It is their country as much as it is ours. It is not the business of the nation to proselyte; that is the business of the Church. We resent the idea of the secular power trying to control the religious opinions or acts of the citizens. In the nation all citizens have equal rights, and we are not afraid to let Christianity have its fair show and no more, and then let the best win. As to the children, if the failure of the state to make Christians of them leaves them to grow up without belief, then the blame is on the Church which fails to do its duty.

Mobile Against Prohibition

The law prohibiting the manufacture and sale of liquor in Alabama becomes operative January 1st, 1909, which allows a year in which dealers can dispose of their stock and drinkers can regulate their appetites. It past in the Senate by so strong a vote as 32 to 2, and the women did it. But the most curious incident in the campaign is the bitter opposition which comes from Mobile, from which city two hundred women appeared to protest against the passage of the law. In Mobile the public schools are supported from the licenses paid by the saloons, and the angry citizens, men and women, threaten to turn the city government over to the Republicans. That is quite too much to believe. Can it be that the fear of negro domination is lost in the love of liquor? Or do the people care so little for public education that they can support it only by encouraging vicious resorts, in a way that Scripture says ensures just damnation? It would be much cheaper for Mobile to support its schools by public taxation than by making its schools an attachment to its saloons.

Edward Payson Weston's name is assurance that he came from a sound ancestry, and altho his distinction is not like that of the Portland pastor whose name his mother gave him, he is an evidence that cleanliness of life is next to godliness. He was but twenty-nine when he surprised the world by walking a hundred miles in twenty-four hours, and following it by walking from Portland to Chicago in twenty-six days. Now, at sixty-nine, he is trying to repeat the feat and has been keeping ahead of his schedule. To be a great "walkist" may not seem as fine an ambition as to be a great poet, but the best lyric poet of Greece thought the victories of the stadium well worth his praise; and we have observed that physical and intellectual superiority go side by side. Poets and historians played second fiddle at the Olympic games.

Now Mr. Rockefeller gives $2,600,000 for the endowment of the Institute of Medical Research in this city. There are no restrictions or instructions. He does not pretend to know better than experts how their work shall be done. It is so with all his gifts. They are absolutely in the hands of the trustees, who are trusted specialists. Mr. Carnegie follows the same wise rule with his gifts, and the results follow. The genius of these men consists, as Mr. Carnegie has said, in being able to find men who know more than they do, and then making it possible for them to do the best their skill can devise.

Russia paid Japan $24,000,000 last week. It is a great surprise that in her disarranged finances, in her poverty and her effort to borrow much larger sums, Russia should have hastened to pay this sum for the support of her prisoners of war. Has Japan urged the payment, or made any threat? We very much doubt it. Russia does not press Turkey for the debt due her. She is willing to hold the club suspended. It looks as if Russia wants to be free to take advantage of any eventualities to recover what she has lost in the East.

On Monday of this week Andrew Carnegie was seventy years old, and he took the occasion to repeat his cheery philosophy that the world is growing better, that war will come to an end, and that our hope in a future life must not make us forget that we have no duties there yet, but that our duty is to pitch the present life high. That is good religion. One ought to be as cheery as Mr. Carnegie is, whose main thought is devoted to making the world happier, wiser and better. He does it not only with his money, but with every public word he speaks.

Insurance

Valuation of Securities in Annual Statements

At a meeting of the executive committee of the National Convention of Insurance Commissioners, held last week at the Manhattan Hotel in this city, the valuation of securities in the annual statements of insurance companies was the subject most carefully considered. The existing financial situation was taken into account and the result of the meeting found expression in the following resolutions, which were adopted:

Whereas, It is the opinion of the insurance commissioners in attendance at the meeting informally held in New York city this twenty-first day of November, 1907, that present market quotations do not fairly represent the true present value of securities held by insurance corporations and required to be reported in their annual financial statements as of December 31st next, therefore,

It is the sense of this conference that insurance companies making their annual statements for the present year to the various departments, in determining actual market values of securities as of December 31st, 1907, should not be required to confine themselves to present market quotations. We believe that the valuations as reported by the companies for the year 1906 more nearly represent the true values of such securities under normal business conditions.

Commissioner Folk, of Tennessee, president of the National Association, also said:

"The present condition of the security markets is entirely abnormal. It is hardly likely that anybody will contend that the present situation represents actual values. In view of this it is the desire of the commissioners to enable these companies to take credit for the actual values of the securities which they hold and not to bind them down to any temporary or fictitious values. In the life insurance companies the policyholders have an important question at stake in that they will suffer severely in so far as their policies mature next year if the present valuations should be used as a basis for estimating the dividend accumulations.

"The commissioners hope that their action will have some tendency toward restoring normal conditions in the business and financial world. At present prices no securities are being sold except to protect credits elsewhere, and we do not believe it just that the insurance companies should be subjected to this condition in making their reports for December 31st, 1907."

Among those present were the following representatives of State insurance departments: R. E. Folk, of Tennessee; B. F. Carroll, of Iowa; Otto Kelsey, of New York; E. E. Rittenhouse, of Colorado; B. F. Crouse, of Maryland; H. R. Prewitt, of Kentucky; James V. Barry, of Michigan; Joseph Button, of Virginia; T. H. Macdonald, of Connecticut; Fred. W. Potter, of Illinois, and Charles W. Fletcher, of Massachusetts. There were also present by request of the commissioners President John M. Holcombe, of the Phœnix Mutual Life of Hartford, who discussed the various proposed plans of financial relief; S. Herbert Wolfe, with tables comparing the security valuations of the past few years, and Deputy Superintendent H. D. Appleton, of New York, as well as the officials of a number of insurance companies.

On November 20th last President Darwin P. Kingsley, of the New York Life Insurance Company, in an interesting address delivered before the eighteenth session of the Transmississippi Commercial Congress at Muskogee, Okla., considered the subject: "Insurance: What Should be the Attitude Toward It of the State of Oklahoma?" Mr. Kingsley contended that every new law bearing on insurance made the work of the agent more difficult. He also declared that the legislation which stopped the general development of life insurance was an economic crime.

Former United States Senator John F. Dryden, president of the Prudential Insurance Company of America, in a recent interview, outlined some of the reasons why his company had changed its plan of doing business. As already announced, the company has changed to a non-participating basis, and this was done because the Prudential had come to believe that the man who buys life insurance today wishes to obtain a policy at the lowest possible cost with the best protection that money can buy. The Prudential has now issued policies in amounts from $1,000 up, and the non-

(*Continued on page* 1328.)

Financial

Guarding National Bank Deposits

Mr. Bryan suggests that depositors in national banks should be protected by a Government guarantee, and that the cost of such a guarantee should be met by a small tax on all the deposits. We regret that he has recently sought to excite opposition to provisions for taxed emergency issues of national bank currency. He is on the wrong side of that question. This suggestion, however, is another matter, and it deserves serious consideration. Those who attack it should remember that the emergency currency plan of the Bankers' Association and the House Committee provides that the proceeds of the required tax shall be used in part to pay the losses of failed banks. It is not just criticism of the suggestion to say that the Government might with as good reason be asked to guarantee the safety and success of ordinary business undertakings. These banks are in a sense Government institutions. Their relation to the Government is such that the suggested plan is not ridiculous or unreasonable, even if it be inexpedient. As for the tax, experience shows that one-fiftieth of one per cent. upon the sum of deposits would be enough to meet the average annual loss.

Some days before Mr. Bryan published his suggestion, we received from C. F. Allis, vice-president of the Second National Bank of Erie, Pa., an amended copy of a bill, prepared by him in 1905, for the protection of depositors in national banks, with the argument for this measure made by himself in September of the present year, before the beginning of the panic. Mr. Allis's plan is better than Mr. Bryan's. An unvarying tax on all deposits, even if it were only one-fiftieth of one per cent., would probably be unjust in its bearing upon the larger banks. Mr. Allis's tax, or assessment, would be from $100 to $400 for each bank, and would be graduated according to the size of the capital. It would yield about $1,100,000 a year, and he would have depositors' losses paid out of it by successive dividends within the two years following the appointment of a receiver. Incidentally, it may be noted that Mr. Bryan's "one-tenth of one per cent." would yield five times as much as would be needed. Mr. Allis holds that it is the duty of Congress to make deposits in national banks safe, when this can be done at no cost to the Government and practically at no cost to the banks themselves, as assurance of safety would so increase the deposits that the banks' income from the additional amount would exceed the tax. His proposition deserves to be discussed by Treasury officers and in the banking committees of Congress.

....Louis Stern, head of the house of Stern Brothers, has been elected chairman of the executive committee of the Lincoln Trust Company.

....John A. Harris, formerly assistant treasurer of the Girard Trust Company, for two years assistant treasurer of the Lehigh Valley Railroad Company, and recently a member of the banking house of Erwin & Co., has been elected vice-president of the Franklin National Bank of Philadelphia, of which J. R. McAllister is president and E. P. Passmore cashier. The capital of the Franklin is $1,000,000 and its surplus $2,000,000.

(*Continued from page* 1327.)

participating features have met with much popular success among the insuring public. The efforts of the Prudential are constantly exerted toward the continued reduction of the expense rate and every economy in management. Last year the Prudential's efforts in this direction brought about a change in which the general expense rate, exclusive of taxes, was the lowest in the company's history. The reduction aggregated nearly 3 per cent. of the premium income. The Prudential has now over seven million policies in force, which is fairly indicative of the general esteem prevailing thruout the country regarding this company.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Recovering From the Panic

Indications of improvement and of progress toward a restoration of normal conditions in business were seen last week thruout the country. In several manufacturing concerns where working time had been largely reduced, preparations were made for resumption of work on full time. The Republic Iron and Steel Company returned to its full schedule; the Shenango Iron and Steel Company began to run both night and day; construction work was resumed on the Harriman railroad lines, where thousands of men were re-employed. Railroad companies placed orders for equipment. A statement published by the receivers of the Westinghouse Electric Company contained a balance sheet showing that on October 23d the company's assets exceeded its liabilities by $11,500,000. The largest failure announced was that of the American Silk Company, which owns several factories in Pennsylvania and New Jersey. President Mellen, of the New York, New Haven & Hartford railroad, gave notice that there would be no reduction of wages in his company's service. It was estimated in the previous week that the number of employees laid off was less than 200,000. This number, of course, did not include those whose working time had been reduced by one-half or one-third. Banks in the interior of the country were questioned as to the date when they could resume full payments in cash. Of 1,000 responding to inquiries sent out from Chicago, 998 reported their readiness to do this at once. Leading bankers predicted that all the banks would resume simultaneously at some date within two weeks. The premium on currency was only ½ of 1 per cent. in the latter part of the week. It was estimated that $40,000,000 had been sold by brokers since the beginning of the panic. Purchases in New York of stocks and bonds in small lots at the prevailing low prices had amounted, it was thought, to not less than $100,000,000. At the end of the week the New York bank statement changed for the better, showing that the deficit in reserve had been decreased by $1,114,175. The reserve of the banks in the association is now a little more than 20 per cent., instead of the 25 per cent. required by law. In the latter part of the week prices advanced on the New York Stock Exchange. Comparisons made on Saturday with the quotations of one week earlier showed additions of from 2 to 7 points for the most active shares and a larger advance for many bonds. Sales for the month of November were only 9,475,155 shares, against 17,359,000 in October, and 19,000,000 in November, 1906. But the sales of bonds ($68,000,000) were larger than in any one of the preceding months of the year. It was said that the Steel Corporation, needing $38,000,000 of its second mortgage bonds for the purchase (by exchange) of the Tennessee Coal, Iron & Railroad Company, had bought in the open market $8,000,000, to be added to $30,000,000 held in its treasury.——It was due in part to the general improvement that the issue of 3 per cent. notes was limited to $25,000,000. Announcement was made on the 27th that no more bids would be received, and it became known two days later that not more than $25,000,000 would be issued. There was reported to be an understanding that half of the total would be re-

deemed at the end of six months. This would make the entire expenditure for interest less than $600,000. Subscriptions for the $50,000,000 of Panama Canal bonds were closed on the 30th, when Secretary Cortelyou said that the bids greatly exceeded the amount offered and that the average price was well above the present market price of the similar bonds issued some time ago. It was reported that the issue would be placed at a little below 104. Notice had already been given that 90 per cent. of the purchase money would be permitted to remain on deposit in the banks; in the case of the three per cents the part thus remaining is 75 per cent. At the end of the week there had been, since November 1st, an increase of $44,357,000 in the bank-note circulation. This included several millions on account of the three per cents. Additions based upon the new Panama bonds and a part of the three per cents were yet to be made. Some thought that with a restoration of general confidence the supply of new currency, which cannot be retired quickly, might be too large. Several methods of providing for emergency issues of currency were discussed at Washington. It was asserted that in any legislation upon the lines of the Fowler bill and the recommendations of the Bankers' Association, Mr. Roosevelt would insist upon an interest rate of not less than 7 per cent.

The Brooklyn Bank Cases

Further investigation of the affairs of the small banks and trust companies in Brooklyn that suspended and were placed temporarily in the hands of receivers has led to additional arrests. On the 26th ult. the three Jenkins brothers were indicted for forgery. One had been president of the Jenkins Trust Company, another the president of the Williamsburgh Trust Company, and all three were interested in a brokerage firm to which these institutions had made large loans thru the agency of the clerks employed. False entries had been used to cover up these transactions. On the same day, Howard Maxwell, the deposed president of the Borough Bank and of the International Trust Company (an affiliated institution recently organized), committed suicide by cutting his throat. Maxwell had been indicted for grand larceny and forgery with William Gow (a director and the controlling stockholder of both institutions), and one Campbell, the Borough Bank's cashier. He had turned over to the bank all his property, about $300,000 in value, and was forced to remain in jail four days because his wife and sisters were unable to obtain the $30,000 required for his bail. At last they were successful, but he had become greatly depressed. He believed that his friends had deserted him, and this appears to have been the belief of his relatives. Soon after reaching his home he killed himself. Gow and Campbell had promptly obtained their freedom. Maxwell had risen from a bank clerkship; Gow, the chief stockholder, was engaged in real estate speculation. Serious offenses were committed in the management of the bank. After suspension, the books and other records were mutilated. Many pages relating to Gow's transactions were torn out, notes bearing fictitious names were taken away, and the checks cashed on the last day of business were destroyed. It appears that the four institutions named above lost in all about $3,000,000 by reason of their loans to officers or directors. It is asserted, however, that they are solvent, and strenuous efforts are being made by depositors' committees to prevent the issue of orders making the receivers permanent. The Borough Bank's record appears to be the worst of all, but Edward M. Shepard, a prominent attorney, who is counsel for the depositors, asserts that the bank has assets enough to pay all claims, with $200,000 over, and is in condition to resume business.

Senator Foraker a Presidential Candidate

Senator Foraker announces his candidacy for the Presidential nomination in a letter to the Ohio Republican League. The advisory and executive committees of that organization on the 20th ult. adopted resolutions denouncing, as the Senator says, "the proposition that I should be eliminated from public life because in the discharge of my duties as a Senator I have been unable in three instances to agree with President Roosevelt," and pledging

to him their support both for the Senate and for the Presidency. Unwilling to appear to be a candidate for two offices at the same time, Mr. Foraker "foregoes the double honor proposed," but "with heartfelt appreciation accepts the support for the Presidential candidacy," remarking that the committees' action is gratifying "because it is a flat rebuke to the suggestion that the office of United States Senator is to be stripped of all the real honor attached to it by making its incumbent a mere agent to register the decrees of somebody else." He defends at length his action concerning the railroad rate bill, joint statehood, and the Brownsville affair. As to the rate bill, he says:

"In the debates on that measure I took pains to point out that if the Government took upon itself the duty and responsibility of making rates, it would of necessity have to determine not only how much a railroad should be allowed to make, but also how much it should be allowed to spend—how much for operation, for extensions, for equipment, and for every other item of necessary expenditure—all of which it is impossible for a Government to do successfully and satisfactorily, and that the result would inevitably be that just at the time when a rapidly increasing business for the roads was making it necessary for them to raise hundreds of millions annually for increasing their tracks, cars and general facilities, we would impair the confidence of investors in their stocks and bonds and thereby not only make it impossible for the roads to sell the additional securities necessary for such purposes, but lead many of the holders of them, both at home and abroad, to dispose of what were already outstanding, and that in consequence the market would be so largely oversupplied that their values would shrink, dragging down all kinds of securities with them, until panic and disaster would take the place of confidence and prosperity.

"To say 'I told you so' is always ungracious, but it is, I trust, permissible to point out that from the day the rate bill passed the trend has been in the direction predicted, and while other things have contributed, that measure has a full share of responsibility for the unhappy fianacial and industrial conditions with which we have been overtaken."

Supervision and regulation of interstate commerce, he continues, should be efficient, but must be sane and conservative:

"The moral standing of the business men of this country has always been high. It was never so high as it is now. There is consequently less occasion than ever before to restrict commercial freedom by statutory details of management and surveillance that are apparently framed on the theory that all men are criminals. Such legislation hampers enterprise, retards business activity, and discredits the whole nation."

There should be, he adds, no toleration of the idea that our Constitution has become in part a misfit or obsolete, and that it must be changed and vitalized by judicial interpretation, or by the mere assertion of public sentiment in support of that which may for the moment be desired. No one should think of amending it except by the method which it provides. In his opinion, no amendments are necessary to enable the Government to exercise all its powers efficiently, and no additional powers are necessary to the proper supervision and regulation of every matter that is a legitimate subject of legislation. With our surplus revenues diminishing, he says, and our enormous expenditures increasing, "it would be like adding the last grain of sand to undertake to tinker with the tariff." To the "beneficent results of our present tariff policy we must look for one of the necessary factors in the work of restoring prosperity." His views as to the protection of the equal rights of citizenship, he says, are well known. He gives notice that he shall ask that all delegates to the next State convention be chosen by direct vote at the primaries.——The Senator's friends say that if the district delegates to the national convention are chosen at the primaries, he will have at least eight of them. Secretary Taft's friends assert that they welcome a contest at the primaries, because it will show that the Secretary is the choice of the Republicans of Ohio. Some think there will be a division which will promote the candidacy of Governor Hughes.

Immigration From Japan

Ambassador O'Brien, at Tokyo, on the 29th ult., officially directed the attention of the Japanese Government to the recent large increase of the number of Japanese immigrants arriving on our Pacific Coast, asking for a thoro investigation and pointing out that this increase might seem to be at variance with promises made by the Government a few months ago. Whereupon the following statement was published by the Japanese Foreign Office:

"We are now considering the best methods

of controlling and further limiting emigration and correcting any mistakes which may have occurred recently. Conditions here are different from those in America. Japanese students who have reached a certain grade in the Japanese schools desiring to visit America register as students in good faith. But, reaching America, they secure work to enable them to prosecute their studies. It is quite probable that frauds have been committed, but without the cognizance of the Government. We are now using every precaution to prevent a recurrence of such frauds."

On a ship which arrived at Victoria, B. C., on the 28th ult., were 222 Japanese bearing tickets for points in the United States. The local authorities insisted that they should be carried by the ship to Seattle.——It is understood that Japan is prepared to meet the views of Canada regarding the limitation of emigration to that country.——Count Okuma recently said that the American fleet of battleships would be heartily welcomed if it should visit Japanese ports. Viscount Aoki, the Japanese Ambassador at Washington, at a dinner given by himself to Rear-Admiral Evans, commander of the fleet, remarked that if the Rear-Admiral should visit Japan he would have a most cordial reception.

Cuba

It is now the purpose of the Magoon Government to hold the municipal elections in May or June next, and the presidential election in the following December. In accordance with this program, the new President would be inaugurated in May, 1909, and the forces of the United States would be withdrawn in July of that year. An elaborate electoral law has been prepared by the Crowder Commission, and it awaits approval by Governor Magoon. The census enumeration recently completed was really an enforced registration of voters, and was designed to prevent fraud in registering and voting. Owing to the apparently hopeless division of the Liberal party, there is an opportunity for the conservatives to organize and nominate, with a fair prospect of success. It is suggested that General Mario Menocal, whose sugar estate is the largest on the island, would be a suitable candidate for them.——General Carlos Velez, who has been in this country for some time past, said at Tampa, on the 26th ult., that he recently called upon President Roosevelt and was "authorized to say to the Cuban people that the United States would withdraw whenever Cuba should feel that intervention was no longer necessary, and should make formal request for withdrawal."——In an address last week at a banquet given in his honor by the Agrarian League, Governor Magoon said that the commercial, industrial and agricultural outlook in the island was most encouraging. The Government intended to expend from $12,000,000 to $15,000,000 upon public works, and 70 per cent. of this would be received by the working classes. A recent increase of revenue showed that such expenditures could be made with safety.——Bankers have applied for nearly all of the $5,000,000 offered by the Treasury, with the understanding that the money will be loaned for the promotion of agriculture. Interest will not be required from the bankers until August next.——Ten of the labor leaders recently arrested are now under indictment, and others also will be prosecuted.

The Nobel Prizes

The income of the fortune left by Sir Alfred Nobel, Swedish dynamite maker, is divided according to his will into five prizes, awarded annually "to those persons who shall have contributed most materially to benefit mankind during the year immediately preceding"; one share each to the persons who shall have made the most important discoveries in physics, in chemistry and in physiology or medicine; "one share to the person who shall have produced in the field of literature the most distinguished work of an idealistic tendency; and, finally, one share to the person who shall have most or best promoted the fraternity of nations and the abolishment or diminution of standing armies and the formation and increase of peace congresses." The Swedish academies of science and literature decide who are the most deserving candidates except in the case of the peace prize which is left to the Norwegian Storthing. Each prize now amounts to something less than $40,000, owing to the large fraction of the income absorbed in administrative expenses. The stipula-

tion that the work rewarded should have been accomplished during the preceding year has been disregarded by the Nobel committees. Including the awards of this year, with the exception of the peace prize not yet announced, the distribution by nationality during the seven years since the foundation, has been as follows: French, 8; English, 7; German, 7; Dutch, 3; Scandinavian, 3; Swiss, 3; American, 2; Russian, 2; Italian, 2; Spanish, 2; Austrian, 1. With the exception of President Roosevelt, who last year received the Nobel Peace Prize for his efforts in concluding the Russo-Japanese War, the only American to be so distinguished is Professor Albert Abraham Michelson, of the University of Chicago, who this year is awarded the prize for the greatest discovery in physics. Professor Michelson, was born in Strelno, Germany, December 19th, 1852, and was graduated at the United States Naval Academy in 1873. He resigned from the navy in 1881 and studied at Berlin, Heidelberg and College de France. He became professor of physics in the Case School; when Clark University was founded, in 1889, he was called there, and in 1892 became head of the department of physics in the University of Chicago. His chief field of research has been light, where he has distinguished himself by his genius for inventing and skill in using instruments of unprecedented precision. His interferometer is capable of making measurements with a variation of only about one part in ten million. This instrument he used to determine the exact length of the standard meter bar of the Archives in Paris, the world's unit of measurement. Its original definition as a ten millionth part of the earth's quadrant having been found inaccurate on account of the irregularity of the earth's form, it was necessary to base it upon some other constant of nature and Professor Michelson's determination in terms of the wave length of red, blue and green light enables it to be accurately reproduced in case of its destruction. By dividing a ray of light into two parts and sending them by different ways thru glass plates and bringing them together again, a difference of half a wave length of light in the length of the paths can be detected because when the crest of one wave meets the hollow of another a dark band is produced thru their interference. In this instrument some of the glass plates were ground so accurately that their irregularity amounted to no more than one 40,000th of a millimeter, or one 20th of the mean wave length of light. The echelon spectroscope, a similar invention of Professor Michelson's, disperses light according to its different wave lengths to a much greater extent than the prism or grating, and by its aid Zeeman and Lorentz, also Nobel prizemen, have been able to ascertain the movements of the electrons inside the atom. Professor Michelson has also made accurate determinations of the velocity of light, and experimented on the existence of a drift of the ether in relation to matter. THE INDEPENDENT, May 9th, 1905, mentioned him as one of the American scientists most likely to receive a Nobel prize. ——Sir William Crookes, who this year receives the Nobel prize in chemistry, was born in London, June 17th, 1832. He has been editor of the *Chemical News* since he founded it in 1859 and of the *Quarterly Journal of Science* since 1864. His long life has been devoted to research in many different fields of chemistry, and he is equally distinguished as an accurate analyst and a daring theorizer. In our editorial department we give some account of his life and views. He was knighted in 1897.——The prize for the greatest discovery in physiology and medicine goes to Charles Louis Alphonse Laveran, who was born in Paris in 1845, the son of a military physician of almost equal renown in similar lines. He was graduated at the Strassburg School of Military Medicine in 1867, and, after having served as professor at Val de Grace until 1878, went to Algiers to investigate malarial fevers, which were the chief obstacle to the French colonization of Africa. In his five years in Algiers he discovered that the cause of malaria was the growth of an ameba-like parasite inside the red corpuscles of the blood. These sporulate at regular intervals, generally every forty-eight hours or some multiple of that period, throwing germs and poisons into the blood and causing the paroxysms of fever. It has been found that the parasite may thus destroy

in a day a million blood corpuscles per cubic millimeter, that is, in a drop such as would hang on the point of a needle. Quinine is poisonous to the parasite. Dr. Ronald Ross received in 1902 the Nobel prize for demonstrating that this malarial parasite is introduced into the human system by the anopheles mosquito.—— Rudyard Kipling, who receives the prize for literature, is so well known that biographical details are unnecessary. We discussed in our issue of August 29th his fitness for this prize.

Reichstag Debates

The presentation of the Government budget to the Reichstag, revealing as it does an increasing deficit and calling for heavier taxation to build a strong navy, brought out sharp criticism of army and court life from both of the strong opposition parties, the clerical Center and the socialist Left. Dr. Spahn, speaking for the former, asserted that the Harden trial revealed the fact that conditions in and outside the barracks were as bad as in Sodom or ancient Rome. Chancellor von Bülow at once made a spirited reply, denouncing the allegations as sweeping and unproved, and holding that the family life of the Emperor set an example that was followed so generally thruout all classes that the excesses of a few individuals could not besmirch them. The camarilla which was claimed to hedge about the sovereign and control his actions had no real existence.

"What sort of a monarch must he be under whom a camarilla can develop and gain influence, for a camarilla without influence is no camarilla at all?

"The first condition for the flourishing of this poisonous plant is seclusion and the lack of self-reliance on the part of monarchs. Many reproaches have been hurled at the Emperor, but that he has secluded himself from intercourse and had no will of his own has, so far as I know, never been charged against him. Once for all, put an end to the chatter, gossip and whispers about a camarilla."

On the following day Herr Bebel, the Socialist leader, quoted from the memoirs of the Chancellor's predecessors in office, Prince von Bismarck and Prince von Hohenlohe, to prove the existence and

THE EMPEROR AND EMPRESS OF GERMANY RIDING THRU THE STREETS OF LONDON TO GUILDHALL.

power of the Eulenburg camarilla, and asserted that the police were afraid to bring out the names of the guilty parties, which included princes of ruling houses, because it would reveal a scandal greater than the Panama and Dreyfus affairs. In discussing the budget he held up a loaf of bread which, he said, weighed less than three pounds altho it was 50 per cent. dearer than the four and a half pound loaf of eighteen months ago. He said that the number of unemployed in Berlin already numbered between 30,000 and 40,000, and that 4,841 school children, according to the official count, had no dinner. Replying to this General von Finem, Minister of War, admitted that the evil practices referred to were widespread, but held that Herr Bebel exaggerated in saying that entire regiments were contaminated.——The Public Prosecutor will have suits brought against Harden and his counsel, Bernstein, for criminal libel against Prince zu Eulenburg and Count Kuno von Moltke in their speeches during the recent trials. Harden was acquitted of the charge of libeling them in his paper, *Die Zukunft,* but the new trial is not a private suit and will be held before a higher court of appeal.——In the Prussian Diet Prince von Bülow admitted that the policy which has been pursued for many years at great expense by the Government of buying lands in the Polish provinces and settling Germans upon them was practially a failure owing to the refusal of the Poles to sell at a fair price, and he introduced a bill involving the expenditure of $87,500,000 for the compulsory purchase of Polish estates for German settlers under the law of eminent domain.

The Czar and the Duma

In the conflict over the reply to the Address from the Throne it was discovered that the Reactionaries in the Duma were not going to have their way in everything. The Octobrists joined the Constitutional Democrats in opposing the use of the word "autocrat" in the reply of the Duma. Professor Milukov, leader of the Constitutional Democrats, made an able and historical address on the evolution and status of the Russian Government. He said that no address which did not contain the word "constitutional" would satisfy his party or the country. Mr. Guchkov, the leader of the Octobrists, said that his party regarded the Emperor's manifesto of October, 1905, as a voluntary renunciation on his part of unlimited power, releasing the monarch from the influence of the court camarilla. Mr. Purishkevitch, for the Monarchists, demanded the use of the word "autocrat," contending that two attempts to establish a constitutional *régime* in Russia had failed, and that the Emperor, in reconstituting the Duma, had shown his autocracy. Bishop Mitrofan held that every attack on autocracy was criminal, that it had brought to the people many blessings, and that they were devoted to it. When the question was put to a vote, the word "autocrat" was rejected by a majority of two to one. The Monarchists withdrew, because they held that it was illegal to vote on an address which denied the right prerogatives of the Emperor. The Social Democrats, Group of Toil and the Poles also withdrew, because their amendments were rejected. Professor Milukov agreed to compromise by withdrawing the word "constitutional" in consideration of the omission of "autocrat." Premier Stolypin, in his address to the Duma, presenting the policy of the Government, took occasion to emphasize the Emperor's free will and arbitrary power in the following terms:

"The Emperor has often shown, in the face of extraordinary difficulties, how highly he prized the basic principles of the new régime of representative government within the limits established by himself. Nevertheless, the historic autocratic power and the unhampered will of the monarch shine out as the dearest possessions of the Russian royal family. Solely by this power and this will, which were created to defend existing institutions, can Russia be saved in an era of danger and demoralization and brought to the path of order and historical truth."

He said that the Government would make its first duty the suppression of disorder and the insistence of loyal service from all state officials, regardless of their personal political opinions. The Government would punish the arbitrary use of power as severely as slackness of administration, and he counted upon the help of the representatives of the people in uncovering illegal acts of Government officials. As soon as normal conditions were restored the Government would de-

vote its attention to the internal development of the empire and the settlement of the agrarian problem. He outlined measures for the reform of the zemstvos, the court and the Church, and said that the army and navy must be developed to a degree commensurate with Russia's position among the nations of the world. ——The visit of Secretary Taft to the Emperor has given rise to rumors that the United States is securing Russia's aid for an expected war with Japan. Some Russian officers have volunteered their services to the United States and are organizing companies of volunteers.

The French in Morocco

The Arabs have turned the tables on the French, and, out of revenge for the occupation of Casablanca and Ujda, have invaded Algerian territory. The raid had evidently been planned for months before, and marabouts had been preaching a holy war against the infidel, but the French were taken unaware and forced to retreat. Bands of several thousand tribesmen crossed the frontier at various points between Ujda and the coast and ravaged the country, burning crops and buildings, and threatening the city of Nemours. The French troops after reinforcement were able to drive the Arabs at Adjeroud back across the Oued Kiss River, which marks the boundary of Morocco, twenty-eight miles west of Nemours.

The Japanese in Korea

China and Japan have come into conflict on two points—the boundary line of Korea and the Manchurian postal service. The Japanese in behalf of Korea claim the Chientao region, which lies to the north of the Tumen River. Both China and Korea have in the past exercised partial sovereignty over this plateau, but the boundary line has not been definitely settled, altho several attempts have been made to fix it. Yuan Shih-kai, who is now the power behind the throne in China, took a special interest in this question when he was Chinese resident in Seoul, occupying much the same position as the Japanese Resident-General has there now. The Chinese claim is that the Tumen River is the national and historic boundary, and that it is marked by pillars along the river. The Japanese hold that Chientao has always belonged to Korea, as the present ruling dynasty originated there, that the eleven pillars along the Tumen have no mark to indicate that they are the boundary pillars, and that another pillar on the Champeh-Shan Mountain bears an inscription dated May 15th in the fifty-first year of Kang-shi, in which the ideographs indicate that the river referred to as the boundary is not the Tumen but one of its tributaries. Some garrisons of Chinese troops are in the region, and more were upon the frontier ready to be brought in when Japan made an advance movement to establish their rights by possession. Colonel Saito with a party of gendarmes went to Hoiryong, on the Tumen, and from there crossed the river, entering the disputed territory some fifty miles to the northwest, establishing a post office at Lungcheng, and connecting it by telegraph with Seoul. His action in this matter is ostensibly to protect the Korean residents of Chientao, who are said to number 120,000. China has made a diplomatic protest against what she claims as an invasion of her territory, and has expressed a willingness to have the matter referred to a boundary commission. The Japanese refuse to agree to this unless it is acknowledged by China that Chientao belongs to Korea.——The Chinese Government, in its zeal for getting rid of the extraterritorial privileges of foreign nations, has demanded that the mails sent on the railroads of Manchuria be confided to the Chinese postal service. Mail has previously been sent over to Pekin in the hands of a Japanese official; this, however, the Chinese Government suddenly prohibited. The Russians are involved in the same difficulty, because they refuse to turn their mail over to the Chinese postal service, preferring to deliver it direct into Japanese hands at the point where the two Manchurian railroads meet. The reason given for this denial of the right of China to receive European mails is that China does not belong to the postal union. Pending negotiations it has been agreed that mails from China eastward for Newchwang shall be transported over the Chinese railways by Japanese carriers as hitherto, but that mail matter destined for Mukden shall be entrusted to Chinese hands.

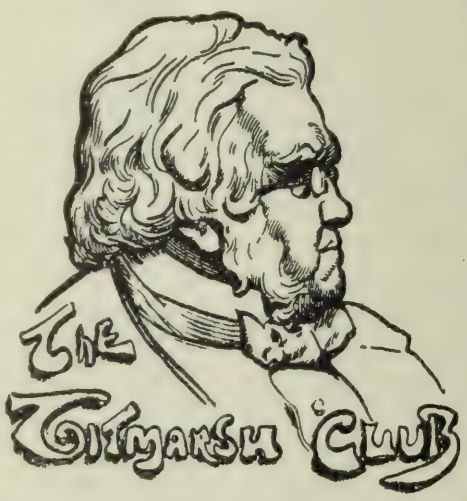
The Evening Light

BY ALFRED AUSTIN

POET LAUREATE OF ENGLAND

ANGELS their silvery trumpets blow
At dawn, to greet the morning glow,
And mortals lift adoring eyes
To see the glorious sun arise.
Then winged with faith, and urged by hope,
Youth scans the hill and scales the slope;
Its pulses bound, its thoughts exult,
It finds no danger difficult,
Doubles the pace, disdaining ease,
Victor before it comes and sees,
Deeming the universe its own,
The sovereign of a self-made throne.

Each hope achieved, fulfilled each prayer,
We glory in the noonday glare,
Welcome the blinding heats of strife,
Deeming resistance part of life.
We deal the blow, return the stroke,
Fighting our way thru dust and smoke,
Until, our battle banner furled,
We tower above a conquered world.
Whether we lead mankind along
By gift of speech or grace of song,
Seize with a strenuous hand the helm,
Or add an empire to the realm,
We front the sun with forehead bare,
Still glorying in the noonday glare.



But as the lengthening shadows glide
Silent along the eventide,
Till dews baptize lawn, leaf and flower
In that dim sanctuary hour,
A sacred something haunts the air,
Tender as love, devout as prayer,
And in the darkening dome afar
Glimmers one bright outriding star,
Announcing to the sentry sight
Coming battalions of the night.
The noonday glare and morning glow
Pale into shadowy long-ago,
We feel earth's vain ambition fade
Into the vanished dust they made.
All that the glow of dawn foretold,
And all the noonday sun unrolled,
Seem nothing to the quiet joy;
No clamor mars, no cares annoy,
'Twixt restless day and restful night
That sanctifies the evening light.

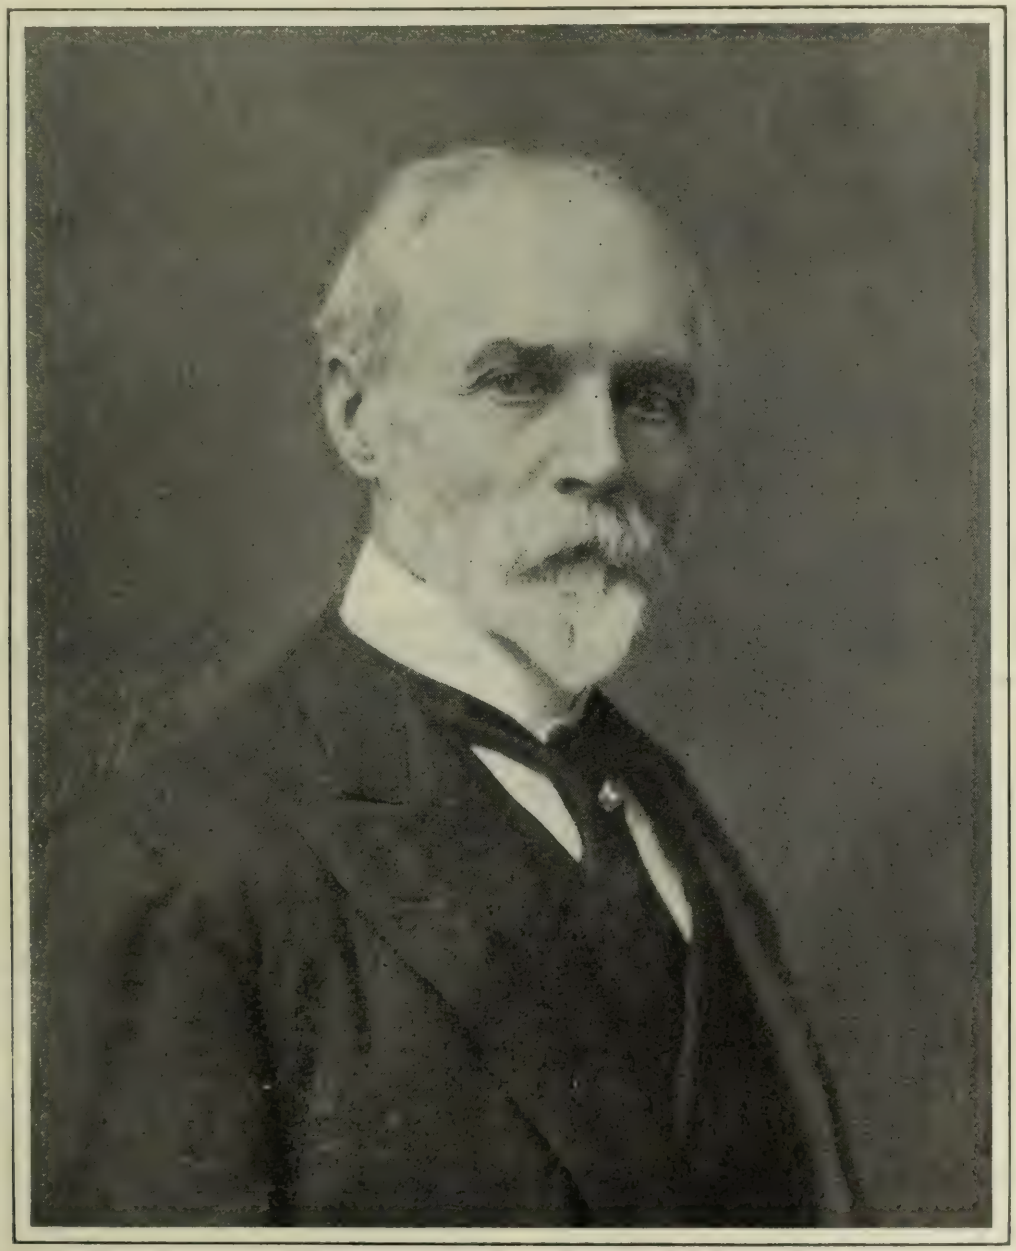
SWINFORD OLD MANOR, KENT, ENGLAND.

William Makepeace Thackeray

BY WHITELAW REID, LL.D.

[Our readers will remember Justin McCarthy's London Letter in THE INDEPENDENT of November 17th, in which he spoke of the third and then forthcoming dinner of the Titmarsh Club at which Mr. Whitelaw Reid, our Ambassador to England, was to preside. The Titmarsh Club, of which Mr. Reid was one of the original members, is composed of the foremost literary men of England, and its object is to pay periodical homage to the memory of Thackeray. As the club's dinner was private it was not reported in the London papers, and accordingly we are very glad to give our readers Mr. Reid's address in full, with the exception of a few lines of purely personal introduction. We reproduce again the effigy-portrait of Thackeray officially issued by the club on all letters and circulars.—EDITOR.]

THACKERAY found his audience in America almost, if not quite, as soon as at home; he always held it, and holds it still. And, perhaps, too, it may be remembered that Mr. Thackeray seemed to like us nearly as well as we liked him, and was never weary of showing his good will—even when he was somewhat more lonely in such manifestations than he would be now.



I never had the good fortune to meet Mr. Thackeray in America, tho I did meet soon afterward your other great novelist of that period. But for years I was constantly hearing gossip about Thackeray from those who had met him during his visit to us, like the genial publisher who was his guide, philosopher and friend among the Brahmins of Boston, or like the old Centurions of New York. Their accounts ran all one way. They admired his talk and they loved him. They pictured him as big, hearty and very human. They didn't find him playing the lion the least little bit, and we may hope he didn't find us playing the spread eagle too much. They pointed out the corner in the Century where he used to sit exchanging literary chat, or, in Yankee parlance, "swapping stories," with a group of clubmen about him. They could tell you years afterward what had been Thackeray's favorite chair, and some had even been so observant of the least trifles about the great man that they knew what particular concoction in a club tumbler had been his favorite "nightcap."

There never was any lack of admiration for the other great novelist to whom I have referred, even when we were still thin-skinned and the "American Notes" and "Martin Chuzzlewit" were still fresh from the press. But there was no such social and club tradition of Dickens. Perhaps the reason is not very obscure. Dickens painted us for the very eyes in all the world wherein we were then most anxious to look well, in the books I have just named. Thackeray represented America to the mother country in the persons of Henry Esmond and George Washington. No doubt we had our Jefferson Bricks and Elijah Pograms, too. I do not deny it, and do not deny that they were painted to the life. But we were human enongh to like it better when the others were presented as our national types.

No such consideration, however, affected the publisher's touchstone—and, I am afraid, the touchstone of most men of letters, too—the sales. These went on in America very much as they did in Great Britain—perhaps more so. The great popular circulation belonged to Dickens, the audience fit tho fewer to Thackeray. I have not seen the late figures—perhaps some publisher here will correct me if I am wrong—but I fancy that the disparity in sales is less nowadays. Few reasonably comprehen-

sive private libraries are without the works of one, if not both; but I believe that in the severer collections of pure literature the name under which we are assembled begins to lead.

We must not think of anything more nearly approaching comparison between these two men of genius. It would be utterly idle if not impossible. I may say, however, without disparagement or offense, that American men of letters are apt to speak with particularly warm admiration of Thackeray. Simply as a story-teller they may not rate him so high as other British authors—not, in fact, so high as some British authors of today. They may even hint at prolixity, and at the frequency with which the innocent reader is held by the buttonhole for overmuch moralizing. But criticism is silenced, all are carried away by his creations of character, by the keen but kindly analysis of human nature, the scorn of meanness, the trenchant satire that still hates to wound, the sentiment at once healthy, manly and tender, the splendid humanity. As for his style, it is thought well-nigh perfect. Leslie Stephen has somewhere told us that at the beginning, if not to the end, this style was the work of a constant revision and interlineation. For myself I do not believe any style of the first order was ever attained in any other way. I have no

WHITELAW REID.

faith—here perhaps speaks the old editor, hardened in his prejudices—but I have no sort of faith in the things that are written at a dash, and handed you without a change of a word. It was no less a genius than Sheridan, was it not, who formulated the immutable literary law that "Your easy writing's curst hard reading."

But this rambling talk must not wander on. As I was thinking before dinner of this man, whose place is secure among the immortals, whom every one counts in the first rank of the great Victorians, I could not help recalling that exquisite little essay of his among the "Roundabout Papers," *"Nil Nisi Bonum,"* as noble a paper as ever adorned even "The Spectator." You remember the warm tribute it pays to two men of letters then lately taken away, one from you, both perhaps I may presume to say, from us, Thomas Babington Macaulay and Washington Irving. He called them the Johnson and Goldsmith of their time, and finally applied to them some words which I venture to think this company of men of letters will think we may apply with equal justice and even greater fervor to William Makepeace Thackeray himself. Let me close by reading them:

"It has been his fortunate lot to give incalculable happiness and delight to the world, which thanks him in return with an immense kindliness, respect, affection. It may not be our chance, brother scribe, to be endowed with such merit, or rewarded with such fame. But the rewards of these men are rewards paid to *our service.* We may not win the baton or epaulets, but God give us strength to guard the honor of the flag!"

LONDON, ENGLAND.

Christmas From Behind the Counter

BY RHETA CHILDE DORR

[We are sure that this true experience of Mrs. Dorr will cause all of our readers to make their Christmas purchases as early as possible this year. The Charity Organization Society in this city has even taken the matter up and is distributing thousands of cards asking people to help the tired shop girls all they can by not putting off their Christmas shopping to the last moment.—EDITOR.]

THEY tell a story of a settlement party given for a club of little working girls. One of the philanthropic ladies who was assisting approached a group of children and offered them a plate of candies. "Ugh!" exclaimed these poor babies, "we don't eat that stuff. We *make* it."

That's the way I feel about Christmas presents. I don't give them any more. I have sold them.

It is not difficult to get a job in a department store at the Christmas season. You must apply in good time, that is, before the 15th of December; you must look strong enough to live thru the experience, or, at least, not to die on the premises before the end of the holiday week; you must be neat in appearance and fairly intelligent; you must present proof of respectability. In only a very few stores is previous experience required.

I did not venture to apply at the more fashionable shops, those enrolled on the White List of the Consumers' League. I modestly chose a great establishment patronized by the rank and file of people, who buy for cash, and have no illusions that they are materially influencing store management. I believe that this kind of store is more typical of the general run of department stores thruout the country than are the others.

Having been accepted as an extra clerk, I was given a locker key, for which I deposited 25 cents. I tucked away my outer garments in the cloakroom and meekly followed my guide to the office of the store instructor. In this

room I found about thirty other candidates, girls and men, sitting on benches before a large blackboard on which was painted an exact reproduction of a sales slip. A subdued murmur of conversation went on, from which I gleaned interesting little bits of life history. One girl was entering the Christmas mill because her father, an ironworker, had fallen from a skyscraper and broken both legs. Another was a kindergartner temporarily out of a position. Another worked in a trade which was dead during the winter months. Several girls were seeking experience as saleswomen, that they might the easier get regular work in some store. None of us, you may be sure, were engaging to work fifteen hours a day for sheer amusement.

Presently the door opened and a man came in. Picking up a piece of chalk and working very rapidly, he proceeded to show us what to write on our sales slips if Mrs. Henry Smith, of No. 1125 Fifth avenue, purchased a pair of shoes for $5 and had them sent home C. O. D.; if a cash customer bought four yards of lace, at 25 cents a yard, and carried the parcel home; or if George Baker, of New Brighton, Staten Island, indulged in a sweater at $3.50 and had it charged and sent. The lesson over, we were dismissed to our various destinations.

I went downstairs to the main floor, carrying in my hand a yellow ticket bearing my number and the number of my department. This turned out to be a counter where men's handkerchiefs were sold. The head of stock, a pretty Irish girl, with a mass of brown hair, seemed glad to see me. "We've only seven girls here," she told the aisle man who convoyed me; "not nearly enough."

There didn't seem room behind the narrow counter for one more, but I squeezed in, and in less than three minutes I was scribbling in my new book: "Four hdkchfs. @ 12½ cts., 50 cts. Pd." and was handing money and handkerchiefs to a fiery tressed young cashier, who scowled at me as if my action were in the nature of a personal affront. We had waited long in the instruction room, so that it was nearly noon before my active career as a saleswoman began. I was ignorant of shop routine, I did not know where any of the stock was kept, yet before we closed that night I had sold $35.80 worth of handkerchiefs. They were mostly cheap handkerchiefs, 10 to 25 cents apiece, so I must have sold a great many of them.

My first day in the shop passed rapidly. The novelty and excitement of the scene was so stimulating that I was hardly conscious of fatigue, or even of the flight of time. About half past five in the afternoon the head of the department came around distributing supper money. She carried a cigar box full of small silver, and each girl was given 35 cents. The extra clerks, who worked only during the holiday season, were paid at a somewhat higher rate than the regular force. I was receiving $7 a week, which was a dollar more than the average wages paid in our department. The regular clerks were receiving something like $6 a week for their services from eight until six o'clock; they were required to labor from three to four hours extra each day during the holiday week, and for this extra work they were paid nothing at all. However, the firm did not require them to buy their supper into the bargain. Hence the distribution of the supper money.

At first the allowance struck me as rather meager, but exchange of confidences among my fellow clerks revealed that, as a matter of comparison, it was really generous. I learned, for example, that in a very splendid Broadway shop, high on the "White List," overtime money amounting to a little more than enough to pay for one's supper was given, but always with a great flourish of trumpets, as a manifestation of rare benevolence. The clerks had to sign little circulars, acknowledging their gratitude, a thing they greatly disliked to do. Besides, the firm claimed the credit of closing at the usual time during the holidays, which was not according to the facts. They closed the shopper out at six o'clock, it is true, but they closed the clerks in, to toil until nearly midnight.

The shop patronized by the rank and file has other advantages, from the clerks' point of view. In our establishment they were allowed to go upstairs in the regular elevators and eat a comfortable meal in the store restaurant. In the fashionable shop the clerks are obliged to take

time from their hour to don street wraps, walk down several flights of stairs, unless they are lucky enough to catch the freight elevator, and seek a restaurant outside.

The explanation lies in the relative social difference between the customer and the clerk in the two establishments. In the fashionable shop a great gulf divides the two, and the customer would not tolerate association in elevator or restaurant with the humble saleswoman.

In the other shop the social position of the customer and that of the clerk are not far removed. The two are in the same class and are likely to meet outside the shop. Hence there is no objection on the part of the customer if a tired figure in black sits opposite her in the restaurant.

Half a dozen of my fellow clerks ate the evening meal with me. I noticed that very few of them spent all their supper money. They bought tea and pie for 10 or 15 cents and saved the rest of their allowance. Perhaps they counted on a substantial meal on reaching home. Not having any domestic ties myself, I had to spend all my 35 cents, and, to tell the truth, rather more, before my appetite was satisfied. I was as hungry as a farmhand, and I gazed in wonder on the slim, pale creatures who could face four hours of work on such a meager diet.

Three-quarters of an hour was allowed for lunch and for supper, a respite of an hour and a half in a day of fifteen hours, for, altho the store was advertised to close at ten, it was much nearer eleven before we left our posts of duty. The last reluctant shopper was tactfully shown the door soon after half past ten, but there was the stock to be put away and the counters to be covered with heavy tarpaulins before we heard the gong that released us from our toil.

In all my life I never faced anything more reluctantly than the necessity of getting up at half past six the next morning. I ached all over from the unaccustomed standing. A dismal rain beat on the window panes, the house was dark and still, and my bed was an alluring thing. I plunged out and dressed with my eyes shut. It seemed to me that my case was a hard one—unique, in fact—but when I stepped into the street I found that I was far from being the only early riser in New York. The street was fairly thronged with a hurrying crowd, in which women and girls predominated—a great army of neat, black-gowned feminine figures, which you will never see unless you take a walk in the business quarter between seven and eight in the morning.

In my store were employed more than a thousand women, and at least four department stores in New York employ a still larger number. There are about twenty large establishments in the so-called shopping district of Manhattan, not to speak of innumerable small shops. It is the population of a good-sized city that fills the streets with neat black gowns every business morning.

Our day began with a terrific crush at the employees' entrance, a dark and forbidding cavern of a place, built to accommodate about half the number that must use it. There were five or six hundred girls, all clamoring to pass the doorman at once, pushing, crowding, exclaiming. If one reached her post after ten minutes past eight she was fined 10 cents, no mean sum out of a weekly wage of $6 or less.

The floorwalker took our time when we reached our department, and we proceeded at once to the task of dusting shelves and counters and putting out our wares. All the handkerchief boxes had to be placed mathematically straight on the shelves, in strict alphabetical order. The loose stock on the counters had to be maneuvered so that all soiled or mussed handkerchiefs were underneath, like the small strawberries in the bottom of the box. By nine o'clock the day was in full swing, and after that there was not a single minute's leisure for anybody. In our shop a few seats were provided, perhaps two to a counter, but no one ever had time to use them. I kept account of my industry, and I found at the end of the week that I had sold, on an average, $85 worth of handkerchiefs every day. I leave it to the reader to calculate how much time to sit down was allowed me. My wages were $1.16⅔ a day, a little less than eight cents an hour. For every $6.50 worth of handkerchiefs I sold I was paid about eight cents.

By noon of the second day I was pronounced expert enough to take charge of a popular bargain sale of twelve-and-a-half cent, all linen, initialed handkerchiefs. They were actually indentical with boxed goods sold for a dollar the half-dozen, when anybody called for anything just a little better than the loose stock at seventy-five cents. Of course this fact was not confided to the customer, and I had some trouble with my conscience as often as a buyer appealed to me to show her the difference between the two handkerchiefs. My real troubles began with my new responsibilities.

It was my duty in the intervals of selling to keep that counter full of loose handkerchiefs in neat and attractive piles, according to initials. I am sure I arranged them at least a hundred times in the course of the day. All the G's together, all the J's, the M's, the D's, and the rest of the alphabet. The utter futility of trying to keep them in proper order, and the patent necessity of doing so if they were to be disposed of, caused me much effort and emotion. Hardly would I get the first four letters arranged when hands would swoop down on the neat piles and scatter them broadcast. Sometimes a woman would pause long enough to buy after destroying, but quite as often the disturber of peace would not even slacken her pace, but would plow her fingers thru the linen without stopping or even looking. These women were professional shoppers, and I soon came to know them on sight. The shopper may have purchase as an ultimate goal, but she is not satisfied to buy until she has examined as many objects in as many shops as time and physical endurance will permit. Sometimes this is prudence, and reveals the straits to which the middle-class woman is put in this era of high prices. Oftener, I believe, the shopper is just empty-minded, idle and foolish. There are men shoppers, as well as women, be it understood. The men are much clumsier than the women, and no saleswoman wastes much time on them. It is plain that they are "just looking," perhaps trying to make fifty cents do the work of a dollar, and one is prepared for their sheepish "Well, I'll come in this afternoon." The woman shopper is sometimes so clever that she deceives even an experienced clerk into the belief that a purchase is contemplated. At least the clerk hopes to outwit the shopper and force a sale. Sometimes this actually happens, but usually the shopper says that it won't do at all, or she prefers the one at Altman's. Sometimes she gives in to the extent of ordering the article sent C. O. D. to an entirely fictitious address. She probably thinks she is doing something highly original and clever, but she isn't. Hundreds of women every day send home from stores articles they have not the remotest idea of paying for. The things come back, and a large force of clerks is engaged each morning in unpacking and returning the rejected stock to the shelves. Oh, the trials of a department store clerk are not few.

But if the saleswoman's task is difficult, there are others whose lot is even less enviable. Anna, our cashier, a girl of eighteen, was the presiding genius of our department and also of a glove counter back of us. She sat enthroned above our heads, a red-haired, splendid, savage queen of what I came to look upon as a sort of a heathen revel. It was really a Christian festival, of course. That is what we intend Christmas to be, I know, and undoubtedly that is what it is. But it looks something terribly different when you regard it from behind a counter. I worked there only one week, but in that time what things I looked upon! I saw girls of seventeen and eighteen weeping with pain and weariness at eleven o'clock at night as with shaking fingers they made their counters attractive against the next day's brutal rush. I saw one young girl drop in a dead faint while selling dolls to a fond mother of children. I saw little boys fall asleep in rubbish corners at the noon hour, their untasted luncheons in their tired hands. I saw these things, but Anna, high up above the counters, must have had a much more comprehensive view. She developed a temper and a vocabulary that caused me to shudder as often as I came within sound of her voice. Some one once defined swearing as the unnecessary use of profane language, and this description occurred to me in Anna's case. When one of my

co-workers moaned "Oh, Lord, my feet," I had no impression of swearing, but when I unwittingly laid a box of handkerchiefs and two dollars on top of another girl's sale, which was against the rules, Anna's remarks were distinctly profane. They were exaggerated. Not that Anna was aware of her own profanity. Her vocabulary was limited and her need of expression very great. That was all.

Monday and Tuesday of the week were difficult, but it was not until Wednesday that we reached the danger point of weariness. By noon of that third day we all looked fagged, and some of the girls were obviously ill. We all complained bitterly of aching backs and swollen feet. We were all sleepy early in the morning. Every one was working under the lash, but working feverishly, unceasingly. The ordinary annoyances of selling—or failing to sell—became tragedies to our tired nerves. One of the nicest and most refined girls burst into a passion of tears as she put up a pile of handkerchief boxes. "D—— that woman," she sobbed, "I waited on her fifteen minutes and she never bought a cent's worth." The actual wrong these time-consumers do the shop girl, especially at the busiest season, is possibly not fully realized by themselves. The value of a saleswoman to her employers, her tenure of office and the salary she receives are calculated from the size of the books she makes—that is, the amount of her sales. If the amount falls below a certain standard the girl is discharged. I should dislike the thought that I had ever been responsible for a saleswoman's lowered salary or the loss of her position.

When Thursday noon came our nerves were decidedly on edge. The store seemed to hold twice as large a crowd as on the previous day, and the restless, swaying, moving, perspiring mass of humanity began to irritate me strangely. I felt a sudden loathing disgust for the whole Christmas idea. "I shall never give or receive another Christmas present as long as I live," I suddenly felt impelled to declare to the girl who stood beside me. "If you keep on selling you'll stick to that," she said, cynically. "And you'll get to hate people, too. It makes me sick to see them crowding in here at ten o'clock at night. I believe they'd keep on coming until morning if they could make the firm keep the place open. I wonder what they think we're made of."

That year our firm tried the experiment of separating the day and evening sales—that is, of having the records kept in different books. If the night sales fell below a certain mark, it was reported, the store would close at six o'clock the next year. I am sorry to say that the night profits were immense. The hours from seven until nine were overwhelmingly busy. The two last hours were a little lighter, but no one had time to sit down up to the minute of closing.

It was on Thursday that we became afflicted with an epidemic of dropping things. It was a sort of a hysteria which affected us one after another, and added greatly to our sufferings. We lost money. One wrapper girl lost five dollars. Our cashier lost a dollar. Several saleswomen made mistakes in reckoning purchases, and change spilled on the floor was a common thing. One girl lost a quarter in this way, and her distress was a pathetic revelation of a poverty so dire that 25 cents one way or another was happiness or misery. Shortly after her disaster I dropped a handful of silver while I was handing a purchase to Anna. One silver piece rolled under the counter into the crowd, where some one promptly confiscated it. "What shall I do?" I asked the pretty head of stock. "Take it out of your pocket, of course," was the reply.

At the counter, waiting for his parcel, stood a nice old gentleman, who looked at me with the deepest sympathy. "Will you have to lose that," he asked, solicitously, "or will they make it all right with you?" "I must lose it," I said, adding, "What do you think of a person who would steal a quarter from a shop girl?"

He was not a rich old gentleman. His overcoat was several winters old, and his neatly brushed hat was rusty and out of date. He stood still a minute, and then, with the sweetest of smiles, he put his hand in his pocket and extracted a quarter. "Will you do me the favor of accepting this?" he begged. "Indeed, it will give me happiness if you will." I

saw that he really wanted to treat himself to a kind action, so I took the coin, saying, "If you don't object, I will give it to my friend here, who has also lost a quarter. I would much rather she had it." To my utter confusion and embarrassment the old gentleman conceived my act to be a case of rare and beautiful altruism. His old face became agitated, betraying an inward struggle between inclination and poverty. His hesitation was painful, but I did not say a word, because I wanted to see how generous he really was. Slowly and reluctantly his hand went down into his pocket. He couldn't afford it, he knew, but—the hand came up with a quarter tightly held. The old fingers shook that held it out to me. "It's Christmas," whispered the old gentleman, smiling.

His was the unique manifestation of the real Christmas spirit, of giving for the love of giving, without any conventional motive, that I encountered during the week. My recollection of the last three days is altogether sordid and hateful. The crowd of buyers assumed the aspect of a mob, and I should not have been greatly astonished if they had suddenly turned on one another and begun to tear and rend. As for us behind the counter, we were so exhausted, so worn with sleeplessness, so racked with the nervous strain of it all, that we fairly staggered about our work. We ran into each other, stepped on toes, jostled, pushed and snarled. In spite of myself my sales began to fall off. I was too tired to present my sales pursuasively. None of the girls were doing good work. Even Sadie, the black-eyed Jewess, who was wont early in the week to capture buyers by leaning over the counter and calling in wheedling tones: "Anything in gents' hankcheefs?" Even Sadie had lost enthusiasm.

At night when we got into the car to go home we fairly fell into our seats, and when strap hanging became a necessity our misery was intense. The girls screamed, when they were thrown against each other by the sudden starting of the car, peals of hysterical laughter that caused well-bred passengers to look at us with annoyance and disapproval. I have often been disturbed by the loud laughter of working girls, but that was before I understood. One night our car was stopped by an automobile accident. The victim, one of our own kind, was being lifted, a limp heap, into the automobile, and a sudden crowd was reviling the owner and his chauffeur. Most of our fellow passengers left their seats and joined in the chorus, but we only raised a passionate protest against the delay. Our sympathies were drowned in an aching desire to get home and to bed. When you have been on your feet for fifteen hours, busy every second of the time, you do not care who is hurt, just so the accident does not delay your progress toward rest. Overwork brutalizes the gentlest. I am sure I never dreamed I could be so callous to suffering as I was that night.

On Saturday morning I notified the handsome and dignified head of the department that I intended to leave that night. She expressed surprise that any girl should venture to leave before the Christmas rush was over, but I assured her that I was tired out and must go. She reluctantly signed my card, necessary preliminary to collecting my wages, and gave me leave to go to the cashier's office. The indignation of that personage was almost beyond expression. What! Leave before Christmas eve? What amazing effrontery! What ingratitude to the firm!

"Now, look here, my good girl," he exclaimed excitedly, "haven't you got any sense of obligation? We gave you a job, treated you well, and here you're going to leave us when we need you most. Monday night's going to be the fierce limit, as you know, and you refuse to stay and help us out. Here you've *used* us all week, and now——"

"Now you want to use me," I interposed.

"Not at all," he sputtered. "Why should you wish to leave? You're drawing a dollar a week more than the regular salesladies. Can't you be as loyal as they are?"

"Eight cents an hour," I murmured, "fifteen hours a day. Thank you, I have had all I can stand. I couldn't be grateful, or loyal, or obliging on eight cents an hour. Nobody could be. Nobody is."

He wheeled away from me wrathfully,

throwing my card back on the desk. "Well, you won't get your money tonight," he snapped. "You think it over and come back on Monday."

I called his attention to the promise on the card, that wages were payable on the day an employee left the store, but he was implacable. I finally compromised, or I was coerced, into agreeing to work Monday evening.

That night when I went to my supper I haw a boy, small for his sixteen years, sitting on a box before the employee's elevator, for which we waited. He looked up at me, and with the craving for sympathy innate in children, he sighed softly: "Oh, my God, I wish one o'clock would come."

"Don't you get off until—merciful heaven, where do they work you?" I asked.

"In the packing department," answered the boy in an emotionless voice. Try to imagine your little boy longing for one o'clock, when he would be allowed to go to bed for five hours.

Upstairs in the restaurant my waitress was also looking forward to some remote hour of respite. "Usually we go home at eleven," she said, "but tonight and Monday we have to stay and make a thousand sandwiches after the store closes. The wagon men have to eat at midnight." At what hour the wagon men ceased work I did not venture to inquire.

The saturnalia of that Christmas Eve beggars description. The crowd of exhausted people that filled the store, weary of body, drained of spirit, seemed like the very antithesis of Christmas. One would have supposed the majority to be driven by hatred rather than love. "Oh, come along," hissed a parcel-laden husband to a woman who stopped at my counter. "Got to——" she gasped, "got to get something for your Uncle Henry. Handkerchiefs will do's well as anything, I guess. Oh, any kind, plain or initialed, doesn't matter," in response to my demand for particulars. She thought of several others she had to buy presents for before she left the counter, and I supplied her with tokens of affection which she was too tired and too cross to even examine before they were wrapped. I sincerely hope I gave her the right initials, but I was as tired as she was. Her husband's expression as she tumbled the bundles into his arms was actually vicious.

All over the store one heard the wails of children, dragged out to share the merry joys of Yuletide. Many of them had been on their poor little feet since morning, for Christmas shopping is always a protracted business. I wondered if these children retained any illusions of angels and Santa Claus.

If the shoppers were at the extreme limit of endurance, the girls behind the counters were in like condition. I can speak for the handkerchief department. The floor under our feet was littered inches deep with torn papers, boxes, trash of every kind, which in other circumstances we would have resented, but which we were now too far gone to notice. The stock was in an indescribable state of confusion. The cheapest and the most expensive boxes were thrown together in disordered heaps, and silk and linen were dumped indiscriminately into common compartments. We were all bursting with temper, altho we were determined not to show it. I never respected any group of people more than I did my colleagues behind the handkerchief counter. Under conditions which might have roused in people of more exalted social station the most barbarous impulses, those girls showed a consideration for one another, a gentle spirit of endurance toward the customers, and a desire to do their full duty to the firm, that aroused all my admiration. It did me good just to touch hands with such characters.

Even Anna rose to the occasion. She summoned an unsuspected capacity for self control, became subdued in her manner, and almost amiable toward the saleswomen. She was literally buried under the shower of parcels, but she wrapped and punched the cash register swiftly and stolidly, heedless of the sharp tones of the customers, who clamored for their parcels and change. At times a perfect chorus of ill-natured criticism was directed at her, but she worked on with a satirical smile on her lips and only an occasional murmur of profanity.

The tumult kept up that night until long after eleven, and when the gong

rang to notify the shoppers that they really must leave, every department in the great store was crowded. People were buying groceries, wines, flannels, dress goods, toys, books, jewelry, hats, gloves, handkerchiefs, automobiles — think of it, at half past eleven o'clock at night, December 24th! Is the world indeed heartless and inhumane? Is it only heedless? Did each individual buyer imagine that his necessity differed from all the others', and that he alone was justified in his late buying? Did one impulse of pity for the worn-out shop people visit a single breast? I wonder. I wonder also what the simple workman of Nazareth, if he looks down on things here below, thinks of the manner in which the most enlightened of nations celebrates his feast.

"Cheer up, Anna," I said, as the red-haired martyr limped down from her desk, her cashbox heavy in her arms. "Cheer up; it's only a few minutes until Christmas."

"Christmas," moaned Anna; "Oh, my Gawd!"

NEW YORK CITY.

What's the Matter With Football?

BY ARTHUR B. REEVE

[In our issue of November 22, 1906, we printed an article from Mr. Reeve entitled "Football Safe and Sane." This article sums up the deaths and casualties of the football season now closed.—EDITOR.]

TWO years ago the football reform agitation began. "Deadly football" was the subject of many heated articles, and one large university at least in the East abolished the game absolutely. In several others the "soccer" game was substituted. In several of the preparatory schools and high schools football was abolished also. Then came the reform from close mass play to the open spectacular game of today. The present season has shown a partial, tho in the main harmless, return to mass play; but it has also shown a return of the high schools and preparatory schools to many of the features of the game which in 1905 we endeavored to abolish. And thereby hangs the lesson of the year in football.

In 1905 the season witnessed 22 killed and 96 more or less seriously injured. In the following, the reform year, there were 10 killed and 63 injured. This year there have been 14 killed and 58 injured. Apparently there is something the matter with football and our task is to discover what it is.

"Reformed football was justified by a 50 per cent. decrease in fatal accidents in 1906 and a 33 per cent. decrease in 1907 below the bad record of 1905. The record of the present year is not quite as good in the matter of fatal accidents as that of last—there have been four more deaths—but it shows a slight improvement over 1906 in non-fatal injuries. Not only are these injuries fewer but they are also less serious than last year. There is food for thought in the fatalities.

Last year of the total of ten fatilities five were due solely to football as a game; the remaining five were due to causes that are operative in every sport, in private life, and indeed were in many cases more likely to happen in other sports than in football. Such accidents should not be properly charged up to the much-abused game of football. In an article in THE INDEPENDENT written on November 10, 1906, I reported that up to that time in the season three of the deaths had been due solely to football; later in the season two more such deaths occurred. This year of the fourteen deaths, no less than ten have been chargeable to the game itself. That fatalities peculiar to the game should be again increasing is unfortunate, but it points to faults not so much in football as in those who play it and the manner in which they play it—faults, by the way, which I have already pointed out twice before.

The fact of the matter is that of the whole fourteen killed the ages averaged something under eighteen years. Not one of them was over twenty years old. All except two were in high schools or players on boys' amateur teams. Furthermore, of the two university players killed only one death was due to football directly, and both of them were in "universities" ranking little higher than preparatory schools. One of the ten cases was of a boy only thirteen years of age. The conclusion is obvious—football is a young man's game, it is not a boys' game. It is many years since there has been a death or even a serious permanent injury to a player on any of the large 'varsity teams, and the minor injuries are comparatively few. The main trouble now is with the boys' and amateur teams, where rules are often lax, anything is fair to win, and, as was pointed out last year, the winning team often gloats over having put up a disgracefully vicious game.

Taking up in detail the fatalities of the year, one player died of a ruptured intestine. But he had barely recovered from an operation for appendicitis, and never should have donned the moleskins, or the paraphernalia of any sport whatever, for that matter. Still another had recently had typhoid fever and the exertion of the game resulted in a fatal relapse. He, too, should never have played football, or any other game, for several months longer. Still another lad had blood poisoning from an otherwise slight scratch which might have happened as well in any of dozens of other ways; and another who had never played the game before was killed in making a flying tackle which no competent coach would have allowed him to attempt except after days of work with a "dummy" over a straw pile. Here is over one-third of the list which by liberal construction should not be charged to the game itself.

The ten deaths chargeable to the game itself included the case of the thirteen-year-old schoolboy who was killed by a blow on the head from an older boy; an amateur player under twenty killed in much the same way; a high-school boy of eighteen whose back was broken in an old-style mass play such as the attempt has been made to eliminate; a sixteen-year-old high-school boy whose skull was fractured; a student in a minor university who was pulled from the bottom of a pile of players with partial paralysis, from which he died a month later; an eighteen-year old high-school student whose neck was broken; a fifteen-year-old boy on an amateur team; two sixteen-year-old boys described as "kicked in the stomach," and a high-school student "bent double under the piling up of players."

It is a bad record. But at a glance it can be seen that it is not damning to the game, provided the game is played by proper players, of seasoned age, in good physical condition, and according to the rules and the spirit of the rules. Surely no game should be played under other conditions than these. Moreover, compare this record with that of 1905, where, of the 22 deaths, no less than 17 were due solely and unquestionably to football as it was played then, mostly injuries to brain and spine.

Furthermore, the decrease in serious non-fatal accidents is striking during the past three years. The following figures are given, in order, for the years 1905, 1906 and 1907: Broken collar bones were 7, 9 and 1 respectively. Broken legs were 6, 8 and 4. Twisted knees were 5, 7 and 4. These three classes of injuries, which it was predicted last year would show an increase and which did show it, have this year thus shown a decrease. They are peculiar to the "open" game, but are even in the second year of its existence decreasing.

Concussion of the brain, peculiar to mass play, decreased from 4 to 2 to 1 cases. Serious but non-fatal injuries to the spine were reduced from 3 cases in 1905 to none in 1906 and 1 in 1907. This 1 case was of a university student "practising" with a couple of companions at home. There were 5 internal injuries in 1905, none last year, and 1 this year. Injuries described merely as "serious" were 13 in 1905, 1 in 1906, and 10 in 1907.

Three arms were broken in 1905 against 2 in 1906 and 1 in 1907; 4 shoulders dislocated against none and 2 in the last two years. Broken ribs figured three times in 1905, none in 1906 and only

once in 1907. Four broken noses were reduced to 2 in 1906 and 3 in 1907.

A case of water on the elbow, 2 of water on the knee, 2 leg bruises, 1 thigh bruised, 2 ankles turned, 1 toe bruised, 1 ankle dislocated, 1 hand broken, 1 leg wrenched, 1 old wound reopened, 4 knees wrenched, 5 heads cut, 6 ankles sprained, 1 strained tendon, 2 shoulders dislocated, 1 shoulder sprained and another broken, and a ruptured appendix, complete the list of injuries of this year. Some of these accidents are such as might have happened had football never been invented. There are many improvements of 1907 over 1906, some grievous backslidings, but taken on the whole, in comparison to the terrible record of 1905, football of today is a far cleaner and safer game.

Before football is condemned, one must remember that every sport has its dangers. Even baseball has 6 players killed this year, an improvement over last, when 12 were killed. I have seen no figures yet of the number of baseball spectators killed this year, but they numbered 12 last year, and there is no reason to believe that there were not at least as many in 1907 as there were players killed. Football is at least not "deadly" to spectators, and their lives do not have to be protected by wire nettings. There were 178 killed and 165 injured last year in hunting, and the figures this year, which are not yet complete, will no doubt equal them. In New England alone more people have been killed in the short hunting season this fall already than in football in the entire United States and Canada. Automobiles last year claimed 209 killed and 851 injured. Even such an apparently innocent pleasure as the scenic railway at the amusement parks has this year exacted a toll of 4 killed and 25 injured.

Fourth of July casualties are too well known to need repeating. During the summer months Monday morning's paper is a constant reminder against the too venturesome swimmer, the amateur sailor of a catboat in fluky breezes, the fool who rocks the boat, and the "didn't-know-it-was-loaded" fiend. Then, also, one must bear in mind the well-known casualty insurance figures that show the dangers of walking the streets in broad daylight, or even of sitting or sleeping quietly at home, to be nearly as great as traveling on a Pullman on a well-regulated railway.

Football, after all, is not a mollycoddle game, by any means, to be played by young men who should be packed in cotton wool; nor, on the other hand, is it a gladiatorial Roman holiday, resulting in swathing young men in sterilized cotton and splints. It is a clean, healthful sport that satisfies the legitimate combative instincts of the human race in the youthful stage of its individual existence, when it must perforce reproduce the past history of the generations that have evolved it into what it now is. Played by gentlemanly, sportsmanlike players, of proper age for such a strenuous contest, and in proper physical condition, it is a game that the thirty and forty thousand spectators and thirty-three or more players in the Yale-Princeton and Yale-Harvard series, for example, may be justly proud to witness and play as the great American college sport.

But what of those adverse figures cited above? Very much. Football should not be played at all by high schools or preparatory schools, or if at all only by young men over eighteen years of age. Perhaps it would be better to have entirely separate rules for the game in the latter case from those of the intercollegiate rules committee for older players better trained. Secondly, no man should play football (or any other game) unless he is in first class physical condition and able to stand all reasonable strains incident to the play. Finally, mass play must even further be eliminated. The tendency evinced this year to return to it must be strictly legislated against by football authorities if the game is to retain the support of impartial people.

An Automatic Milk Seller for Schools

BY MAX A. R. BRUNNER

In educational and sanitary matters German authorities lead all others; the recent visit of the Lord Mayor of London and his aldermen has again demonstrated this fact. This month a very commendable feature has been introduced in several schools here; automats were placed in the courtyards which, for a small coin, deliver hot or cold milk. First, one procures a cup which falls out of an opening and which is made of waterproof strong paper; then a pedal is pressed down and the cup is filled with pure milk at any desired temperature. Heating is done inside entirely automatically by liquid fuel. The cleaning and rinsing of the tubes and tanks thru which the milk runs is also effected automatically. The amount asked is so small, 2 cents, that scarcely any profit is made, as it is intended to give the pupils the milk at actual cost. It should be pointed out that the whole process is unexcelled from the hygienic standpoint, as only the best inspected milk is used, and every person receives a separate cup, features which we do not find in the many restaurants and milk shops. The success with these patented automats has been very great and they will be installed in many more schools of the German empire.

BERLIN, GERMANY.

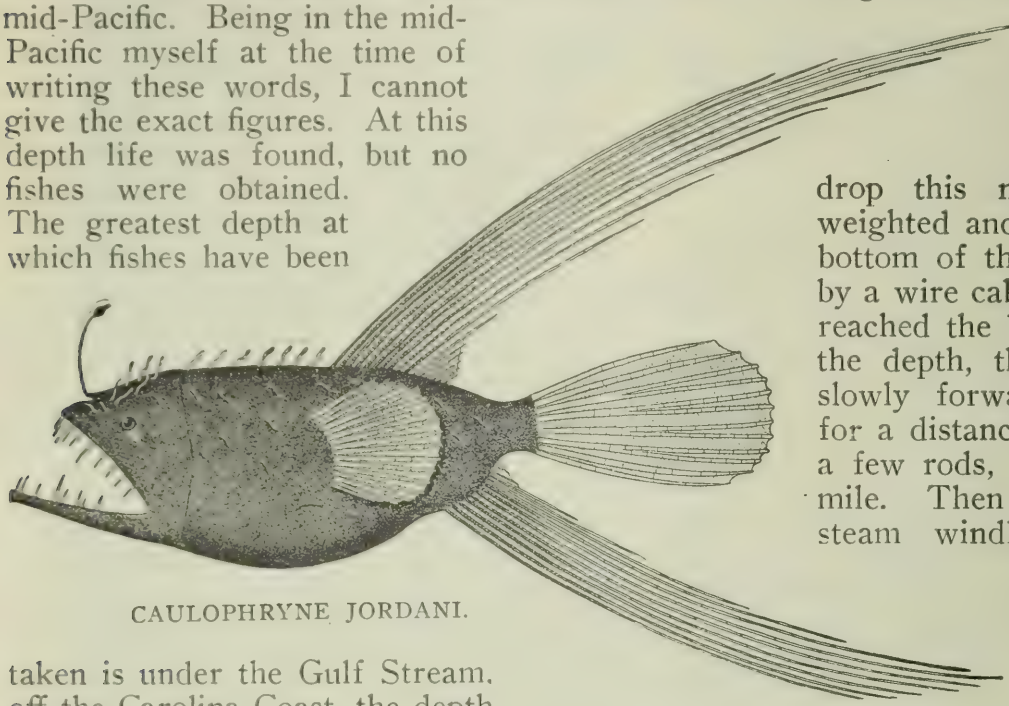
The Fishes of the Deep Sea

BY DAVID STARR JORDAN, LL.D.

President of Stanford, Jr., University

THE study of the animal life of the deep sea is mainly concerned with three categories of creatures. The first of these is that named by Haeckel, *Plankton*—the organisms, mostly minute, which float on the surface of the open ocean. Among the Plankton, young fishes may sometimes be found, occasionally the young of shore fishes, carried from their natural habitat by oceanic currents. Next comes the pelagic forms, those moving freely in the water near the surface and choosing the open sea by preference. Besides whales and dolphins, many fishes are pelagic. Among these are various large forms, sharks and numerous members of the mackerel family, as the tunny, the albecore, the bonito and their relatives. The smaller pelagic fishes usually go in schools, the larger ones swim about singly. Among those in schools are certain species of mackerel and most of the flying fishes. All these pelagic forms resort to certain regions, chosen bays and straits, usually within the tropics, for purposes of spawning. From these regions they sally forth on more or less definite predatory expeditions. Many pelagic fishes breed in the Mediterranean and in the West Indies. Others find their homes about the Santa Barbara Islands of Southern California, and in Hawaii and Southern Japan.

The third category of deep-sea life is that constituting the bassalian fauna or life of the depths. This includes forms living below a depth of 500 feet, some of them swimming freely, others lying close to the bottom, or, in the case of invertebrates, often attached to the ground. The bassalian fauna grades perfectly into the ordinary shore fauna, yet it has many characteristics of its own. It is largely composed of fishes, yet sea urchins, shrimps, crabs, crinoids and a great number of microscopic forms extend into its region and form part of it.



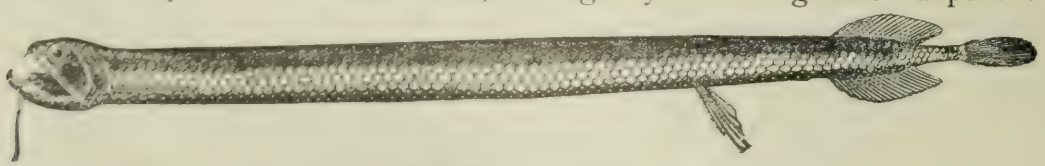
In general, the bassalian area lies below the region penetrated by sunlight. The differences of temperature of day and night, of summer and winter, do not extend to it. It is, therefore, an area of cold and darkness, of uniformity of conditions, and the tremendous pressure of the water keeps the creatures developed in it from extending their range upward or downward in the water. A deep sea fish rising above its depth is crushed by the reduction of the outside pressure. Its tissues swell, its blood vessels burst, its eyes are forced out, its stomach turned wrong side out as the pressure within exceeds that on the outside. Conversely, a fish sinking below the pressure to which it is accustomed is soon crushed or suffocated. Sometimes a deep sea fish, in a struggle with its prey, is carried above or below its depth, in which case both are destroyed. It will be understood that the tissues of a fish developed below a mile of water are permeated with water of the same degree of pressure as that outside. The deep sea fish, in his normal position, no more feels the 2,312 pounds pressure per square inch of a mile depth of water than we feel the 15 pounds per square inch of forty miles depth of atmosphere.

NOTACANTHUS PHASGONORUS.

The greatest depth of the sea yet re-

corded is approximately six miles. This is found to the eastward of Guam, in the mid-Pacific. Being in the mid-Pacific myself at the time of writing these words, I cannot give the exact figures. At this depth life was found, but no fishes were obtained. The greatest depth at which fishes have been taken is under the Gulf Stream, off the Carolina Coast, the depth approaching five miles, as I remember.

CAULOPHRYNE JORDANI.



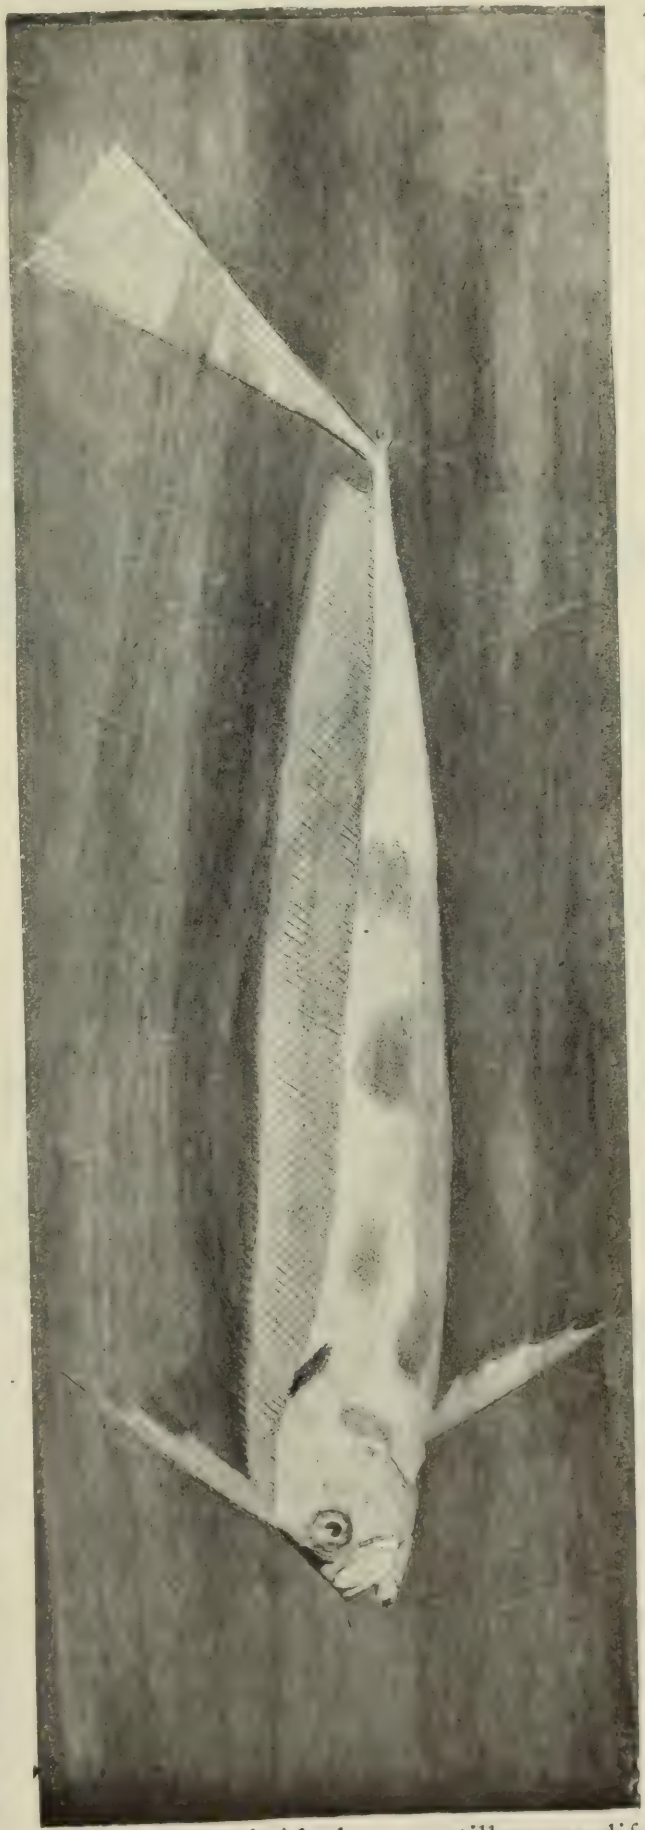
The study of the life of the deep sea has been mainly the result of vessels especially fitted for the work of dredging and trawling. First in importance in this regard stands the "Albatross," a vessel of the United States Navy, controlled by the United States Bureau of Fisheries. Next comes the British ship "Challenger," which made a notable cruise around the world for the purpose of deep sea investigations. This trip has yielded larger results than any other single cruise, so far as the deep seas are concerned, but the "Albatross" has made a far greater number of expeditions. Other notable dredging vessels are the "Investigator," in the Indian Ocean; the "Travailleur" and the "Talisman," about the coast of France; the "Vigilante," in the Mediterranean; the "Knight Errant," about Great Britain; the "Blake" and the "Fish Hawk," in the United States, and the "Thetis," in Australia.

The writer's experiences on the deep seas have been mainly on the "Albatross." The principal piece of apparatus used in this work is the beam trawl. This is a long net resting at its mouth on two curved iron bars like sled runners.

The method of fishing is to drop this net, properly weighted and adjusted, to the bottom of the sea, holding it by a wire cable. When it has reached the bottom, whatever the depth, the vessel steams slowly forward, dragging it for a distance; it may be for a few rods, it may be half a mile. Then by means of a steam windlass the net is drawn to the surface. Those fishes which lie near the bottom are sure to be taken, and others may be caught as the net rises. As nets are unknown to these creatures, they make no effort to escape, and even the most active are readily caught if near enough to the bottom.

Sometimes the trawl is caught on a rock and is lost altogether. Sometimes the net is torn on a coral mass or other jagged obstruction. Sometimes it is filled with soft mud, or with loose stones; sometimes again with sea weeds, or occasionally, when the depth is not great, with sea urchins, or sponges, or scallops, or other shellfish. Sometimes it contains nothing at all, even after a laborious half-day has been given to a single operation. More often the naturalist is rewarded by a few fishes, with crabs, sponges, sea urchins, and sometimes in a single haul he captures very many.

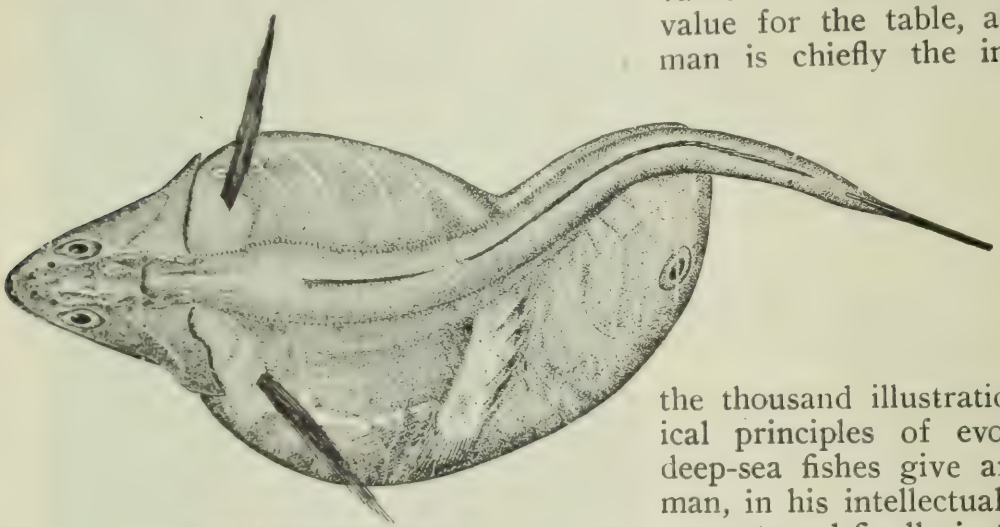
At the depth of a few hundred feet the fishes are usually red in color, with very large eyes. At greater depths they are all of a uniform violet or inky black, and the eyes are either excessively large or



STOMIAS FEROX.

excessively small. The very large eyes seem to represent an effort to make the most of what little light there is. The very small ones are simply vestiges, and mean that nature has given up the idea of letting her creatures see. A certain number of these deep-sea fishes are provided with lanterns or luminous spots by which they find their way in the great depths. All the species thus provided have well-developed eyes. The luminous spots usually lie in rows along the side of the body. In some forms the whole snout is luminous, like the headlight of an engine. In the case of a Japanese deep-sea sharklet the whole belly is luminous. Of this species, *Etmopterus lucifer,* Dr. Peter Schmidt, of St. Petersburg, once made a sketch in the night by the light given out of the animal itself. This little illuminated shark is only about a foot in length.

The deep-sea fishes are all descended by degeneration and specialization from various tribes of shore fishes. The degeneration involves loss of organs, the softening of the tissues, both bones and muscles, and often the loss of fins or scales. By the stretching of the tissues a deep-sea fish may often swallow another of considerably larger size. The specialization consists in the great development of luminous spots in many cases, the development of very long teeth in most cases, and in occasional modifications of fins as organs of touch.



Most of the luminous forms are of the group called lantern fishes, degenerated from allies of the smelt and trout. Many deep-sea forms are modified eels. Still others are derived from the anglers or fishing frogs. Some are degenerate herrings, some degraded mackerels, and the large group called grenadiers are modifications of codfish. A few sharks and chimæras enter the depths, as also occasional members of several others of the various orders and families of fishes.

As the conditions of life in the depths are very uniform, there is practically no difference between the deep-sea fishes of the tropics and those of the north. Many species extend their range unchanged over a very wide area, and yet species are separated from their allies by isolation in the deep seas as elsewhere. Most of the species of the Atlantic are different from those of the Pacific. Those about Hawaii are different from those of Japan for the most part, and those of California and Alaska are still more different.

Dealfish, or King of the Salmon, *Trachypterus rex-salmonorum* Jordan & Gilbert. Family *Trachypteridae.* (From a specimen taken off the Farallones.)

Among the deep-sea fishes are many most astonishing forms. Perhaps as striking as any is the great oar fish, *Regalecus,* called in Europe in different languages, "King of the Herrings" and in Japan the "Cock of the Submarine Castle." This fish has the shape of a broad ribbon, sometimes twenty-five feet long, nearly a foot across, and about two inches in thickness. Its texture is soft,

CHIASMODON NIGER.

almost gelatine-like. Its color is transparent blue, and on its head the dorsal spines rise high, like a mane, each with a crimson knob at the tip. This creature lives in the open sea, at no very great depth, and occasionally it is cast on shore, where it is always reported as a sea serpent.

To the books on the deep-sea fishes the reader is referred for the details in these matters.

To the practical question as to the value of these fishes we may say: Most of them are good to eat, but their flesh is watery and without flavor. Their value to museums far exceeds their value for the table, and their value to man is chiefly the intellectual one of showing him to what lengths nature can go in the direction of utilization of space and adaptation of forms. And the thousand illustrations of the biological principles of evolution which the deep-sea fishes give are worth more to man, in his intellectual and moral development, and finally in the conduct of life, than would be any conceivable number of fish dinners.

Wherefore the bassalians have their place in the cosmos as clearly as the cod or the herring.

STANFORD UNIVERSITY, CALIFORNIA.

Thou Shalt Kill No One

BY COUNT LEO TOLSTOY

IN the beginning of July, 1907, the man who worked in St. Petersburg for the publishing firm "Obnovlenye" was imprisoned by the St. Petersburg magistrate on the charge that he distributed the brochure which I wrote seven years ago, entitled "Thou Shalt Not Kill."

Insignificant as it is, compared with the present incessant imprisonments, exiles and executions, the incident is significant because of the motive for which it was committed.

Now that all Russia is groaning from the horror of the unceasing and ever-growing number of murders, the brochure which confirms the ancient law, recognized for thousands of years by all religions—"Thou shalt not kill"—this brochure is prohibited, and the man who distributes it is thrown into prison, like a criminal.

It would seem that the Government, which has so long combated unsuccessfully against the murder-mania that is taking an ever stronger hold on the Russian people, should have encouraged the people who disseminate ideas condemning murder; but, strange to say, the Government, on the contrary, is punishing such people.

It is the strange law of retaliation

which inevitably punishes the people that pervert the law of God.

Nineteen hundred years ago Christ, expounding the fundamental commandments of his doctrine, no longer placed the ancient commandment "Thou shalt not kill" at the head of all commandments (he considered this commandment so fixt that he did not speak of it), but the commandment that every man should shun all that which may lead to murder, that man should bear no ill will to his neighbor, that he should forgive all, that he should make peace with all, that he should have no enemies.

But this commandment was not only not accepted by men, but even the ancient commandment, forbidding murder, was rejected, even as it was rejected after the laws of Moses. And people who called themselves Christians continued, with perfect assurance in their uprightness, to kill in war and in peace all those people whose death seemed desirable to them.

The governments of the Christian nations, with the aid of the churchmen, have long taught the people they ruled that the law "Thou shalt not kill" did not mean that people should not kill other people without any exceptions, but that there are instances when it is not only permissible, but even necessary, to kill people, and the nations believed their governments and helped to murder those whom the government selected to be murdered. When the time came that the faith in the infallibility of the governments crumbled away, the people began to treat those constituting the governments in the same manner as the governments treated the people whose death was desirable to them, with the only difference that governments considered it proper to kill people in war and after certain deliberations which are called courts of justice, the people decided that it is proper to kill in time of revolution and after deliberations of certain people calling themselves revolutionary committees, and so forth.

And the result was that which is going on in Russia at present—that is, after nineteen hundred years of preaching Christianity, people have now for two years unceasingly killed one another—the revolutionaries their enemies, the government its enemies—killing men, women and children—all those whose death they consider useful, and, what is most surprising, they act thus, feeling perfectly confident that they are not violating the moral or religious law.

It has come to such a state that if all people in Russia were given the opportunity of killing all those whom they regard as dangerous to themselves, almost all Russian people would have killed one another; the revolutionists would have killed all the rulers and capitalists; the rulers and capitalists would have killed all the revolutionists; the peasants would have killed all the landed proprietors; the landed proprietors would have killed all the peasants, and so forth.

This is not a joke; it is really a fact. And this terrible state of the people has existed for several years, and with every year, with every month, every day, it is growing ever worse and worse.

The state of the people is growing ever worse and worse, particularly because the Government, feeling forced to counteract such a state of affairs, is endeavoring to check it by methods which it regards as the only effective ones. These methods, both irrational and cruel, consist in committing those same crimes against which the Government is fighting. And as it might have been expected, especially now that there are such perfected weapons of murder—revolvers, bombs and cannons—with which a small child can kill a hundred strong people, these irrational and cruel methods not only fail to attain the desired aim, but render the situation ever worse and worse.

The tragedy of the position of the Russian Government lies in the fact that tho it cannot help seeing that by employing this irrational and cruel means, the situation is only growing worse, yet it cannot stop. What is more, aside from being unable to stop, it cannot employ the only possible and effective means of combating murder—the explanation of the criminality and the sin of murder. Not only is it unable to employ this means, but it feels compelled to use its stupid and cruel methods also against those people who want to apply this only possible means of saving the Russian people from the miserable position in which they now find themselves.

The Government persecutes the brochure "Thou shalt not kill" and imprisons those that distribute it. Now the Government must inevitably persecute that which I am writing just now, it must execute me, and to be consistent, it should long have suppressed not only the Gospel, but even the Ten Commandments of the Old Testament, and should have executed all those that distribute it.

Yes, it is the strange law of retaliation which executes those that pervert the law of God.

All Russia is groaning from the horror of the beastly instincts which have manifested themselves, unrestrained by anything, and which incite people to commit the most horrible, senseless murders.

And now the most liberal people, who defend all sorts of liberty, when asked if it is proper to maintain the liberty of life—that is, not to kill any people—these people are either silent, thus recognizing by their silence the necessity of murder, or they recognize this necessity openly, even as the revolutionaries and the Government recognize it. And the Government, and the revolutionists, and murderers that belong to no parties are continuing to kill one another under various pretexts.

The condition of Russia is terrible. But the most terrible thing of all is not the material condition of Russia, nor the stagnation, nor the agrarian order, nor the proletariat, nor the financial confusion, nor the robberies, nor the mutinies, nor the revolution in general. The most terrible thing of all is the spiritual and mental derangement which lies at the root of all these miseries. The most terrible thing of all is that the majority of the Russian people live now without any moral or religious law which should be compulsory to all; some look upon religion as decayed, ancient beliefs, which no longer have any rational meaning and which are not necessary for guiding man's conduct; these people are guided in life only by their own considerations and tastes; others, rejecting all sorts of religions, are also guided by their most varied considerations and desires. Thus the majority of people, acting at present in Russia under the most contradictory considerations as to what would constitute the bliss of society, are in reality guided only by their egoistic, almost animal, impulses. The most terrible thing about this is that these people, having renounced the rational human life, having lowered themselves to the grade of animals, are perfectly satisfied with themselves, and are confident that all the stupid and nasty things they are saying and doing, imitating the Western nations (the Government officials as well as the revolutionists), prove conclusively their superiority over the wise and saintly people of the past, and that it is not only unnecessary to endeavor to establish some religious conception of life by which all might be guided, a religion which could unite the people, but they are confident that the absence of any religion proves their intellectual and moral superiority.

People can live a harmonious, human life not because of certain political creeds, but because of a unifying conception of the fundamental meaning of life.

Political creeds cannot unite mankind, for the reason that there may be a countless number of political creeds. Some may believe in this or that form of parliamentarism, in socialism or in anarchism. But there can be only one high conception of the meaning of life, in a certain historic period, for a certain nation. Thus it has always been. Thus lived the Greeks, the Romans, the Arabs, the Hindus, unified by one and the same high law of life; thus lived and still live the Chinese; thus lived also the European nations, so-called Christians, while they really believed in the creed—adapted by St. Paul to the pagan customs and mode of life—which was called the Christian Catholic faith.

We now see clearly all the inconsistency of this religious, confused, vague and hypocritical doctrine of the churches, which prohibited the reading of the Gospel; which substituted the renunciation of earthly pleasures and acts of love, by salvation thru faith and the administering of the sacraments; which recognized the necessity to obey the worldly powers instead of the evangelical recognition of the power of one God; which recognized miracles, the worshipping of images, saints, the infallibility of the Pope, and

so forth. We see clearly the inconsistency of this doctrine with the simple, clear teaching of the Gospel. But people were born in this false faith, this faith was instilled in them from childhood on, and however crude (from our present point of view) this faith was—permitting murders, executions, wars, duels, at the same time recognizing the God of love—the people believed in it sincerely, and this faith united them. This union continued for centuries, but then came a time when the people began to interpret the doctrine differently, in their own way. Protestantism appeared in all its varied forms, and animosities and disputes arose between the various creeds of perverted Christianity. The unity of faith which had until that time kept the people together was destroyed. People ceased believing in the same religion; at first they stopped believing in one and the same religion, and later, because of different interpretations and disputes, they ceased believing in the Christian religion itself.

There were many causes which destroyed in men the faith in the Christian religion in all its forms—in Catholicism, in Greek Orthodoxy, in Protestantism. The religious conflicts and the ever-growing civilization were among these causes, but the principal cause was that Catholic as well as Protestant Christianity sanctioned executions and war. It was natural for the people who introduced Christianity into the pagan nations, because they belonged to the ruling classes of society, that in accepting and introducing Christianity to the people they should either conceal or overlook in it all that is incompatible with the mode of pagan life by which they have profited. These people, in order to accept Christianity and introduce it into the nation, had to do one of the following two things—either to change the mode of pagan life in accordance with the Christian doctrine, or to change the Christian doctrine in accordance with the existing form of life. They chose the second; that is, using the interpretations of St. Paul, they so perverted Christianity that everything which was contrary to the existing order of things, resting on violence and murder, was covered up and misinterpreted. In order to misinterpret Christianity so that it should not be contrary to the pagan order of things and the license to murder, which is the mainstay of such an order of things, it was necessary to change and to conceal the very essence of Christianity. In Judaism and Mohammedanism it was possible to go around the commandment "Thou shalt not kill" without violating the law, for in both religions people are subdivided into faithful ones and unfaithful ones, and therefore it was possible to apply the commandment "Thou shalt not kill" only with regard to the faithful. In Christianity, however, the very essence of which is the recognition of all people as brothers, which is founded on love, which expressed itself in forgiveness, in love for the enemy—in Christianity it was impossible to do it; the toleration of murder of any people destroyed the main foundation of the Christian doctrine. And therefore, in order to make Christianity compatible with murder it was essential to do it by means of interpretations which destroyed its very essence. And that is what really happened. And when this came about, Christianity, having become perverted, ceased to be a religion. And the result was that the Christain Church religion became either a matter of custom, of propriety, or profit, or poetic conception; but the real religion, that is, a religion which really united people and guided their conduct, departed from the people of the Christian world.

It would seem that having lost the only principle — Religion — which could unite the people, the people of the Christian Church should have disunited, should have ceased to live together in harmony, but this did not occur, because their transition from religion into perverted Christianity did not come about suddenly, but gradually, and while freeing themselves from this unification by faith, the people were falling ever more under the influence of another unification, which is based not on religion, but on power, which, in turn, had been established and maintained by false religion. The people ceased believing in God and His law, and began to believe in the power of the rulers and their law. And when faith in false Christianity disappeared, faith in the rulers, in their

power and their law, replaced the false religion and continued to keep the people together artificially.

But this unification, based on the inertia of power instead of religion, could not go on. The time arrived when thru the diffusion of enlightenment, the people understood that there was no inner cause why they should obey one particular power and not another. And having understood this, the people ceased to believe in the necessity to obey the ruling power and began to combat against it. This conflict started long ago, but it manifested itself particularly toward the end of the eighteenth century. The conflict continued thru the last century; it has been kept up in a more or less concealed form to this day thruout the so-called Christian world, and is going on with particular energy at the present time in Russia

That which is happening in Russia now is the same struggle of people who have lost the inner religious ties that had bound them to one another, and who have lost also their faith in the need of obeying the ruling powers. The conflict consists of the fact that the people are endeavoring to free themselves from the power of violence by the same coarse and cruel methods which have been employed by that power in order to force them to obedience.

If in Russia this struggle has manifested itself in a more ugly and cruel form than in other countries, it is simply because in Russia this struggle has manifested itself later than in other countries.

In many respects the situation of the Russian people is similar to that in which some European nations found themselves a hundred years ago, but there are many things which make their situation altogether different. It is similar to the situation of the European nations in that the great majority of the Russian people, like the European nations at that time, understood that the faith in the Trinity, in heaven and hell, the sacraments, the ikons, the relics of the saints, the fasts, the prayers, the faith in the holiness and greatness of the Czar and the duty to obey the ruling powers—this faith which is compatible with murder and all sorts of violence—is not real religion, but merely an imitation of it, and therefore they have of late begun to free themselves from this false religion as well as from the groundless faith in the benevolence and the necessity of the power of the Czar and from the ruling powers in general.

In this yearning of the people to emancipate themselves from their faith in perverted Christianity and in the indispensableness and sacredness of the ruling powers, the situation of the Russian people is exactly like the situation of the European nations in the beginning of the eighteenth century. The difference is that the revolution which is going on in Russia at present is the latest, and therefore the Russian people can see now that which the European nations could not have seen—that is, to what the nations were brought by their struggle against their governments. The Russian people cannot help seeing that all these struggles not only failed to destroy completely, but did not even lessen, the evil against which they combated. The Russian people cannot help seeing that all the efforts wasted during the revolutions, all the blood that was shed, did not destroy poverty and the dependence of the laboring classes upon the rich, and the ruling powers, that the wasting of the strength of the people in the efforts to seize other people's dominions—in wars—has not ceased, that they did not free the people from the power of the few. The Russian people cannot help seeing the vanity of fighting violence with violence—on which the European nations have wasted so much strength. Herein lies one cause of the difference of the present situation of the Russian people from the situation of the people of the Western world a hundred years ago.

The other and more important cause is that aside from the official so called Christian religion, which has been inoculated alike in the Russian people and the European nations—there has always existed from ancient times in the Russian people another unofficial, living Christian religion, preserved in some strange way, thru the holy lives of old people, through fanatics, pilgrims—

a religion which penetrated into the people, the proverbs and stories and legends, taking a firm hold on them and guiding them. The essence of this religion is that man should lead a Godlike life, satisfying his soul, that all men are brothers, that what is great before man is an abomination before the Lord, that a man can save himself not by observing certain rites or by prayers, but by deeds of benevolence and love. This faith has always lived in the people and has been their true faith, which guided their life side by side with the false church religion which was outwardly inoculated in them. This true faith was firmly rooted in the people until some seventy years ago, but during the last fifty years, especially because of the decline of the morality of the clergy, particularly in the monastic life, it began to weaken in the masses of the people, and it stood out in the sects of the Molokans, Stundists, Chlists, Subbotniks, God's People, Malovantsi, Egovists, Dukhobors and many others. The common traits of the majority of these sects, aside from the general positive renunciation of the Greek Orthodox faith, were the introduction into the conduct of their life of moral Christian rules and the refusal to recognize the demands of the ruling powers—above all, the refusal to recognize the legality and necessity of murdering one human being by another. This faith has of late started to crystallize itself and to assume a clearer aspect, as if to resist the revolutionary wrath which has seized a portion of the Russian people. People of different social standing and different education, professing this faith, are ever growing in number, and these people are coming ever nearer and nearer to one another and their conception of the Christian truth is becoming ever simpler and is introduced into life.

Thus, notwithstanding the general traits of the Russian revolution with the revolutions that preceded it, the Russian people cannot help arriving from their revolution to a different outcome than that of the Western nations in the last century.

An intense struggle is going on in Russia at present between two diametrically opposed qualities in human nature—between the brute in man and the Christian.

Two ways are now open to the Russian people: The road along which the European nations have gone and are still going—that is, to fight violence with violence, to overcome it, and to establish by violence and maintain by violence the new order of things. The other way is that the people, realizing that the unification of the people by means of violence is only temporary, but that there is only one conception of life and the law emanating from such a conception that can truly unify the people, will make an effort to define to themselves clearly this conception of life and the law emanating from it, excluding under any circumstances the permission to commit murder —to define to themselves this conception of life, and build their life upon this alone, and not upon violence.

And such a substitution of the unification of the people, based on violence, by a unification founded on a Christian conception of life will take place, I believe, in our time, not only among the Russian people, but also in the whole Christian world.

A long time will pass, and perhaps a great deal of blood will be shed, before this will come about. But it is impossible that this should not come to pass. It is impossible that the time should not come when the people, having freed themselves from the false religion and from the violence resulting from it, will be united by a conception of life common to all, under which it will not only be impossible but entirely unnecessary to commit murder of human beings. Such a time will come, because the life of people united by violence can only be a temporary, transitory state—it cannot be the permanent life of rational beings. Animals may be united by violence, but human beings can be united only by one conception of life common to all. And I believe that this conception is the one expressed in that form of Christianity which admits under no circumstances the usefulness, the indispensableness, the legality of murder.

If all the people who think they believe in Christianity were to cast aside all non-

sense and recognize only one simple and clear truth, which was uttered thousands of years ago, which constituted the first essential negative condition of all morality—a truth recognized both by the heart and the mind, and by the whole being of every unspoiled person—the truth that one human being should not kill another human being—and the entire existing terrible and brutal order of our life would change immediately, and then life would be established in accordance with the consciousness of the people of our time; that toward which our best people are now striving would thus immediately be accomplished.

Mankind is rising higher and higher slowly, halting and retreating, and at times moving back, while going up, step by step, toward perfection and bliss. Mankind has stood long on the step which lifts it to the possibility of a harmonious life without the necessity of murder, but whether it wants it or not, it must enter this life during our time. If not our reason or our striving toward good, the very wretchedness of our condition, which is growing ever worse and worse, will compel mankind to do it—that is, to begin constructing life, not on the principles of hate and threats, but on the principles of reason and love.

"The kingdom of heaven on earth—that is the ultimate aim and desire of mankind. Christ brought this kingdom near to us, but the people did not understand him and they erected within us a kingdom of priests, and not a kingdom of God," said Kant. "And only then," he added, "will it be possible to say conclusively that this kingdom of heaven has come to us, when the people will become conscious that it is essential to pass gradually from the religion of the Church to the universal rational religion."

And I think—indeed, I am convinced—that this time has come. The people have constructed their life on a foundation which is contrary both to the mind and the heart of man—on murder—and, together with this, they have assured themselves by a cunning deception elaborated for centuries that they were acting according to a certain law of Christ, or that they knew a science by which it is proven conclusively that the murdering of one human being by another is justifiable both by the mind and the heart of man. And when they are told that their life is the life of beasts, that their Christianity and their science are but a mockery and a raillery at religion and science, that they must stop being murderers if they would be Christians and civilized human beings, they simply smile and shrug their shoulders. It seems to them so unfeasible to stop doing that which had been prohibited by the most primitive religious laws of the most ancient people, that which is rooted in the conscience and the heart of every unspoilt man, and that which cannot be reconciled by the most cunning and ingenious arguments with the doctrine of Christianity which they are supposed to profess, nor with the civilization of which they are so proud.

How terrible must be the mental decline of the people of this world, if they can believe that their life will grow worse by ceasing to execute, torture, murder, hang one another.

And how greatly perverted must be the moral and religious feelings of the people, if it is necessary to convince them that "Thou shalt not kill" does not mean that they are permitted to kill people of other nations, or in general, those whose death would be useful to us; but that these words, ascribed by us to God, mean that *we should not, therefore we must not, kill any one.*

Yes, the moral and mental decline of such people is terrible, especially when they regard themselves as standing upon the summit of spiritual development. And, it is terrible to say it, such are all the people of our civilized perverted world, with but few exceptions.

The only consolation is that this terrible decline is a symptom of the last degree of perversion which is to be followed by an awakening. And I believe that the present Russian revolution will lead us to this awakening.

Of course, the teaching of Christ is unfeasible to those people who live by supervising and commanding the construction of warships, fortresses, soldiers who are taught to murder, schools where murderesses are trained, courts, prisons,

gallows—to people possessing great fortunes which are guarded by murder. To such people the doctrine of Christ is impracticable. But the people who are building the warships and fortresses, who are being taught to commit murder, who are being perverted in the schools, who are executed and shot; those who amass these fortunes protected by murder—it is time for these people to understand that life without murder, without violence is better than the one they are leading at present. And I think that the Russian people, the great majority of the Russian people, will understand this—indeed, they almost understand it already.

I believe this because the absurdity of that which is happening is too obvious. Representatives of the government and revolutionists are devising the most subtle, ingenious, scientific and governmental laws, the others are devising still more ingenious, complicated and far-sighted plans as to how mankind shall establish itself, in the future, but these as well as the others, in order to attain their ends, admit the necessity and legality of murder, and therefore, notwithstanding all the profundity of thought, the care and zeal of these people, all their subtle and ingenious devices do not improve life, but, on the contrary, make it still worse than it is.

The people have built a garden and planted in it the most precious and tenderest plants by the most perfect method; they cultivate it, weed it, water it, but they have forgotten one thing: they left a hole in one of the fences, and the cattle enter the garden, crushing and spoiling everything that grows in the garden, and the people are wondering and worrying, and are unable to understand why all their efforts are in vain.

The same is true of the life of the people of the so called Christian world. The people of our time have devised all sorts of religious and governmental laws, which are intended to guard them, and they have perfected their flesh-life in every way; they communicate their thoughts across oceans, they fly in the air, they perform all sorts of miracles, but they have made one digression from what their wisdom of the past, their mind and their heart dictate—they have recognized in men the right to kill one another, and thus all the religious and governmental defenses have ceased being defenses, and all the wonders of technical perfections not only fail to aid their happiness, but they even tend to destroy it.

This is happening because before establishing one system of life or another, before perfecting the means of availing ourselves of the powers of nature—it is first of all necessary for mankind to establish the religious and moral doctrine revealed to them thousands of years ago, to the effect that the same divine principal lives in the body of every human being, and therefore no one man or no body of men has the right to destroy this unification of the divine principle with the human body, that is, to deprive man of his life.

And the recognition and the establishment of such a moral and religious doctrine are not only possible, but life becomes impossible without the recognition and establishment of this religious and moral law, which is nothing else than the familiar teaching of Christ in its true sense, which is so near to all of us. And I believe that our senseless and terrible revolution will lead the majority of the Russian people to recognize, establish and introduce into their life this religious and moral principle of the Christian doctrine.

Yes, all this will be when the kingdom of heaven will be established on earth, but what is to be done before it has been established? We should do that which is necessary in order to bring about the kingdom of heaven on earth. What is the hungry man to do while he has no food? He must work in order to obtain food. Even as food does not come of itself, so the kingdom of heaven—that is, the good life of man—will not come of itself. We must make it such. And to make it we must cease committing the most terrible evil—which keeps strengthening the evil life of men—murder.

In order to cease doing this we need but little. The consciousness of the impropriety to human nature to murder another human being has already sufficiently rooted itself in an enormous majority of the Christian world. All that is neces-

sary is to understand, to reorganize and to introduce into life the idea that we were not called to establish the life of other people by means of violence, which inevitably leads to murder, and that every murder that we are committing, in which we participate, on which we erect the benefits of our life, cannot be useful either to us or to ourselves, but, on the contrary, aggravates the evil which we wish to remedy. If people only understood this, and if they refrained from any interference with the life of other people, if they only ceased to seek to improve their life in the outward system based on violence, which is impossible without murder, and if each man only sought for himself to approach the ideal of perfection which is so clearly presented before every man by the Christian doctrine, and which is in no way compatible with murder—and then, the life toward which the people are striving in vain would be realized.

There is but one way out for the people from the miseries which they are bearing, and which are forever increasing. This way is—to recognize and introduce into life the true Christian doctrine which will open a new era for mankind, that true Christian doctrine which, without the recognition of its fundamental position toward the non-resistance of one evil by another, is only a hypocritical doctrine, binding nobody to anything; a doctrine which not only fails to change the beastly, animal life by which people live now, but which even tends to maintain such a life.

"Ah, again the old story of non-resistance," I hear self-confident voices saying, with contempt,

But what is a man to do when he sees that a crowd, crushing, killing one another, is thronging and pressing against an indestructible door, in the hope of opening it from the outside, while he knows that the door opens only from within?

Sahara Desert Explorations

BY GOVERNOR FERNAND FOUREAU

[The writer of the following article belongs to that brilliant galaxy of French explorers who, during the past thirty or forty years, have contributed a vast amount of new material to the world's storehouse of geographical information. He is the author of a most interesting illustrated volume of nearly one thousand pages, entitled "From Algiers to the Kongo by Lake Tchad," and of a really monumental work, in two great quarto volumes, with a third one devoted wholly to maps, which give the scientific results of the great journey described in the first named book. These three superb volumes are printed under the auspices of the French Geographical Society, and the immense enterprise is briefly touched upon in the article given below. M. Fernand Foureau is at present the Governor of Mayotta and its dependencies, a French island possession in the Indian Ocean, between Madagascar and the east coast of Africa.—EDITOR.]

EUROPEAN penetration into and exploration of the Sahara has been almost exclusively French. The history of Sahara explorations begins, of course, with the celebrated French traveler, René Caillé, who lived from 1799 to 1838, and who was the first European to visit and describe Timbuctoo. Then came another famous French explorer, Henri Duveyrier, who was born in 1840, who journeyed thru a part of eastern Sahara, but could give us only a surmise of what the rest of the great desert might be. With the two expeditions of Colonel Flatters, in 1880 and 1881, we come down to the present fecund period of Saharan discovery. He threw much fresh light on the regions thru which he past. Finally, I may mention my own labors in this vast field, which extend over a period from 1876 to 1898, and which contributed consider-

ably to our knowledge of the Sahara, in the departments of topography, geology, botany and ethnography. But this does not mean that we yet know thoroly this vast region, notwithstanding further contributions to our knowledge made by bold dashes under the command of Louis Say, Largeau, Méry and d'Attonoux, to say nothing of the work of excellent travelers outside of France, such as Major Laing, Denham and Clapperton, Barth and his companions, and Nachtigal Gehard, Rohlfs and Lévy.

In 1898 I started at the head of a mission whose purpose was to cross the Sahara Desert and study it thoroly, our objective points being the French possessions in the Sûdan, around Lake Tchad and the River Chari. This expedition awakened the whole Saharan question, threw open its secrets to the world and removed the confused ideas which scientific minds held concerning this immense region. At almost the same time the Flamand mission took possession of the oasis of Insalah, and since then, the Sahara has been crossed and recrossed, on all sides and in all directions, by scientists and officers—all French—until the whole vast region begins to be known as never before. The list of the names of these explorers is too long to give here, this fact alone showing the magnitude of the work which they have accomplished; and the excellent labor is still going on. Each new expedition adds to our store of information concerning the geology, the geography, botany, ethnography of this quarter of the globe, and especially gives us fresh knowledge of the men who occupy and travel about thru this long-unknown territory.

FERNAND FOUREAU.

Among the benefits which the Sahara region owes to this French "penetration" should be mentioned the two principal ones—the large addition to the store of water and the increased protection to travelers which is now enjoyed. As far back as 1854 we had begun a systematic creation in northern Sahara of artesian wells, and the result was immediately most encouraging. Today these artesian wells are working their way down into the south, and latest reports show that we have reached the most southern parts of the Tidikelt district, which means the twenty-seventh parallel north. There can be no doubt that, in a comparatively near future, the whole surface covering water will be bored thru and thus France will have supplied with gushing springs the driest and poorest lands of the world.

Of scarcely less importance is what we have accomplished in making the Sahara a safe country to travel in. Hardly more than ten years ago the visitor to those regions was in constant danger from attacks by roving bands, and caravans were always suffering loss of camels by thieving marauders, while the murder of unprotected travelers was a common occurrence. In a word, razzias of all sorts were the order of the day. But now every thing is relatively safe and orderly in the parts occupied by Europeans or natives, and when any of the old occurrences happen, it is an exception. France has a right to be proud of this great blessing which she has bestowed on the Sahara region, for the merchants no longer hasten from point to point trembling with fear, feeling that the only source of safety is in rapid flight.

This penetration and organization of the Sahara has been accomplished on lines which I have preached and urged during some thirty years. I have always held that if you wish successfully to travel thru and pacify an uncivilized country you must act like one of its inhabitants, adopt their means of transportation, and imitate, in this instance, the rapid and easy movements of the natives, being careful, especially, not to load yourself down with too much baggage. Speed and mobility are often questions of life and death in the Sahara; you and your animals must drink, and watering

places are frequently separated by enormous distances. To this freedom of movement the explorer should add a degree of firmness, impartiality to friend and foe, and great humanity. Such are the necessary elements for the pacification and conquest of the Sahara. Frenchmen have had the good sense to apply these rules, and success has, as we have seen, crowned their excellent efforts. The work of France has, consequently, been methodical and thoro, and it shows that the country can, when necessary, display patience, perseverance and devotion. There is ground to hope, therefore, that our labors will bear full fruit in the not distant future, and I am convinced that to secure this result, the qualities which we have so far revealed will suffice.

Today the Sahara is divided into two distinct parts—the Algerian or northern portion, and the Sûdan or southern portion. This rather strange division of the region has existed long enough to show how it works, and an impartial observer can not honestly say it is a success. Similar lands and similar peoples are cut in twain, and one-half given one sort of administration and the other half another sort of government. The inhabitants, of course, cannot understand what it all means. I firmly believe, however, that a new organization will eventually be given to this great stretch of territory, and what was once known as the Great Desert and was the happy hunting grounds of ungoverned thieves and marauders, will surely become a land of peace, well ruled and scientifically developed to the marked benefit of the natives, who till now have been living only in an atmosphere of disorder, want and general misfortune.

I have devoted some thirty years of my life, and devoted it joyfully, to the study and exploration of this land of the Sahara, and it is with the sincerest pleasure that I see it today entering upon this happy phase of its existence. My feelings will be fully shared and completely understood by those who have ever had the good fortune to admire those immense regions, to view with delighted

VIEW OF THE SAHARA FROM THE SFA PASS.

A CARAVAN ON THE MOVE ON THE ALGERIAN DESERT.

eye the beautiful and never-to-be-forgotten tints of its mountains and sand hills, and to stand entranced before the magnificence of its panoramas. For these sights touch most profoundly the senses of the true artist and lover of nature.

ISLAND OF MAYOTTA.

Beware

BY ZITELLA COCKE

Ah, who knows
What lies hid in the heart of a rose—
A bee with its biting, burning sting,
A canker-worm, a venomous thing,
That wounds from its sweet and blooming lair—
Dear hand, beware!

Ah, who dares
Look 'neath the mask that the gay world wears,
Where smiling lips hide the fret and fray
Of aching hearts, where sweet words betray
And friends are far in the sorest need—
O soul, take heed!

Ah, whose eyes
See what is hid in the summer skies?
The thunder's roar, the shriek of the storm,
The lightning's lance, in a white-cloud form,
And gallant barks, with fair sails a-spread,
Lie wrecked and dead!

BOSTON, MASS.

Literature

The Letters of Queen Victoria

It is almost impossible to overestimate the importance of Queen Victoria's letters* as a contribution to the political history of England. The period covered by them—1837-1861—is now separated from us by more than a generation, and all the men who were then prominent in English politics have passed away. More than this, their biographies and letters have in nearly every case been published, and it might seem as tho there were little left to be learned of the conduct and fate of administrations during the first third of Queen Victoria's long reign. But in the biographies that have appeared of all of the statesmen who were prominent during this period, the story is told with reference to one man and one party, and events and periods in which he and his party were not in power, or were not actively concerned, are passed over lightly. Such, for instance, in Morley's "Life of Gladstone" is the treatment accorded to political affairs in England during the years when Gladstone was not in office, and especially when he was traveling in Europe in 1850, and again in 1858. The great value of the Queen's letters lies in the fact that in them there are no such hiatuses in the story. The Queen was equally interested in the formation of each Cabinet, whether Whig, Tory, Coalition or Liberal; and, while Queen Victoria certainly cannot be called a disinterested onlooker, she was in the position of having equally intimate knowledge of both parties, and of standing by during

THE DUCHESS OF KENT AND INFANT DAUGHTER.
From "Letters of Queen Victoria."

*The Letters of Queen Victoria. A Selection from Her Majesty's Correspondence Between the Years 1837 and 1861. Published by Authority of His Majesty the King. *Edited by Arthur Christopher Benson, M. A., and Viscount Esher, G. C. V. O., K. C. B.* Three volumes. Pp. xviii, 641; xiv, 575; ix, 657. New York: Longmans, Green & Co. $15.00.

all the intrigues and negotiations which accompanied the fall of one Cabinet and the construction of its successor. In fact, a large proportion of the letters might be collected from these three volumes and issued separately under the title of "Cabinet Making," and it is to be feared that many of these letters would not wholly redound to the credit of some of the British statesmen from and to whom they were written.

It has long been known that there was almost constant friction between Queen Victoria and Viscount Palmerston while Palmerston was Foreign Secretary, and also in the later years, when he was Prime Minister. Lord John Russell also frequently came into conflict with Queen Victoria during these years; but between the Queen and Palmerston there existed a state of tension which has been frequently attributed to Palmerston's love of liberty and democracy and his closer sympathy with the British nation as regards foreign policy and the efforts of the peoples of Europe to obtain some degree of political rights. *The Letters of Queen Victoria* throw a new light on the long controversy with Palmerston. It was impossible for the Queen to take any step to vindicate herself during her lifetime, and, until now, Palmerston's friends have had the advantage in the presentation of the case, tho from letters of the Queen already published it is known that she based her disapproval of Lord Palmerston on constitutional grounds, and that she asserted only the acknowledged right of the sovereign to see and approve dispatches from the Foreign Secretary before they were sent to the Powers of Europe. The constitutional aspect of the struggle, however, is often less regarded by people at large than the principles and tendencies of the actors, and, as long as the struggle was considered to center around a forward democratic policy on the part of her Minister, and reactionary tendencies on the part of the sovereign, popular sympathy was bound to be with Palmerston.

That Queen Victoria was naturally and essentially conservative, and that she was not in sympathy with the revolutionary efforts to shake off monarchy in Europe of the years 1848 and 1859, is fully confirmed by these letters. But the most salient characteristics of her dealings with foreign nations, which are also clearly brought out in her letters, were honesty of purpose, scrupulous adherence to treaty obligations, an avoidance of even a suspicion of bad faith, and a fixed determination to keep England at peace and free from entanglements in European politics. It was not against Lord Palmerston's democratic tendencies, but against his inconsistency, his unreliability, and his habit of taking his own way regardless of his engagements and promises both to the Queen and to his colleagues of the Cabinet, that Queen Victoria protested; and it was for the honor and peace of England that she feared the consequences of Palmerston's unconstitutional, hasty and often ill-advised actions and dispatches. During Palmerston's administration of 1859-65, when Lord John Russell was Foreign Secretary, and when the foreign policy of England was to be attributed to the Premier quite as fully as to Russell, the friction between the Queen and her Ministers extended itself to Russell almost as much as to Palmerston; and in the dispatches to Lord Cowley, who had been sent on a special mission to Vienna concerning the negotiations which closed the war undertaken by Napoleon III for the liberation of Italy from the domination of Austria, the friction reached its culmination; and the Queen's action was fully justified by members of Palmerston's own Cabinet. Palmerston and Russell were anxious to intervene during the negotiations for peace in order to guard Italy "against the ruthless tyranny of Austria and the unchained ambition of France" — an intervention which the Queen felt to be a departure from the principle of non-intervention which had been publicly proclaimed by Great Britain at the beginning of the war.

The great confidence with which Queen Victoria regarded Sir Robert Peel is markedly in contrast with her distrust of her two later Premiers—Russell and Palmerston. This confidence was the more remarkable because Sir Robert Peel began his career as first Minister under the handicap of the Queen's positive aversion. Lord Melbourne, who was Premier when Queen Victoria came to the throne, had obtained a complete ascend-

ancy over her mind and affections, and the very idea of seeing him supplanted by Sir Robert Peel was abhorrent to her. This feeling had been strengthened by the unfortunate conflict of 1839, when Peel had been summoned to form a Cabinet, over the question of the Ladies of the Bedchamber. Peel was then obliged to give way, and Melbourne had been continued in office. But when in 1841 the Whigs were definitely outnumbered and Peel was again called to form an administration, the Queen's distrust and antagonism quickly gave way to respect and confidence, and her attitude toward Peel is one of the strongest proofs of her desire to keep her relations with her Ministers within strictly constitutional limits, and a proof also of the fact that it was the character of Lord John Russell and Lord Palmerston rather than their policy that brought about the miserable condition of tension and friction that lasted thru the greater part of their administrations.

The English royal family is now very closely related to almost every sovereign of Europe. In the first twenty-five years of Queen Victoria's reign the relationships were neither so close nor so universal. Nevertheless the Queen's personal relations with the various European courts were close and almost invariably friendly. The nearest relative of the Queen among European sovereigns was King Leopold of Beligum—father of the present King. He was the brother of the Duchess of Kent, and, besides being the Queen's maternal uncle, he had also been the husband of her cousin Charlotte, daughter of George IV, and had thus narrowly missed occupying a place similar to that of Prince Albert, as husband of the Queen regnant. King Leopold had lived in England for some years after the death of the Princess Charlotte, and had acted a father's part toward the little Victoria in the days of her distress and poverty after the death of the Duke of Kent. Very close and tender was the affection between Leopold and Queen Victoria, and if occasionally a tendency can be seen in his letters to influence English politics for the benefit of Belgium—a tendency which, by the way, was quickly discerned and discounted by the Queen—it must not be overlooked that he constantly gave to the Queen most excellent and high-minded advice concerning her conduct as a constitutional sovereign. Nor was the advice either given or accepted in a perfunctory manner. The insistence by Leopold on the duties and responsibilities of the Queen's position, on the sacrifices she was called upon to make as Queen of England, colored the whole of the Queen's life and thought. In the early letters that passed between Victoria and her uncle there is never an allusion to the rights and privileges of the Queen of England nor to the glory attaching to her exalted position; but there is a great deal about the work that was demanded of her if she would fill that position worthily, and the arduous preparation that was necessary for the proper performance of this work. In Queen Victoria's hearty acquiescence in this view of life, and in her faithful efforts to live up to her uncle's ideals, is to be found the cause of the gradual rehabilitation of the monarchy in English thought and affections, and its present unparalleled popularity in the person of the great Queen's son.

The work of selection among the immense quantity of letters and memoranda which exist in manuscript can have been by no means easy, and there are many opportunities for the complaint that, on the one hand, many exceedingly trivial matters are allowed disproportionate space, and, on the other, that events of importance on which the Queen must have expressed herself are left untouched. The chief objection, however, is that so many subjects are touched upon and left incomplete. One letter is given, but not the reply to it, nor the letter which called it out. This may arise from the incompleteness of the available material; but in many cases subjects are touched upon and left unfinished in a way that is positively tantalizing. The editors' summaries at the opening of each chapter are clear, concise and satisfactory *résumés* of the events of the year covered by the letters, and in the footnotes there is a sufficient explanation of the persons and events to which allusion is made in the text. Not much can be said for the volumes as literature. As a revelation of the Queen's life and character; as an illumination of the poli-

tics of Europe, and the thought and life of the European courts during the years they cover; and, above all, as a contribution to the history of England, they are invaluable. But, as an example of literary style, the Queen's letters cannot be recommended to writer's of the King's English. As might be expected, the Queen wrote best when she wrote directly in the first person to members of her own family. In her more formal third person letters, tho she never failed to make her meaning clear and unmistakable, her English is frequently faulty and confused, and, if it were not for the great interest that attaches to the letters, their reading would be somewhat wearisome and would give little enjoyment.

Unpragmatic Humanism

THE war between the pragmatists and their foes having spread beyond the bounds of the philosophical journals, many readers will be prepared to demand of a book calling itself *Lectures on Humanism** on which side of the fight it is arrayed. Professor Mackenzie does not ignore the challenge. He sees in the pragmatist view that we are guided by the idea of an end even in our most theoretical investigations, and that truth is not something statical, one illustration of what he understands by humanism. On the other hand, he recoils from the pragmatist position, which, as he conceives it, denies that individual choice is guided by universal principles or takes into consideration the objective conditions by which life is determined.

The humanism of the renaissance was a reaction against scholasticism; pragmatism is opposed to absolutism and meaningless speculation; Professor Mackenzie's humanism is opposed to naturalism. Naturalism interprets man from the point of view of nature or mechanics. It sees only the "quantitative aspect" of things. Humanism seeks the key to the universe in man. It lays emphasis on quality, purpose, teleology. The value of the distinction must be sought in its application, and the author himself essays to do so by pointing out its bearings on certain sociological questions.

Humanism might be thought to be opposed to democracy, since the political philosophy of Plato, prince of humanists, was aristocratic. But altho democracy's mechanical method of deciding public questions by majorities is apparently non-humanistic, humanism is able to approve of democracy by viewing the process as a means of allowing the intelligent and expert few to tip the scales balanced by equal masses of ignorance.

Humanism might be conceived to be opposed to legislation and in favor of relying on morals to improve the state. But humanism is able to approve of legislation by viewing it as a means of making men better. The author is, therefore, not surprised to find the philosophers whom he classes as humanists —Plato, Aristotle, Hegel, Comte, Burke and Carlyle—advocates of legislative compulsion, while naturalists like Mill and Spencer vigorously denounce the sins of legislators and plead for liberty.

In short, so far as these political questions are concerned, humanism makes no practical difference in one's views. The questions must be settled on other grounds. Equally ambiguous results follow from the application of humanism to economic problems. The author selects the topics, value, economic history and control.

Humanism must be opposed, he begins by saying, to the extremely subjective view of value held by the Austrian school. This it must do, we presume, in the interest of the objective conception of "good," which is elsewhere advanced. Ruskin's view of value as the measure in which things support or enhance life is objective enough, but there is difficulty in making practical use of this conception. Professor Mackenzie would not urge that Ruskin's point of view be absolutely substituted for the other, but "he would urge that some attention should be given it."

The historical school of political economy is approved in the same fashion. Economic history is said to be humanistic only when it is guided by the idea of human development. The mere chronicling of past facts and conditions is not humanistic. We might ask, Is it

*LECTURES ON HUMANISM, WITH SPECIAL REFERENCE TO ITS BEARINGS ON SOCIOLOGY. *By J. S. Mackenzie.* Pp. xix, 243. New York: The Macmillan Company. $1.25.

naturalistic, or anything at all but stupid?

Humanism must set its face against the doctrine of *laissez faire,* we are told, for that doctrine is based on the conception of society as a collection of competing elements which must be allowed to work out their destiny undisturbed. Humanism demands that political economy study the best possible methods of guiding the economic forces. Does this mean the abandonment of "every semblance of *laissez faire*"? Not at all! The control of economic forces should be mainly in the direction of education, "in the widest sense of that term," which includes the educative influence of a protective tariff.

The same dialectical method of marking time is continued in the chapters on education and religion. The author's logic enables him to annihilate by unflinching qualification every seeming advance. Applying to the philosophy of humanism as expounded in this book the pragmatic test, "What difference would it make to one's views on sociological questions if one were this sort of humanist?" we are obliged to answer, "No appreciable difference whatever."

Socialism and Near Socialism

MR. SPARGO'S *Capitalist and Laborer*[1] is a reply to Professor Goldwin Smith's recent booklet, "Progress or Revolution?" It is an excellent piece of work from the Socialist standpoint, spirited and dignified in style and cogent in argument. From the Webbs's "History of Trade Unionism" and other authoritative sources he takes the liberty of correcting some of Professor Smith's historical allusions, and thereupon devotes himself to what is at once a defense of the Socialist movement and a criticism of Professor Smith's statements. The paper will be especially valuable to the average reader whose acquaintance with Socialism consists chiefly of a bundle of misapprehensions. The second part of the book contains a lecture given by Mr. Spargo before the New York School of Philanthropy last March. The lecture is in the main a reply to the lectures given in this country last year by Mr. W. H. Mallock.

Mr. La Monte[2] is also of the orthodox Socialist camp. He has studied his books, and he writes with dash and cleverness. But his tolerance of persons who do not see with him is by no means gentle. Mr. Upton Sinclair in particular awakens his ire, as one who, tho a Socialist, has not sufficiently divested himself of his bourgeois ideals and states of mind. Mr. La Monte is a revolutionist (not necessarily a warlike one), and the nihilism, the destructiveness of existing forms, which he finds in Socialism, constitute that movement's main charm for him. Accordingly, he sees with rapture the family, the state, religious and present-day ethical standards all doomed to extinction with the coming of industrial collectivism. He is wholly forgetful of the fact that many institutions, no matter what their genesis, take to themselves accretions from the complex life of the generations that grow up under them, and thus fit themselves to outlast any changes in the economic basis of society. The notion, for instance, that marriage, if its origin is to be found in individual accumulations of property, would be terminated by the collectivizing of property, is singularly unscientific and visionary.

Professor Le Rossignol,[3] of the University of Denver, sets himself lightheartedly to the task of demolishing the theories of Socialism. His style is didactic, and his diction clear, but a confusion of thought is often apparent, a fact made all the more apparent by the simplicity of his diction. He starts from the position (p. 3) that "the scientific Socialist is the only Socialist worthy of the name," and his thesis is that "the fundamental theories of Socialism are by no means scientific." It cannot be said that he has aided greatly in establishing proof of his contention. A rather formidable bibliography is given, but the relation of the books mentioned to his own text is not made evident.

[1] CAPITALIST AND LABORER. An Open Letter to Goldwin Smith. To which is added Modern Socialism, a Lecture. *By John Spargo.* Chicago: Charles H. Kerr & Co. 50 cents.

[2] SOCIALISM, POSITIVE AND NEGATIVE. *By Robert Rives La Monte.* Chicago: Charles H. Kerr & Co. 50 cents.

[3] ORTHODOX SOCIALISM. A Criticism. *By James Edward Le Rossignol.* New York: Thomas G. Crowell & Co. $1.00.

Professor Reeve's book, *The Cost of Competition*,[1] is an ambitious, a thoughtful work; it has even revolutionary intentions—for it seeks no less the overthrow of the competitive system than the overthrow of Marx and the orthodox school of Socialism. The book may be said to have fallen between two schools. It is not a Socialist work. It dismisses the labor theory of value; it has evidently no concern with surplus value; it is wholly indefinite and obscure on such fundamental Socialist doctrines as the class struggle and the economic interpretation of history, and it casts aside the accepted Socialist terminology and employs one of its own. On the other hand, it is certainly not an anti-Socialist work, for its chief argument is the burden and waste of competition and the necessity and (apparently) the inevitability of a co-operative system. It is rather to be classed with those self-contained individual proposals for social reorganization more common in the days of the Utopians than now—when each social pathologist and reformer was at once law and prophet unto himself, projecting his scheme and calling upon the world to reject all other remedies and accept his own.

Professor Reeve is an engineer, and no doubt understands the social aspect of inventions and improvements. He can hardly be blind to the fact that every mechanical contrivance or process embodies the thought, the skill, the knowledge, the achievement of millions of men in past times. But there is no evidence that he is conscious of the social aspect of political and economic thought. He writes as tho he were the first actual explorer in the wilderness of the socio-economic world. Hardly a single name of all the illustrious men who have built up the sciences of economics and sociology is mentioned. Marx is fortunate enough to be referred to in a note (p. 77) wherein his theory of value is jauntily dismissed, and Henry George, the apostle of single tax, is not wholly overlooked; while Bellamy, whose mechanical and impossible State Socialism has long been discarded by all serious students, is inferentially set up as a social creator. The others would seem to have thought and written in vain. Professor Reeve is intent upon doing the whole thing himself in almost complete obliviousness of what has been done before him.

Need for a Philippine Handbook

IT is an unfortunate result of the political controversy that has been waged over the Philippines that since 1898 almost every book, review or article written about those islands and their people, even when the writer's purpose is entirely non-political, is, consciously or unconsciously, tinged with partisanship. This appears, in spite of the author's protest that he has avoided all controversial ground, in the latest book on the islands, one intended primarily as a reference work for tourists, exporters, industrial promoters, etc.* The author, Mr. Hamilton M. Wright, who visited the Philippines in 1906 in the interest of a commercial body in San Francisco, leans almost as far over on the side of optimism and cheerful prophecy of progress as the author of "Our Philippine Problem," some time since criticised in these columns, leaned on the side of pessimism and direful prognostications as to everything connected with the "American policy" in the islands. The two books might be recommended as antidotes for each other; neither alone is a reliable guide for the man seeking to know the actual situation and the prospects of the Philippines.

So far as regards strictly political issues, the over-optimism of Mr. Wright's *Handbook* is nothing serious, since it is only incidentally that such matters are touched upon. But the book is put forward as "a practical reference work to the Philippines of today; their commerce, productions, industries and opportunities." And not only is it written with the roseate optimism of promoters' literature, but as a compilation of facts it has been carelessly prepared, from inadequate study of sources and hasty observations, and is far from being either accurate or complete. The bibliographical lists at the end of chapters confirm what the text itself reveals, viz., the author's scanty

*A HANDBOOK OF THE PHILIPPINES. *By Hamilton M. Wright.* Chicago: A. C. McClurg & Co., 1907. Pp., xvii, 431. 8vo. $1.40 net

study and hasty work. Like others before himself, Mr. Wright has thruout drawn from Foreman as an "authority"—and it is really time that those who set out to write about the Philippines should know better than to do that.

The undue optimism may be noted, to cite examples, in what is said about the Philippine climate, pp. 37, 269 *et seq.*, and particularly in such amazing misstatements as these (p. 271): "American children develop faster and are stronger in the Philippines than almost anywhere else in the world. In fact, the climate is to be accounted a great asset." We are treated again to a rehearsal of the dream about Manila becoming "the trade center of the Orient," because it "stands at the gateway of this vast trade," tho we are given no other reason why the products constituting this trade should be unloaded at Manila and reshipped from there, instead of being shipped direct to their destinations, than that the new harbor facilities will render Manila "the most economic shipping port in the Orient." Some of the data on agriculture have been drawn from antiquated sources, and one is occasionally startled by such very incorrect assertions as this (p. 128): "It costs no more to lumber in the Philippines than it does in the United States." One must fear also that any tourist who relies upon the statements of this book as to hotels, steamships and other facilities for traveling about the Philippines will come home with a grievance against the author.

Political Problems of American Development

Dr. Shaw, the writer of the Columbia University lectures which form this volume,* is a publicist of wide vision, accurate information, judicial temperament and democratic sympathy, competent as few would be to present this comprehensive survey of the political problems which have arisen in the upbuilding of the American nation. Only by the easy mastery of the facts of history and politics and the application to their interpretation of a philosophic judgment, can such a survey be made readable and convincing. Dr. Shaw's general thesis is that the

> "process of growth and development across the continent was not by methods that were random or accidental—or even natural, in the sense of being unrestrained. It was upon the whole a process of an ordered sort, guided by a national policy that was concerning itself as regards the permanent character of American citizenship. The thing aimed at was fitness to maintain thru future generations the democratic political life of the country whether local or national."

In grouping the facts, so bewildering in complexity, which illustrate this thesis, and in passing judgment upon them, Dr. Shaw betrays the cheery confidence of the Westerner. He is a professional optimist, as the editor of every magazine of wide circulation must be. To him what is, is best! The national policy respecting the Indians has been marked

> "by great care . . . and by various provisions to protect the Indians and all their rights of person and property during a future transitional period." "Altho the aboriginal instincts are stubborn and hard to overcome, the inexorable pressure of our white population will either absorb the red man or cause his numbers to dwindle toward the point of extinction."

No hint is given of the violation of agreements with the Indians and of the hardship worked on them (due doubtless to their "stubborn aboriginal instincts" which they got from Satan), by the "inexorable pressure of our white population," which will "either absorb the red man or cause his numbers to dwindle toward the point of extinction."

The negro also has cause to rejoice. "There is no working class in any European country possessing a tithe of the advantages that are at the hand of the negro working class of our Southern States." Even his disfranchisement is for his own good and the nation's greater glory. Happy negro!

Any one reading this book would not need to be informed that Dr. Shaw is a stalwart Republican, a friend of President Roosevelt. It is curious how an academic examination discloses that the measures in harmony with the eternal principles of statesmanship and the underlying purposes of American life happen to coincide almost to an inch with the proclaimed policies of Theodore Roose-

*Political Problems of American Development. *By Albert Shaw.* New York: Columbia University Press. $1.50.

velt, while such measures as happen to be associated with the names of Democratic leaders curiously conflict with the judgments of an Olympian observer.

Confident about the wisdom of every progressive step so far taken or suggested in Presidential messages, Dr. Shaw is a little hesitant about the advisability of further changes, a little solicitous lest it should appear that he approves any policy not likely to receive the White House stamp. "There must be unremitting effort to destroy every phase of corrupt relationship between great business enterprises and the forces of politics and government." But in what direction that "unremitting effort" shall operate is not declared. Perhaps it may be included in the next Presidential message and therefore in the second edition of this book. For the book is so valuable as to deserve a second edition.

Il Programma Dei Modernisti. Risposta all' Enciclica Di Pio X 'Pascendi Domini Gregis.

This is the first of a series of publications of the *Societa Internazionale Scientifico-Religiosa,* Rome, which the Italian Modernists have organized to defend themselves against Papal aggression, and the unknown authors of which have been excommunicated, and their book forbidden to be read. It is evident that a religious war in the bosom of the Catholic Church has begun whose consequences none can foresee. This volume of 232 closely printed pages defends the Modernists against the misrepresentations of the Encyclical. It is not the work of an individual, but a work in which many representative Modernists have taken part; and its ability, tone and character contrast favorably with that of the Encyclical itself. It squarely says that the assertions of the Encyclical with reference to the Modernists are false. These scholars accept the name of Modernists, not of their own choice, but because they have been branded with it by their enemies, as has been the case with many other historic names. They deny that their views of the Bible and history are based on philosophical presuppositions, but assert that they are due to inductive scientific criticism. They deny that they are agnostics or atheists. They admit that they emphasize the divine immanence, tho not in a sense contrary to the definitions of the Church, but in accord with the ancient fathers and doctors of the Church. They deny the transfiguration and disfiguration of doctrines and facts ascribed to them, and claim that they hold to that which the leaders of the past have always held: that the faith grows, not in itself, but in the apprehension of it by men in the different ages as they advance in the knowledge of it. They claim that they are the true successors of the scholastic theologians in that they adhere to their spirit of progress, rather than to their stereotyped modes of thought and statement. They claim their rights to freedom of thought and writing, within the limits of the dogmatic decisions of the Church, which are alone infallible, and their elementary rights of self-defense, and their canonical rights as priests and bishops of the Church not to be condemned, without a hearing, in accordance with the misrepresentations of traditionalists, who are as ever battling for their own opinion rather than for the truth and honor of the Church. There is, then, a manly protest against the renewal of the medieval inquisition, or worse, which is proposed in the Encyclical, and a warning not to try to dam up the irresistible stream of modern thought and life. The volume has, as a sort of appendix, a large number of criticisms upon the Encyclical from the Italian press and a copy of the Encyclical itself.

The Book of Nahum. A New Metrical Translation with an Introduction; Restoration of the Hebrew Text, and Explanatory and Critical Notes. By Paul Haupt, LL.D. 8vo. Pp. 53. Baltimore: The Johns Hopkins Press. 50 cents.

Dr. Haupt's presidential address at the last annual meeting of the Society of Biblical Literature and Exegesis, here presented with a title page, is taken from the *Journal* of that society. Dr. Haupt has the courage of his investigations, and uses all his scholarship to revise the Hebrew text and assign its portions to various periods of Hebrew history. He holds that Nahum is a liturgical compilation in honor of the glorious victory of

Judas Maccabæus over Nicanor in 161 B.C. There are, he says, four poems, of which the two last are taken from much older poems written by one who saw the fall of Nineveh in 606 B.C., while the two first are of the Maccabean period. But it is not feasible to tell the reader exactly how these are divided, because the learned editor has so transposed and omitted and reconstructed the text that one must have this book in hand. The notes are full and original, and the printer had a difficult and expensive task to set up correctly all the scattered Hebrew and Greek words. The radical nature of the interpretations appears in the notes, that in chapter 3:1, 7, "the bloody city" and "Nineveh" mean Antioch as the capital of the Seleucidan kingdom, while "the well-favored harlot" of verse 4 is Hellenic culture.

The Churchman's Treasury of Song. By John Henry Burn, B. D. New York: E. P. Dutton & Co. $1.50.

Hymns That Are Immortal. By Wilson T. Hogue, Ph. D. Chicago: S. K. J. Chesbro. $1.00.

Mr. Burn has selected a religious lyric for each day in the year, following the calendar in the Book of Common Prayer. While the Anglican tone predominates, the collection is not unsuited to the use of members of other churches. The aim has been to be catholic and impartial in the selection, and we note poems by Watts, Wesley, Anne Steele, Ray Palmer and the Unitarians Longfellow and Sears. There are no less than ten from the Presbyterian Bonar—as many as from the Anglican George Herbert. It is perhaps natural that where the liturgical scheme of the Church year is followed, authors not so well known outside ecclesiastical circles should predominate, and accordingly we find seventeen poems by Isaac Williams, thirteen by Lord Kinloch, and fourteen by George Taylor Farquhar. As a whole the quality of the verse is high, and the compiler is evidently a man of taste. Dr. Hogue is a compiler of a different sort. From well-known treatises on hymnology, and from sources not so reliable, he has gathered facts of more or less interest and trustworthiness, concerning some of the more famous hymns. It is surprising how many people in books of this sort die singing hymns. In an experience as a clergyman extending over some years the reviewer has never known such an instance, and physicians give the same testimony. Stories of the use and influence of hymns should be carefully verified with exact reference as to time and place, for the apocryphal literature on the subject is large, and is constantly increasing from questionable sources.

Back Slum Idylls. By Olive Catherine Parr. London: R. & T. Washbourne, Ltd. 2s.

Miss Parr dedicates her book of *Back Slum Idylls* to "all lovers of humanity," and in her brief preface announces that her "stories are fact, not fiction." With such good intentions and with her rich material, for she writes of what she has known and shared in her mother's work among English convicts, it is a little disheartening that she fails of moving effects upon the reader's heart. It may be that her familiarity with the class she depicts has made her see their sordid lives in the dry light of matter of fact; at least, there is a certain flippancy in the style which does not suit the tragic themes of poverty, ignorance and crime. The professional philanthropist cannot write, as a rule, the real story of the people he serves in so many noble ways; he stands too near. The romancer, who has perhaps never helped or saved anybody in his life, somehow gets a better perspective. The pity and the horror of it has not become a commonplace to him; murder and seduction are not an old story to him. We read the annals of devoted people, priests of the poor and outcast, and we know how full of sacrificing love their lives are, yet the recital leaves us cold, because it lacks the altar-fire of imagination. And so, in this little book, we can read between the lines a story much more interesting than any Miss Parr has told—her own and her mother's beautiful lives of devotion to the lowest poor of London, their unfailing sympathy and goodness, and the cheerful hearts they carried thru all the misery, which sought the comfort they gave. But, perversely, we feel that, while it was right that the author should be cheerful, these stories should not be so! For they deal with horrible facts in an incongruously light-hearted way.

Race Life of the Aryan Peoples. By Joseph Pomeroy Widney. 2 vols. New York: Funk & Wagnalls. $4.00.

Many men of bold and generous minds, undisturbed by the ceaseless grind of the press turning out scientific criticism of minutiæ, have attempted to compass, within a single work, both a summary and interpretation of the countless ages of the Western civilizing process; and now Mr. Widney, with his unqualified celebration of the Aryan, joins the great throng of high generalizers. His book is designed to serve as an epic of the Aryan race, beginning with the Asiatic period and tracing the bewildering migrations from the "original homeland" into India and the West. The thesis is a well-known one: The Aryan is the chosen of the Lord. "God, the lawmaker, thru his law made the Aryan masterful among men. . . . Climate and environment only helped on." It is a primitive notion entertained by the Jews concerning themselves, and Herbert Spencer quotes a Bedouin sheik as saying: "There are eighty tribes in this region; seventy-nine of them are doomed to destruction, and one to salvation; thank the Lord we are the fortunate one." Dr. Widney, totally oblivious to the recent demonstrations of the complexity of ethnic problems and to the revelations on the Ur-Afric origin of the Græco-Latins (tho they were hopelessly mixt), writes of a mighty Aryan "race," and traces its myriad branches—Indo, Græco-Latin, Celto, Slavic, Teuto Aryans—with a firmness akin to that with which the theologian of the forties drew his genealogy of the whole human family from Adam down. The anointed of this hydra-head "race" is the Protestant Anglo-Saxon, whom Kipling has already made famous. Every chapter is reeking with error and exploded fancies. To be concrete, the theories of Green, Freeman, Kemble and the Teutonizers, now dead among anthropologists and historians, and beyond hope of resurrection, are reproduced in the chapters on the English and the making of England. In addition to being based on worthless data, the volumes are full of high and loose talk about such things as "the first great readjustment of social forces which has come since the fall of the Roman Empire," and *"sæcula sæculorum"*—that would be eloquent if there were reality in it. The best that can be said for the work is that it has swing and style and may afford material for patriotic addresses. As for scientific value, it has none.

Ancestors. By Gertrude Atherton. New York and London: Harper Bros. $1.50.

Mrs. Atherton's literary style is improving. She does not give the impression she once did of walking about in her own story with a horse-whip in her hand ready for the timid critics whose terrifying duty it is from time to time to introduce her to admiring readers. Possibly the notorious insufferableness of the English has disciplined her proud spirit during her late sojourn among them. In any case, she does not hector so fiercely, and this last is a good story of its kind, with love and scandal and all manner of diabolical human interests to make it startling. The hero is a young English politician who is horribly afraid he may become a peer thru the death of a relative and be obliged "to rot in the House of Lords." And the scene which opens brilliantly in London is changed to California, and the book closes with the San Francisco disaster. The contrast between the English and their American cousins is shrewdly drawn, sophisticated and as lacking in kindness as one may expect from an author who places wit before humor, and who is incapable of understanding the pathos of being human either in this country or in England. The significance of the title is derived from the fact that everybody in the story talks incessantly about his or her ancestors, or upon topics that trail back to their Adamic pedigrees. Even in the closing scene, with the terrible city toppling and burning about her, we behold the servant of the heroine cutting the portraits of her ancestors from the frames to preserve them.

A Lost Leader. By Phillips Oppenheim. Boston: Little, Brown & Co. $1.50.

Mr. Oppenheim is one of the few writers who can make a political novel as interesting as a good detective story, where the reader is expecting some one to be

shot on every page. This time he lays his scene in the drawing-rooms of the English nobility where in novels one may always look out of the window and see the Houses of Parliament. But there is one pathetic thing about the men who move and have their political being in these awful regions. They all have unfortunate liaisons with unscrupulous women, and when Mr. Oppenheim takes after one of them with his wonderful pen things are complicated, as in this story, by the fact that the "leader" is shadowed by one of those hero outlaws of the people with a knife up his sleeve. The effect of this knife in the argument which ensues between the politician and the brave would-be assassin is very obvious in the change of views which takes place in the leader's mind, and that is why the other side "lost" him. This is a new method of influencing statesmen, and should not be indulged in too freely outside of Mr. Oppenheim's novels. A kindergarten should be established for the training of political leaders, and they should be removed entirely from the field of fiction until they are more mature.

Memoirs of the Comtesse de Boigne, Vol. I, 1781-1814, Vol. II, 1815-1819. Edited from the Original MS. by M. Charles Nicoullaud. New York: Charles Scribner's Sons. Each, $2.50.

After the overwhelming flood of French memoirs published during the last decade or so, one had come to believe that all the available material was exhausted, that nothing had escaped the minute searching of family archives which had yielded so rich a crop, when, behold, a veritable find is unearthed for us in this book, so fresh, so entertaining, so original and independent in its opinions and judgments, and occasionally of such genuine value in its estimation of historical personages and events. The period it covers is that dealt with in most of its predecessors of the last ten years, the period of the closing days of the *ancien régime,* the Revolution and the First Empire, but it is, for all that, far from being a repetition of what others have already said. It is markedly free from bias, prejudice and hero worship, and it is distinguished by a social and political tolerance that assures for it a goodly place among the footnotes of future biographers and historians. Whether she be writing of Marie Antoinette or Josephine, of the bad manners of Louis XVI or those of Napoleon I, of the Comte d'Artois or Louis XVIII, the clarity of Mme. de Boigne's vision is never obscured, her judgment always her own. She has a happy knack of drawing kit-kats (those of Madame de Staël and Madame Récamier deserve special mention), a happy gift of characterization. Thus she says of Pozzo di Borgo:

> "He was perfectly correct in regarding himself as a rival of Bonaparte at that time (1796). But when that idea was once fixed in his Corsican head, he could never get rid of it, and continued to regard himself as the rival of the conqueror of Italy, of the First Consul, and even of the Emperor Napoleon. He was too sensible to proclaim this idea in set terms, but it was working in his brain."

The *Memoirs* are most successful, however, in their reproduction of atmosphere, social and political, whether it be that of the court at Versailles, of the morally lax colony of *émigrés* in London, or of Paris in 1814, on the eve of the Restoration. Madame de Boigne lived in London and Naples during her exile—she has something to say about Lady Hamilton—and traveled in Holland and Belgium. She is always good-natured, impartial, perspicacious and frank, revealing herself as the possessor of a clever brain and a temperament whose resiliency no misfortune, no hardship, not even her own unhappy marriage, could break. She is tolerant of the foibles of others, because she had humor; and she is anecdotal without being trivial. "*L'anecdote est la boutique à un sou de l'histoire,*" said Dumas. Here is a delightful shop of historical anecdote. The record of the first volume ends with the year 1814. Its success has already secured the publication of a second volume, devoted entirely to the five succeeding years, which Mme. de Boigne spent in Italy, Paris and London. Her pictures of the reaction in Italy, of the attempt to reintroduce the social and political conditions of the *ancien régime,* remind one of "La Chartreuse de Parme." The Hundred Days are but indirectly referred to in the *Memoirs,* since their writer was not in France at the time, but she tells some curious anecdotes of

the arrogance of Wellington in Paris after Waterloo. Her chronicle of affairs and people in France under Louis XVIII is rather unimportant, as it needs must be by comparison with the grand scale of the Napoleonic era. She writes frankly, and not without historic interest, of English society during the second decade of the nineteenth century, devoting considerable space to the Regent and Princess Charlotte. A discussion of the domestic arrangements of Talleyrand may be referred to *passim*. On the whole, however, this second volume is inferior in interest to the first, owing, as has just been said, to the lesser importance of its subject-matter.

The Pickwick Ladle and Other Collectors' Stories. By Winfield Scott Moody. New York: Charles Scribner's Sons. $1.50.

This volume of short stories calls attention to a class of people usually neglected by writers of fiction—curious misers of the past who are out of touch with life except as it refers backward to the dead and gone thru its old furniture and old silver. Not since Sir Walter Scott wrote the "Antiquary" has any effort been made to interpret their dust-snuffing emotions except as a sort of "side line" in some novel of modern life. And while these stories are not especially good, we should be grateful for the volume, since it will serve so admirably as a Christmas present for the fossil-minded friend we all have, and who is usually so hard to provide for on account of his mania for "old things."

Gunhild. By Dorothy Canfield. New York: Henry Holt & Company. $1.50.

Miss Dorothy Canfield has achieved success as an author of short stories. *Gunhild* is her first novel, and a promising one. The group of Americans stranded in an out-of-the-way Norwegian village are possible people, and the pages of description are many of them beautiful. The young Norwegian interpreter, with her heavy golden braids and voice of "strained honey," had been a Kansas girl for many years until her father's nostalgia carried the family back to the fjords and forests of Norway; and, in her, there is a new heroine, one of placid charm, most restful to the novel reader jaded with the nerve-storms of the usual leading lady. Her placidity is needed in a country where "it rains eight days in the week," as the proverb says of Bergen, and the neurotic hero announces that in another hour he will "know how Oswald felt in 'Ghosts'—drop back in idiotic despair and clamor to be given the sun—the sun!" There is a grayness and a chill in the atmosphere of the book, caught, perhaps, from the sodden skies of Norway; and the only sunshine comes from Gunhild's golden hair and from her heart of gold; Aunt Nancy is a brave lady, and her warrior spirit gives a bracing and tonic support to the rest of the characters, who all seem to need her care, save Gunhild, who is more accustomed to caring for other people than to being looked out for. We shall await Miss Canfield's next book with an expectation of still finer achievements.

A Horse's Tale. By Mark Twain. New York: Harper & Brothers. $1.50.

In Mark Twain's latest story we have the short history of a little Spanish-American girl, sent to live with her uncle, a general, on the frontier. The child captures the fort and the hearts of the soldiers, from the commander to the Indian scouts; she "lives in a nursery with more than eighteen hundred nurses." Soldier Boy, a beautiful black horse, tells much of Cathy's story, and he talks quite as well as Mark Twain himself. The description of the bull fight is full of fierce satire. The horses listen to an animated account of a bull fight, in horror at its atrocities, and then say to each other: "When we die, Sage Brush, do we go to heaven and dwell with man?" "My father thought not. He believed we do not have to go there unless we deserve it." And we feel the throb of the kindest heart in the world beating for the helpless, whether brute or human, in this book, as in its long line of predecessors.

Between the Dark and the Daylight. By William Dean Howells. New York: Harper & Brothers. $1.50.

Mr. Howells dips into psychological twilight in his latest volume of short stories. They are queer and creepy without being exactly supernatural. In

"Editha" there is a war story of a new kind, altho its heroine is the same old, inconsequent and exasperating girl that Mr. Howells has drawn for so many years he could probably do it with his eyes shut by this time. "It all interested her intensely; she was undergoing a tremendous experience and she was *being equal to it!*" And so with the egotistic cruelty of youth she sends her lover to his death and has to face his mother afterward. The other tales are less tragic, and told as Mr. Howells alone can tell such small comedies, by means of conversations among intimate friends, with the graceful give and take of actual dialog, as the group discuss the affairs of their friends with after-dinner philosophic interest.

Helena's Path. By Anthony Hope. New York: The McClure Co. $1.50.

This book is a disappointment. We all know that the first chapter of any novel written by Anthony Hope makes the reader sit up and listen, and the first chapter of this story is so good that the reader is almost outraged at the inane character of the rest of it. To be sure, there is a whimsical charm about its very folly, but the trouble is that the author has apparently selected a theme suitable for a short story, and, by dint of much idling in words, he has stretched it into a book. It is an ugly way some successful writers have of watering their own literary stock. The scene opens, one might say, in the air, with the hero away from home sowing his wild oats as usual, for it is often observed that, if the author of an English novel has not got the hero out of the way when he begins the tale, he packs him off in the second chapter. And the reader is told that nothing is heard of him "in four years." It is nearly always four years. Meanwhile the author remains at home laying his scenes, making us acquainted with everybody's family skeleton, and preparing generally for the most direful complications, so soon as the son and heir is recalled by the death of my lord, his parent. Almost never does the author accompany him upon these journeys. And we are half thru the story without having seen more of him than a passionate note to his original lady love before he becomes disaffected and drops into silence with some foreign Juanita. All this happens in Anthony Hope's story, according to the traditions which govern British romance. And naturally, when the noble prodigal returns (in this instance Lord Lynborough), the lines of his face have been drawn a trifle tighter, longer and deeper. This is to indicate to the virtuous reader, who is obliged to take his vices by proxy, that the said Lord Lynborough has been leading a profane, not to say reckless, existence. And the effect is to reduce his countenance to a thinness that renders it little more than a profile. And naturally one has the right to expect the very worst from such a person. Nothing short of a morose disposition and murder in the end would satisfy us. But what do we actually get in this story? A little house-party quarrel over a path across the property of a provocative young woman, who refuses to allow My Lord Lynborough to traverse it on his way to bathe in the sea. There are no complications worth mentioning, no inspiring incident unless it be the one when Lynborough jumps over the head of the lady who bars his passage. And the whole thing ends like a comedy in tender tears. Lynborough at last sees his way thru the forbidden gate by proposing to the offensive lady. It was inevitable, and might have happened within the two thousand words instead of sixty.

Literary Notes

....The Rev. J. H. Jowett, of Birmingham, successor of Dr. R. W. Dale, has deservedly an enviable reputation as one of the best living English preachers. Some of his discourses designed to comfort the troubled are collected in *The Silver Lining.* (Fleming H. Revell Co. $1.00.)

....Students of sciences allied to medicine are often interested in the terminology of human anatomy. A definite attempt to reform this was made at a meeting of the Anatomical Society held in Basle some ten years ago. While the suggestions of that congress have not been generally adopted as yet, there is no doubt that they eventually will be, and every year sees them more used. Dr. Barker's book, *Anatomical Terminology,* with special reference to the [B. N. A.] (Blakiston), represents an easy method means of becoming acquainted with this system of nomenclature, as well as of proper anatomical terms in general.

....A recent valuable contribution to the psychology of religion is Prof. James Bissett

Pratt's *Psychology of Religious Relief* (New York: The Macmillan Co.). Professor Pratt seeks to demonstrate by a review of religious belief in India, Israel, and Christianity, and also by cautious induction from a questionaire, that faith is not so much a matter of authority and argument as is commonly supposed, but is actually based on insight and feeling. He contends that this foundation of faith is not weak and uncertain, but strong and reliable, and that the faith of to-day and to-morrow has nothing to fear, but everything to hope, from this modern understanding of the source of its life. The argument is well reasoned, and is expressed in clear and popular style. It sheds no little light on the interesting and important questions, Why do men believe? What is the real basis of religious confidence?

....The Musician's Library is a collection of masterpieces of song and piano music issued in artistic and convenient form, with critical introductions and portraits of composers. The volumes are sold separately at $1.50 in stiff paper or $2.50 cloth binding, by Oliver Ditson Company, Boston. The numbers are *Twenty Piano Compositions by Mozart,* edited by Xaver Scharwenka; *Thirty Piano Compositions by Mendelssohn,* edited by Percy Goetschius; *Twenty Piano Compositions by Haydn,* edited by Scharwenka; an *Anthology of French Piano Music,* edited by Isodor Philipp, two volumes devoted respectively to early and modern composers, and *Wagner Lyrics for Baritone and Bass,* edited by Carl Armbruster.

....Professor Harnack has set German scholars a good example in the respect he has shown for the original and independent investigations of English-speaking students in the field of New Testament criticism. In his recent work on *Luke the Physician* he acknowledges indebtedness to Hobart's exhaustive study of "The Medical Language of St. Luke," and confessedly bases one of his principal arguments on the observations made twenty-five years ago by this patient British scholar. For the "Horæ Synopticæ" of the Rev. Sir John Hawkins he has also high praise, and complains, "Er scheint bei uns kaum gelesen worden zu sein," which rebuke is modified in the English translation to "The valuable work of this scholar is not so widely known as it deserves." Professor Burkitt also comes in for recognition, and reference is made to Dr. Plummer's "Commentary on Luke." The English translation has one reference to the latter authority which is not found in the German. In his original text Professor Harnack put forth a modest claim to originality for his observation of the prominence of women in the writings ascribed to Luke, but in the copy furnished to the translator this claim was withdrawn, and a note called attention to the remarks on this subject by Professor Plummer. As long ago as Schaff's "History of the Christian Church" this predilection of the third evangelist was noted, as one may see by consulting page 662 of Volume I of that voluminous but still useful work.

Pebbles

To avoid panics human nature in a new country should be changed.—*American Cultivator.*

My Bonnie lies under the auto;
My Bonnie swears under the car,
Please send to the garage for some one,
For 'tis lonesome up here where I are.
—*The Home Magazine.*

A man who is always on the lookout for novelties, says the *St. James Budget,* recently asked a dealer in automobiles if there was anything new in machines. "There's a patented improvement that has just been put on the market," replied the dealer. "A folding horse that fits under the seat for use in emergencies."

Mrs. Homer—Don't you think your husband is rather headstrong for an invalid?

Mrs. Neighbor—Yes, and the doctor is to blame for it, too.

Mrs. Homer—Indeed! And why, pray?

Mrs. Neighbor—He won't allow him to take any nourishment but goat's milk.—*Our Dumb Animals.*

REMORSE IN INSTALMENTS.

There was once a man who was robbed of one hundred dollars. A long time afterward he received this letter:

"Dear Sir: Five years ago I robbed you of one hundred dollars. I am filled with remorse that I could have done such a thing. I send you a dollar and a half to ease my conscience."—*New York Tribune.*

A RUMPUS ON THE ROAD.

A couple of couples went for a ride in the country last Sunday, and when about five miles out disagreed on some proposition, and a couple of young ladies walked back to town. They report the roads in some places needing the attention of the road boss.—*Phillipsburg (Kan.) News.*

A NEW SUGGESTION.

As for Roosevelt, I think him entirely justified in his unwillingness to run again. If he is wise, he will stick to this resolution rigidly, and refuse the nomination even if tendered to him. And not only this, but, when his term is up, he will not accept a seat in the Senate or Governorship in the Philippines or a managership over the Panama Canal. Instead, he will use the last months of his term in having the Navy Department organize an Arctic exploring expedition to sail March 5, 1909, with plenty of provisions, for an old fashioned long compaign in the ice; he will quietly get himself a berth in this party, and will make his political friends promise to use all their influence to prevent the sending of any rescue party before 1913. Then he could come back and go into politics again. An absolute vacation of this length would probably not fit him for another term as President, but it would enable him to go into the Senate and do better than the average Senator.—*Editorial in Liberty.*

TERMS OF SUBSCRIPTION, PAYABLE IN ADVANCE

One Year, $2.00. Single Copies, 10 Cents

Single Copies over six months old twenty-five cents. Postage to any Foreign Country in the Postal Union, $1.75 a year extra. To Canada $1.00 extra.

Order for the change of an address should be received one week before change is to take effect; the old as well as the new address should be given.

Persons desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, in that case, hold ourselves responsible for their return. Authors should preserve a copy.

Sir William Crookes

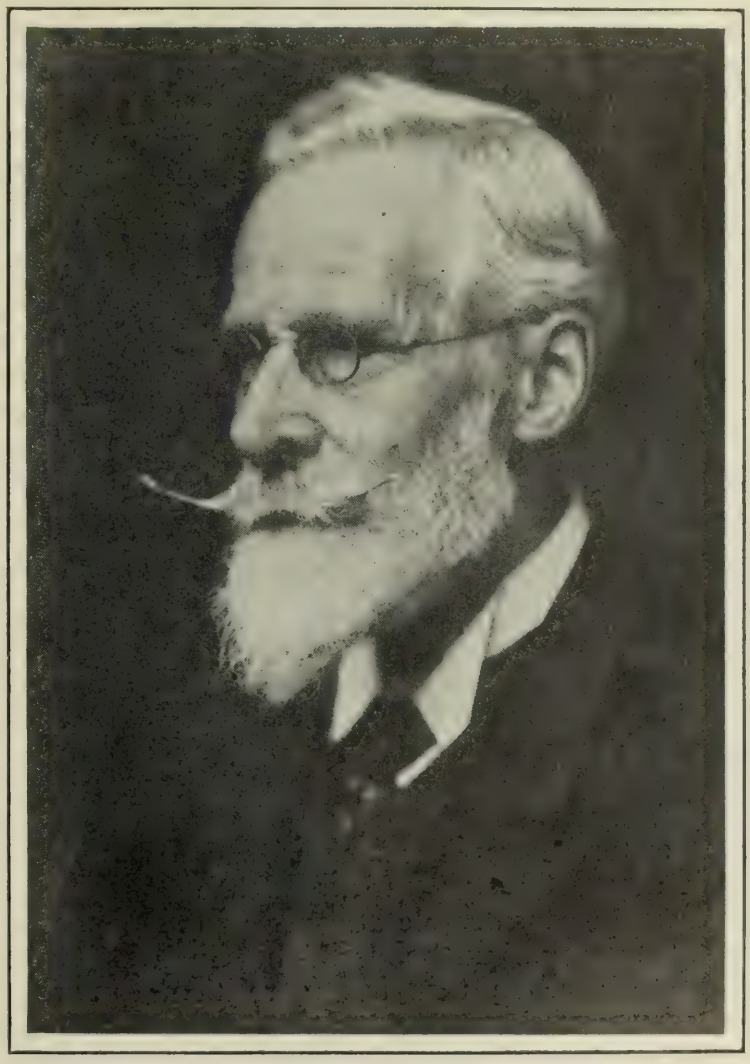
"If you would seek his monument, look about you."

THESE words from the tomb of Sir Christopher Wren in St. Paul's Cathedral would apply very well to Sir William Crookes. If you would know what he has done to deserve the Nobel prize you have only to look about you on a city street at night. Some of the store windows are lit by gas flames tipped with dainty mantles composed of the rare earths over which he worked for many years; in other windows are long glass tubes, filled with a mysterious wavering glow of ghastly green or rosy tint; these are commercial adaptations of the "Crookes' tubes" of the laboratory.

Fifty-seven years ago Crookes began his researches in chemistry with the analysis of some selenium residues from a sulfuric acid factory, in which he discovered the new element thallium, the metal of the green twig, so he named it from its spectral line. Since then his private laboratory in Kensington Park Gardens has sent forth an incessant stream of contributions to knowledge, from the most practical to the most recondite, the latter frequently proving to be the former. His technological handbooks and analytical guides are to be found in every laboratory. He discovered that England was losing $80,000,000 in the sewage that was allowed to run into the sea and he devised methods for saving it. The purity of London's water supply was placed in his hands. He startled the world by prophesying that the wheat supply was going to run short in a generation or so by the exhaustion of the soil, then in the course of the same lecture he saved it from starvation by showing how the free nitrogen of the air could be fixt for use as a fertilizer by combining it with oxygen by the electric discharge. Niagara alone would supply enough energy to double the wheat crop of the world.

In attempting to separate and identify the elements of the rare earths, too numerous to mention or even to name, he became convinced that these "terrestrial asteroids" were not discontinuous and eternally distinct forms of matter, but groups of indefinable and unstable elements and "meta-elements." In his memorable address before the Sheffield meeting of the British Association for the Advancement of Science in 1879 he spoke of the "dissociation point" of such elements of high atomic weight like uranium. Since recent investigations have given considerable experimental evidence in support of this bold hypothesis, his words are worth quoting:

"But as the host of celestial asteroids, unimportant individually, become of high interest when once the idea is grasped that they may be incompletely coagulated remains of the original nebula, so do these elusive and insignificant rare elements rise to supreme importance when we regard them in the light of component parts of a dominant element, frozen in embryo, and arrested in the act of coalescing from the original protyle into one of the ordinary and law-abiding family for whom Newlands and Mendeleef have prepared pigeon-holes."



Less than twenty-five years later Crookes was able to put upon the market a cheap pocket instrument, his spinthariscope, in which any one could actually see the decomposition of an element by the sparks which fly, like the explosion of a rocket, when the particles expelled from a tiny bit of radium strike the piece of zinc spar under the microscope.

From his vacuum tubes he obtained other arguments for his belief that all matter originated in a "formless mist," or "protyle," as he called it, into which it was continually decomposing and would ultimately dissolve and disappear. When he past an electric current thru a tube containing a mere trace of some gas, a millionth of an atmosphere, he found that a stream shot out straight from the

kathode or negative pole, a ray that as he proved was not of ether waves like light, but composed of minute material particles, for it was capable of turning a wheel, of staining the glass where it struck, of making gems incandescent, and of being deflected by a magnet. This kathode ray, as he said as early as 1879, consists "of something smaller than the atom—fragments of matter, ultra-atomic corpuscles, minute things, very much smaller, very much lighter than atoms — things which appear to be the foundation stones of which atoms are composed."

If there is any pleasure in being able to say "I told you so," Sir William Crookes must be one of the happiest of men, since he has lived to see so many of his peculiar views verified and generally accepted. His scientific contemporaries were inclined to smile at his enthusiasm when he claimed that his tubes contained not merely an excessively rarefied gas, but matter in a "fourth state," as different from the gaseous as that is from the liquid and the liquid from the solid. In looking back over the history of science we are always wondering why a discoverer did not take just one step farther into the unknown, tho in the case of a man who has done so much pioneer work as Sir William it is especially ungrateful. But we cannot help observing how near he came to cutting out three other scientists of Nobel prizes. If he had put an aluminum window in his tube, as did Lenard sixteen years later, he would have conducted his kathoderays into the open, where they could have been better studied. If he had exposed a photographic plate to the green spot on the glass where the rays struck he would have anticipated Röntgen in the discovery of G-rays. If he had been able to calculate the number of "ultra-atomic corpuscles" in the kathode ray, as did J. J. Thompson, he would have hastened by a quarter century the coming of the electronic theory of matter, which he foreshadowed in the closing paragraph of his address before the British Association in 1879:

"In studying this fourth state of matter we seem at length to have within our grasp and obedient to our control the little indivisible particles which, with good warrant, are supposed to constitute the physical basis of the universe. We have seen that in some of its properties radiant matter is as material as this table, while in other properties it almost assumes the character of radiant energy. We have actually touched the border land where matter and force seem to merge into one another, the shadowy realm between known and unknown, which for me has always had peculiar temptations. I venture to think that the greatest scientific problems of the future will find their solution in this border land, and even beyond; here, it seems to me, lie ultimate realities, subtle, far-reaching, wonderful.

William Crookes.

"Yet all these were, when no man did them know,
Yet have from wisest ages hidden beene;
And later times thinges more unknowne shall show.
Why then should witlesse man so much misweene,
That nothing is, but that which he hath seene?"

This passage is doubly interesting because it contains a reference, in the words "peculiar temptations," to an episode in his scientific career that his admirers would willingly forget—if he would let them—that is, his excursion into the realm of psychical research. But the discussion of the question of how so thoro and skilled a scientist should have become convinced of the reality of what appears to us the grossest and most incredible of the phenomena of modern spiritualism, that is, the materialization of the dead, must be postponed.

Lessons of the Panic

MANY signs of recovery from the shock of panic were to be seen last week. The premium on currency declined to one-half of 1 per cent. or even less. It became known that the banks of the country were in such condition that within a few days they could again make free and full payments of cash. In New York the bank reserve deficit was reduced. There was an increase of working time in some of the factories where the panic had caused a decrease. On the Stock Exchange there was a considerable advance in the prices of stocks and bonds. The Government's decision that not more than $25,000,000 of the new 3 per cent. notes should be issued was encouraging. General improvement had shown that much of the new circulation for which these notes were designed to be the basis would not be needed.

Predictions were made that soon the supply of currency would be abundant and possibly too large. Up to the end of the week there had been, since November 1st, an increase of nearly $45,000,000 in bank note circulation. If notes are to be issued upon all of the new Panama Canal bonds, as well as upon $25,000,000 of 3 per cents, the addition to the bank-note currency will, in the near future, exceed $100,000,000. If this amount should be issued and should prove to be too much, there is not, in our present laws, unfortunately, provision for automatic and speedy retirement of the new notes. At the beginning of the panic and thruout the course of it the need of legislation for emergency issues of taxed currency in time of stress has been clearly shown; it may be shown again, after the panic, by inability to retire promptly the additional circulation, if it shall no longer be required.

The Government has been sharply criticised for offering to borrow $100,000,000 from the people at 3 per cent., partly for the reason that the offer was made under a law which authorizes such borrowing only when the money is needed to meet public expenditures. Those who made the offer probably see the objections more clearly now than they did when the action was taken. As the Government did not need the money for its expenses (having a large surplus on hand), it seems to us that the issue was not authorized by the statute. There was danger that purchase of the notes by the banks would reduce reserves already too low, and the new circulating notes might come too late to be of service. The terms to the banks, as finally agreed upon, were such that a very comfortable profit was assured. Critics of the Administration have said that too large a profit was thus permitted. The original purpose was to draw out money that was being hoarded by the timid. In this respect the issue appears to have been unsuccessful.

On the whole, it was fortunate that improvement enabled the Government to cut down the issue to $25,000,000 or less. But the effect upon the public mind of the offer, when it was made and immediately afterward, and of the President's accompanying letter, was excellent. A powerful influence for the restoration of confidence was thus exerted.

It is possible now for the people and their representatives to consider calmly what the lessons of the panic are with respect to legislative and other action designed to prevent such disturbances hereafter or to mitigate their severity. We think, as we said some weeks ago, that the controlling officers of the banks in the New York Clearing House Association should undertake to keep national

banks and other banks of the city out of the hands of such men as those whom they ousted from offices and control just before the panic began. We expect to hear within a few weeks that a plan for permanently safeguarding the banks in this way has been adopted.

The trust companies should be required by law to carry a cash reserve of 25 per cent. against their demand deposits, and new regulations for their loans are needed. Undoubtedly Governor Hughes's commission will recommend at least a considerable increase of reserves.

Official examinations of trust companies and State banks in New York before the panic were not what they should have been. There is plenty of evidence on this point. The new superintendent should be heartily supported by the Legislature and the people in his efforts to do thoroly and effectively the work of his office.

Congress should give elasticity to the rigid volume of our national currency by providing for emergency issues of taxed notes. There is need in the autumn of every year, and especially in time of general fright and hoarding, of statutory provision for an automatic, speedy and safe temporary increase of the banknote circulation, an increase to be followed by an automatic retirement of the additional notes when the demand ceases. Germany and other countries have such methods in use; we have very unwisely declined to adopt them. Some time hereafter we may have a central bank of issue. Provision for one cannot be obtained in Congress now, and probably not for some years to come. But a bill for guarded emergency issues can be past this winter if all who know how much it is needed will work for it.

Several plans for emergency issues have recently been brought forward at Washington, in addition to the one proposed by the Bankers' Association and in last session's Fowler bill. Some would have such issues made upon the recommendation of special clearing-house associations, and secured by deposits of collateral. Others would legalize in some way the issues of existing clearing-house associations. It is also proposed that the banks issue emergency notes upon the security of deposited bonds of the savings bank class.

If the tax be made high enough to cause prompt retirement, the Bankers' Association's plan seems simplest and best. In this plan a cash reserve of 25 per cent. is required, the issue is limited to a certain proportion of the national bank's bond-secured circulation or capital, and the main security is the bank's assets. It is said that Mr. Roosevelt would have the notes taxed at 7 per cent., instead of $2\frac{1}{2}$ or 5. The tax should be high enough to compel retirement when normal conditions prevail, but not so high that it would prevent issue in time of severe stringency or incipient panic.

If the national banks had been empowered to issue such currency to the amount of only 15 per cent. of their capital, we could easily have had in the first days of this panic more than twice as much new circulation as has been obtained by tedious process and great effort, up to the present time, and more than the new Panama bonds and three per cents will eventually yield. The notes would have been perfectly safe, and in all probability they would have been retired within three months.

The Elder Statesmen

JAPAN has invented a new thing in government which has not received the attention it deserves. Japan is ruled in a purely constitutional manner, after the pattern of European States, with the Government responsible to the Parliament. There is nothing peculiar in all that. The Emperor is like King Edward or Kaiser William, and his Premier has much the position of the Premier in London or Berlin. So the parties in the Japanese Parliament are much like those that divide the German and British Parliaments. But Japan has, for the present, an institution, not formulated into its constitution, but adopted in practice, by which some three distinguished statesmen, who had part in the revolution which established the present constitution of the islands, are called into council in any special emergency or crisis, and their advice is of the greatest weight in deciding what the Government shall do. When the Government is backed by their

approval no one ventures to criticise or object. They are a sort of balance-wheel, like the governor in an engine, or like the safety-valve which protects against danger. It is a device which has been found of the greatest value for Japan.

Now is there anything like this that could be feasible and useful in a country like ours, where Washington and Jefferson and Adams and Hamilton, our elder statesmen, have past away long ago?

Our Government is by parties, and necessarily so. Congress, by its majority, represents one party, as does the Executive; only the Judiciary is unpartisan and uninfluenced by the changes of the popular will. By a revolution in our politics the "outs" become the "ins." There is a sudden change of policy. The President chooses an entirely new set of advisers more or less inexperienced. To avoid flagrant blunders the new Secretaries of Departments depend on elderly clerks in subordinate positions, who know routine and precedent, but are not likely to have any large view of statesmanship. The new President must depend on new advisers largely untried in their new positions.

And yet there are always a certain number of experienced men of both parties, or of no party, without political ambition, men of age and wisdom, who might give most valuable counsel if it were only feasible to ask it, just as in Japan Prince Ito and the Elder Statesmen are called to advise in cases of emergency. Almost always there are one or two ex-Presidents who have past the period of further office-seeking. Ex-President Cleveland has been President for eight years, and might well give advice even to a Republican President. There are always men of age who have served as Secretaries of State or of the Treasury or other Departments who possess much acquired wisdom. Still further, there are men in our universities who are recognized as having special knowledge and judgment in diplomatic or financial or sociological affairs who might well be made such advisers. Do we not remember that when an adviser was wanted for the finances of Santo Domingo the President sent a university professor for the task, and equally to study and advise in China and the Philippines?

Already in the case of a financial crisis we do in an irregular way something of this sort. The Secretary of the Treasury, who may have been lately transferred to his position from some other one which is occupied with an entirely different kind of administration, when, as lately, there is a serious panic, comes to New York and consults the wisest financiers, or they are invited to Washington to advise with him, and their advice is of the greatest value and the people accept it as such. They might be definitely selected as advisers, and equally it would be possible that the ablest and wisest experts in the theory of finance or diplomacy in the universities might be selected by their associates in these branches to be the recognized advisers of the Government in times of question or peril, just as such men are occasionally chosen in tariff and other commissions.

There is already in Great Britain the Privy Council, something like what is here suggested, the members of which receive a certain salary, and may be called on to give their advice to the Government, but we hear very little of their service. It is rather a provision for retired officials, and the salary seems to be largely the purpose of the system.

If we could have in this country such a body of Elder Statesmen, dissociated as in Japan from political activity, men whom the existing President might call on for advice and support, it might, one would think, do much to unify public opinion and make ineffective the noisy and senseless babble of virulent opponents of the Government. We remember that the statesmanlike support which Mr. Bryan and other Democrats gave to the treaty with Spain after the late war did much to strengthen the Government and solidify public opinion.

A Great Biblical Discovery in Egypt

One discovery follows fast on another. Now, on the very heels of the discovery of Menander, we have what looks much like the recovery of a lost chapter from the Book of Nehemiah. A few weeks ago Professor Breasted, writing from Berlin, mentioned in one of the Chicago University publications that some extraordinary papyri had been found by the

German excavators in Egypt which showed that the Jews had a temple there as well as in Jerusalem. Previously some Jewish business fragments had been found which showed that the Jews in Egypt in Jeremiah's time worshiped Jehovah under the name of Yahu. But M. Clermont-Ganneau has given *Le Temps* an account of this new discovery, and the translation made by the German scholar Dr. Sachau. The document is a copy of a petition sent by the Jews of Elephantinê, an island in the Nile, to the Persian Governor Bagohi (Bagoas of Josephus), in the seventeenth year of Darius, telling how, when Egypt was conquered by Cambyses, their Jewish temple was spared while the Egyptian temples were destroyed. But during the absence of the Satrap of Egypt the worshipers of the god Khnum had persuaded the local Governor to give orders to have their temple destroyed, and during the three years since they had been in deep mourning. They had appealed in vain for help to the Jewish high priest Jehohanan, and had written to the sons of Sanballat at Samaria, and now they begged Bagohi to allow them to rebuild their temple, in which case they would be able to burn incense there and would pray for him and send him a thousand talents of silver. This petition was granted. The special interest of this document lies in the fact that it shows that in Egypt, as well as in Jerusalem, the Jews had their temple and performed ritual services. Also Sanballat and Jehohanan are both Bible characters. Sanballat was the enemy of the Jews under Nehemiah, and Jehohanan is mentioned in Ezra 10:6 and Neh. 12:23; while this seems to be the same Jehohanan who, according to Josephus, murdered his brother Jeshua.

We are able to give our readers an English translation of this remarkable letter, for which we are indebted to Professor Driver, in the London *Guardian*. Thus we have it accredited by three of the very best Oriental scholars of Germany, France and England—Professor Sachau, M. Clermont-Ganneau and Professor Driver. It is as follows:

"To our lord Bagohi, Governor of Judah, thy servants, Yedoniah and his companions, the priests, in the fortress Yeb [Elephantinê]:

"May our Lord, the God of Heaven, grant thee peace abundantly, at all times, and give thee favor in the eyes of King Darius, and the sons of his house, a thousand-fold more than now, and give thee long life! Mayest thou be happy and in good health at all times!

"Now thy servants, Yedoniah and his companions, speak thus: In the month of Tammuz [July] in the 14th year of King Darius [411 B. C.], when Arsam [the Persian Governor in Egypt] had departed and gone to the King, the priests of the god Chnub in the fortress Yeb gave money and goods to Waidrang, who was chief in command here, saying:

"'The Temple of the God Yahu [Jehovah] in the fortress Yeb shall be removed thence.'

"Thereupon this Waidrang sent letters to his son Nephayan, who was commander of the garrison in the fortress Syene, saying:

"'The Temple in the fortress Yeb is to be destroyed.'

"Thereupon Nephayan led out the Egyptians with other forces: They came to the fortress Yeb with their . . . they entered into the Temple, and destroyed it to the ground, and broke in pieces the pillars of stone that were there. The seven great gates also, built of hewn stone, that were in the Temple, they destroyed, and their tops they . . . ; and the bronze hinges of the doors, and the roof which was wholly of cedar wood, together with the stucco (?) of the wall and other things that were there, all this they burnt with fire. And the bowls of gold and silver, and whatever was in the Temple, they took and appropriated to themselves. And already in the days of the kings of Egypt had our fathers built this Temple in the fortress Yeb. And when Cambyses [B. C. 529-522] entered Egypt he found this Temple built; and tho the temples of the gods of Egypt were then all overthrown, no one injured anything in this Temple. And since they have done this, we, with with our wives and children, have put on sackcloth and fasted and prayed to Yahu, the Lord of Heaven, who gave us knowledge of [*i. e.*, punished] this Waidrang. The chain [of office?] was removed from his feet, and all the goods which he had acquired perished, and all the men who wished evil against this Temple were slain and we have seen our desire upon them.

"Also before this, at the time when this evil was done to us, we sent a letter to our lord Bagohi, and to Jehohanan, the high priest, and his companions the priests in Jerusalem, and to Ostan, his brother, who is Anani, and the nobles of the Jews, but they sent us no answer.

"Also from the Tammuz day of the 14th year of King Darius to this day we have put on sackcloth and fasted; our wives are become like widows; we have not anointed ourselves with oil or drunk wine; neither from that day to this day of the 17th year of King Darius [408 B. C.] have meal-offerings, frankincense, or burnt-offerings been offered in this Temple Now, therefore, thy servants, Yedoniah and his companions, and the Jews, all the citizens of Yeb, say thus: If it seem good to our lord, think upon this Temple that it may be built, because we are not permitted to build it: look

upon the recipients of thy goodness and of thy mercy who are here in Egypt. May a letter be sent from thee to them concerning the Temple of the God Yahu that it may be built in the fortress Yeb, as it was built in former times. And we will offer meal-offerings and frankincense and burnt-offerings upon the altar of the God Yahu in thy name. And we will pray for thee at all times, we and our wives and our children, and all the Jews who are here, if thou doest thus, until the Temple is built. And thou shalt have a portion before Yahu, the God of Heaven, from every one who offers to him burnt-offering and sacrifices, in value equivalent to . . . . And so concerning the gold, concerning that we have sent we made known. We have also sent the matters in a letter in our name to Delaiah and Shelemiah, the sons of Sanballat, the Governor of Samaria. Arsam also has no knowledge of all this that has been done to us.

"The 20th of Marcheshvan [November], in the 17th year of King Darius."

What is of very great interest in this almost biblical record is the fact that a splendid temple of Jehovah was in existence in Upper Egypt shortly after the time of Jeremiah; that sacrifices were offered there as at Jerusalem, notwithstanding the prohibition, and that the name of Jehovah was in free use under the pronunciation Yahu.

There is now no reason why we may not hope to find in Egypt copies of the old Hebrew Scriptures antedating the revision of the text which took place in the first century of our era. That would be a discovery indeed.

The Pocket Handkerchief

One of the great philosophers of our time makes the statement that "the education of a nation can be judged by the length of its words in common use." The expanded meaning of this is that a word in frequent use is subject to a vocal attrition which gradually softens, impairs and eliminates such of its syllables or parts as are not strictly essential to the conveyance of its full meaning, and the final product—pruned, purged and condensed—stands in its curt significance both as the symbol of the thought or thing intended, and as evidence of the innumerable repetitions which gradually abraded the word to its reduced dimension.

Our language abounds with striking illustrations of this law of abridgment. For instance — Monseigneur, Monsieur (Signor, Señor, Senhor), Sieur, Sire, Sir. Again, the old English word "dow" means to thrive, to prosper; hence a *dow*ry to a bride, and en*dow*ment of a person or institution. Thus, How do you *dow?* means How do you prosper? or How do you thrive? but the law of phonetic decay has shortened our much used salutation to "How do you do," while in Kentucky and our great Southwest the economic abbreviation has progressed to "Howdy."

But perhaps one of the richest phrase-words in English is the rather ponderous, but self-definitory and wholly direct word, "handkerchief." In it we have an agglutination of monosyllabic words, each standing in trim completeness for a definite and distinct use; and in the order of their prefixing can be read the layered, encysted history of a nation's transient customs. First in order we have "chief," from *chef,* the head; then "ker," which is a variant of "cur," from *couvre,* a cover. Just as *couvre-feu,* cover fire, exists to us as curfew, so *couvre-chef,* head cover, abides with us as kerchief and is eloquent of a time when the sheep-herd, the swine-herd, the cow-herd, the hind, and all that great mass of a nation who are known as "hands," went about their hewing of wood and drawing of water with a kerchief, or square of cloth, bound round their heads, both as a protection against the weather and as a sumptuary badge of their serfdom and low condition.

The hat was worn only by persons entitled to distinction and in token of their authority, and even to date of this current year of grace we are not wholly emancipate from the glamor of the hat, for do we not still accept the king's crown, the cardinal's hat, and the "strike-oil plug" of the successful miner as appropriate tokens of the high estate and condition of their owners? Our cousins across the water still describe a worthless or objectionable man as "a shocking bad hat," and that the personality of the individual was typified by his hat is easily read in the phrase "hats in the ring," which meant a hat owner's protest against alleged unfairness in a ring fight, and his personal gage of battle for the redemption of his token and the enforcement of his claim. The

hat once represented an individual much as a flag now represents a nation, and any abasement or insult to the hat was a "fighting insult" to the person concerned and to his following, hence the meaning of the verse:

"There is brass on my target of barkened bulls hide,
There is steel in the scabbard that swings by my side,
And the brass shall be burnished, the steel shall flash free,
'Ere *low lies the bonnet* o' Bonnie Dundee."

We have no sumptuary laws in this country, but we have an instinctive sense of fitness and propriety in regard to head covering, a sense that has come down to us through a long inheritance, and its working efficiency is easily tested. Which would shock us the most, to see the Mayor of the City of New York attending to his official duties while wearing a cloth cap, or to see a City Hall bootblack performing the functions of his art while wearing a silk hat? Well, the drastic rules of hat distinction disappeared with the cheapening of the article, and—save for the sailor of melodrama, the "bandana" of a field hand on a West Indies plantation, and a few of the more remote peasantry of Central Europe—the kerchief as a head covering has dropped to the dump of forgotten things.

The next phase in its evolution is the handkerchief, or the hand-carried-head-cover, and is significant of a more refined age when it was part of a gentleman's training to carry and use this article of dress with grace and distinction. From the flicking of dust specks from his buckled shoes and the snuff grains from his lace and ruffles; from its correct disposal on the crook of his disengaged forearm while doffing the hat (just as the competent waiter carries a napkin when serving a dish), or the dispersal of a too pertinacious, or imaginary, fly, to the proper cleansing of the nose and mouth—all were parts in that careful training which made up the now obsolete art of "deportment."

But knee-breeches died out at the dawn of republican institutions, and with our increased number of pockets and a larger need for unhampered hands in the affairs of life it became the pocket-handkerchief, or the pocket-carried-hand-used-head-cover. The transitional uses of this necessary article of dress leaves two things to mourn. First, Why do so many seemingly "desirable citizens" persist in thrusting the handkerchief into the germ-incubating, hot and inaccessible hip pocket, when each and every man of them is provided with an obvious breast pocket in his coat, in addition to, at least, a couple more outside pockets in that garment? It may be that this crudity is a survival of the farm-land habits of the person or his immediate ancestor, when the coat was an omitted article of work-day attire and the hip pocket of the "one-suspender" jeans was the most used receptacle, because it was least in the way and the easiest to reach from between the plow handles or the seat of a harrow. But whether this suggested explanation be true or not, the fact remains that the practice in point is a perpetuation of the uncouth habits of the kerchief class of a bygone time, and marks the civilization of the individual as somewhat less than that of his sartorial equipment. The second theme of mourning is much graver than the first, and the car companies and others who post board of health notices, legal excerpts and prohibitions in conspicuous places are themselves very greatly to blame for the non-observance of these ordinances. It does not seem to have occurred to those responsible for this literature that the only people this prohibition concerns are our peasants of the kerchief class and period, whose claim to civilization is largely made up of their right to vote and the delusive veneer of their tailor-made clothing. The people of this class are honestly ignorant of the full and proper use of their upholstery, and of the consistently cleanly handling of their persons; to them the prohibition and the threatened penalties are alike absurd, vexatious and an attempted infraction of their individual rights.

The plight of the man who was told that his accustomed practice was forbidden "on the floor," and who inquired, "Well, where shall I do it, on the ceiling?" is quite intelligible. No one had enlightened him to the civilized use of the most civilized article of dress, and his grievance was a very real one. The place to begin this elementary, but supremely important, instruction is the public

school; but in the meantime, for the sake of the public health and the alleviation of a national nuisance, let the street commissioners, the passenger transportation companies and all others concerned replace or supplement their present mandatory signs by a little tabloid education for backward adults. The paragraph need not be long, but should be visible to all, and in certain districts it ought to appear in two or more languages—"Do not spit at all, but, if you must, then use your handkerchief."

The Chronoscope and Crime

THE apparatus and system described by Prof. Hugo Munsterberg, in *McClure's Magazine*, is a merciful substitute for the kind of police inquisition known as the "third degree," but the chronoscope, which measures the time required to effect and express association of ideas, seems to be essentially defective in lacking some sort of automatic governor sufficiently sensitive to allow for the normal habit of thought and the effect of nervous strain in a person under examination.

Expressed in the simplest form, Professor Munsterberg's device records the time it takes the subject to match, by association of ideas, a word thrown at him, so to speak. For example, after being instructed that he is to reply as promptly as possible by saying what is suggested by association of ideas, the operator offers some such commonplace noun as "dog." The subject is supposed to reply what first comes to him by association—say, terrier, hound, setter, hunt, bark or any other word expressing a subordinated or co-ordinated idea which dog suggests.

The examination might then run along thru such words as house, horse, coat, table, bed, carpet, handkerchief, but judiciously interspersed are words which have some actual or possible bearing upon the offense or crime suspected, or the consequences thereof—such as blood, thief, forgery, burglar, arrest, trial, jail, death, and so on. The time required for each answer is accurately measured and recorded. If on comparison it is found that the answers to words wholly irrelevant to the real object of the examination are made at a rate averaging, say, 1.6 second, and those which suggest it require, say, an average of two or more seconds, or are not answered at all, this is deemed significant as showing that they have started lines of thought as to how the answer should be framed to avoid incriminating admissions.

For illustration, if an average of less than one second is needed to effect such associations as river-water, ox-yoke, tobacco-pipe, and two or three times as long to do this in the case of such words as confession, jury, death, pardon, blood, jail, conviction and the names of persons or places supposed to be associated with the crime under investigation, the conclusion would be indicated that the subject was trying to frame answers which would be misleading and this would be accepted as pointing to the consciousness of guilt. On the other hand, if the subject's normal habit of thought was sluggish and he needed an average of two seconds or more to make the river-water, tobacco-pipe or kindred combinations, but made instant and more or less relevant combinations with blood, jail, confession, etc., it would show that he was on the alert to avoid any appearance of hesitation. Thus the chronoscope would seem to catch him, "coming or going."

This is very ingenious, and in the hands of a careful and conscientious experimenter like Professor Munsterberg, might point to significant conclusions, especially if he had a definite and reasonably plausible theory of guilt or innocence to work upon; but it is difficult to resist the conclusion that if tested upon a normal person not under suspicion, it might give results as interesting and surprising as when substituted for the "third degree." A great deal depends upon the mental habits of the subject, and really very little upon guilt or innocence. Allowance must also be made for "the nerves," which play so important a part in all psychological phenomena.

There is a parlor game called "Beasts, Birds and Fishes," formerly and perhaps still a good deal played by young people, which shows how difficult it is to predict how the mind will act when confronted by an insistent question which must be answered instantly and correctly. Asso-

ciation of ideas is the secret of this little game, just as it is in Professor Munsterberg's system. But that such association is sometimes tardily effected is seen when a person not expecting to be called upon has the cane pointed at him, and must name a beast, a bird or a fish, as required, while the inquisitor is counting ten as rapidly as possible. The more intelligent and thoughtful a person chosen for this experiment, the more easily may he be caught.

If two of Professor Munsterberg's colleagues in the Harvard faculty were put to the test for facility of association of ideas, by chronoscope measurement, the probabilities are that they would show that the normal mind acts more quickly in the conception of subordinated or co-ordinated ideas when the common nouns of daily use are employed, such as dog, cat, river, bread, etc., than if those inducing a wider range of thought, such as thief, guilt, jail, death, blood, defalcation, etc., are used. Such words do not readily suggest their own analogies or antitheses, and it is quite probable that to two subjects of test they would appeal very differently.

For example, a professor of physiology might hesitate at crime, jail, guilt and the like, but instantly make the blood-hemaglobin, death-life combination. On the other hand, a professor of literature who had read much romance might readily and rapidly make combinations by association of ideas with crime, jail, guilt, trial, sentence and like words, but needs to think much longer over words suggesting wounds, blood, death, etc.

This would not mean in his case that he was delaying his answer to avoid self-incrimination; neither would it necessarily mean this in the case of a suspect. In any person selected for test it will be found that some classes of words suggest association of ideas more readily than other classes. Possible errors from this cause may be corrected out if enough is known of the mental habits of the subject, but to do this demands a great deal more knowledge than the chronoscope is capable of supplying. Given this knowledge—and it is not easy to discover that the chronoscope can usefully increase it—all that resulted from the application of this device to Henry Orchard, the self-confessed perpetrator of many murders, was the conclusion that he believed his own confessions, not all of which are accepted by others.

To the layman it would look as if a more valuable instrument in crime detection than the chronoscope was the highly sensitive miniature instrument invented some years ago, but since forgotten, which read and recorded the effect upon the nerves, respiration, circulation and temperature of a suspect, of an examination in which the discussion of indifferent subjects was suddenly varied by the interjection of pointed references to the details of the crime charged, or leading questions equally dangerous to answer or leave unanswered. Perhaps Orchard might be immune even to such a test; but the normal man would not be. However, the conclusion would seem to be warranted that, at best, mechanical aids in crime detection are but short cuts to dangerous generalizations, and that for what value they develop we must look rather to the operator than to the instrument.

Meanwhile, the practical police conclusion that the only evidence of crime which is really convincing is circumstantial, comes nearer the truth than science is likely to get.

Sulfites in Food

Dr. Wiley's squad of Washington clerks who have been devoting their stomachs to the cause of science by living on food even more strongly adulterated than that falling to the lot of ordinary mortals, have completed their experiments with the use of sulfites. The question is one of great importance, for sulfurous acid or some of its salts, the sulfites, are more commonly used in food products than any similar substance, because it acts both as a preservative and a bleaching agent. The popular demand, or supposed popular demand, for evaporated apples of a deathly pallor, blondined peaches and syrups like molten gold has caused manufacturers to subject them to the fumes of burning sulfur. The same ingredient is also to be found frequently in wine, beer and some canned fruits and vegetables, thru having been introduced as a preservative or accidently in the cleaning of the receptacles. The

twelve young men in Washington who were fed on sulfites for twenty days were found to have suffered in health from the *régime,* and the conclusion is that their use in any form in food products is objectionable. Headache and indigestion were complained of, but the most serious symptoms were the impoverishment of the blood in the number and activity of the white and red corpuscles and the incipient albuminuria and other evidences of overworking of the kidneys which might lead to chronic disease of that organ. These experiments are the most careful and weighty that we have on the question, altho they are not entirely conclusive as to deleterious effects of more minute quantities than were here used. It is an unwarranted assumption that the difference in the effect of large and small doses of a drug is one of degree, not of kind. On the contrary, in physiological experiments on both animals and plants it is often observed that a minute amount of a drug produces the opposite reaction from that of a larger quantity. Nevertheless, according to our present knowledge the use of sulfites in food is to be condemned, since there is no evidence at all that they are beneficial to the human system even in traces.

President Wilson on Education

In President Woodrow Wilson's address last week before an Association of Colleges and Preparatory Schools there were not a few truths expressed in a fresh, epigrammatic way, of which we may mention one or two. He said:

"Don't teach your pupils English except by the indirect method of example. The only way to learn a language is to love it and use it. Pedagogically you cannot impart appreciation for the song of a bird, the glory of a landscape or the subtle shade of an idiom."

He is right. Of course one must know grammar, but that has nothing to do with literature. The good taste comes from much reading of good books, and much talking with intelligent men. Reading manuals of literature helps nothing. One must read and love, and love and read, and he will learn by absorption. Equally was President Wilson right in his distinction between liberal and technical education:

"The great body of our young people must be made mechanics, either of the hand or mind. They must be trained, that is, to a skilled capacity for accomplishing certain definite and narrow tasks. A technical education prepares one to be an artisan of the mind. . . . This age needs men of liberal education more than minds trained to technical pursuits."

It needs both. It needs many technicians, but it needs not a few men of broad education. He well says:

"If ever an age stood in sore need of those who see the invisible this does; if ever an age needed statesmanship of the mind, this age needs it. Let there be an army of workers with their gaze concentrated on their own little tasks, with no one to dream dreams for them, none to see visions, no generals of the mind to organize our great combinations of effort, and it will not be long before we stumble upon disaster. I don't mean to tell you that information is not a part of education, but I do say that brute information—mere gross bodies of fact—does not educate. Information, so far from accelerating the powers of the mind, may even clog them; unless it disciplines it impedes."

Gambling for Offices

We had a striking example last week of the extremity to which the President and the country are driven by the policy which distributes offices among political leaders. It is a rule with the President to assign offices in accordance with the will of the two Senators of a State. To be sure, offices were never created to benefit the Senators or the President, but solely to benefit the people; but President Roosevelt is "no slouch" of a politician, and he thinks the best way to find the best man for an office is to ask and follow the advice of the Senators of the State where the officer is to serve, that is, if they are Republicans. This oils the machine and helps the hold of the Senators on the party, and, incidentally, gives the President the support of those whom he has thus favored. But there are times when the plan will not work. In South Dakota the two Republican Senators are not on speaking terms, and would not agree as to the men to whom they should direct the President to give the offices. So the President called them and required them to cast lots and toss a coin to settle who should have the first choice, and thus he gave certain offices to one and the rest to the other Senator. Now, if the President is not under obligation to find the most competent man, but is only the personating puppet of those who appoint to please themselves, it makes no difference to him, in a case like that of South Dakota, to

which of the two Senators he shall assign the offices, and he can do no better than to settle their differences by lot. It is a discreditably absurd way to make appointments, but the absurdity lies back of of the coin and rests in the accepted political theory. We believe that Commissioner Leupp happened to be present, and he was doubtless much interested to have Indian agents appointed who would work for the interests of the Indians and not for the interests of the Senators, but how could the President ask his advice when this is politics, not good government, that is carried on? Let the Indians suffer, let the citizens suffer, but let the Senators strengthen their machine.

Bryan's Platform

While Mr. Bryan, in his proclamation of himself as a willing candidate for the Presidency, did not at all formulate the policies on which he would desire to stand, and did not tell us what the Democratic platform would be, or should be, he has in a way rectified that omission in an address before the District of Columbia Democrats. But he did it, not *à la* Bryan, but *à la* Roosevelt. He recounted the Democratic principles for which President Roosevelt stands, and then those for which he does not stand, or has not announced himself. By putting them together one can make out what is the platform on which, at present, he would have his party stand. Indeed in his proclamation of candidacy he declared that they must put forth a platform that will please him or he would not be a candidate; it must be progressive. The following are the Democratic doctrines which he credits to the President: Railroad regulation, the enforcement of law against trusts, the income tax, and arbitration of labor disputes. The Democratic doctrines which the President has, he says, not yet advocated are: Tariff reform, the election of Senators by direct vote of the people, the promise of ultimate independence to the Filipinos, and the suppression of government by injunction. Here are eight planks for a Democratic platform, of which four seem to be equally Republican.

Senator Daniel, of Virginia, met Mr. Bryan the other day in Washington and personally accused him of trying to dictate to the Democratic party. But why should not any leader try to use his utmost influence to control, or, if you choose the word, dictate to his party? It is to Mr. Bryan's credit that he chooses to lead, not to follow. Mr. Bryan lacks humor, or he would not make a serious defense of the donkey as the emblem of the Democratic party. The donkey, he tells us, is the people's servant, while the elephant is the show beast of kings. True, but he did not add that the donkey is proverbially stupid and can carry but a small load, while the elephant is the most intelligent of animals and carries the heaviest burdens.

And now Senator Foraker definitely puts himself forward as a candidate for the Presidency. It does not approve itself to us, much as we admire the independence of Senator Foraker. He knows he stands no chance to be nominated, and the only effect of his putting himself in the field is to divide the Ohio delegation and prevent the nomination of Secretary Taft. He may succeed, but it is no generous act, and will not redound to the honor of his State. In his letter he distinctly declares himself against any revision of the Dingley tariff.

Four years ago Governor Vardaman vetoed the appropriation for the support of the Alabama Industrial and Mechanical School for Negroes, at Holly Springs, on the ground that education makes negroes less easy to handle, thus killing the school. It has just been revived by the contribution of $100,000 mostly given by white people living within the State. Thus they rebuke their Governor.

The *New York Tribune* gives photographs of 103 new members of Congress. Of these four only wear the full beard, one each from Pennsylvania, West Virginia and Oregon, and a delegate from Alaska; 34 wear only a moustache, and 59 are close-shaven. Evidently the beard has gone out of fashion.

Secretary Metcalf asks of Congress a big sum for the Navy, for it includes $69,270,000 for new ships. We doubt if Congress will think it necessary that we should be in such feverish haste to secure and keep the second greatest navy in the world.

Financial

Farm Wealth

At about this time every year the attention of our people is directed to reports showing the enormous value of the agricultural products of the United States. It is fitting that trustworthy statements which point out the great and growing agricultural wealth of the country should be available when financial panic and signs of depression have led some to forget how strong the foundations of our industrial and commercial fabric are. A correspondent in the West, writing about the prosperity prevailing in the corn belt, reminds us that the farmers of Illinois, Iowa and the southern counties of Minnesota have produced this year and will sell within the next two or three months $1,000,000,000 worth of grain, cattle, poultry, etc., and that their farm lands are worth $4,500,000,000. He points out that the tendency in that region is to cut up large tracts into small farms, upon which large profits are obtained by careful cultivation in accord with the latest and most approved agricultural practice. Development has been stimulated by such commendable projects as the recent and successful Corn Exposition in Chicago, and by a network of interurban trolley lines.

Secretary Wilson's annual report, published last Saturday, covers the whole field. He shows that the value of our farm products this year is the enormous sum of $7,412,000,000. This exceeds last year's total by 10 per cent., and the value in 1899 by 57 per cent. It is noticeable that in nearly all cases the present farm value of a crop is much higher than the value last year, altho the crops are not quite so large. Thus, the cereals fall 214,000,000 bushels, or 5 per cent., below the five years' average, but the value exceeds the average by $296,000,000, or 23 per cent. In the case of barley, an increase of 2 per cent. in size is accompanied by one of 85 per cent. in value. The year's dairy products are worth nearly $800,000,000, and more than $600,000,000 is the value of the year's poultry and eggs. Here an increase of from 40 to 60 per cent. in farm prices since 1899 is noted. Exports of farm products in the last fiscal year were $1,055,000,000, cotton alone accounting for $482,000,000. Among the achievements of the Department has been the introduction of durum wheat. Experiments were first made from 1899 to 1902. This year the durum crop is 30,000,000 bushels, grown upon 3,000,000 acres of semi-arid land, a large part of which had been almost worthless for other agricultural purposes.

The Knickerbocker Trust Company

The question of the resumption of business by the Knickerbocker Trust Company is not only of interest to the seventeen thousand depositors in that company and its stockholders, but it is of importance to the whole community. No trust company has ever been more widely advertised. Its imposing building, at the corner of Thirty-fourth street and Fifth avenue, and its three branches, at No. 66 Broadway, 125th street and Lenox avenue, and 148th street and Third avenue, offered banking facilities to every section of the city, and its solicitors had obtained the accounts of hundreds of out-of-town banks and financial institutions.

When it was forced to suspend payment on October 22d, owing to unprecedented conditions which suddenly confronted the financial world a few days prior to that date, it had paid out over eight millions of dollars before its cash resources were exhausted. Upwards of forty-eight millions of deposits were locked up by the suspension.

Every one interested in the financial honor of the city desires to see the company open its doors again. Various depositors' committees have been formed and plan after plan has been put forth to enable the company to resume, but none of the plans formulated prior to the one issued by the Committee of Depositors of which Hinsdill Parsons, first vice-president of the General Electric Co., is chairman, and Herbert L. Satterlee is counsel, has met with enough encourage-

ment to warrant hope of resumption. The effort of this committee has been to form a plan which would enable the company to re-open on its general credit, thru the forbearance of its depositors and the raising of $2,400,000 by its stockholders. The committee state that this assessment of $200 a share on the stock, together with the money coming in to the receivers during the month of December, will place the company in a position at the beginning of the new year to meet the checks of all those depositors who are "preferred" by law; that is, savings banks and estates of which the trust company is executor or administrator by order of the court.

It will also be possible for all the other depositors to receive negotiable certificates of deposit for 70 per cent. of their claims, 10 per cent. of which will be immediately subject to check and the remainder will be paid at the rate of 5 per cent. every ninety days until the certificates (which draw 3 per cent. interest) have been retired. If the rate of interest allowed by trust companies generally should fall below this rate, the depositors will profit to that extent, and the average time of the payment to them of 70 per cent. of their claims will be seventeen months. The remaining 30 per cent. will be represented by "surplus certificates" drawing 4 per cent. interest, payable semi-annually on July 1st and January 1st, out of the net earnings of the company, and cumulative; the principal to be paid only out of the net earnings and so much of the surplus as may exceed $10,000,000. These certificates, issued to depositors, will be called series "A," and stockholders who subscribe to the fund of $2,400,000 will receive similar certificates of the series "B," payable only after the depositors have been entirely paid.

Until the depositors have been paid off, the stock of the company is to be placed in a voting trust; a majority of the voting trustees to be representative of the depositors who assent to the plan, and the board of directors of the trust company to be acceptable to at least two-thirds of the voting trustees. No dividends will be paid on the stock until the depositors have all been paid. This plan has received general comments of approval, owing to its directness, and it is claimed that it will result in a better return to the depositors than a permanent receivership or any form of liquidation, which must necessarily sacrifice the assets and absolutely destroy the good will and earning power of the company.

....According to the report of the Geological Survey, issued a few days ago, the value of the mineral products of the United States in 1906 was $1,902,506,206, against $1,623,928,720 in 1905.

....Edward T. Perine, who has practically been connected with the Audit Company of New York since its organization in 1897, has recently been made president. He was formerly general manager and treasurer of the company.

....It is reported that very extensive deposits of iron ore have been found near the surface in Gloucester County, New Brunswick, directly south of the Bay of Chaleur. They can be mined at small cost and the depth of them is said to be 300 feet.

....The First National Bank of Ridgewood, N. J., in honor of its eighth anniversary, has issued one of the most comprehensive surveys in little of the general subject of banking. The book is well printed and intelligently written. It contains portraits of the principal officers. The compilation was made by Lucius F. Spencer, cashier of the bank.

....Hugh Kelly was last week elected president of the Oriental Bank in place of Richard W. Jones, Jr., resigned. Mr. Kelly was born in Chicago in 1858 and is president of Hugh Kelly & Co., commission merchants of this city. He is also president of the Central Ansonia Sugar Company, a director of the Occitania Sugar Company, the Chaparra Sugar Company, the Nipe Bay Company and the United Fruit Company, and he is a trustee of the Emigrant Industrial Savings Bank. Nelson G. Ayres, the first vice-president, has been connected with the Oriental for more than thirty years, and Charles J. Day, a vice-president for five years, was connected with the Broadway National Bank for thirty-eight years. The Oriental was established in 1853 and has a capital of $750,000 and a surplus of $1,200,000.

Insurance

Taxing Life Insurance Premiums

In his address before the eighteenth session of the Transmississippi Commercial Congress at Muskogee, Okla., Darwin P. Kingsley, president of the New York Life Insurance Company, pointed out the absurdity of taxing the premiums paid by life insurance policyholders. These taxes now range in the several States from a fraction of 1 per cent. in one or two States up to more than 3½ per cent. in one State. These premiums are in themselves a self-imposed tax inspired by thrift, whereby the payment of a lump sum is the subject of contract between the policyholder and the insuring company based upon the law of averages and contingent upon death or the expiration of a term. Taxing such premiums can only tend more or less toward inprovidence, as the logical conclusion of the man who is taxed because he wishes to prevent his dependents from becoming public charges must be to let his dependents become public charges and so escape taxation. The State exempts school property and church property from taxation, because the consensus of opinion has been that the Church and the school were beneficial to the State. It is difficult to perceive wherein life insurance is not also a benefit to the State, and The Independent agrees with Mr. Kingsley that in taxing life insurance while the others are exempt there is a great inconsistency somewhere.

The Mutual Life Insurance Company Withdraws From Wisconsin

The Wisconsin laws affecting insurance companies that were past by the last Legislature have been considered as a menace ever since enactment. Efforts made to have these laws officially defined and the State's policy regarding the enforcement of statutes that some persons have been wicked enough to say were not understood either by the legislators who past them or by the executive who approved them have all failed. One consequence of the resulting situation was made clear last week when the Wisconsin agents of the Mutual Life Insurance Company were instructed to write no new policies in that State after December 31st. Policies now alive will remain so. They represent an aggregation of $28,112,981, according to the most recent report of the Commissioner of Insurance. The Mutual Life is the first of the giants to take action that takes the company out of Wisconsin. What the other insurance companies will do is not yet announced.

Appointments as lecturers made by Yale College in the university's insurance course, just announced, include the following experts in this field, viz.: John B. Lunger, vice-president of the Travelers' Insurance Company; John M. Holcomb, president of the Phœnix Mutual Life Insurance Company, and Richard Bissell, vice-president of the Hartford Fire Insurance Company. Edward K. Root was also appointed lecturer on life insurance examinations in the Medical School.

A fireboat has been recommended for Tacoma, Wash. In his estimate for next year's budget the fire chief of that city has included $125,000 for a brick station and an oil-burner boat with a steel hull. Extras of $500 for furnishings, $50 for helmets, $250 for indicator and gong, and $2,000 for a wharf and berth for the boat have also been included. The Tacoma tug fully equipped would be on a scale very much like the Washington, D. C., fireboat. It will require an operating crew of eleven men, whose combined salaries would entail an appropriation of $1,015 per month. The boat's capacity, according to specification, would be 6,000 gallons per minute, and working to full capacity would throw a dozen streams. The boat would draw about seven feet of water.

The Independent

VOL. LXIII NEW YORK, THURSDAY, DECEMBER 12, 1907 No. 3080

Entered at the New York Post Office as second-class mail matter.

Survey of the World

The President's Message

The message sent to Congress by President Roosevelt on the 3d is a very long one. Our summary will include the leading recommendations of it. At the beginning there is a passage suggested by the financial disturbance of the last few weeks. No other nation, the President says, has greater resources than ours; the citizens of no other nation possess greater energy and industrial ability:

"In no nation are the fundamental business conditions sounder than in ours at this very moment; and it is foolish, when such is the case, for people to hoard money instead of keeping it in sound banks; for it is such hoarding that is the immediate occasion of money stringency. Moreover, as a rule, the business of our people is conducted with honesty and probity, and this applies alike to farms and factories, to railroads and banks, to all our legitimate commercial enterprises. In any large body of men, however, there are certain to be some who are dishonest, and if the conditions are such that these men prosper or commit their misdeeds with impunity, their example is a very evil thing for the community. Where these men are business men of great sagacity and of temperament both unscrupulous and reckless, and where the conditions are such that they act without supervision or control and at first without effective check from public opinion, they delude many innocent people into making investments or embarking in kinds of business that are really unsound. When the misdeeds of these successfully dishonest men are discovered, suffering comes not only upon them, but upon the innocent men whom they have misled. It is a painful awakening, whenever it occurs; and, naturally, when it does occur those who suffer are apt to forget that the longer it was deferred the more painful it would be. In the effort to punish the guilty it is both wise and proper to endeaver so far as possible to minimize the distress of those who have been misled by the guilty. Yet it is not possible to refrain because of such distress from striving to put an end to the misdeeds that are the ultimate causes of the suffering, and, as a means to this end, where possible, to punish those responsible for them. There may be honest differences of opinion as to many Governmental policies; but surely there can be no such differences as to the need of unflinching perseverance in the war against successful dishonesty."

Turning then to the supervision and regulation of corporations engaged in interstate commerce, he quotes several hundred words from his message of two years ago, in which the need of such supervision and regulation was pointed out, together with the futility and unwisdom of attempting to prohibit all restraint upon competition. He now says that "almost all big business concerns are engaged in interstate commerce." It cannot be regulated effectively by any State. "Only the National Government can in thorogoing fashion exercise the needed control":

"This does not mean that there should be any extension of Federal authority, for such authority already exists under the Constitution in amplest and most far-reaching form; but it does mean that there should be an extension of Federal activity. This is not advocating centralization. It is merely looking facts in the face, and realizing that centralization in business has already come and cannot be avoided or undone, and that the public at large can only protect itself from certain evil effects of the business centralization of providing better methods for the exercise of control through the authority already centralized in the National Government by the Constitution itself. The most vital need is in connection with the railroads. As to these, in my judgment, there should now be either a national incorporation act or a law licensing railway companies to engage in interstate commerce upon certain conditions. The law should be so framed as to give to the Interstate Commerce Commission power to pass upon the future issues of securities, while ample means

should be provided to enable the Commission, whenever in its judgment it is necessary, to make a physical valuation of any railroad. As I stated in my message to the Congress a year ago, railroads should be given power to enter into agreements, subject to these agreements being made public in minute detail and to the consent of the Interstate Commerce Commission being first obtained."

The railroads and all other great corporations, he continues, will do well to recognize that this control must come. Taking up the subject of trust legislation, he remarks that modern industrial conditions are such that combination is not only necessary, but inevitable, both in the world of business and in the world of labor. Corporations and labor unions should be heartily encouraged so long as they are properly managed. "It is profoundly immoral to put or keep on the statute books a law nominally in the interest of public morality that really puts a premium upon public immorality, by undertaking to forbid honest men from doing what must be done under modern business conditions, so that the law itself provides that its own infraction must be the condition precedent upon business success." He quotes from his message of one year ago what he then said about the Sherman anti-trust law, and the need of traffic agreements among railroad companies; also from one of his recent speeches his remarks upon the same subject and his references to the railway investigations. The Sherman act, he now says, "should not be repealed, but it should be made both more efficient and more in harmony with actual conditions":

"It should be so amended as to forbid only the kind of combination which does harm to the general public, such amendment to be accompanied by, or to be an incident of, a grant of supervisory power to the Government over these big concerns engaged in interstate business. This should be accompanied by provision for the compulsory publication of accounts and the subjection of books and papers to the inspection of the Government officials. The law should not prohibit combinations that do no injustice to the public, still less those the existence of which is on the whole of benefit to the public. But even if this feature of the law were abolished, there would remain as an equally objectionable feature the difficulty and delay now incident to its enforcement."

He points out the difficulties encountered before obtaining a final decision in the courts. And to control these corporations by lawsuits means the imposition of "an impossible burden" upon the courts and the Department of Justice. The design should be to prevent the abuses incident to the creation of unhealthy and improper combinations, instead of waiting until they are in existence and then attempting to destroy them by civil or criminal proceedings:

"No corporation or association of any kind should be permitted to engage in foreign or interstate commerce that is formed for the purpose of, or whose operations create, a monopoly or general control of the production, sale or distribution of any one or more of the prime necessities of life or articles of general use and necessity. Such combinations are against public policy; they violate the common law; the doors of the courts are closed to those who are parties to them, and I believe the Congress can close the channels of interstate commerce against them for its protection. The law should make its prohibitions and permissions as clear and definite as possible. Among the points to be aimed at should be the prohibition of unhealthy competition, such as by rendering service at an actual loss for the purpose of crushing out competition, the prevention of inflation of capital, and the prohibition of a corporation's making exclusive trade with itself a condition of having any trade with itself. Reasonable agreements between, or combinations of, corporations should be permitted, provided they are first submitted to and approved by some appropriate Government body."

Congress might enact a general law under which existing corporations or new ones could take out Federal charters; but Federal authority should decide whether an applicant is an unlawful combination. Or a license law might be enacted; or a combination of the two methods might be tried:

"At least, the anti-trust act should be supplemented by specific prohibitions of the methods which experience has shown have been of most service in enabling monopolistic combinations to crush out competition. The real owners of a corportion should be compelled to do business in their own name. The right to hold stock in other corporations should hereafter be denied to interstate corporations, unless on approval by the proper Government officials, and a prerequisite to such approval should be the listing with the Government of all owners and stockholders, both by the corporation owning such stocks and by the corporation in which such stock is owned."

Such national control, he holds, would be beneficial to the corporations, and to every well-managed railway, facilitating the investment by the public of money needed for improvements and extensions. Concerning railway rates he says:

"While there must be just and reasonable

regulation of rates, we should be the first to protest against any arbitrary and unthinking movement to cut them down without the fullest and most careful consideration of all interests concerned and of the actual needs of the situation. Only a special body of men acting for the National Government under authority conferred upon it by the Congress is competent to pass judgment on such a matter."

He directs the attention of those who fear the extension of Federal activity to the meat inspection and pure food laws, which were opposed and delayed but are now admitted to be highly beneficial. The "same men who now denounce the attitude of the Government in seeking to oversee and control the workings of interstate common carriers and business concerns asserted that [in the meat inspection bill] we were 'discrediting and ruining a great American industry,' but it is already evident that the great benefit this law confers upon the public is accompanied by an equal benefit to the reputable packing establishments."

Currency, the Tariff and Taxes

Concerning the currency, Mr. Roosevelt quotes a part of his last year's message, in which the lack of elasticity was pointed out and Congress was asked to consider Secretary Shaw's plan for the use of taxed emergency issues. He now urges the need of immediate attention to this matter, saying that provision should be made for heavily taxed emergency issues, based on adequate securities approved by the Government:

"It is worth investigating to determine whether officers and directors of national banks should ever be allowed to loan to themselves. Trust companies should be subject to the same supervision as banks; legislation to this effect should be enacted for the District of Columbia and the Territories.

"Yet we must also remember that no legislation can by any possibility guarantee the business community against the results of speculative folly. When an individual mortgages his house to buy an automobile he invites disaster; and when wealthy men, or men who pose as such, or are unscrupulously or foolishly eager to become such, indulge in reckless speculation—especially if it is accompanied by dishonesty—they jeopardize not only their own future but the future of all their innocent fellow citizens, for they expose the whole business community to panic and distress."

Concerning the tariff, he says that to uproot the protective principle would "cause widespread industrial disaster." But "it is probably well that every dozen years or so the tariff laws should be carefully scrutinized, so as to see that no excessive or improper benefits are conferred, that proper revenues are provided, and that our foreign trade is encouraged":

"There must always be as a minimum a tariff which will not only allow for the collection of an ample revenue, but which will at least make good the difference in cost of production here and abroad; that is, the difference in the labor cost here and abroad, for the well-being of the wageworker must ever be the cardinal point of American policy. The question should be approached purely from a business standpoint; both the time and the manner of the change being such as to arouse the minimum of agitation and disturbance in the business world, and to give the least play for selfish and factional motives."

Experience has shown that in a year preceding a Presidential election it is "impossible to get men to treat this subject from the standpoint of the public good"; therefore he thinks the best time to deal with it is "immediately after such election." An income tax and an inheritance tax, he says, should be parts of our system of Federal taxation. He hopes that a scheme for an income tax can be devised that the Supreme Court will declare constitutional. The inheritance tax, however, is a better one, and it has been sustained by that court. He shows at length the use of this tax in European countries, asserting that here it would "help to preserve a measurable equality of opportunity for the people of the generations growing to manhood." Proposals for such legislation, he says, are directly opposed to Socialistic theories.

Labor Legislation

Much of the message relates to labor questions. "Instances of abuse in the granting of injunctions in labor disputes," the President says, "continue to occur." He urges Congress to devise some way for preventing such abuse of a process the wise use of which is commendable. Considering the appalling loss of life on the railways, he suggests provision for Federal inspection of the lines, or, at first, for an investigation of accidents by some Federal officer. Congress should enact, for all workmen within the scope of the

Federal power, "a model employers' liability law, far-reaching and thorogoing":

"The law should be made such that the payment for accidents by the employer would be automatic instead of being a matter for lawsuits. Workmen should receive certain and definite compensation for all accidents in industry irrespective of negligence."

He points out that in the last ten years nearly all other civilized countries have enacted laws embodying a complete recognition of the principle which places upon the employer the entire trade risk in the various lines of industry. The eight-hour law should be extended to affect all Government work, contracts included. He again recommends that provision be made for the compulsory investigation of labor controversies, and asks for the enactment of a model law concerning the employment of women and children in the District of Columbia and the Territories. In the course of his remarks about capital and labor he says there is urgent need of a public opinion that will condemn not only vice in its cruder and more archaic forms but also the vice which denies that it is vice if it can escape conviction in the courts:

"Swindling in stocks, corrupting Legislatures, making fortunes by the inflation of securities, by wrecking railroads, by destroying competition thru rebates—these forms of wrongdoing in the capitalist are far more infamous than any ordinary form of embezzlement or forgery; yet it is extremely difficult to secure the punishment of the men most guilty of them, most responsible for them."

He denounces "the members of the business community, the educators, or clergymen, who condone and encourage" such wrongdoing.

Other Topics

Postmaster-General Meyer's recommendation for the establishment of postal savings banks is approved. The experience of the last few weeks shows, the President says, that in time of stress such banks would be very useful, because money withdrawn from other banking institutions and hoarded by the timid would be thru postal banks restored to the channels of trade. He commends also the proposed extension of the parcel post on rural routes, and asks that the $3,000,000 of annual profit gained in the ocean mail postage be used in increasing from $2 to $4 per mile the mail payment allowed to steamships of only sixteen knots speed, in order that mail lines to South America, the Philippines and Australia may be established. He recommends that fourth-class postmasters be included by law in the classified civil service, pointing out that the Administration has already sought to remove them from the domain of partisan politics by refusing to remove any of them except for reasons connected with the good of the postal service. Concerning Presidential campaign funds, he remarks that corporations should be forbidden to contribute, and that publication of contributions and expenditures should be required. But it is difficult to enforce laws of this kind, which can be evaded, and he suggests "a very radical measure" which "would work a substantial improvement in our system of conducting a campaign":

"The need for collecting large campaign funds would vanish if Congress provided an appropriation for the proper and legitimate expenses of each of the great national parties, an appropriation ample enough to meet the necessity for thoro organization and machinery, which requires a large expenditure of money. Then the stipulation should be made that no party receiving campaign funds from the treasury should accept more than a fixed amount from any individual subscriber or donor, and the necessary publicity for receipts and expenditures could, without difficulty, be provided."

We have never suffered, he says, from the evils of militarism; our evils are those of industrialism. "Declamation against militarism has no more serious place in an earnest and intelligent movement for righteousness in this country than declamation against the worship of Baal or Ashtaroth." The army is too small, and there are not enough officers. The medical corps is too small. He urges that the pay of officers and enlisted men be increased, that promotion from the ranks be encouraged, that a special corps for manual labor be created, that promotion above the rank of major be for merit only, and that preference over civilians for appointment to certain offices be given to soldiers or sailors of twelve years' service. We cannot expect limitation of armament by international agreement, and we should provide this year for the construction of four battleships. Naval

promotion above the grade of lieutenant commander should be by merit only, and officers should be enabled to reach the highest grades at a less advanced age. The battleship fleet should "now and then" be moved to the Pacific. Our inland waterways should be developed, beginning with a deep channel from the Great Lakes to the Gulf of Mexico. Irrigation work should be extended, and might include the reclamation of swamp lands in the East and South. The Government's title to lands containing coal, oil or gas should be retained, and they should be developed under leases. There should be a Bureau of Mines, to collect statistics, investigate concerning accidents, and prevent fraud. Much is said about the approaching exhaustion of the lumber supply, and the acquisition of additional forest reserves is recommended. The tariff duty on wood pulp should be repealed. In a long passage about the interests of farmers, the President insists that schools for practically teaching agriculture are greatly needed and suggests inspection and grading of grain by national authority. In his remarks about our foreign relations, the work of The Hague Peace Conference is reviewed. Important steps were taken, he says, and substantial progress made toward further agreements in the future. He finds much cause for encouragement in the vote on the treaty for obligatory arbitration, the agreement as to collection of debts by force, and the creation of an international prize court. There is a highly complimentary reference to Mexico and President Diaz. Japan has invited us to attend her World's Fair in 1912. Mr. Roosevelt urges prompt and generous provision for the representation of our Government and people at this exposition and speaks of "the warm friendship" maintained between Japan and the United States for so many years "without a break."

The Financial Disturbance

Owing to the continued improvement of business conditions, the issue of Panama bonds was reduced, on the 6th, from $50,000,000 to $25,000,000, and the issue of 3 per cent. notes was limited to $15,000,000. The bonds were taken at an average of about 103, and the issue was largely oversubscribed. Answers to a call for reports upon the condition of all national banks showed that many banks in cities of the interior had largely increased their reserves and might fairly be charged with hoarding cash. In November, nearly $54,000,000 was added to the bank circulation, and the actual supply of money was increased by $131,000,000, which included $64,000,000 of imported gold. At the end of last week, the New York bank statement was again favorable, showing that the deficit in reserve had been reduced by nearly $7,000,000. Western cities were withdrawing and canceling clearing house checks. But there was still a small premium on currency. Among the unfavorable events of the week were several bank failures. The savings bank at Chelsea, Mich., controlled by State Treasurer Frank P. Glazier, was closed, owing to his failure and the bankruptcy of his stove company. In this bank he had deposited $684,000 of State funds. His private bank at Stockbridge, Mich., was also closed. Mr. Glazier had been a prominent candidate for Governor. In Kansas City, the National Bank of Commerce (largest in the city) was closed on the 5th. In four weeks it had paid out $18,000,000 of its $34,000,000 deposits. President Woods ascribes the run on the bank's resources mainly to the effect of instructions given by the Waters-Pierce Oil Company (a branch of the Standard) to its traveling agents. It is asserted that depositors will suffer no loss. In Pittsburg, the Fort Pitt National Bank suspended, and this was followed by the failure of the large brokerage house of Whitney, Stephenson & Co. The appointment of receivers for the California Safe Deposit and Trust Company, in San Francisco, disclosed its hopeless insolvency. To directors $3,000,000 had been loaned on their personal notes, and to a clerk $484,000 upon his written promise to pay. During November, there were 164 deaths from heart disease in New York City, against 95 in November of last year. This increase is ascribed in part by the health authorities to the panic.

University Enrollments

The attendance at American universities, annually compiled by Prof. Rudolf Tombo, Jr., of Columbia, shows some interesting figures for 1907. Harvard

holds the lead as the largest university, with 5,346 students. Columbia, Michigan, Chicago, Cornell, Minnesota, Illinois, Pennsylvania, Yale and California follow in the order named. These ten largest universities represent a total attendance of over 40,000. The largest gains were made by Columbia, New York University, Illinois, Wisconsin, Michigan and Minnesota; that is, two Eastern and four Western institutions. At three of the prominent State universities of the Middle West a decrease in the number of male students enrolled is counterbalanced by an increase in the number of women. Wisconsin has 87 less men in 1907 than in 1904, but 138 more women. There is a steady gain in the enrollment at Smith, Vassar and Bryn Mawr. The greatest number of degrees conferred in 1907 was by Harvard, with 1,187 to her credit. Michigan, Columbia and Yale follow in the order named.—— The decrease in the number of American students at all the German universities is this year more marked than ever. According to the registration statistics of Berlin University, which has been the most popular of all the German universities with Americans, there are now only 95 students from this country—68 men and 27 women enrolled. Three years ago there were 203 and ten years ago over 400.

Death of Oscar II

Oscar II, King of Sweden, died at 9:10 in the morning of December 8th, at the castle in Stockholm, from calcification of the cerebral and cardiac blood vessels. The aged Queen Sophie, the Crown Prince and the ministers were with him at the last. At 1 o'clock in the afternoon the Council of State assembled and Crown Prince Gustaf, Duke of Värmland, took the oath of office, assuming the title of Gustaf V and the motto "With the people for the Fatherland." His oldest son, Gustaf Adolf, the new Crown Prince, his brothers and the State officials took the oath of fealty. Memorial services according to the Lutheran forms were held an hour later in the palace chapel, attended by the royal family and the court. In his proclamation King Gustaf refers to his father in the following manner:

"Providence richly endowed that magnanimous Prince with great and brilliant qualities. His sense of duty, his respect for justice, and his love of right and his unceasing regard for the welfare of his subjects—these were the traits of character in the late King which we shall all remember with gratitude and regret."

King Oscar II was the fourth sovereign of the House of Ponte Corvo and grandson of Marshal Bernadotte, who arose from the ranks in Napoleon's army, and being adopted by the childless King of Sweden, Carl XIII, as his heir, secured the throne of Sweden by joining with the allied Powers of Europe to crush Napoleon. King Oscar was a man of distinction, both physically and mentally. He was six feet three inches in hight and of great personal bravery and ability. He wore a medal for life-saving, conferred upon him in 1861 by the French Government for stopping two runaway horses hitched to a carriage, that was on the point of dashing over a precipice, and five days later saving a child from drowning at Nice. He was very affable and democratic in manner, accessible to the humblest of his subjects and to foreign visitors, preferring to walk about the streets or use the street cars rather than to drive in state. He wrote many volumes of poetry and history, and was able to deliver orations in Latin and most modern languages. He was the most scholarly of the monarchs of the present day, a deep student of philology and well versed in natural sciences. He was a lover of peace, and on account of his justice and impartiality was frequently called upon to be an arbiter in international questions. He decided the Samoan question in 1902 and he was proposed as final arbiter in the Venezuelan dispute between the United States and Great Britain in 1896. He was born January 21st, 1829, and was therefore nearly seventy-nine years old at his death. He married, June 6th, 1857, Queen Sophie, daughter of the late Duke Wilhelm of Nassau. He has four sons, of which the eldest, now King, was born June 16th, 1858, and married September 20th, 1881, to Princess Victoria, daughter of the Grand Duke of Baden. King Gustaf resembles his father in stature and features. He studied at the University of Upsala and served in the army for many years. He has several times acted as Regent in the illness of his father. The secession of Norway, in June, 1905, was a

great blow to King Oscar, who had devoted his tact and ability during his long reign to keeping the "brother peoples" on good terms with each other.

Secretary Taft at St. Petersburg

Secretary Taft spent five hours with Emperor Nicholas at Tsarskoe-Selo on December 4th. After a long conversation in the private study of the Emperor, they proceeded to the riding school and reviewed the Semenovsky Regiment, afterward lunching with its officers. The Emperor is reported to have discussed military topics with Secretary Taft and questioned him as to his impression of the journey over the Trans-Siberian Railroad. His Majesty showed a keen interest in the Philippine Islands and the new Assembly, and complimented the work done by the American Government at Panama in the suppression of yellow fever. At a dinner given by the Americans of St. Petersburg and attended also by several Russian officials, Secretary Taft took occasion to emphasize the peaceful nature of his mission. Personally he had a strong feeling of affection with regard to Russia on account of the two years' residence of his father there as American Minister. On his present trip his only official mission, he said, was the inauguration of the Philippine Assembly, and he

FOUR GENERATIONS OF SWEDISH ROYALTY.
The late King Oscar II, the new King Gustaf V, the Crown Prince Gustaf Adolf, Duke of Scania, and his infant son, Prince Gustaf Adolf.

was returning home by the way of Russia to avoid the voyage across the Pacific, which he had already made many times. In his judgment there was no possibility of war between the United States and any country, nor was there any reason for it. The world needed peace, and was indebted to Emperor Nicholas for the inauguration of international efforts for a permanent peace and the mitigation of war by the organization of The Hague Conference. At a dinner given by Foreign Minister Iswosky, the Secretary referred to the friendship that has been cherished by Americans since the Civil War, and drew a parallel between the problems of America and of Russia in the settlement of a vast empire, such as he had just traversed. The *Rossia,* the official organ of the Government, also disclaimed any diplomatic significance in the visit of the Secretary in the following words:

"The high position and the personal merits of Secretary Taft explain the heartiness of his reception and the honor of an audience of the Emperor, but it is a mistake to suppose that Mr. Taft's visit is in any way connected with a change in the international policy of Russia. There is not a word of truth in the rumors that we are to give base for an American fleet at Vladivostok or any other Pacific port, but the visit of Secretary Taft will renew and strengthen the old bonds of sympathy between Russia and America."

——Viscount Aoki, Ambassador of Japan to the United States, has been recalled, and in his place has been appointed Baron Kogoro Takihira, who was his predecessor at Washington. He is now the Japanese Ambassador to Italy. Minister Hayashi has announced that it is the intention of the Government to limit emigration to the United States and Canada.

Bülow's Victory

Prince von Bülow, the Imperial Chancellor, has succeeded in gaining the support of a compact majority in the Reichstag by a threat of resignation. Ever since the dissolution of Parliament, when the Chancellor broke with the Center, and placed his dependency upon the various Radical, Liberal and Conservative groups, it has been a question of whether this "bloc" or coalition would give him the necessary parliamentary backing. This doubt became emphasized on the opening of the Reichstag, when Dr. Herman S. Paasche, First Vice-president and one of the National Liberal leaders, attacked the Government on the ground of its extravagance and sheltering of the officers concerned in the Harden scandal. Herr Paasche denounced the policy of the Government in allowing the imperial expenditure to exceed the revenues, and contracting loans annually to cover the deficit. He demanded a general property tax for imperial purposes on all property valued over $12,500, and also an imperial indemnification from all men rejected as recruits by the authorities. He held up a bundle of letters which he said had been written by Count von Hohenau from the imperial headquarters at Wilhelmshohe to Herr Bollhardt, the Guardsman, who testified to the orgies at the villa of Count Lynar. Chancellor von Bülow secured an adjournment of the Reichstag for one day, on the ground that he had no proper parliamentary majority. Then, calling together the leaders of the coalition parties, he stated to them plainly that unless he could count upon their unlimited support he would ask the Emperor to give him leave to retire. This is an unparalleled declaration from a German Chancellor, because they have previously claimed to hold the office by direct appointment of the Emperor regardless of a parliamentary majority. It virtually therefore transforms Germany for the first time into a true parliamentary Government. It is supposed that this action of the Chancellor's received the full approval of the Emperor before he left for England. When the Reichstag reassembled the leaders of the two Conservative and three Radical groups arose one after another and expressed their determination to support the Government, amid such laughter and gibes from the Clericals and the Socialists that the President was absolutely unable to maintain order so business could be carried on. Minister of War von Einem announced to the Reichstag that the Court of Honor proceedings against General Count Wilhelm von Hohenau had been suspended by the order of the Emperor, and that Hohenau and Lynar were to be tried by the civil courts in the usual way.

The New Encyclical

BY PROF. CHARLES A. BRIGGS, DD., LL.D.

[It has been the hope of Professor Briggs that ultimately there might be some basis of recognition and fellowship between the Catholic and the Protestant communions. With a view to this he had an interview with the present Pope soon after his accession. He has been much in Rome in connection with his studies and has large acquaintance with scholars and ecclesiastics there and keeps in close touch with movements in the Catholic Church of Europe.—EDITOR.]

A GREAT change has taken place in the policy of the Pope since he graciously granted me an audience in the spring of 1905. On the basis of that interview, and of conversations with a number of other Roman Catholic scholars who were in the Pope's confidence, I wrote an article on "Reform in the Catholic Church." The Pope was aiming at a reform in the spiritual life of the Church, to restore all things in Christ, to bring about a reunion of Christendom. He was greatly interested in Protestantism and thought union with Protestants more likely than with the Greeks. He said that reasonable freedom of discussion would be given to solve the hard problems that divided Christendom and that strict theologians were very bad for the Church. The rector of the Benedictine College of San Anselmo, Dr. Janssens, one of his chief advisers, in a similar spirit, promised to write an article distinguishing the essentials of the doctrine of the Eucharist from those things that were merely the private opinions of scholars, in order to remove as far as possible objections to the Catholic position.

In a year the entire attitude of Rome changed. Pius X like Pius IX changed suddenly from a reforming Pope to a reactionary Pope, and apparently for similar reasons. Pius X began with a friendly policy to the Italian, German, and even the French governments. His wish was to reconcile and harmonize interests. But he was not familiar either with civil or ecclesiastical politics, and his young Secretary of State was too inexperienced to deal wisely with the intricate affairs that confronted him; and the older hands were not unwilling that some failures should be made by those who had taken the management from them. And so, in a few months, faithful France was separated from the Holy See, the Church disestablished, and all Church property sequestered by the State. In Italy the nation was stirred to its depths by a battle between the anticlericals and the clericals, so that in many places priests and prelates, and even the Cardinal Secretary of State, have been insulted in the streets. And in Germany several of the leaders of the Center party have been humiliated, and are so disgruntled that its influence is greatly threatened. The strain may be estimated from the address of the rector of the University of Wurtsburg, who branded those who would vilify the memory of Schell as "hyena theologians."

These failures should have been charged by the Pope to the mistakes of his advisers; but these have succeeded in persuading him to attribute them to evil influences, and to charge their blunders upon the modern disrespect and disobedience to authority, and above all to certain philosophical presuppositions and tendencies of the Modern Age which must be resisted and overcome at all hazards. And so following in the footsteps of Pius IX we have a new Syllabus of Errors and an Encyclical against Modernism, and probably ere long the Vatican Council will be recalled to go still further in magnifying an authority which is already strained almost to the breaking.

The new Syllabus of Errors is a condemnation of a number of statements selected from the writings of Loisy, Tyrrell and other modern Catholic scholars. These are taken out of their context, and generally thereby put in a false light and given a twist in meaning which misrepresents their authors. In this collection good, bad and indifferent statements are put together without dis-

crimination. I doubt whether any one would be responsible for the most of them, unless stirred to do so because of this challenge from the Pope. As the Pope himself assured me that the Syllabus of his predecessor was not infallible, he certainly will not claim infallibility for his own Syllabus; and therefore even Catholic scholars are quite justified in discussing its merits without fear or prejudice. And many of them were about to do so when the Encyclical against Modernism was sprung upon them.

This Encyclical has raised a storm thruout Catholic Europe which even transcends that which burst upon the world at the time of the Vatican Council. This Encyclical is not infallible, according to the definition made to me by the present Pontiff, but it has been issued with a sort of *quasi* infallibility which imposes it upon the Catholic world in a tyrannical and altogether uncanonical manner.

Some of the American bishops have taken the same attitude toward it as they did toward the condemnation of Americanism a few years ago, and on the surface they seem justified in so doing, because the Modernism described by the Encyclical is just as much a caricature destitute of reality, and just as truly a gross misrepresentation of modern scholars as was the Americanism condemned at Rome. But when one looks closely into the documents, the situation is altogether dissimilar. The condemnation of Americanism was made by a wise Pope and a veteran Secretary of State renowned for his skillful policy. These wished to rebuke an aggressive Americanism which was disturbing the Catholics of Europe, but not at all to interfere with the American spirit of practical Christianity as it was working itself out in America. But the condemnation of Modernism is not only a caricature and grievous misrepresentation of the modern spirit; it goes into such details, and strikes with such a venomous temper, that it is impossible for any Catholic, who has in him the least spark of the life of the modern world, to escape.

How, for instance, can the American bishops hold up their heads as Americans against the condemnation of the separation of Church and State, and the renewed condemnation of Americanism for its preference for the active virtues? Are there no American Catholics who desire a reform of the Roman congregations, especially those of the Holy Office and the Index? Are there none who wish the priests and laymen to have some part in the government of the Church? Are there none who wish that the ecclesiastical power would refrain from the political and social spheres? Are there none who would harmonize dogma with science and history? Every one knows that there are multitudes of such Catholics in America. And yet every one of them is condemned by the Encyclical and threatened with ecclesiastical censure and degradation.

This Encyclical divides the Catholic Church thruout the world more distinctly than it has ever been divided before into two irreconcilable camps, between which a war of extermination has been declared. It makes such a detailed and variegated description of the Modernists that are condemned that it is difficult to see how any priest or layman who thinks in modern lines, or lives in modern ways, can avoid it. In all probability the Vatican desires, for the present at least, to confine the harsher features of this Encyclical to Catholic countries and to avoid any conflicts with American Catholics, upon whom Rome relies for increased financial support; and therefore it may be quite possible for the American Episcopate to ward off the severity of the attack from this country for the present. But it is difficult to think that the Catholics of America will submit to such a censure without a protest, or that they will hold back from sustaining their brethren in Europe in their life and death struggle, upon which the whole future of the Church depends.

The Encyclical is avowedly a condemnation of Modernism. So far as Modernism is an *ism,* and like all other *isms* an exaggeration of certain peculiar features of the modern world in antagonism with historic Christianity, there would be few who would challenge the right or the duty of the Pope to condemn it. The polemic in the Encyclical against the excesses of Evolutionism, Agnosti-

cism and such Pantheistic conceptions of the divine immanence as are presented by Dr. Campbell, of London, might be regarded as unwise or unnecessary, but not as unwarranted. Such Modernism the Roman Church cannot do otherwise than condemn without being unfaithful to her historic position in the world. It is possible that such Modernism does exist here and there among Roman Catholic priests and laymen; but the Roman Catholic scholars who are now under condemnation by the Curia are not such Modernists. It is nothing but slanderous misrepresentation to put Loisy or Tyrrell in that category. The group of Italian priests who have just issued the able and representative reply to the Encyclical say distinctly that "that assertion of the Encyclical is false." The many eminent Catholic scholars who have been removed from their chairs of instruction in Germany, France and Italy are certainly not Modernists of that sort, but simply biblical scholars, historical scholars and Christian apologists who use the methods of historical criticism and endeavor to reconcile modern science with the Catholic faith. These may all be mistaken in their methods and in their results, and conservatives, and especially reactionaries, may honestly think that they deserve censure; but they should be censured for what they really say and do, and not for opinions and practices which they disclaim and which are only imputed to them by their enemies. It is a strange situation, at least to the Anglo-Saxon mind, that such scholars should be regarded as guilty of "impiety and rebellion against the Holy [illegible] threatened with "penalties that will [illegible] the world" because they refuse to be classed with the Modernists that the Encyclical describes, and venture to defend themselves against such gross misrepresentations.

The Encyclical, like many other documents prepared at Rome, may be used by tyrannous authority and explained in various ways according to circumstances. Its general description of Modernism is such that if one does not go into specifications any Roman Catholic scholar may repudiate it. But the description of it is so gross that to charge any scholar with it, especially when he is refused a hearing in self defense, is to justify his condemnation in the eyes of all who do not know him.

The Encyclical is so framed that it may be used very much as the authorities please. As a Roman prelate is reported as saying: "They may not be Evolutionists, Agnostics, or hold the divine immanence in the sense condemned, but they are guilty of other serious heresies which the Church condemns." It is indeed quite easy to pick out from the details of the Encyclical any one of a number of things which will condemn any modern scholar. And it is also easy to wink at such things as of such minor importance that they may be disregarded. It all depends upon the animus and disposition of the authorities.

The underlying motive, the strain that runs thru the entire document and gives its real character, is the determination to resist modern thought and overcome it by making the medieval scholastic philosophy and theology the norm of all philosophy and theology for the Roman Church. I said in my article on "Reform in the Catholic Church" that Leo XIII made a very important step in reform when he directed that Thomas Aquinas should be used as the standard authority in all Roman Catholic colleges and seminaries, for thereby theology was divested of the accretions of the so-called Newer Scholasticism since the Reformataion, and of the corrupt Scholasticism of the fourteenth and fifteenth centuries. The present Pope was easily persuaded that he was carrying on the work of his predecessor in this regard. But in fact the scholastic theologians, Janssens, Billot and their like, who are generally regarded as responsible for the philosophical [illegible] final part of the Encyclical, [illegible] entirely changed the spirit and the character of this reform. If on the one hand they have grossly misrepresented modern philosophy and theology in their characterization of Modernism, they no less truly exaggerate the Scholastic philosophy and theology into scholasti*cism* and medieval*ism*, and make that *ism* the norm of Philosophy and Theology and the test of Catholicity and Christianity. Any one who studies the scholastic systems of theology of Janssens and Billot sees very

clearly that they only nominally adhere to Thomas Aquinas when they follow the lines of his system and pursue his methods. They really introduce into their systems the theories of other scholastics, ancient and modern, and so mingle the doctrine of St. Thomas with these other doctrines, and their own explanation and adaptation of them to modern situations that the systems are just as truly those of Janssens and Billot as are the doctrinal systems of other modern theologians who pursue other methods. And in fact these modern scholastics seek to impose upon the modern world, not the doctrines and philosophy of St. Thomas, but their own philosophy and dogma. "The voice is Jacob's voice, but the hands are the hands of Esau."

The Encyclical has made a very serious antithesis between Medievalism and Modernism, which if persisted in will be destructive of Historic Christianity. For if Medievalism is made the normal Christianity, and that in such an exaggerated form, it not only attacks modern Christianity, but no less truly discredits ancient Christianity. The Italian authors of the "Reply" are quite correct when they claim that they are the true successors of Thomas Aquinas, in that they have the same spirit of reform that St. Thomas had, who in spite of opposition and charges of heresy used the Aristotelian philosophy as the handmaid of theology, and that the scholastics who are behind the Encyclical are not true to St. Thomas, tho they pretend to follow him. They rather have the spirit of the opponents of St. Thomas, who made his life miserable and would, if they could, have deprived him of his office as teacher, and degraded him, as they now wish to degrade those who do not follow implicitly their new scholasticism.

The Pope is only nominally responsible for this situation. I cannot regard him as really responsible. He thinks he is carrying out the policy of Leo XIII when he really is endorsing scholastic theologians who have an entirely different spirit from that of Leo XIII, and who are so exaggerating his reform as to deform it and wreck it.

New York City.

The Central American Peace Conference

BY WILLARD FRENCH

THE Central American Peace Congress now in session in Washington, D. C., has a golden opportunity. There were rumors of jealousies and something like a lack of mutual confidence before the convention, but nothing of the kind has materialized. The preliminary work has progressed amicably and hopefully.

It is not a new measure, this peace movement among the Central American republics. There have already been several congresses convened for the purpose of preventing the interminable wars which have become so nearly second nature to the five small nations that the task has proved difficult. For the last ten years leading men among them have been exerting every energy in the direction of perpetuating peace as their only salvation, but they have rebelled against being saved almost before the ink was dry on each new treaty. In the present effort many of the same men participate who have previously been to the fore, and there appears, this time, a desperate determination to succeed. There is no doubt that the work in Washington will be well and thoroly done, and if the home governments only lend hearty indorsement there will be effective results.

The first step before the present congress has been taken. The draft of the proposed treaty of peace between the five

Central American republics has been prepared and is before the delegates for careful consideration. The committee of three who prepared the draft were not without the aid of past experience in the work. The congress of 1906, which met at San José, prepared a treaty which was signed on board the U. S. S. "Marblehead" by the delegates from Gautemala, Salvador, Honduras, and Costa Rica, which in its way was a model of careful construction. But its final failure, like the efforts preceding it, is an admonition that a more difficult task remains to be accomplished after the terms of the treaty are arranged. This task was suggested by Secretary Root in his address to the delegates opening the congress. Among other things he warned them

"to find practical and definite methods to which you shall make it somebody's duty to see that the great principles you declare are not violated; by which, if an attempt be made to violate them, the responsibilities may be fixed. These, in my judgment, are the problems to which you should specifically and most earnestly address yourselves."

The obvious need of such advice was evident in the reply of Señor Anderson, President of the Congress, Secretary of Foreign Affairs for Costa Rica and delegate to several previous conventions. He said:

"It was a divine inspiration which led the Presidents of our sisters at the North, at the moment when Central American soil was threatened with new bloodshed—brothers' blood—to raise their friendly voices bidding the murderous arm to stop and calling us to Washington to undertake in a brotherly conference the work of peace—peace which raises and gives dignity to nations and leads them on the road of civilization and happiness.

"The disturbances which are taking place in some of the Central American republics and their awe-inspiring resulting calamities are more than anything else the outcome of abuse. I believe that I interpret the sentiment and patriotic feeling of each of the Central American delegates when I say that we have faith that we will reach the goal, and our gratitude for this will be sincere and eternal to those who have aided us in this noble work."

The part which the United States and Mexico played in calling the Congress, at the vital moment, has led to suggestions of sinister motives—suggestions for which there is no possible ground. The call was practically instigated by leading men of the Central American Republics who have the prosperity of their countries most at heart, and who realize that only in perpetuating peace is prosperity attainable. It was thru their efforts that intervention was finally secured.

The part which the United States and Mexico will continue to play in this congress will be influential, but not authoritative. Secretary Root and Señor Enrique Creel, Ambassador from Mexico, have been made honorary presidents of the conference and are present, or represented, at the debates, taking part in each conference, but without vote. The five nations are represented by two or three delegates each, each country having a single vote. The personnel includes, unquestionably, the best men which the Central American republics could have sent to represent them. In each case the resident Minister Plenipotentiary and Envoy Extraordinary is one of the delegates. With Minister Calvo, Costa Rica has sent Señor Luis Anderson, her Secretary of Foreign Affairs, who has wisely been elected president of the congress. He is a man of exceptionally attractive personality, a lawyer of keen insight and rare ability, tho the youngest member of the Costa Rican Cabinet. Immediately on approaching him you feel that he is a man possessing the courage of his convictions. It is a quality which impressed itself upon us some years ago when he came to the United States on legal business, and his acumen and insight were apparent to all who met him. He has been intimately connected with the entire peace movement among the Central American republics for many years.

Minister Calvo, the senior member of the Central American representatives credited to Washington, is a born diplomat. His capacity, integrity and good judgment have too often been tested in his dealings in Washington to require comment. He founded the first daily paper in Costa Rica, and as Governor of Cartago and secretary of the first Peace delegation laid the foundation for much which has followed.

Dr. Jauregui, of Gautemala, is another old-time peace advocate and exceptionally well adapted to the work, owing to his intimate knowledge of the various

republics. In the course of his career he has represented Salvador, Honduras and Nicaragua, and is in close touch with the National College and Postmaster-

SENOR DON JOAQUIN B. CALVO.
Costa Rican Minister, leading member of the Peace Conference.

General of Gautemala, and has recently been representing his country in Costa Rica. They are efficient supporters of Dr. Harrarte, the Gautemalan Minister, who came to Washington from a successful diplomatic career in Spain and Brazil.

Dr. Ugarte, the Minister from Honduras, is among the leading orators of Latin America, whose life has been devoted to public service. Associated with him are Mr. Fiallos, who was educated their conflicting tendencies. He is a professor of jurisprudence and is one of the best known writers of Latin America. He has associated with him Señor Sanchez-Ocaña, who has been director of in the United States and whose works on political science are held as authority, and Señor Bonilla, who was elected President of Honduras in 1905.

Nicaragua and Salvador are in no sense behind their neighbors in sending to this conference their best men—better it would be difficult to find. The delegates declare themselves on the most friendly terms with their associates, and all are determined to secure results. They do not profess to be instigated wholly by the demands of patriotic philanthropy. They are primarily after the commercial benefits of peace. The little nations are seriously hampered in their development by lack of stability. For-

SENOR DON FRED MEJIA.
Delegate from Salvador.

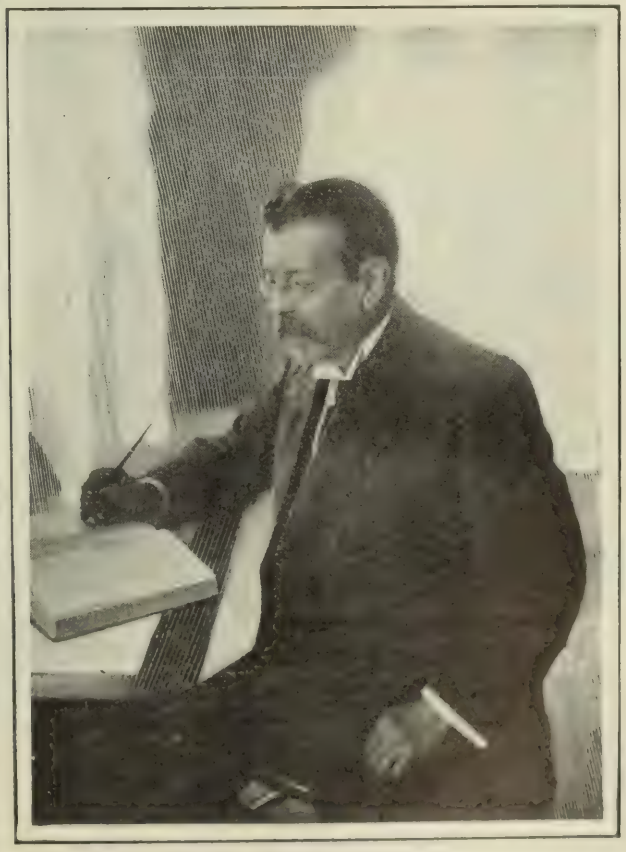
eign capital fails to turn as it might in their direction, lacking security on account of constant political upheavals. It is in great part a business proposition which confronts the delegates in their efforts to find a mutual ground which shall insure the maximum benefit with the minimum loss of individuality and prestige, which each nation is most jealously guarding.

The first step, the preparation of a treaty, is well under way. The next and most serious step will be an agreement upon some court of justice and arbitration, and after that comes the most difficult task of the conference, which all of

the delegates are more or less dreading—the establishment of some power behind the throne capable of enforcing the dictates of the court and keeping the peace according to the terms of the treaty after it has become a law.

This is the point where the United States and Mexico will probably be called into active participation if it can by any possibility be so delicately done as to cause no vigorous resistance when the terms are laid before the home governments for ratification.

Nothing is openly said upon this point as yet. All of the delegates are anxious



SALVADOR RODRIGUEZ.
Delegate from Salvador.

to shove off as far as possible the evil day—for it is an evil day when a member of one of the Central American republics crosses popular sentiment. He is not quietly ignored. He is generally strenuously obliterated and forced to leave the country. Elections are more or less of a farce in mose of these countries—rather more, as a rule. Indeed, Costa Rica is the only one of the five which for the past quarter of a century has possessed anything like a stable government. As one of the delegates said to me the other day, in speaking of the present uncertainty: "Why, suppose an editor has said something displeasing in his paper. Biff! a bullet comes thru the window beside him. He looks out. Half a dozen men are there shouting uncomplimentary things about him. He replies with his pistol, and, presto! a revolution is on."

It is generally accepted that the United States and Mexico stand ready to enter into some arrangement for practically policing the district, if unanimously called upon to act in this capacity, and that the delegates have most seriously at heart, as the acme of their efforts in Washington, the making of such a request unanimous.

There is active opposition in some quarters, at home, to the United States assuming too paternal an attitude toward Central and South America; but that is still another possible complication, and at

SALVADOR GALLEGOS.

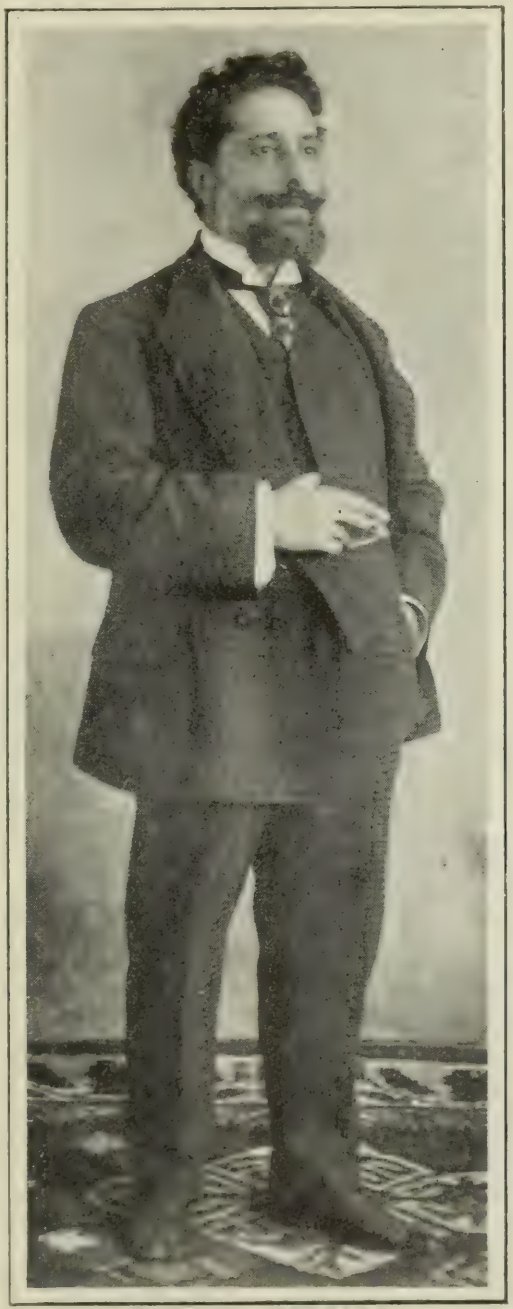
present there is quite enough unborrowed trouble confronting the anxious delegates at the Central American Peace Conference.

WASHINGTON, D. C.

MUSIC ART AND DRAMA

Metropolitan Operas



At the Metropolitan Opera House, which began two weeks later than the Manhattan, there has been so far one novelty—Cilea's "Adriana Lecouvreur" —and one revival—Wagner's "Flying Dutchman." The Cilea opera was appropriately chosen for the opening night, which is largely a social function, all the morning papers giving three times as much space to the audience as to the performance. "Adriana Lecouvreur" does not afford Caruso opportunity to show his vocal art at its best, but it gives Madame Cavalieri a chance to show her rare beauty to great advantage, and she made the most of it. Were her voice as beautiful as her face, she would have few rivals on the stage. The libretto of the opera is based on the well-known play of Scribe and Legouvé. Like so many other Italian librettos based on plays, it has too much prosaic dialogue, which is very difficult to set to music. Cilea has not overcome the difficulties, and there are many dull minutes in his score. The music frequently suggests other contemporary composers, and its chief trait is perhaps sentimentality. There are several numbers that rise above the commonplace, but not enough to redeem the opera.

"The Flying Dutchman" had not been heard at the Metropolitan for nearly seven years, and its revival was therefore looked forward to with pleasant anticipations. This opera has a way of disappearing. After its first performances in Dresden, in 1843, it was shelved for twenty years in that city, but gradually it became what the Germans call a repertoire opera. Wagner's musical genius was slow to develop; he was only twenty-eight when he wrote this opera, and there are not a few weak pages in it. Yet the extraordinary realism of the storm music, the merrily melodious spinning chorus, the weirdly sentimental ballad of Senta, and the splendidly effective responsive choruses in the last act in view of the ships cause it to be revived again and again. It was rumored that Mr. Conried had surpassed Bayreuth and Munich in the realistic presentation of Daland's vessel and the Dutchman's phantom ship, and rumor proved correct. The cast was exceptionally strong. It included Gadski, Knote, Van Rooy, Blass and Dippel, who, like a true German artist, was not above taking the small rôle of the steersman. Fortunately Mr. Conried did not follow the foolish Bayreuth precedent of giving the opera in one act, like "Rheingold."

The production of Boito's "Mefistofele," with Geraldine Farrar and the Russian basso Chaliapine, has been another notable event at the Metropolitan. Miss Farrar returned with her lovely voice improved in its weak spots and her histrionic art as fascinating as ever. She had a most cordial reception; no one seemed to bear her a grudge on account of the interview in a Berlin paper in which she was alleged to have said that Americans knew nothing about art. Chaliapine's début came near being marred by a Russian clacque, which he did not at all need, for his success with the American audience was instantaneous and emphatic. He is not the usual subtle, crafty devil of the operatic stage, nor does he seek out humorous touches. The impression he makes is chiefly physical; he is a man of remarkable size, weight and muscular development, and the dramatic power of his impersonation is emphasized by a huge, robust voice, of which he makes good use.

It would be impossible to find any one

more antipodal to this Russian bass than the Italian tenor Bonci. When Mr. Conried engaged him there were not a few who predicted that his small voice would be almost inaudible in the vast auditorium of the Metropolitan. They forgot that the carrying quality of a voice does not depend on its bigness, but on its purity and the manner of tone-production. Bonci's voice carried without diminution of volume to all parts of the house, and the only drawback to enjoyment was that he sometimes forced it needlessly, which caused it to deviate from the pitch. His vocal art, as the Duke in "Rigoletto," was greatly relished by the connoisseurs, and so was the singing of Madame Sembrich, who, as Gilda, appeared once more as the very embodiment of the *bel canto*.

RODOLFO FERRARI.
New leader of the Metropolitan Orchestra.

Offenbach's Fantastic Opera

Any man who relieves the monotony of the current operatic repertory must be called a public benefactor. Mr. Oscar Hammerstein is such a man. He is keeping his promise of making operagoers in this country familiar with the works that are at present particularly interesting the the Parisians. The first of them was them was "The Tales of Hoffmann," the last of the stage works of Offenbach, who died before it was quite completed. It was a brilliant success when first produced in Paris in 1881; but the accidental circumstance that it was during a performance of it that the Ring Theater in Vienna was burned, with a loss of four hundred lives, created a superstitious prejudice against it. A recent revival, with some modifications, in French and German cities, was welcomed so cordially that Mr. Hammerstein wisely concluded to try it at the Manhattan Opera House. It was in reality a revival, for Maurice Grau once gave four performances of it in New York; but that was twenty-five years ago, and with artists who were inferior to the present cast, which includes Renaud, Dalmores, Gilibert, De Cisneros, Jomelli and Zeppilli.

Offenbach had good reason to call his last work an *opéra fantastique*. Its plot is unique. Any one of the acts might be transposed or left out without seriously affecting the opera! The explanation is very simple: The hero, who is the German poet Hoffmann, is represented in the prolog as telling to his student friends in a tavern his several love affairs; but instead of hearing him relate them, the audience sees them enacted. The first love proves to be a skilfully constructed automaton; the second is a Venetian courtesan who, after inducing him to kill a rival, turns her back on him and departs in a gondola with another admirer; the third is a consumptive singer who has been forbidden to use her voice. Urged on by the demoniac Dr. Miracle, and by the picture of her mother, brought back to life by him, she disobeys her doctor and sings herself to death. Musically this opera differs from Offenbach's operettas in being free from buffoonery and in an even more serious

attempt to make the music suit the words and the action. There are some pleasing melodies, too, and altogether the opera is a welcome addition to the repertory.

Mary Garden and "Thais"

It is undoubtedly easier for an American student of music to find employment and win fame in Europe than in America. The reason is not far to seek. We have only half a dozen grand opera companies in this country, while Europe has over two hundred. At these the Nordicas, Eameses, Fremstads and Farrars become celebrities, and then return to delight us with their accomplishments. The latest example is Miss Mary Garden. Five years ago the indisposition of the leading singer at the Opéra Comique in Paris gave her an opportunity, of which she made brilliant use, and in a short time she became one of the operatic stars in the Parisian firmament. She is considered at her best in Charpentier's "Louise" (which gave her the opportunity just referred to), in Debussy's "Pelléas et Melisande," and in Massenet's "Thaïs." The last named was chosen for her New York début; the others are to follow.

"Thaïs" was new to local operagoers, but Paris heard it thirteen years ago. It was written for an American singer, Sibyl Sanderson, and it is likely that if Miss Sanderson, on her return to America, had been as successful as she was in Paris, she would have introduced it here. It remained for Miss Garden to be the first to impersonate the Egyptian priestess of Venus, who is persuaded by the zeal of the monk Athanael to renounce her life of sin and become a saint—while her saintly rescuer becomes a sinner. Anatole France's story, as adapted for the stage by Louis Gallet, appealed strongly to the fancy of Massenet, who wrote for it some of his most mellifluous and ingratiating music, parts of it tinged with Oriental color, and all of it melodious and entertaining. The two rôles of Thaïs and Athanael seem to have been created for Miss Garden and M. Renaud; the eminent French baritone is not only a good singer, but as an actor he has hardly a superior on the stage today; he was every inch the fanatic, infatuated monk. Miss Garden proved to be a good singer, not of the first rank; but in passionate moments her vocal art reaches a high level. Her uncommonly attractive personality she succeeded in merging in the part of Thaïs in a really remarkable manner. Whether Massenet's opera was a success remains to be seen; Miss Garden certainly was.

Large and enthusiastic audiences heard the first performance of the Offenbach and Massenet operas. Apart from them, Mr. Hammerstein's repertory has been made up chiefly of old favorites like "Carmen," "Faust," "Aïda' and "La Giaconda." In the two last-named ones, triumphs were won by Madame Nordica, Mr. Zenatello and Mr. Campanini, the wonderful conductor, who is always "half the battle."

The Oratorio Society

For several years reports have come across the ocean of the growing popularity in Germany, Italy and Holland of Wolf-Ferrari's choral work, "Vita Nuova." These reports induced Mr. Frank Damrosch to attempt a production of this cantata at the Oratorio Society's first concert, altho experience has shown that American concert-goers are even more wary of novelties than opera-goers. The audience, as was to have been expected, was not a large one, but there was plenty of applause, altho the performance as a whole was hardly up to the usual level of this organization. Wolf-Ferrari was only twenty-five years old when he penned this work, yet it is replete with contrapuntal intricacies that make it difficult of execution without a great deal of rehearsing. It cannot be said that the solo parts are particularly agreeable. They were in the hands of Miss Edith Chapman Goold and Mr. Giuseppe Campanari, and considering how much the parts were written against the grain, the vocalists acquitted themselves creditably. In the combination of instruments the composer has tried some unusual effects, but the strength of the cantata lies in its choruses. Beside two four-part mixed choruses, the work calls for a choir of boys' voices, and in the massing and contrasting of these Wolf-Ferrari has

secured some impressive effects. His cantata was preceded by Brahms's familiar "Song of Destiny."

Orchestral Concerts

Poles and Russians are, as usual, playing an important rôle in the season's musical life. Reference was made in our last review to the concerts of Josef Hofmann and Paderewski. Since then Vladimir de Pachmann has also been heard. He used to be famed as an interpreter of Chopin—at least the lighter Chopin—but of late he allows himself so many liberties with the text of that incomparable composer that one has to exercise much forbearance to relish his good qualities—his sweet tone, his marvelous variety of touch and his limpid execution. At the orchestral concerts Russian music has been much in evidence. The Russian Symphony Society, under Mr. Modest Altschuler, has made us acquainted, almost before the ink was dry, with Glazounoff's latest symphony —his eighth. It is beautifully orchestrated, but is not otherwise a masterwork. The Philharmonic Society's Russian conductor, Mr. Safonoff, has given delightful interpretations of Tschaikovsky's fourth symphony and Rubinstein's "Ocean Symphony." The latter, after several years' neglect, was most welcome to the audience. Paderewski, too, has brought forward the Russian Rubinstein prominently by playing his splendid D minor concerto at the New York and Brooklyn concerts of the Boston Symphony, which, since Dr. Muck became its conductor, always plays to crowded audiences.

Mr. Walter Damrosch is certainly the most original of program makers, and with the rejuvenated New York Symphony Orchestra he is able to give his selections an effective performance. One of his Sunday concerts at Carnegie Hall was devoted entirely to Dvorák, the Bohemian who came to America and wrote the "New World Symphony," the greatest orchestral work ever composed on this side of the ocean. Another one was Celtic in its make-up, being devoted partly to Grieg (whose paternal ancestors were Scotch), partly to the Irish Villiers Stanford and to the "Welsh Rhapsody" of Edward German, who had come over here to superintend the production of his charming operetta, "Tom Jones," and who remained to conduct his "Rhapsody." Still another unique program was that which was devoted to "The Family." It contained three numbers: a "Hymenaen," which Dr. Leopold Damrosch composed to celebrate his silver wedding; Richard Strauss's "Sinfonia Domestica," and Wagner's "Siegfried Idyll."

The New Kneisel Quartet

There was great consternation among the lovers of chamber music last Spring when it was found out that the Philadelphia Orchestra had offered its conductorship to Mr. Franz Kneisel, and that he was inclined to accept it. Not that his quartet concerts were unprofitable; quite the contrary; but he objected to spending so much time traveling, and, what is more, he was about to lose his second violinist and his violoncellist. Luckily some wealthy patrons made up a fund, doing away largely with the necessity for touring. Mr. Kneisel then went abroad and succeeded in obtaining two excellent associates to replace those he had lost. The season's first concert showed that the Quartet was as good as ever, playing with the precision, the beauty of tone, the purity of intonation, the refined shading and the excellent ensemble that have for sixteen years characterized the Kneisels, who have not their superiors, perhaps not their equals, in Europe.

National Society of Craftsmen

The exhibition held at the National Arts Club from November 20th to December 11th was not entirely devoted to present day work. The club itself furnished many groups of antique specimens in various crafts, which, tho not in themselves the best examples of the work for which they stood, with some notable exceptions, such as the ikons and samplers from the Drake collection, nevertheless served to mark our present day art craft products as merely rudimentary in beauty and taste. The jewelry designs on exhibition, when not affectedly simple, were ugly and uncertain. The modeled work was deplorably bad, and

in spite of the exceptions noted, the effect of the collection as a whole was to impress one in the belief that beauty is not attained by setting half-trained people to do things by hand. Still, we must have beginnings, and the Society of Craftsmen will doubtless go on to better things. The wood carving, pottery and bookbinding arts were best represented, and of the work of schools in this vicinity the embroideries from the Y. W. C. A. Art School showed most promise.

THE ARTS AND CRAFTS EXHIBITION.

The interest in this exhibition centers upon the fact that the Arts Club has in it assembled for the first time a comprehensive exhibit, not only of modern craftwork, but interesting examples of antique handicraft as well

At Knoedler's were shown last month a few portraits by Harrington Mann, whose work counts with the best London sees every year. It is in no way remarkable work, but neither is it meretricious thru cheap cleverness, as are so many technically good portraits by the men who succeed today. A group of a woman reading to two children seated by a hearth and lighted by the fire—called "A Fairy Tale"—had much charm of sentiment, and the faces and natures of several children were well rendered in this exhibition.

The weaknesses in the work of Louise Heustis, shown at Knoedler's, since the Mann portraits were removed, are very pronounced. Excepting a certain amount of vigor, which, however, expresses itself

in forced action and restlessness in arrangement of masses and lines, this painter has as yet very little to show. Her color is occasionally good in places, but she has made no portrait a good picture so far. She places her sitters badly on the canvas often, and then paints with memories of the way others have done, and the result is insincere, tho often the attempt is a bold one.

Landscapes

Mr. Macbeth showed fifteen extremely delicate and promising canvases by Augustus Vincent Tack, in which, beyond and excepting the touch of Japanese influence which no searcher for beauty in our day can escape if once subjected to it, one felt only a sincere and refined personality acted upon by all the moods of New England except the bitter and the hard. Mr. Tack's color is very beautiful, tho not yet deep.

Altogether different and blatant by contrast was the work of Hugh Breckenridge, shown at the Fishel, Adler & Schwartz Gallery. We have often commented admiringly upon the vigor and selective power of Mr. Breckenridge's art when seen in the general exhibitions, but thirty-eight Breckenridges seen by themselves were overpowering. He is not one of the men whose work contains delicacies that suffer in the clash of a large academy show, but rather a person of such exuberance of spirits that he could shout his way amongst any number of competitors, while left alone he is seen as too crude. The figure picture called "Summer" would have gained greatly by a more careful relation of eye to mouth in drawing, but decoratively it had great beauty. Nothing here was as good as his portrait at the Water Color Club last month.

Mr. Paul Dougherty, who has been painting only seven years and is only thirty years old, has accomplished wonders. As told of Breckenridge, he has the real color sense which the other lacks, and the deeper mentality that must be behind broad work. Brooklyn, his birthplace, has had a sight of twelve of his pictures and twelve sketches in the Pratt Institute Gallery this month. Most of his works are already owned by collectors or museums.

Different again, and of the kind which, like the late John Twachtman's, waits for appreciation until a life has been lived and ended, are the works of Charles Austin Needham, shown at the New Gallery, November 19th to December 7th. Here one felt that only a quiet private exhibition could allow one to realize these poetic dreams and to be played upon by the emotional appeal of the color. Such a thoroly religious picture as "The Fourth Watch" is rarely seen in New York. One almost felt Blake's visionary power.

It is interesting to note in this connection that the Worcester Museum has recently bought a Twachtman for $3,500, the sixth public museum to acquire a picture by this painter.

Decorations

The absence of large galleries in this city as a rule deprives us of the chance of seeing mural works, orders for which are happily multiplying thruout the country. Two of La Farge's decorations for the Baltimore Court House were shown privately at the Century Club last month. One has a splendid Moses as a central figure, with Joshua and his brother near. The other the great Byzantine Justinian, with his Empress and a counselor. Both treated with the usual splendor of color and gold which only La Farge can give us out of his vast storehouse of impressions gained all over the world.

Other decorations of importance recently finished or in progress are the panel of "Justice," by W. B. Van Ingen, for the Indianapolis Court House; the first part of the great series for Pittsburg Institute, by J. W. Alexander, and a decoration for the beautiful new hall of the College of the City of New York, by E. H. Blashfield.

Etchings

Mr. Montross's treat for the week ending December 7th was an exhibition of the etchings, mostly of street scenes, by Charles Henry White. These included bits of the more picturesque and bedraggled sections of New York, Philadelphia, New Orleans, Boston, Richmond, Charleston and Salem, with one from Venice. As etchings they were all very

clever in handling, a few—notably in the New York series "The Shipsmith," in the New Orleans series the "Spanish Prison" and "An Old Courtyard," and the "Belle Isle" of the Richmond series—were impeccably fine in design as well. Occasionally he is too exact and real to please, as in the "St. James," Richmond, and often his figures are out of accord by being strange in scale, but on the whole the plates show an accomplishment in the art of etching not often attained.

The Drama

The season so far has not been rich in successes from either the artistic or financial standpoint. The three that stand out most prominently are Ibsen's "Master Builder," in which Madame Nazimova appears as Hilda; Belasco's play of life in a country town of Indiana, with David Warfield as the Grand Army Man, and Thomas's new play, "The Witching Hour." This last is interesting because it makes ingenious use of the supernatural—not the old-fashioned ghosts and witchcraft—but the modern pseudo-scientific, endorsed by the Society for Psychical Research. Concerning these things the public is now in a receptive attitude, ready to acknowledge that "there's something in it," and willing to be led to believe that there is a great deal. So even the climax of the play, that a departed spirit has influenced a decision of the Supreme Court of the United States, does not arouse sufficient skepticism to disturb the enjoyment of the audience. If the Supreme Court were never affected by any more material and malign influences than deceased Kentucky belles we would be better off. Still it is to be hoped that such "psychics" as the character interpreted by John Mason in this play will remain as rare as they are—too rare to be found. A gambler who could read cards thru their backs and tamper with a jury by telepathy would be an undesirable citizen. The play is well constructed and admirably acted. The moral which Mr. Thomas enforces, the desirability of pure and wholesome thoughts, holds whether his psychology is sound or not.

The visit of Mrs. Patrick Campbell and her company gave us an idea of how the modern drama of the Ibsen-Sudermann-Pinero type is done in London. Mrs. Campbell is a beautiful, stately and effective actress, well qualified to render the rôles of more or less emancipated heroines, who are the heroines of such plays. The Notorious Mrs. Ebbsmith is a woman of other ideals than those that nature desires and society dictates. In spite of her determination to live her own life as she thinks best, the conventional morality is victorious, forcing her back into the old, well-worn track which humanity has found by the experience of many thousand years to be safest and best.

"The Toymaker of Nuremberg," by Austin Strong, is a farce of the sentimental and pathetic kind, too grotesque and exaggerated to produce its intended effects. The dear old German toymaker, who has been making dolls for half a century, finds himself thrown out of employment because he refuses to make Teddy bears instead, but he is saved by his son, who comes back from Kansas City rich—"not German rich, but American rich"—having made his fortune by cornering the Teddy bear market.

"The Morals of Marcus," by W. J. Locke, is a comedy of English society, with the unconventional addition of a Syrian heroine—a refugee from a Turkish harem. What this child of nature says and does to shock the social conventions of British aristocratic respectability are familiar to those who read the novel, which appeared two years ago. Marie Doro, who assumes the rôle of the Syrian, is a charming actress. She has a beautiful, fresh and almost Oriental face, and her figure is lithe and graceful. Her voice is both tender and dramatic, and her broken English most fascinating. The rest of the cast rendered excellent support, especially the Sir Marcus of Mr. C. Aubrey Smith. "The Morals of Marcus" is a strong, if untrue to life, society comedy.

All musical comedies sound alike to us. "Tom Jones," however, is replete with real music, and it is not stretching a point to say that not since the days of Sir Arthur Sullivan have we had anything more genuinely fresh and good. The less said about the wit of the dialog, however, the better. It is not even on

speaking terms with W. S. Gilbert. The comedy is founded on Fielding's classic masterpiece of the same name, tho Tom's peccadilloes are not so much in evidence on the stage as in the novel. In fact, Tom is a rather conventionally virtuous sort of good fellow. But the music is the redeeming feature of the play. It is by no less a composer than Edward German, whose ambitious symphonies have already been played by the best orchestras of England and America. In "Tom Jones" he most successfully imitates the old English folk music, in which the lines "fol de rol" and "hey nonino" were made to do such yeoman service. To sum up, "Tom Jones" is poorly written, acceptably acted and beautifully sung.

The experienced John Drew is always good. In "My Wife," a comedy from the French, he is once more the astute man of the world. Clever, yet liable to error, as are all men, he is withal a good husband, and ultimately falls in love with his own wife, whom he married for convenience. Miss Billie Burke, Mr. Drew's leading woman and an English importation, is bright and full of vivacity. The movement of the play is smooth but rapid, and its moral tone has been greatly strengthened by its translation into English.

"The Rejuvenation of Aunt Mary" is an American comedy taken from Annie Warner's book of that name, in which May Robson plays the leading rôle. It is mostly horseplay and fun, and Miss Robson is the whole show. It depicts the startling experiences of a set New England spinster on entering the Bohemian life supposed to prevail in the great American metropolis. If it does not appeal to a high order of intelligence it can do little harm. But no New England people ever talked as the actors do, and no members of our "smart set" were ever quite so smart as Aunt Mary's nephew and his boon companions.

Francis Wilson, in his new comedy extravaganza, "When Knights Were Bold," neither sings nor dances as of yore. The cold he has in his head prevents singing, and dancing has no place in the "legitimate" drama, into which Mr. Wilson has now entered. "When Knights Were Bold" follows somewhat the lines of "The Road to Yesterday"; that is, the second and third acts take the audience back to the good old times of chivalry, which do not seem so good when we get back to them. The play is exceedingly amusing thru the efforts of Mr. Wilson.

Bunyan's "Pilgrim's Progress" has given comfort and inspiration to a multitude of devout Christians, but the Pilgrim on the stage is quite another thing. For, altho there are many scenes portrayed in the book which can be put on the stage, yet the story, or dream, cannot be played to advantage, for the reason that it does not deal with morality or conduct, but with intensely spiritual experiences. That is to say, it has to do with salvation in its narrowest sense. The temptations which beset the Pilgrim are not such as come to men in the ordinary affairs, or even in the critical periods of life, but are specifically temptations to turn back and forsake Christ. Altho great pains and expense had been taken to give the play an elaborate scenic mounting, it did not succeed in striking the popular taste.

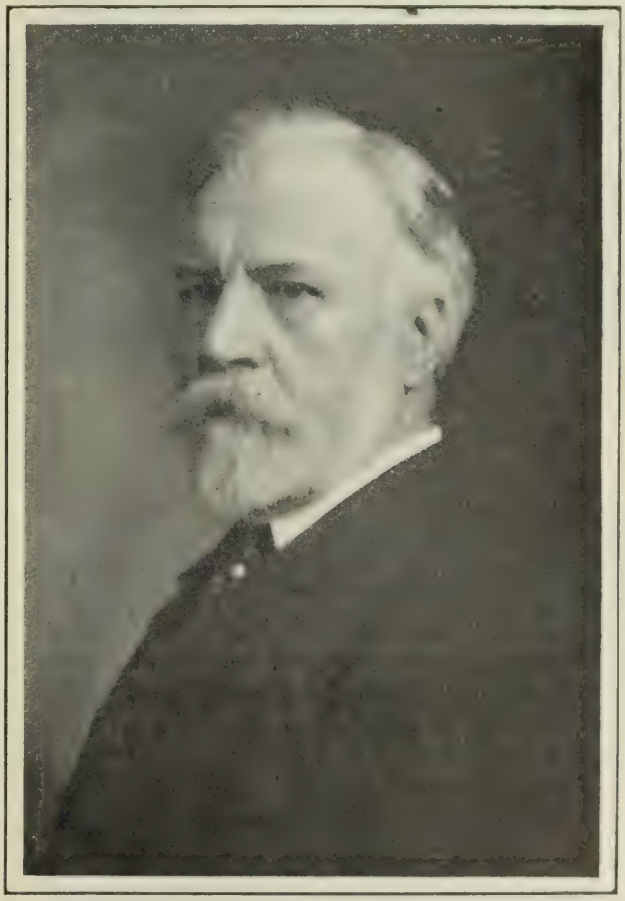
Politics, Books and Persons in England

BY JUSTIN McCARTHY

LONDON is just now enjoying or enduring the festivities belonging to the visits of Imperial and Royal strangers, to the sixty-sixth birthday of King Edward himself, and to the Lord Mayor's day, and the historic pageantry attaching to its celebration. Now, whether the Londoner ought to be described as enjoying or enduring the effects of these entertainments depends very much upon who the Londoner is and what his position in society and the quarter in which his home is set up. I do not myself profess to attach much importance to the friendly visits of Imperial and Royal personages to England, but I am really inclined to believe that the visits this time do bring with them serious promise of improved peaceful relations among the great European states. King Edward VII has certainly proved himself as the years go on a ruler more and more capable of maintaining a policy which leads toward a good understanding with other states and toward the direction of the common policy of all to peace and the prosperity which must be mainly founded on peace.

Just before these recent and present celebrations the public of these islands had received the news long anxiously waited for that the great crisis in the work of our railway systems had been brought to a satisfactory settlement. The settlement, to be sure, is not as yet absolutely final, but it at least proclaims a truce between the contending interests and gives ample opportunity for a permanent arrangement between the representatives of capital and the representatives of labor in our railways. The representatives of capital, in other words the directors of the various railway companies, refused for a while to recognize the union of the railway workers as a body entitled to ask for a conference and the position thus taken up seemed at one time to render any satisfactory arrangement absolutely impossible except thru the direct and overruling interposition of the Imperial Parliament. Then indeed the condition of things appeared well-nigh desperate. The railway workers were practically unanimous in their resolve to stand together, and if the railway directors would not recognize their right to be even admitted to a conference there seemed nothing for it but a strike of the workmen, and thus the absolute stoppage of all railway traffic for the time thruout the kingdom.

Already it began to seem that the Government and the Houses of Parliament would have to interfere and to pass rapidly some measure of legislation which should settle the whole dispute by the high hand. Then came into play the personal intervention of Mr. Lloyd-George, the Secretary to the Board of Trade, who went into council again and again with the representatives of each side of the dispute, was accepted willingly or unwillingly by the directors, was welcomed warmly by the workers and was able at last to induce the directors to come down from their high horse and treat with the representatives of the workingmen. The conferences are now to be continued until some satisfactory arrangements shall have been made and in the meantime the danger of a strike has been entirely averted.



It is still regarded as possible that Parliament may have sooner or later to adopt some measures of legislation which shall insure more moderate hours of labor and better pay for the railway workingmen on whose health and vigor and on whose nerves so much of the safety of the whole travelling public must necessarily depend. There is even a very strong and general feeling abroad thruout the country that the whole quarrel may possibly lead to the state becoming the owner of all the railways thruout these islands and working them, not for the mere creation of dividends, but for the benefit of the whole community.

In the meantime Mr. Lloyd-George has become the hero of the hour, is the subject of the chief cartoon in *Punch,* his name is spoken with praise all thru these islands and in other countries too, and he has made a name and a position for himself which would be a triumph

for any career. The parliamentary career of Lloyd-George had indeed for several years been distinguished and even brilliant. He is a Welshman by birth and he entered the House of Commons in 1890 as the representative of a Welsh constituency. I can well remember his early years in the House of Commons, where from the first he attracted attention by his great skill in debate and by the genuine eloquence of his style as a speaker, his voice and manner giving an added charm to every spoken sentence. He was an advanced Liberal in his political creed and he soon became recognized in the House as one of its most ready, effective, and fascinating debaters. When the present Liberal Ministry was formed Lloyd-George was made Secretary to the Board of Trade, and that position gave him the opportunity of trying his hand at the great work of mediation which has thus far proved so splendid a success. I sat for many years in the House of Commons while Lloyd-George was winning his celebrity there, and I felt sure from the first that he was destined to hold a high position in some Liberal Administration.

Sir Henry Campbell-Bannerman has more than once during the last few weeks announced the resolve of his Government to adhere to their program of policy with regard to the great questions of national education, the licensing system, and the restriction of the legislative powers so long enjoyed and so often misused by the House of Lords. With the opening of the next session, now not very far off, this policy is to begin its work of legislative reform. The Prime Minister is a man on whose promises Parliament and the public already know well that the most thoro reliance can be put. He never blusters, he never even seems to be making himself up for any portentous resolve, and with his happy gift of humor he always appears as if he were undertaking some easy and even agreeable duty. There can be no question, however, but that Parliament and the country are in for a most heavy time of it during the coming year. It is almost certain that by far the greater part of that year will be occupied by succeeding sessions of both Houses and that the members of the representative chamber will find their intervals of holiday recreation very severely diminished. The members of the hereditary chamber can, of course, have a more easy time of it, but even they will be expected to occupy their crimson benches while the various clauses of the Government measure with regard to the licensing public houses are under discussion and when the new Education Bill comes on, concerning which the Liberal Ministry propose to make their appeal to the country for a limitation of the destructive power in legislation hitherto enjoyed by the House of Lords.

We have had some very remarkable literary works published in England since I sent my latest article to THE INDEPENDENT. One of the most remarkable is the novel called "All Moonshine," written by Richard Whiteing and published by Messrs. Hurst & Blackett, of London. I have called this book a novel because it presents itself to the reading world merely as such, but the name of novel would certainly not prepare the reader for such an extraordinary literary production as that which Mr. Whiteing has given to the world. It is at once a dream-story, a love-story, a poetic allegory in prose, and a rapturous anticipa-

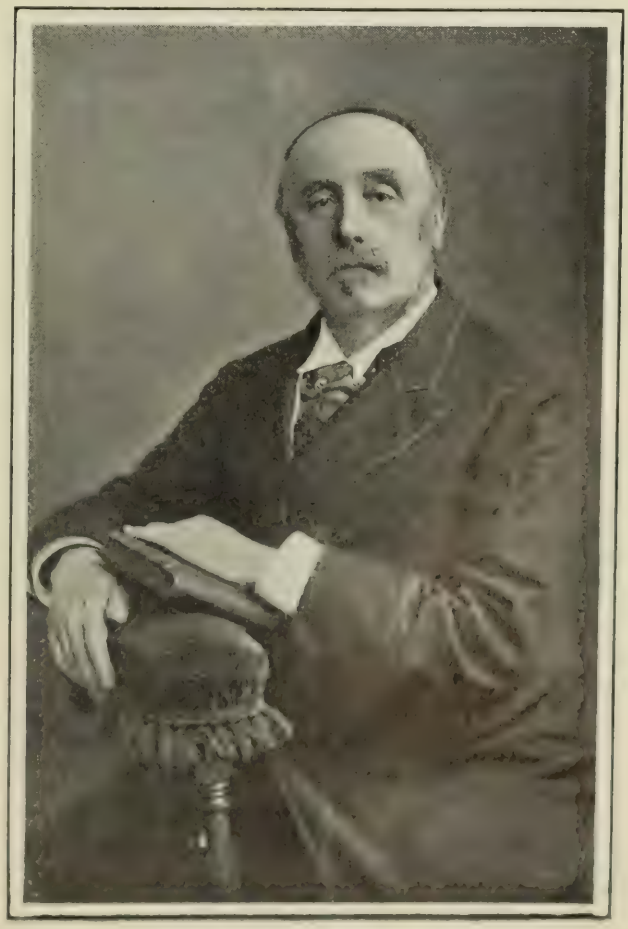
ARTHUR RANSOME.
Author of "Bohemia in London."

tion of a time soon to come when mankind is to be freed from the devastations of the war spirit. It is sometimes a satire, sometimes a prose-poem, sometimes a fairy tale, and the reader absorbed in its pages finds himself unable to say in which of these fields of literary production the author makes the greatest success. The love-story, which runs thru and keeps together the whole narrative, is in fact a continuation of a novel, "The Island," written by Mr. Whiteing some years ago. For Mr. Whiteing's present purposes the gods annihilate both time and space, but not to make two lovers happy—rather to help them in the accomplishment of a magical work which is to make the whole world happy by re-establishing the reign of peace. The critic is spared all trouble of raising questions as to possibilities or probabilities when dealing with the dream-story, which proclaims itself to be "All Moonshine." The reader will find himself carried away by the story in all its moods and will fancy many a time that he is actually looking on some of the marvelous scenes which the author causes to pass, panorama-like, before his eyes. All the brilliant peculiarities of Mr. Whiteing's style, peculiarities which have made for him a distinct reputation, are shining thru the pages of this book. The author is now humorous, now melancholy, now sarcastic, now grimly severe, and in each mood he seems to find the same felicities of expression. "All Moonshine" may, of course, be classed among what used to be called novels with a purpose, but in many even of the most successful and famous novels which used to be described by that name the reader sometimes found that the purpose overshadowed or almost extinguished the story, and that he was only reading a tract put into allegorical form. This fault cannot certainly be found with Mr. Whiteing's new story, because we feel from first to last the deepest interest in the hero and the astral Nyleia, notwithstanding the devotion which they both display to the promulgation of the arts of peace, and notwithstanding also the magical means by which the crusade for peace is supposed to make its way. Richard Whiteing has indeed long been recognized as a man endowed not merely with great talents, but with that gift which must be called genius, and I feel well convinced that "All Moonshine" will give the world of readers another reason for admitting him to that limited circle of living authors on whom such praise is fittingly bestowed.



I have been reading with much interest a book bearing the title of "Bohemia in London," and published by Messrs. Chapman & Hall. The author of this volume is Mr. Arthur Ransome, and I feel very confident that "Bohemia in London" will prove a distinct literary success. Bohemia, I need hardly tell my American readers, is that bright, fanciful realm or republic of letters, arts, and limited means founded in Paris by Henri Murger so long ago as 1845. It has established its outlying settlements in many lands, and I feel well assured that the New World as well as the Old has sheltered some of its communities. I have had a good many opportunities of making myself acquainted with that Bohemia in London which Mr. Ransome describes in his volume, and I can say with conviction that the book gives the most life-like

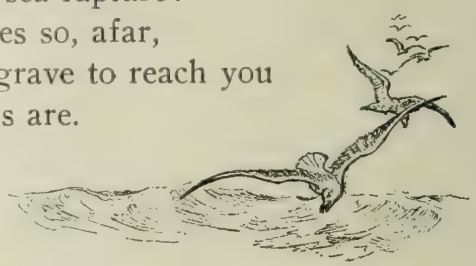
picture of that London quarter which the author sets himself to describe. The "Bohemia in London" is distinctly British and not Gallic; it is founded on the same code of laws as that which prevailed in the more famous Bohemia of Paris; there is no exaggeration in its pictures and there is no suppression of realities. The book is rich in humorous descriptions and portraitures, has many pathetic scenes, and gleams here and there with genuine poetic feeling.

Messrs. Chatto and Windus have issued this month another of their beautiful Color Books. This one is about "Cairo, Jerusalem and Damascus, three chief cities of the Egyptian Sultans." It is written by D. S. Wargoliouth, Litt. D. The color pictures are by W. S. S. Tyrwhitt, R. B. A. and Reginald Barratt, A. R. W. S.; the line drawings by P. B. Whelpley. The book itself is intensely interesting both in its historical account and its description of these three great cities and is profusely illustrated with most beautiful pictures and drawings of the famous places in them. The difference of "atmosphere" of Cairo and Jerusalem which, though both so distinctly Eastern, are yet in many ways so unlike, is wonderfully conveyed. These two great cities I know well. I have never been in Damascus, but the pictures of it in this book make me long to go there and, indeed, this delightful volume must give almost equal pleasure to those who have been in the places and those who have not, for it seems to take back those who have been there and it brings the scenes and places to those who have never actually seen them. The Cairo, Jerusalem and Damascus Color Book is certainly one of the most beautiful of the series.

While I was still occupying myself with the short and rapid survey of recent literary productions the news was brought to me that literature has suffered a loss by the death of Sir Lewis Morris. We are not living just now in an age of great poets and certainly no one could feel inclined to claim for Sir Lewis Morris the rank of a great poet but he was unquestionably very popular in his time and his "Songs of Two Worlds," and the "Epic of Hades" each obtained a sudden and widespread popularity. Sir Lewis Morris was born in Wales in 1833, and was called to the bar and for some years occupied himself in the business of conveyancing and he actually presented himself on more than one occasion as a candidate for a seat in Parliament, but he did not succeed in his efforts and he soon gave up law and politics alike and kept himself to his favorite work—the production of volumes of verse. His poetic efforts do not seem to me to have ever risen to the high level of genuine poetry, but they were unquestionably very popular, and when the death of Tennyson was expected there was a general impression that Lewis Morris would be created his successor as Poet Laureate. The choice, however, fell upon Mr. Alfred Austin who thus and thus only became the successor to Lord Tennyson. Lewis Morris was very popular in London society and during several years I had frequent opportunities of meeting him. As to the office of Poet Laureate I cannot help thinking that the title might well have been allowed to drop when Tennyson passed away. The poet is born and not made, and I think something the same might be said of the Poet Laureate.

London, England.

SIR LEWIS MORRIS.



Short Beach

BY THE LATE RICHARD HOVEY

Oh, the salt wind in my nostrils!
And the white sail in the creek!
And the blue beyond the marshes!
And the flag at the peak!

My soul lifts to the bugles
Of a far call on the breeze—
The cry of my storm-kin calling
Overseas, overseas!

Blow horns of the old sea-rapture!
When your call comes so, afar,
I would rise from the grave to reach you
Where the sea-dooms are.

Government and Publicity

BY HENRY BRUÈRE

[The following article is an account of the work of the Bureau of Municipal Research of the City of New York by its Director. We comment on it in our editorial columns.—Editor.]

THE Bureau of Municipal Research is an agency for the promotion of efficiency in the administration of cities. Its program is a program of publicity. It believes that the publication of *facts* respecting the acts of government will not only prevent specific acts of misgovernment, but ensure a progressive development of governmental efficiency by providing a basis for the exercise of intelligent popular control.

Historically, the bureau is an outgrowth of the repeated failure of political reform movements in New York and American cities generally. These movements, regularly predicated on the patent corruption of particular administrations, as regularly dissolved after a brief and disheartening period of power. The two years of the Low administration, characterized in many ways by excellent service, resulted in the return to power of Tammany. Men were not convinced that the administrative methods of reform were essentially different from those of Tammany, should Tammany assume respectability. Reform had failed to make an appeal to the popular imagination which Tammany could not surpass The public continued to think of government in terms of personality, because reform, like Tammany, had governed thru personality.

At the close of the first McClellan term in 1905 the reformers had no issue. Since no scandals had cropped to the surface there was nothing to galvanize opposition. The Republicans had no program until the eleventh hour, when Mr. Ivins came to the rescue of his party. The Citizens' Union, the foster mother of reform, had barely vitality enough to echo the promises of Jerome. Mr. McClellan's re-election scarcely would have been disputed had not Mr. Hearst entered the field to undermine the foundations of Tammany on the collateral issue of public ownership of public utilities.

What had actually happened during the two years of Mr. McClellan's administration nobody knew. The Citizens' Union found satisfaction in the belief

that the example of the reform administration had raised the standards of Tammany. No one asked: What has Tammany accomplished and how has the public business been transacted? Has the tenement house law been enforced? Have the streets been properly cleaned? Has unnecessary sickness been prevented? Have children died needlessly from infected milk in summer? Does the death rate indicate an efficient Health Department? Are there adequate sittings for school children, and if not, why? Have the public funds been productively and economically expended? Has every dollar spent produced a dollar's value in result? Are the poor receiving the value of their taxes?

To a group of social workers who realized that the poor man's good government must be an efficient government, and that the poor do not consciously prefer the glad hand and cheap bounty in the form of a Thanksgiving turkey, shoes or burial money, to decent tenements, clean streets, attractive parks, pure milk, and educational opportunities for their children, it seemed indispensable to intelligent action by an independent electorate that there should be a perpetual agency for securing publicity of the facts respecting government.

It was not urged that the publication of the facts would prove damaging to Mr. McClellan. It was contended, however, that unless Mr. McClellan or any other administrator, however gifted in leadership, knew the facts, it was a safe assumption that efficient administration of his office could not be possible to him.

Dr. William H. Allen, at that time general agent of the Association for Improving the Condition of the Poor, proposed to Mr. R. Fulton Cutting, the chairman of the Citizens' Union, that that body conduct a bureau whose function it should be to accumulate and publish information relating to the government of New York City. In January, 1906, the Bureau of City Betterment was organized under the control of a subcommittee of the Citizens' Union. The bureau's staff consisted of a secretary and three assistant investigators, $12,000 being provided for the first year's work.

The press, persuaded of the futility of reform, was skeptical of this new undertaking of a reform body. Tammany saw in it at best only a temporary inconvenience. It was soon discovered, however, that the bureau was not attempting the accumulation of political capital for one political body as against another. It made its first statement to call attention to the absence of published reports on the operations of many departments of the municipal government, for periods running back from one to four years. It pointed out, for example, that no statement of the work and expenditure of the Department of Street Cleaning had been published during either the Low or McClellan administrations. It called attention, by simple analysis and tabulation, to the significance of statements reporting the increases of salaries in the various departments, found scattered and disordered in voluminous issues of the official city daily. Day after day it gave publicity to facts which, unclassified, would have escaped attention. The Street Cleaning Department was under severe criticism for failure to clean the streets. It was known that its annual expenditure exceeded $5,000,000, but no information was available as to its organization, its methods or its use of its funds. The bureau, in a pamphlet, invited attention to certain facts digged out and compiled from forgotten public records. An aldermanic investigation of the department followed. Wherever publicity was given, public interest was aroused and administrative quickening resulted. The public, for example, suffered continual annoyance from the use of dynamite in building operations. Houses were bombarded by flying stones; workmen were maimed and killed. The bureau undertook an investigation of the agency maintained to control blasting operations, and made a detailed report, after inspection, on its failure to compel contractors to conform to the precautionary measures prescribed by law. The official responsible for the law's enforcement did not survive the publicity given to his incompetency. Attention was called to the delinquencies of public service corporations respecting the payment of obligations to the city. The facts set forth, the city immediately began suit for recovery. The bureau quickly learned that information and publicity of facts

react beneficially on the methods of administration, and the bureau discovered, too, that most public officials welcomed information that would enable them to govern well.

With the co-operation of the Chairman of the Finance Committee of the Board of Aldermen, the bureau undertook an analysis of the departmental estimates submitted for the annual budget. The estimates totaled many millions more than could be provided. In the light of the estimates, even a budget of $130,000,000 appeared inadequate. What were the merits of the requests? Department heads rarely offered reasons or arguments in support of estimates asking for increased appropriations. How was money voted last year spent? What results had it provided? The estimates sent in by department heads did not tell. Money asked for twenty different things was voted in the budget in lump sums less in amount than the aggregate of the twenty requests. How did the fiscal authorities decide what to allow and what to deny? How did they know that money appropriated to this thing was not spent for that? The bureau believed that an unintelligent budget meant an unintelligent administration; that a need which was left unrecognized in the budget meant a need unfilled.

Finding the Commissioner of Health convinced of the need of awakening public and official interest in the problems of his administration, the bureau made an analysis of the Department of Health's expenditure of the funds appropriated to it for the year 1906. It showed how much of the appropriations voted under eleven heads had been spent for each of the forty-nine departmental activities. To make this analysis, a complete redistribution of the expenditures of the department was necessary. The accounts, tho well kept, failed to show what each activity cost. Consequently, the department could make no intelligent appeal for additional funds to support its activities. Since the department stated its case only in generalities, the fiscal authorities could decide only on the basis of these generalities, and, accordingly, cut down the estimates as one cuts off the tops of standing grain. With the department itself and the fiscal authorities uninformed, the public was left hopelessly at sea. With the information of what had been spent for each activity, the bureau urged that allowance be made on the basis of results produced and needs foreseen. The mere consideration of each need resulted in the voting of a budget to the department more nearly adequate than it otherwise would have received. This display of interest in the notoriously perfunctory process of voting the annual budget, determining the scope and direction of next year's municipal program, led the Mayor and the Comptroller and their colleagues in the Board of Estimate and Apportionment to determine that, in the future, all departmental budgets should set forth a specific item for every line of activity conducted by the department, in the manner adopted for the budget of the Health Department.

An intelligent (segregated) budget must be premised on intelligent (segregated) accounts and properly controlled operative records and reports. The bureau, in co-operation with the Department of Health, undertook the provision of this mechanism of intelligent and efficient administrative control. The results of this work are described in a recent bureau publication.*

For the budget of 1908 the bureau, in co-operation with Comptroller Metz and his staff, has, in a similar way, provided information for the functional segregation of budgets for eight of the principal departments. These budgets were based on statements of expenditure classified according to functional activity or lines of work. They represent the judgment of the fiscal authorities as to the measure of support each activity shall receive, and place upon the administrative official the obligation of measuring his expenditure with specific results. The Comptroller has also undertaken the general installation of classified accounts in all departments, this work having been begun in those departments to which segregated budgets have been voted. In this work the bureau is actively co-operating, providing and supervising a corps of accountants.

Tammany grants preferment to its members when they can point to a record of acts friendly to the poor and op-

*Making a Municipal Budget.

pressed. In 1903 Tammany elected John F. Ahearn, a forceful district leader, to the office of President of the Borough of Manhattan, on a legislative record of service to teachers, firemen, police and orphans. Mr. Jerome, popular idol, publicly endorsed Mr. Ahearn as one of the cleanest of the Tammany leaders. His family life was exemplary, his eagerness to be of service undisputed.

In 1905 Mr. Ahearn was re-elected, even the Hearst opposition only serving to swell his majority. The office of the President of the Borough is one of close relation to the daily comfort of the people. He has charge of the street pavements and of the sewerage system, of public buildings and building operations, and under his control is the great system of public baths thruout Manhattan. Here was a popular idol. How had he governed? The bureau sought to find out. To secure information proved a laborious task. The records of his office were uninforming, his published reports meaningless. The bureau's report, when published, altho an ungarnished statement of fact, was stamped by Mr. Ahearn as a "mass of misinformation." It was sufficiently disconcerting, however, to prompt him to ask for an official investigation. The investigation was ordered of the Commissioners of Accounts by Mayor McClellan. These officials proceeded to react in the expected manner. Instead of investigating, they undertook the preparation of briefs in reply to every statement contained in the bureau's voluminous pamphlet. It happened, however, that the bureau continued its investigation after the publication of its pamphlet. Among other things, it made a careful examination, analysis and tabulation of the facts shown on the thousands of vouchers drawn by Mr. Ahearn during his incumbency in office. Armed with these facts it convinced the Mayor and Corporation Counsel that the Commissioners of Accounts were wantonly whitewashing Mr. Ahearn. Immediately a special corporation counsel, Mr. John Purroy Mitchel, was placed in charge of the inquiry, the co-operation of the bureau invited, and a real investigation begun. The Borough President, finding that the investigation was unexpectedly earnest, exerted every effort to block its progress. When the public hearings began and the unpleasant truth was told or reaffirmed, Mr. Ahearn lost all his aplomb. For three years he had enjoyed the reputation of being "a pure and competent official." No one knew in what respect he was competent, but not having extraordinary evidence to the contrary, competency was conceded to his purity and popularity. The public learned that for three years Mr. Ahearn had been spending hundreds of thousands of dollars on supplies and repairs without the slightest pretense of conserving the city's interest. Mr. Ahearn saw published the fact that thousands of dollars had been paid by him to the political agent of a fellow district leader, in the guise of a supply company, who reaped a profit of from 30 to 300 per cent. on the goods bought by him and sold to the city. When Mr. Ahearn realized that his neglect and indifference had gone too far for him to persuade the public that pavements full of holes were in good condition, the popular leader lost consolation in his popularity and, forgetting his vaunted competency, suddenly began to fear removal from office by the Governor. A lifelong friend of the people and enemy of reformers suddenly turned reformer himself. His chief subordinate, a fellow district leader, he turned out of office, charging him with responsibility for his own neglect. One after another "trusted" subordinate was removed. Mr. Ahearn had capitulated before facts. The bureau's "misinformation" suddenly appeared the inexorable truth.

Acting on the facts educed in the investigation and set forth in the report of the Commissioners of Accounts, the City Club of New York brought charges against President Ahearn before Governor Hughes, with a petition for his removal. The hearing on these charges consumed nearly four weeks, the Governor himself presiding. Mr. Ahearn's sole defense was that he had been uninformed of the acts of his subordinates, and that when the facts were brought to his attention he immediately took steps to correct the abuses revealed. With tears in his eyes he pleaded his personal innocence of any wanton maladministration. He declared that he had repeatedly inquired of his subordinates whether this

or that transaction was proper, and had granted his approval only on being reassured of its propriety. In defense of his appointment to administrative offices of men with only political qualifications, he declared that they were as competent as he; that he had been twice chosen by the people for his important administrative office, and that in choosing him a second time they had sanctioned his selections of district leaders as his chief subordinates.

In this defense Mr. Ahearn summarized the whole case of the Bureau of Municipal Research. To Mr. Ahearn the uninformed sanction of the public justified any administrative practice pursued prior to the expression of this sanction. It is the bureau's contention that, had the facts of the first year of Mr. Ahearn's administration been made public at the close of that year, instead of at the close of the third year, practices then found prejudicial to the public interest would not have been tolerated. Had the Citizens' Union had the information respecting Mr. Ahearn's administration in the fall of 1905 that was available to it in 1907, there would have been no want of issues. Money wasted by Mr. Ahearn in two years, in the hands of the Health Department, would have saved additional lives; in the hands of the Tenement House Department, strengthened the enforcement of the housing law. The Citizens' Union might have seriously shaken the popularity of the friend of the poor by calling attention to public benefits denied by the waste and incompetence of his administration.

The widening scope of the work of the Bureau of City Betterment, especially in the field of co-operation with officials, prompted its establishment as a separate institution, without connection with any political body. In May, 1907, the bureau was incorporated as the Bureau of Municipal Research. The staff now numbers eighteen men. The supervision of its work is entrusted to three men, who in turn are responsible to a board of trustees. Its expenditure will exceed $50,000 for this year. Much of its present energy is devoted to the installation of a mechanism of information which will make the intelligent control of administration possible to governing officials, as well as provide the basis in facts for intelligent judgment by the public.

Modern systems of accounting, carefully devised systems of controlling records, and reports made truthful thru control, are the necessary antecedents to even intelligent publicity. Certainly they are prerequisite to constructive development of the methods and activities of government. The bureau's work has resulted in the renewed emphasis of the functions of the Commissioners of Accounts, the agents for securing information for the guidance of the executive. This office, being practically a bureau of audit, with the powers of a legislative commission of inquiry, is potentially of greatest importance in providing the Mayor with accurate information of the transactions of his subordinates. Hitherto it has practically failed to perform this function, and was utterly neglected during the reform administration. Being exempt from civil service restrictions, it was made the means of providing berths for "the enemies of Tammany." A part of its staff was transferred to the Mayor's office, there to perform purely clerical work. Had Mayor Low utilized the power of the Commissioners of Accounts to learn the facts about the administration of his predecessors and to tell him the truth about his own, the continuance of Tammany methods under reform colors would scarcely have been possible. It would have done much to make impossible, for example, the plea of Mr. Ahearn that he had trusted one of his subordinates (and the one proved least deserving of trust) *because* he had inherited him from reform.

Publicity of the acts of municipal government and the methods of administrative and popular control over the mechanism of government are the problems with which the Bureau of Municipal Research is concerned. It believes that the only good government is government by intelligence. To secure this intelligence, an agency of the character of the bureau is required. To make such an agency effective its permanency must be insured, that it will not prove only a "temporary inconvenience" to officials who thrive on confusion and misgovernment.

New York City.

A New Umbrella

BY MAX A. R. BRÜNNER

A PARASOL or umbrella is always in the way when we need our hands for other purposes, as in cycling, climbing mountains, landscape-painting, carrying parcels, etc. Attempts, therefore, have been made to construct shades which were fastened to the upper part of the body so as to leave the hands free. The first experiments were not very successful, as the method of fastening was too complicated, the protective surface too small and the price too high.

In the accompanying photographs an umbrella is shown without these draw-

NEW PORTABLE UMBRELLA.

backs. It is carried on the shoulders and fastened to them by rubber bands and straps. Its construction is rather simple, the protection large enough, and it can be easily folded. There are various types, ranging in weight from nine to eleven ounces. A square piece of tissue is connected with the skeleton which forms a saddle-roof. When closed the

STYLISH FORM OF PORTABLE UMBRELLA OR SUNSHADE.

apparatus forms a roll of about the thickness of an ordinary umbrella. The skeleton is composed of thirteen black painted steel tubes four mm. thick, which are connected by twenty-two hinges and are kept tight by springs and diagonal struts. The three longest sticks form the ridge and edges of the roof, and four rods the support. In this position the apparatus is put over the head and tied to the shoulders. When it is closed all sticks lie parallel and the loose cloth is wound around. With the usual types

there is no wooden stick in the center. Owing to the design the shade is not centric to the body axis, but protrudes, and experiments have shown that it is well adapted to protect the bearer from sun and rain and is also strong enough to withstand wind. It leaves the arms perfectly free to move around and the weight is scarcely felt on the shoulders. As the roof is open in front and behind, wind coming from these directions has no effect. Only if it comes from the sides does it exert a pressure, yet owing to the inclined position the full pressure is much reduced. Also the numerous struts and the way of tying them to both shoulders distribute the pressure upon the upper part of the body. Owing to the numerous advantages these appliances will be welcomed by those who have to be in the open air in any weather, like field engineers, gardeners, farmers, rural mailmen, tourists, cyclists, anglers and so on.

BERLIN, GERMANY.

India as Seen by a Parsee Lady

BY BHIKHAIJI RUSTOM CAMA

[Madame Cama, a Parsee lady from India, is visiting this country to study our free institutions and create sentiment against British rule in India. The reader will see that she desires to see India free and self-governed.—EDITOR.]

I WAS born a high-class Parsee, into a home of opulence and love. The Parsees are a mere handful in India, being but 80,000 among a population of 300,000,000, but we are the most advanced, according to modern standards. Our women are educated, and some even have collegiate degrees and practise medicine and other professions only recently adopted to any extent in European countries.

We mingle with men socially; we go about unveiled, and, in fact, we have adopted a part of the dress of Europeans. I would not give up the beautiful flowing draperies of the Indian costume, the nearest approach to the Greek robes famed in art, but it is necessary in practical living that we wear a "shirtwaist" of white silk or cashmere to protect the throat and arms, whereas the Hindu women, secluded in the house, go with arms and neck bare.

The Parsees were Persians who fled from religious persecution 1,300 years ago, much as did the Puritans from England many centuries later. These Persians, followers of Zoroaster, were received hospitably by India (altho of a different religion) at a time when religious intolerance was rife in Europe, when England was still semi-barbarous, not yet infused by Norman culture, and the crudest superstitions and bigotry were the rule.

During all these centuries we have refrained from inter-marrying with the Hindus and Mohammedans, and so have retained our lighter color and maintained certain standards. We live in harmony with the three other races and religionists (Hindus, Mohammedans, Buddhists) and are in general prosperous and educated, caring for our own in times of pestilence and famine, and looking after their needs financially and educationally.

In my grandfather's day marriages in India were made by the parents; in the next generation the boy and girl were brought together and "influenced"; today they are allowed nearly as much freedom of choice, in intelligent families, as in Europe.

Thruout India, as in China, the patriarchal system has prevailed. In a sense, it should be called the "matriarchate," for the mother-in-law is supreme. This is most natural, considering the extreme youthfulness of the bride. When child-marriages are contracted it is natural that the little girl, who is taken

from her own home and placed in that of her husband's parents, should be brought up to obey her mother-in-law. Even when she has children, the *belle-mère* in her superior wisdom, governs these—

MADAME CAMA AND MR. SIRDARSHINGJI KANA.

but if the bride lives long enough her turn at queening it will come. This system is only now in vogue among Hindus.

The patriarch's will is law in money matters. Under his roof-tree is an enormous household. Usually the sons live with him until they are fifty, so that their own children are nearly grown. He deals out even the family jewels to the various daughters-in-law when they attend social functions (for women only) and the jewel-wearing is indiscriminate. Everything is common property, or, rather, belongs to the patriarch.

My parents were married under the old system, my mother being eleven and my father fifteen. The marriage was not consummated until four years later. It was an ideally happy one, altho they

never had met until married. They had eleven children. I was born a few years after they had left the patriarchal home, and set up their own establishment, which was not a small one, as it consisted of two parents, eleven children, and forty servants. I recall one old superannuated servant whose sole duty was to serve tea, and who importuned us every few hours to partake of the beverage. In our own family we treated them as faithful friends.

I married much later in life than was the old custom, and went much in English (Governmental) society. Many times have I been entertained sumptuously at the Governor's mansion in Bombay, and by the wives of the civil and military officials. I rode horseback with the English, and I assisted at their fancy bazars, the tableaux vivants, and other fashionable social events. The fact that I am related to one of the only few baronets in India probably impressed them, but I am honestly democratic, and usually quarrel with my most aristocratic relatives because they have no sympathy for the wrongs of the common people.

In those gay days I was not unmindful of the frightful conditions of the poor Indians, but I believed that the British were blind to existing evils; that they needed only to be enlightened, in order that they would plunge into the work of reformation of their own system. Gradually my eyes were opened, and I now believe with my whole soul that Great Britain is glutted by power and that Kipling sounded a note of warning in his "Recessional." I know whereof I speak, for I have seen the high and the low.

Many of our own best people hope only for colonial government, like that of Canada and Australia, and for needed reforms and greater industrial opportunities. Once I was of this party of Moderates. My husband and some relatives still are. But I have had the privilege of foreign residence, and my eyes are opened to the possibilities of real freedom. It has not yet dawned upon the majority of Indians, even as an ideal.

Altho a vast number of natives are illiterate, they are naturally intelligent. They have generations of culture behind them. They are by nature well-bred, gentle and courteous. Their memories have been highly trained. What appears to be an ignorant peasant subsisting on almost nothing can recite the whole of the beautiful scriptures, the Ramayana and the Mahabharata.

Yet I do not belittle modern Western education. My grandfather was the first to start girls' schools in Bombay, and he held very advanced ideas. My father-in-law works constantly for social and religious reform and for female education. He has founded many scholarships. One of the desires of the highly educated Indians in New York is to establish scholarships by which selected boys and girls may be brought from India to New York, and trained in textile industries, trades, and for economic and social leaders for their country. For this purpose there already is a Pan-Aryan Society and an Indo-American one.

As a young girl I was interested in the poor and tended the sick servants in my father's large household. Even in my life of social opportunities I did not forget the suffering around me. I nursed the plague-stricken, and myself had the plague. I worked among the famine sufferers. But who can allay famine when there are 300,000,000 people, whose average income is 3 farthings a day (1½ cents), and who are overtaxed, both on the land and for irrigation, so that they cannot till the soil, and whose industries have died out, because they could not compete with their conquerors, who made the laws governing commerce?

India has a great past. We were a people of fabulous wealth and deep culture. Our carvings and pearls and jewels, cloth of gold and silks, our temples and shrines, were the subjects that stirred the imagination of the world. "The wealth of the Indies" was a phrase to conjure by. Our princes governed well, considering the anarchy of the Middle Ages. We had some abuses similar to those of the robber barons of Europe, but we had learned political economists and rulers, and our revenue system has never since been equaled. One single illustration of the wisdom and justice of our native rulers: They used to levy a tithe or tax on the farmers, but it was a small per cent. of their yearly earnings. Thus, in years of famine or other calamities the farmers paid noth-

ing, because they had nothing to pay. The present foreign Government, on the contrary, levies a tax which must be paid before anything else, so that, if times are hard, the owner of the soil is utterly ruined.

Our natural scenery is very wonderful, but climatic conditions and the lack of transportation facilities and modern comforts of travel have prevented the inroads of travelers common to Europe. We have some stupendous waterfalls and mountains, equal to hundreds of Switzerlands in one.

In certain seasons the wealthy take to the hills, for it is difficult to endure the malaria. Among these, ladies never have been taught any of the domestic arts, all of which are left to servants. Speaking generally, high-class Hindus do not waste time upon frivolous pursuits and changing fashions, so that even married women with many children have abundant leisure, and this they frequently employ in cultivating their minds. I have one friend who, since she has been the mother of four children, has taken her master's degree. In the strict Hindu households men and women seldom see one another. All "society" is confined to ladies dining with one another. They never see their husbands in the daytime or at any meals. The gentlemen take pride in providing elegant costumes for their wives, but never have the pleasure of seeing them worn in public. However, most of us inherit our dresses. As styles never change, we wear the same identical garments that our grandmothers wore. Our robe is merely six yards of silk, or satin, or crêpe, or cashmere, bordered with a gold or embroidered passementerie. We literally have scores, hundreds of these, in beautiful colors. They are easy to pack in traveling! We drape these ourselves, each time we wear them.

Americans imagine that we are religious fanatics. The first thing asked me is about religion. I, like most of you, inherit my religion. I am a Parsee follower of Zoroaster because my parents were, and I suspect you are a Christian —a Catholic, or Methodist or Presbyterian—for the same reason! I am not at all interested in occultism or mysticism, or anything but humanitarianism and a free India. I suppose we are regarded as religious cranks because some of the Hindu priests have lectured in this country.

A few years ago there was established the Indian National Congress. This meets yearly, and is doing an enormous work in educating public opinion. My husband and I both are members of this, he sitting with the "Moderates," I with the "Extremists." The congress professes loyalty to the Government, but the extreme party is gaining rapidly, and these openly advocate *swaraj*—self-government. This year's congress was to meet in Central India, which is a section thickly populated with those who advocate self-government. Just now, however, the word has gone forth that it is changed, and will meet near Bombay—which is very moderate, politically.

Occasionally learned articles are written to prove our incapacity for *swaraj*, but I say that we governed ourselves well before England was ever heard of, in our beautiful land of plenty. We were conquered by several successive countries of fighters (Portuguese, English, etc.), because we are a peaceful philosophical people, who practice the nonresistant principles of your Jesus, which not one Christian nation makes a pretense of living up to!

India has had her superstitions and bad practices, as have other countries. In my own day there may have been a few remnants of the suttee. This custom, however, was practically abolished in the last century by a Hindu social reformer, Rani Mohun Roy, who proved to the Governor that the Scriptures did not sanction the burning of widows on the husbands' funeral pyre. The general credit is usually given falsely to Anglo-Saxon civilization.

My life could be as serene and indolent as that of any of the leisure class. I enjoy Europe and its advantages, and my poor health makes me inactive much of the time. But I cannot forget my starving countrymen, nor the economic and political conditions which might so easily be changed.

It has been a great sorrow to have some of my own people forsake and even assail me, for having the welfare of India so much at heart that I speak

strongly against present abuses. But the defection of my English friends and some of my own relatives does not move me to adopt a lazy indifference. I hear that the Indian papers are praising me, merely because I have the cause of my own country at heart, and the English papers are abusing me. As a matter of fact, I am extremely harmless, and am conspicuous only because of the prominence of my family and the unusual action of one of the fortunate and pampered going among the peasants and seeking to free them, educationally and industrially.

All I ask is that India be allowed to develop her industrial arts; that her 300,000,000 inhabitants may support themselves and sustain life, and try to reawaken the spirit of her glorious past; that her children be educated and her government be self-sustaining. People can learn only thru responsibility. If they are not allowed to develop thus, they are a nation of slaves. Gladstone said, "Liberty alone makes men fit for liberty." We want responsibility, activity, freedom of speech, of the press; in short, all of those precious things for which Anglo-Saxons for centuries have fought and died. And altho we wish for only passive resistance, and are a peaceable people, we, too, are willing—for these things—to fight and die.

NEW YORK CITY.

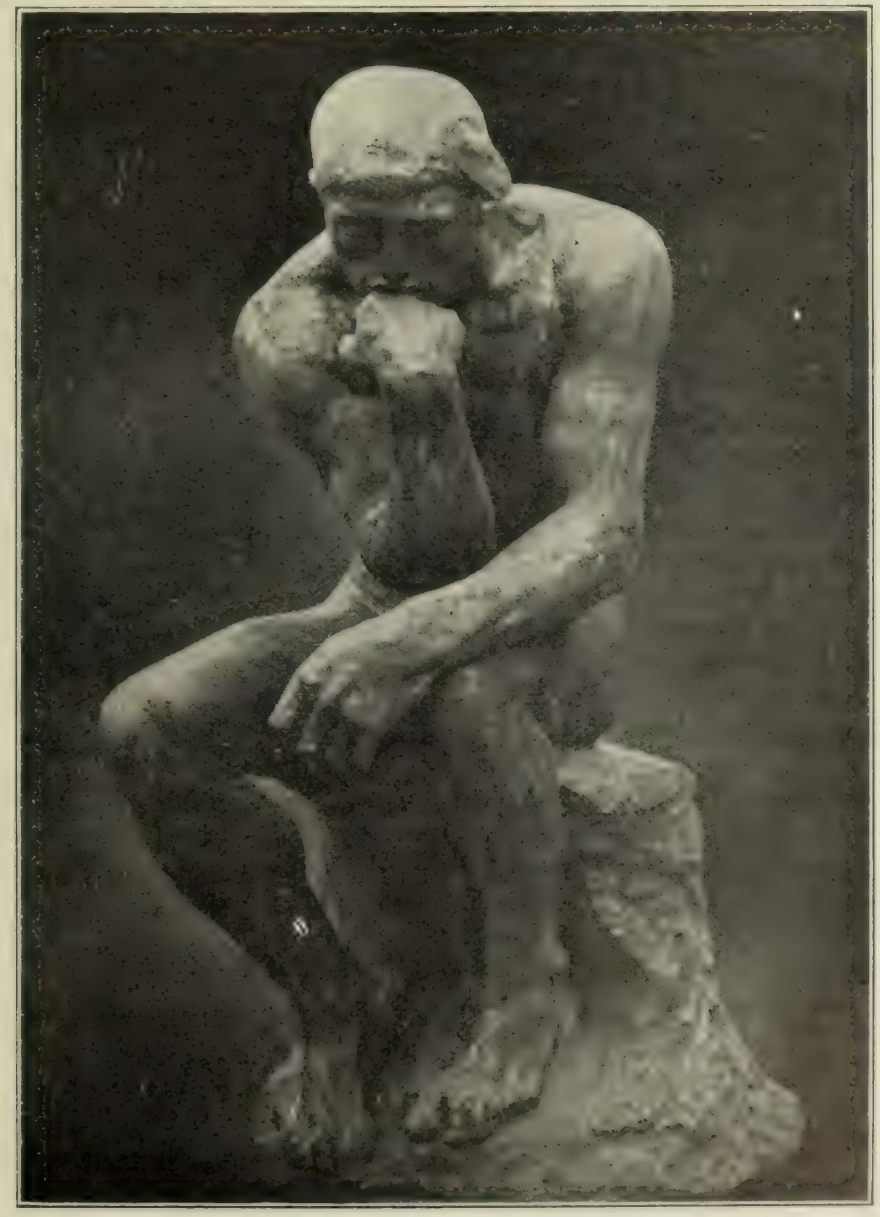
The China Crucifix

BY C. H. LYTTLE

IN the land of counters and aisles and shelves, where the bluish arc lights hum,
And store-stuffs wait, in showcase state, as the gazers go and come;
Where, jangling still, the busy till ticks the plodding moments on,
Ere a dusty pall has shrouded all, and the throbbing day is done:

In this land of counters and shelves and aisles, a folk of merry mien,
On a corner shelf, by a row of delft, 'mid the porcelain is seen;
Señoras pert, and a gypsy flirt, and a fiddling troubadour,
A milkmaid blithe, a harlequin lithe, and a vivandiere demure.
There's a chubby china cherub, too, with odd rococo locks,
And Hans and Gretchen hand in hand, clog-shoon, and baggy frocks.

In this land of counters and shelves and aisles, on the shelf where the statuets stand,
There's a crucifix, too, of tawdry blue, a Christ with nail-pierced hands.
But the dust is spread on the drooping head, and the red-limned wounds are dim,
And the shop-worn Christ is half the price of the things that encircle Him.



O Man of woe, in the long ago, when the crosses crowned the hill,
Your throne of pain was a symbol plain of love that triumphs still..
For tho years have sped since His blood was shed, yet the shabby cross again
In the busy store speaks the love of yore, the love of a Man for men.

CLEVELAND, OHIO.

Literature

Kenyon Cox on Art

ENCOURAGED, he says, by the reception of his first volume of essays in critical appreciation, that, "in spite of the ancient opinion that artists are the worst of critics, a part of the public is willing to listen to a practical artist talking of art,". Mr. Keynon Cox now gives us a second series of studies in the interpretation of painting and sculpture.* It is gratifying to know that that first sheaf of "Old Masters and New" has met with something of the recognition it deserves, for, as we pointed out in THE INDEPENDENT at the time it was published two years ago, nothing that was finer, fresher, more interesting or more enlightening in art criticism had appeared in many a long day. This second group of papers is both welcome and valuable because it is imbued with those fine qualities of insight and interpreta-

RODIN'S "THE THINKER."

*PAINTERS AND SCULPTORS. A Second Series of Old Masters and New. *By Kenyon Cox.* New York: Duffield & Co. $2.50 net.

tive skill which distinguished the first collection of Mr. Cox's opinions. Tho less in bulk of written contents, and lacking, perhaps, something of the freshness of appeal of his earlier book, it is yet noteworthy for the author's coupling of large technical knowledge, breadth of judgment and catholicity of taste with unusual skill in verbal expression—indeed, with a style of his own that is not alone perfectly lucid and intelligible, but also distinguished and decidedly pleasing—a combination of abilities that is extremely rare among writers on art.

In this collection Mr. Cox treats of "The Education of an Artist," the Brothers Pollaiuoli, "Painters of the Mode," Holbein, "The Rembrandt Tercentenary," Rodin and Lord Leighton. In "Painters of the Mode," one of the most interesting essays in the book, starting with a protest against judging of the value of a work of art by its subject rather than by its excellence, the writer sketches rapidly the course of art and of feminine fashion for the last four hundred years as exemplified in the work of many of the greatest artists who "have devoted their talents to the painting of beautiful women in the fashionable toilettes of the time." As a sample of the charm with which he can invest this kind of subject take this vivid pen picture and summary of the achievement of Velasquez—"a painter who seems to have had no ancestry, and no immediate posterity, but whose influence today is greater than that of any other master whatsoever—the master from whom are ultimately derived the varying styles of Manet and Whistler and Sargent—Diego Velasquez":

> The portrait of the Infanta Maria Theresa, in the Prado, is technically one of the world's masterpieces of painting, a miracle of lightness of hand and justness of eye, but its interest for us just now is in the complacency of a great artist before the most monstrous costume that was ever worn in the world. The stiffness of Italian costume in the latter part of the sixteenth century is thought to have been due to Spanish influence; by the middle of the seventeenth the Spanish Court costume had become an extravagant caricature of this stiffness such as no other nation has ever tolerated. The skirt is supported on a hoop, which is built out sideways until it holds the arms nearly horizontal, and the figure is actually wider than high; the body is incased in a rigid sheath which shows no vestige of natural curves; the hair is puffed out on either side of the head and often tricked out with a multitude of little bows and feathers; the very face is daubed with red and white, and everything natural is suppressed that it is possible to suppress. Yet these extraordinary garments the great painter can copy with utmost precision, and in this little painted idol he can see, and make us see, the charm of living, human youth. Art has done many marvelous things, but nothing more marvelous than this.

The paper on Rodin, which, our author takes pains to point out, makes no pretensions to definitiveness, but is "more concerned with his direction than with the distance he has traveled," contains some acute analyses of the French sculptor's aims and methods, and among other good things this contrast with the American, Saint Gaudens:

> They are antipodal types of artist, these two Augusti, the natural designer who becomes a modeler thru continued effort, and the great modeler who achieves, sometimes, an approach to satisfactory design.

Rodin, thinks Mr. Cox, "is not only not a designer by nature, but that he has an innate incapacity for design on a large scale, a lack of the architectonic faculty, an inability to think except in fragments." He is a wonderful modeler, and "from a realistic sculptor Rodin has gradually become an impressionistic sculptor. . . . The essence of this evolution is the transference of interest from objects to the light that falls upon them, and Rodin has, apparently, attempted something altogether new in sculpture, the carving in marble of an atmosphere, and the rendering not so much of the actual forms of the human body as of its luminosity."

The justness of the estimate of Lord Leighton as, "if not one of the world's greatest geniuses, yet a true, a sincere, an accomplished artist, and one who created certain forms of beauty and distinction worthy to endure," is particularly timely when students and brash youngsters of all ages are wont to decry everything "academic," and ignore the real talent of one of the greatest of English artists.

The publishers have given the book an attractive dress and provided it with some seventy good "half-tone" illustrations that really illustrate the points made by the author.

Molmenti's "Venice"*

NEARLY thirty years ago Professor Pompeo Molmenti, then a young lawyer in Venice, produced the monograph which is the core of this monumental work. His original volume took a prize awarded by the Royal Venetian Institute, and the intelligent public soon confirmed the award by calling for other editions of a book which has proved to be both solid and popular. It was translated into other languages, but English-speaking readers have had to wait long for an English version. One compensation this long wait brings—the author has so added and enriched that this, his definitive edition, in Mr. Horatio F. Brown's translation, will fill six convenient volumes. Allowing for difference in type and format this means that Professor Molmenti has nearly trebled the contents of his history.

He set himself the task of describing the history of Venice by the study of the private life of the Venetians, and he has followed his plan consistently and elaborately. Not events, but manners and customs are his main theme; but, while he has done for Venice what Burckhardt did for the Renaissance, he has interwoven events into his *Culturgeschichte* much more than Burckhardt did. This we believe is desirable, because, after all, manners and customs are not everything. At a given period luxury may prevail, for instance, and it may account in part for the legislation or decadence of a people; but it is too vague an explanation, and has too many exceptions, to be comprehensive or final. We must know what a nation did in its collective career, not less than what it ate, or wore, or how it amused itself, in order to know what it was. In other words, manners and customs are but garments, where fashion changes from age to age. So Professor Molmenti has done well to weave history, in the proper sense, into his work.

His method is topical. He takes up the political constitutions, or commerce, or social classes, or civil and criminal laws, or art and literature, and treats each evolutionally, thereby enabling us to see what development ensued in each, and, naturally, how one affected another. A reader unfamiliar with the amount of material accessible on the earlier period, down say to the year 1400, will be surprised at the fulness of the first two volumes. He will find himself able to trace the growth of the State, from the tentative republic to the masterful oligarchy, and to know what the Venetians thought and how they lived, as well as what they did.

The second series, which Professor Molmenti calls "The Golden Age," abounds in material. It comprises the fifteenth and sixteenth centuries, when Venice was the most fascinating spot in Christendom—the throne of a queen who held in fee not only the gorgeous East, but the imaginations of the worshipers of beauty, magnificence and pleasure thruout the civilized world. These volumes furnish a description of the magnificence—and of the defects which accompanied it; how the pursuit of pleasure stimulated immorality; how wealth led to extravagance; how luxury undermined the sturdiness of character, the trained judgment, the self-reliant and invincible will. The danger is, in any work where so much attention is given to the spectacular as the history of Venice in the sixteenth century warrants, that the deeper issues, which touch the very soul of the nation, shall be obscured; but any one who ponders over Molmenti's chapter on "The Corruption of Manners" will not be misled by the chapters which describe the splendor. To get the right perspective, to adjust the balance between good and evil, to learn to perceive that great virtues may go along with grave vices, to penetrate, in short, to the very heart of an individual or of a race and to see the life actually lived, is the object of the intelligent reader of history. And since Professor Molmenti enables us in his volumes to get this perspective and to strike this balance, he has produced a truly valuable work.

We cannot discuss its details here. Every chapter, every theme, has been the object of many debates. In the main, we find Molmenti's verdicts sound, and his attitude judicial. That he is pro-

*VENICE. Its Individual Growth from the Earliest Beginnings to the Fall of the Republic. *By Pompeo Molmenti. Translated by Horatio F. Brown.* I, The Middle Ages, 2 vols. II, The Golden Ages, 2 vols. Chicago: A. C. McClurg & Co. Cloth, 8vo, profusely illustrated, $2.50 per vol.

Venetian in questions where Venice was involved in foreign conflicts does not affect the essential fairness of his examination. Of the great interest of the subject itself, whether we consider Venetian history as a whole or study it thru the manifestations of the social and esthetic life, it is hardly necessary to speak. But we must praise the very readable translation of Mr. Horatio Brown, himself a recognized authority on matters Venetian, and we must call particular attention to the illustrations, which do, in truth, illustrate the text on all sides.

The Fruit of the Tree

MRS. WHARTON is not only gifted, she is versatile. The two things are not always synonymous. Usually a genius is a genius because all his faculties point mightily in one direction, and he can do only one particular thing in his gifted manner. But Mrs. Wharton writes a number of different kinds of stories in an equally gifted manner. It is not long since she gave us "Madame de Treymes," a volume in which the lives of several people were distilled into a kind of worldly-spirited vapor. Now comes *The Fruit of the Tree*,* with the scenes laid among common American realities, and written out boldly, with no dim affectedness of phrasing which has alarmed some of us lest Mrs. Wharton should become a lady disciple of Henry James. By the fruit of the tree she means the consequences suffered by the leading characters from doing what they think is right, and this presents at once a problem which the moralists have always shirked—that the average human being may suffer more from meaning to do the right thing in a tight place than from doing wrong in any place. Whether this shirking is the result of cowardice or prudence it is impossible to say. We are still very primitive morally and retain childish notions of rewards quite out of keeping with the reward system of the slow eternities. But there is no cowardice or prudence in a novelist when it comes to dealing with the issues of life. Any one of them will seize upon our terrible uncertainties, make them certain and thus stagger us with our own fate made fictitious. So does Mrs. Wharton in this story. She grapples with a question which is sometimes whispered, looked by doctors and scientists from eye to eye, but which all have been too squeamish to answer. And she answers it with confident but inhuman courage—and in the name of an august compassion for all hopeless sufferers.

Naturally the scenes are laid in elegant drawing rooms adjacent to one of those sad industrial centers of the poor—naturally, because all the people in fiction these days are engaged in the terrible tragedy which is being fought out between the rich and the poor. The poor young assistant manager of the Westover Mills, who has theories for bettering conditions there among the operatives, marries the rich widow who owns the mills. He begins by attempting to spend his wife's income upon improvements for the workers. But with the passing of the honeymoon, she insists upon spending it in her own natural way, upon motor cars and squash courts. The consequent friction and ultimate separation of the two is inevitable. And the story would fail in interest if this were all, but Mrs. Wharton has apparently written thus far to give it the modern background, and to view it with the common life and adventurous ethical and intellectual spirit of the times. The real problem she presents and dramatizes is that of euthanasia.

Bessy Amherst, estranged wife and wilful heiress of the Westover Mills, is thrown from her horse and sustains an injury to her spine. She can never recover: a paralyzed, death-in-life existence is the best that could be hoped for. But it is even doubtful if she can be kept alive at all till her husband and father can reach her from distant countries. The surgeon fights for this. It is "a beautiful case." The unspeakable agonies of the sufferer restrained from death are not taken into account. The ambition of the surgeon is to win a reputation, a victory for science by prolonging life under conditions that forfeit life. Justine Brent, Bessy's devoted friend, herself a graduate nurse, sees the point, is horrified by the professional ambition to be gratified at such expense, and in a

*THE FRUIT OF THE TREE. *By Edith Wharton.* New York: Charles Scribner's Sons. $1.50.

moment of fierce compassion for the agonized victim she administers sufficient morphia to rid both the pain and life in a moment.

She has no compunction for what she has done. But after her marriage to Amherst herself some time later, the surgeon who had been thwarted of his ambition betrays her secret to her husband. And it is at this point that Mrs. Wharton contradicts human instinct in the action of her characters. According to her, the evil in practising euthanasia is not to the one who has been put mercifully out of pain into death, but it is to the one who does the practising. A nurse who has the courage to put her patient out of pain in such a manner and for the most humane of reasons becomes terrible and dangerous, because one cannot tell where she might draw the line next time between life and death. So in this story all who know of Justine's act conceive a still horror of her. She is obliged to fly and hide herself from this repulsion. Then suddenly, without any change in the facts as in the meaning of what she did for the tortured dying woman, she is restored to the warmth and tenderness of her family. It makes the story end cheerfully, but it is an absolutely false sequel to such an act. A woman who would put her patient out of pain in such a manner might kill her own baby if it had epilepsy, or her husband if he was hopelessly paralyzed. Whether wrong or not it is too dangerous to be permitted.

Money and Investments. A reference Book for the Use of Those Desiring Information in the Handling of Money or the Investment Thereof. By Montgomery Rollins. Boston: Dana Estes & Co. Cloth. 8 vo. $2.00 net.

We have received many letters lately from our subscribers asking us to recommend an elementary book on finance, but have been puzzled what book to designate. The present volume by Montgomery Rollins, author of several other technical works, seems to fill the bill. The object of the book is essentially to furnish to the layman information about the simple forms of financial transactions, to explain the slang of the stock market, and to guide him in his investments. The foreword of 36 pages gives a general review of the financial situation with suggestions to investors. The remaining 430 pages are in the form of an encyclopedia, with headings alphabetically arranged. Here one may find how to draw a check, open a bank account, or obtain an analysis of the advantages of life insurance. There are in all, over 2,500 headings. The newspapers of the country print a great part of their financial news in a jargon quite unintelligible to a large fraction of the people. Such expressions as "laundrying," "selling short," "flat," and "averaging down" convey but little to those who do not follow the market. The heading "Women's Signatures," is one we wish could be read by all women, who have business dealings. How many business concerns have been puzzled by receiving letters, signed by a name like Helen Smith. Is it Mrs. or Miss? If she refers to previous business dealings of her husband, it does not occur to her that the recipient of the letter does not realize she is the wife of Roger Smith. A woman should always sign her name, Helen Smith, and in parentheses below (Mrs. Roger Smith).

The Convert. By Elizabeth Robbins. New York: The Macmillan Co. $1.50.

The Convert is a frankly propagandist novel. The "Suffragette" has not been a popular person in England, nor can Elizabeth Robbins, charm she never so wisely, make her attractive or indeed comprehensible to an American audience, but that is not saying she is uninteresting. On the contrary the story of the "Militant Suffrage Movement," as Mrs. Cobden-Sanderson, now in this country, prefers to call it, is interesting thru many pages of argument and stump-speech oratory. Yet this vivacious and veracious history never persuades us that it is the best way to win a hearing. It is just that women should vote, in England and in all America, as they do in Australia, New Zealand, Finland, and in four of the United States of America; every legitimate means to secure the right we should favor; but we deplore some of the methods used in *The Convert* to gain a hearing for Woman Suffrage from London mobs, standing on chairs at street corners haranguing

crowds of laughing or surly and brutal auditors, who "boo" and interrupt with impudent questions, often offensively personal. Nor is the interruption of political meetings and court proceedings any better. The millions of women who now vote did not win their rights by such methods, and their experience ought to be some guide. Still, British politics is such an absurdity altogether that you never can tell what will work there.

Literary Notes.

....The December number of *Interior Decoration*, under the editorship of J. M Bowles, appears in a new and artistic form, printed from Village type, with rubricated initials on deckle-edge paper. The price will be raised next month from one to three dollars per year.

....The *Success Magazine* is one of the few periodicals that have succeeded in living up to their name. The Christmas number is gorgeous in cover and contains, besides the usual literature of the season, an exposé of Lawson as sensational as his exposé of "the system" and the third instalment of Merwin's study of the narcotizing of China.

....A sympathetic interpretation of *The Teachings of Huxley*, by Dr. I. W. Voorhees, is given in a small volume issued by the Broadway Publishing Company at a dollar. The author summarizes and comments upon Huxley's views on evolution, miracles, vivisection, immortality, spiritualism and the many other topics he discussed in the course of his long and adventurous career as a dialectical free lance.

....The author of "The Faith of a Christian" appears in a second anonymous work entitled *The Fifth Gospel, Being the Pauline Interpretation of the Christ* (Macmillan). The work is a strenuous, tho not very logical and consistent, defense of the physical resurrection as an historic fact and an essential of Christianity. The author says that "literal ascension into heaven is in these days inconceivable," but suggests "a gradual dissipation of the materal medium, due to the immensely augmented spiritual force with which Christ returned to it." Between the orthodox, traditional interpretation of the event and this "gradually dissipating medium," most sensible moderns would prefer the former.

....A new commentary on *The Epistle of St. Jude and the Second Epistle of St. Peter*, by the veteran Cambridge professor, Joseph B. Mayor, embodies the best traditions of English classical and philological scholarship. (Macmillan, $4.50.) The study of the Greek text is thoro in the extreme. Dr. Mayor concludes that Jude was written a little before 80 A. D., and that II Peter, which undoubtedly quotes from it, was composed not earlier than 125 A. D., and not by the Apostle Peter. The pseudonymity of II Peter may now be said to be recognized universally among scholars. This commentary has the same general characteristics and high merits of other Cambridge commentators—Lightfoot, Westcott and Swete.

Pebbles

PHIL C.—I think I detect an odor of gasoline.

PHIL E.—It must be a case of auto-suggestion.—*Harvard Lampoon.*

"MAMMA, mamma, don't let sister kill that poor fly on the window."

"Why not, Tommy?"

"Because I want to kill it myself."—*Translated for Tales from Charivari.*

EPH—How'd you git along ridin' in them there sleepin' cars when you took your trip?

Simp—Got along all right, but I caught a colored feller tryin' to sneak away with my boots an' made 'im bring 'em back.—*The Indianapolis Star.*

THE brotherhood of monkey and man is more firmly established than ever. A respected chimpanzee named Hezekiah Slick has had his appendix cut out. The event occurred in Indianapolis, and Mr. Riley will write a poem about it, it is thought.—*Washington Star.*

"I TELL you, golf is going to be the salvation of the nation. It is going to make athletic men and women of our puny offspring and lengthen our days by decades."

"But our ancestors didn't go in for golf!"

"And where are they now? Dead! All dead!"—*N. Y. Times.*

FOR some time members of the Continued Story Club (composed of women who carry in their heads from one month to another heroines and heroes, left in all sorts of hazardous and perilous circumstances till the next month's magazine is due), have been watching with eagerness for the appearance of *Appleton's*, that they might get another instalment of "The Younger Set," a story as lurid as a sunset painted by an amateur. The agony ended with this month's dose, and the hero and heroine were united in the following closing paragraph:

"She stood waiting as he came up thru the purple gloom of the moorland, the stars' brilliancy silvering her—waiting—yielding in pallid silence to his arms, crushed in them, looking into his eyes, dumb, wordless. Then, slowly, the pale sacrament changed, as the wild rose tint crept into her face; her arms clung to his shoulders, higher, tightened around his neck. And from her lips, she gave into his keeping, soul and body, guiltless as God gave them, to have and to hold beyond such incidents as death and the eternity that no man clings to save in the arms of such as she."

And how, in the name of all that's holy, can a husband expect his wife to get up and fry liver and eggs, and wipe the baby's nose, in a spirit of contentment, after reading stuff like that?—*Atchison Globe.*

Single Copies over six months old twenty-five cents. Postage to any Foreign Country in the Postal Union, $1.75 a year extra. To Canada $1.00 extra.

Order for the change of an address should be received one week before change is to take effect; the old as well as the new address should be given.

Persons desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, in that case, hold ourselves responsible for their return. Authors should preserve a copy.

President Roosevelt's Message

In his Message the President retracts nothing. His attitude toward "successful dishonesty" is unchanged. This is shown by what he says now as well as by his reproduction of long passages from previous Messages and speeches. But no one should fail to mark these words in his opening sentence:

> "As a rule, the business of our people is conducted with honesty and probity; and this applies alike to farms and factories, to railroads and banks, to all our legitimate commercial enterprises."

His recommendation for currency legislation is brief. Undoubtedly there should be provision for imparting elasticity to the volume of our currency by means of emergency issues, but the President would have these issues "based on adequate securities approved by the Government." To require such a basis would be to retard or prevent the needed issue of notes, and thus, probably, to defeat the purpose of the emergency legislation. It would be unnecessary and unwise to require the banks to buy or otherwise procure the securities and to submit them for approval or deposit. For emergency issues there would be sufficient security in the banks' resources, plus a cash reserve of 25 per cent. Loss would be prevented by the tax fund. We think, however, that the tax rate mentioned in emergency issue plans recently proposed is too low, and that the possible volume of the additional currency is too large.

Great corporations engaged in interstate commerce should be under national control. State supervision, as the President says, is too drastic or too lax and cannot be thoroly effective. He asks that railroad corporations be controlled by national incorporation or license, that future issues of stock be made under national supervision, and that the companies be empowered to enter into traffic agreements, subject to official approval. We may safely predict that eventually such national control will be exercised. The sooner the better. What he says about the traffic agreements or associations leads to a consideration of the defects of the Sherman Anti-Trust law, for such associations are needed, and it is well known that they have continued to exist since they were made unlawful by decisions of the Supreme Court. But they should be subject to official approval or rejection.

The Sherman act should be so amended that it will not prohibit all combinations, whether harmful or not; but it will be very difficult not only to obtain legislation for that purpose, but also so to frame the legislation that it will make the desired distinction. Foreseeing difficulty in enforcing the amended law, Mr. Roosevelt would relieve the Department of Justice and the courts of a great burden by the use of Federal charters or licenses, or both, to be granted conditionally, and by entrusting enforcement to an executive officer or board. But the courts could not be avoided. To them would go eventually many questions arising as to grounds for refusing or revoking licenses. They would be required to decide whether a corporation under the ban was unlawfully monopolistic and whether its methods, as affecting competition, were such as those which the President denounces and would have forbidden by statute. Moreover, we do not understand it has been finally determined that some of the great manufacturing corporations are engaged in interstate commerce. Such regulation as Mr. Roosevelt has in mind is to be desired, but it is not to be obtained easily, and the path to it is by no means plain. The whole question is undoubtedly one of much importance.

It would be unwise to attempt a revision of the tariff before the approaching

Presidential election, as he says, but immediately after that election the work should be undertaken. A tariff that should "make good the difference in labor cost of production here and abroad," with perhaps a small additional margin of duty, would not very closely resemble the present law. Works of art and wood pulp should be on the free list, as he says, but he realizes, we presume, that it is impracticable to remove the duties on two products without taking up the whole question of revision.

While he still hopes that a scheme for a graduated income tax can be devised that will not be rejected by the Supreme Court, he expresses a decided preference for an inheritance tax. We are in sympathy with his purpose, but there are some practical objections. States which now impose and collect inheritance taxes might reasonably complain, for the estates of decedents should not be subjected to double taxation. Another objection is that there is no warrant for such a tax in need of more Federal revenue. Existing Federal taxes yield a surplus, and the President does not suggest the repeal of any of them. He points out that in the last six years the excess of income over expenditures has been $190,000,000.

We are glad that he heartily approves the Postmaster-General's recommendation for the establishment of postal savings banks. If the country had had such banks during the last few weeks much money that has been hoarded would have been deposited in them, and thus would have been restored to circulation. The advantages to be offered would be interest at 2 per cent. (probably) plus absolute safety. Under normal business conditions these would not divert money from well-conducted savings banks paying 3½ or 4 per cent., but in time of stress the postal banks would be very useful, and at all times they would serve the interests of the people where ordinary banks are practically inaccessible. If the $3,000,000 annual profit on foreign postage, when paid to sixteen-knot ships at the rate which faster ships now receive, will establish new American lines to the Philippines, Australia and South America, it seems to us that the money would be reasonably expended. Mr. Roosevelt has already in practice applied the merit system to the fourth-class postmasters, but Congress should now honor his recommendation by placing these officers under the civil service rules by statute. This would be a notable triumph for the principles of civil service reform.

It is suggested by him that something would be gained if Congress should appropriate public money to pay the legitimtae expenses of "each of the great national parties" in Presidential campaigns. Some day our people may find it advisable to do this. For the present we prefer that legislation concerning campaign funds furnished by the public be thoroly tested. It is not yet known what can be accomplished by good laws compelling publicity for all campaign receipts and expenditures.

Altho the President still holds that the interstate commerce clause can be used for Federal control of child labor in the States, he urges that first a model statute for the regulation of the labor of women and children in the District of Columbia and the Territories be enacted. His earnest desire for a just improvement of the condition of workingmen and for a peaceful settlement of labor controversies is shown in his recommendations concerning employers' liability laws, compulsory investigation of disputes, the investigation of railroad accidents and the eight-hour law. The Government, he says, should set an example to promote the use of the eight-hour day thruout the land.

In years to come he will be credited with untiring, intelligent and successful effort for the conservation of the natural resources of his country. What he says about the development of inland waterways, the preservation of forests, the retention of title to public lands containing coal, oil or gas, and the extension of irrigation is wholly commendable and has an importance which too many, unfortunately, do not now perceive.

It is quite plain that if the army is to be maintained in good condition, the pay of officers and enlisted men must be increased and some other changes which he suggests must be made; also that the medical corps should be properly supported. There is room for some differ-

ence of opinion as to the need of providing for four new battleships in one year. The prominent features of his statement concerning our foreign relations are his justly optimistic comments upon the results of the recent Peace Conference at The Hague, his tactful but not unwarranted commendation of Japan's project for a World's Fair, his plea for the encouragement of Chinese students by our educational institutions, and his gracious allusions to Mexico and President Diaz. It was his pleasure to know, three days after this Message was published, that the Peace Conference of the five Central American Republics, convened at the joint suggestion of President Diaz and himself, had created a permanent High Court of Justice and Arbitration, agreeing that all the international disputes, without exception, of the five countries should be referred to this tribunal, and that its decisions should be final.

Suicide

It is evident that anxiety about financial matters has been the occasion of the unusual number of suicides during the past few weeks. It is startling to take up a morning paper and find in it the accounts of several suicides of men and women of considerable distinction—university professors, bankers, artists, players—who have cut their lives suddenly short by pistol or poison.

Doubtless the general conviction is correct that cowardice is the usual occasion for suicide. Again, it is truly said that suicide is confession, but it is a cowardly kind of confession. A man has lived in a certain style, with certain associates, and by a stroke of fortune or by some criminal act he has forfeited their fellowship or respect. He has not the courage to live, perhaps, without the comforts or social fellowships to which he has been accustomed, but which his loss of wealth will deprive him of; he lacks the force to begin again at the foot of the ladder and again try to climb. Or the discovery of his financial misdoings makes him afraid to meet their results. It is pure cowardice, tho justified then if ever. But that it is cowardly prudence even Belial recognized in Pandemonium:

"I laugh when those who at the spear are bold
And venturous, if that fail them, shrink, and fear,
What yet they know must follow—to endure
Exile, or ignominy, or bonds, or pain,
The sentence of our conqueror."

And yet suicide is not always wholly the escape of a coward running away from the result of his misfortune or folly or crime. There certainly are cases in which a nobler motive has its part. We may suppose that a bank president, who knows that trial will convict him to prison bars, may be able to endure that for himself, but he may say that he will not endure it for his innocent family. He may see and say that it is better for them that he die a suicide's death, with guilt unadjudged by law, and with all possible excuses and lies open for their relief, than that they should go branded for years with the shame that husband and father is serving a sentence in jail. There is an element not ignoble in such a resolve. There may be moral courage in it, or immoral—as a man risks for his dear ones' sake going uncalled to his Maker; and the ancient or modern world has never called Seneca's suicide cowardice when, at the bidding of his pupil, Nero, Seneca and his wife cut their veins, and the philosopher died calmly discoursing on philosophy and duty. Nor was it cowardice in Samson to draw together the pillars of the temple and slay more Philistines in his death than in his life. Nor is it cowardice that has made the Hindu widow die on her husband's funeral pyre. Nor was it cowardice that made several thousand Jewish soldiers besieged in the fortress of Mesada by Roman soldiers commit suicide; nor can we charge those five hundred Jews with cowardice who, in the twelfth century, committed suicide in York, England, at a time of persecution. And it was something other than fear, if quite as ignoble, that made Ahithophel kill himself when the counsel of Hushai was preferred to his own. The lovesick swain who kills the maid who has refused him and then kills himself is driven by other passions than cowardly fear.

Christianity has always condemned suicide from the day that Judas Iscariot hanged himself. Even those believers were condemned by the Church who, in

time of persecution, put themselves unnecessarily in the way of gaining the martyr's crown. Paganism has usually condoned or allowed, or even lauded suicide, as in Japan. In China the defrauded or injured bank depositor stabs himself on his debtor's doorstep, out of vengeance, not fear, while in this country it is the bank president who commits suicide, not the depositors. The Stoic philosophy approved of suicide when life became a burden, and the Code of Justinian specified seven cases when suicide is justifiable.

But even before Christianity the better philosophy of Aristotle condemned suicide as unmanly, and that of Plato as disobedience to the gods. Says Socrates:

"There is a doctrine whispered in secret that man is a prisoner, who has no right to open the door and run away. I believe that the gods are guardians, and that we men are a possession of theirs. A man should wait, and not take his own life till God summons him, as he is now summoning me."

Here is exprest the final and most conclusive reason against suicide—it is infidelity to One who has bidden us stand in our place until he frees us. It is the obedient soldier's duty. Drop the religious challenge, the religious faith, the belief in God and the future life, and half the compulsive force of the vital instinct is shattered, and, as now, the number of suicides will be much increased. It is true that the rights of the community or of the state, or the instinctive passion for living and fear of death will indicate the path of duty, but these can be explained away and overcome. We may say—and it is true—that the general welfare of the state makes a general law which overrides special conditions, just as, in a developed social condition, monogamy becomes a virtue and polygamy a crime; or just as abstention from intoxicating drinks becomes a duty based not on personal but social grounds; but it is the religious argument that will most prevail, under Christianity, against suicide. Even among Jews, whose ethics is so close to that of Christianity, in all countries suicide is more frequent than among Christians.

We may add that the publication of one suicide is likely to suggest another. But for this sensational journals do not care. Perhaps even worse is the effect of the frequent representation of suicide on the stage. Of course our modern complex life gives frequency to self-destruction, but there are not a few who would endure the ills they have if examples were not set before them. As it is, suicides are becoming fearfully frequent, and especially in the Germanic and Anglo-Saxon races, as many as one in two thousand of our population, or even more than that; and those who kill themselves are by no means mostly insane. At least we are glad that suicide has as yet got no soft name, as certain kinds of murder are tenderly labeled euthanasia.

Physics and Psychics

In 1898 Sir William Crookes occupied what must be called, in spite of its paradoxical sound, a unique double position. He was simultaneously president of the British Association for the Advancement of Science and of the Society of Psychical Research. The anomaly of the situation lies in the fact that the two societies, tho professing to have the same purpose, the extension of human knowledge, and the same method, that of experiment and induction, are not, so to say, on speaking terms with one another. The older and larger association, tho embracing the whole circle of sciences, refuses to receive any papers on the subjects that occupy the attention of the younger society. The very existence of the phenomena studied by the psychical researchers is denied by most of the scientists, who, therefore, are unwilling to add to their alphabetical list of sections a Section X devoted to the unknown realm of metapsychics.

Some curiosity was aroused to see if President Crookes, in his address before the British Association, would ignore that episode in his scientific career which those he was speaking to regarded as a blot upon it, that is, his investigation of spiritualistic phenomena thirty years before. He elected to speak of it, holding it to be cowardice to do otherwise, and he reaffirmed his belief that his experiments demonstrated the existence of an unknown psychic force capable of the most astounding manifestations.

We bring the matter up now, not for

the purpose of taking from the table the previous question of the reality of the phenomena, but for the purpose of considering the often heard and quite natural inquiry, Why did the scientific world accept his statements about his physical experiments and laugh at him when he talked about his psychical experiments? Were not the experiments in these two fields performed by the same man and sometimes even on the same day in the same laboratory with the same apparatus? Is not the weight of his authority the same in both cases?

The answer to this is that his "statements" as to his discoveries in physics and chemistry were not "accepted" in the sense in which these words are commonly used in the ordinary affairs of life, and that in science the opinion of the highest authority has little weight and should have none except as an incentive and guide to the research of others. Crookes himself, even when his temper was sorely strained at the reception given to his published reports, did not reproach his colleagues for their incredulity; he only remonstrated with them for not investigating for themselves. Last week we showed that in a number of instances his bold predictions in advance of experimental proof had been in the course of years confirmed, but there is no reason to think the progress of science was impeded because contemporary scientists refused to accept at par value his views as to radiant matter, the decomposition of the elements and ultra-atomic corpuscles.

The difference between the two cases is just this: within a short time after their discovery every laboratory had a set of Crookes's tubes and was repeating his experiments, while on the other hand the patient and laborious investigations of Crookes and of the Society for Psychical Research have not in the course of thirty-five years succeeded in producing a single tiny experiment demonstrating psychic forces which can be repeated at will and verified by others. In this period of time the rare earths investigated by Crookes have become the bases of important industries, his radiant matter has opened a new realm of science, but the spirits are still performing the same old tricks under the same obscure and unreliable conditions, and there are fewer people now to give them credence than there used to be.

No manifestations more remarkable or better attested have been produced since 1870 than those of Professor Crookes. Let those who would accept them upon his authority understand what sort of a blank check they are signing. It is not enough that they are willing to say that "there are more things in heaven and earth, Horatio," or to acknowledge a belief in telepathy or magnetic influences or something of the kind. They must be prepared to believe that Professor Crookes, thru the mediumship of Miss Florence Cook, made the acquaintance of the materialized form of her familiar spirit, "Katie King," and continued the friendship for three years. Many of the manifestations took place in his own laboratory, illuminated by his own electric light, in the presence of his family and friends. According to his account Katie behaved on her visits like an ordinary flesh and blood young lady, shook hands with everybody, made up bouquets for her friends, mended her clothes, held the lamp, gathered the children around her and told stories of her past life to them, wrote letters, and cut off locks of her hair, "a rich, golden auburn" (the medium's hair being dark brown). Professor Crookes convinced himself of her separate identity by seeing and photographing her standing by the recumbent and covered form of Miss Cook and by hearing them converse together. He timed Katie's pulse and heartbeat, tested her lungs, and after politely asking her permission clasped her in his arms "as any gentleman would do under the circumstances."

Here, then, is a straightforward account of a long series of experiments carried on by a man of the highest repute in science, distinguished for his skill in investigating delicate phenomena in many fields. Why is it not convincing? Because science cannot be founded on human testimony, however positive and respectable. Law and history have to; that is why they are not and can never become true sciences. Ordinarily, many of the statements of reputable scientists do pass current without independent verification for months or

even years if nothing much depends upon them, just as checks pass from hand to hand without close scrutiny in times of financial peace, but these statements of individuals—checks drawn on the Bank of Truth—have to be payable on demand to whoever holds them. No reputation in science is sufficient to support a statement when it is challenged. The Crookes case is an admirable illustration of this fact. Very few scientific men credit his observations; some orthodox spiritualists, then and now, balk at believing in such substantial manifestations; many members of the Society for Psychical Research, tho convinced of the existence of some super-normal phenomena, will not go so far as this; the general public, tho cherishing some vestigial superstitions, and always avid of marvels, is, at the end of a generation, still incredulous of these.

This is not because the phenomena have been satisfactorily explained. They are as astonishing and incomprehensible as any conjurer's exhibition. Podmore, in his exhaustive examination of this and similar cases in his "Modern Spiritualism," is able to offer no better hypothesis than "collective hallucination." To be sure, Miss Cook was seized and caught cheating by Hipp in 1873 and by Sir G. Sitwell in 1880, but most psychical researchers frankly admit that all or nearly all mediums cheat when they need to to get the expected results, tho they hold that there are some residual phenomena inexplicable by trickery. But, as Professor James has said, referring to Eusapia Paladino, of whom M. Camille Flammarion makes much in his new book, "Mysterious Psychic Forces," it is unpleasant to think "that the whole order of nature might possibly be overturned in one's own head by the way in which one imagined oneself, on a certain occasion, to be holding a tricky peasant woman's feet."

Only one of the sacred books of the world is provided with the documentary evidence of its genuineness that skeptics demand, and that is the one that has the fewest believers. It is the Book of Mormon, which contains on its first page an affidavit of eight witnesses that they had "seen and hefted" the golden plates from which it was transcribed. So, too, the world is right in not believing that Sir William Crookes has "seen and hefted" Katie King. That he is an authority on one kind of spectral phenomena does not guarantee his accuracy in regard to the other kind.

The Bureau of Municipal Research

LAST year we printed a symposium of suggestions as to the benevolent uses that might be made of the Russell Sage millions. The claims of research—biological, medical, historical—were particularly urged by eminent specialists. To such of our readers as did not find in the many suggestions then offered the particular opportunity for benevolence for which they may have been looking, we commend the article in this issue by Mr. Henry Bruère, Director of the Bureau of Municipal Research. Mr. Bruère's message tells, briefly, the purposes, methods and extraordinary results of an experiment in government reform simply by making public the facts as to government; moreover, it points out the way to effective giving, not only of millions or thousands by the few, but of dollars and hours by the multitude with small incomes but large sense of civic responsibility.

Government by taxpayers, made intelligent as to government methods and government results, is better than government by political party, by a small commission (as urged by President Eliot), or by good intention, uninformed. This is the simple proposition for which the Bureau of Municipal Research stands. Its simplicity and its truth are so obvious as to make us wonder why it has so long escaped the notice of reformers addicted to the much advertised remedy, "Turn the rascals out!" If, as Ambassador Bryce wrote, years ago, "Municipal government is America's most conspicuous failure," the cause, according to Mr. Bruère, is to be sought not in the corruption of men, but in the inefficiency of methods. Tammany Hall has dominated New York City because Tammany Hall has possessed concealed opportunities for graft. Attempts at reform have failed in New York and elsewhere because the Republican and

Democratic Tammany Halls of our cities have had inside information and have been able to make black look white because the general public was uninformed. When reformers have been given power they have failed, not because they were not good and honorable, but because they tried to work by government methods that made it impossible to convert their good intentions into obviously good results. "The best wheat in the world will not make good flour if past through a coffee mill." Reform is discredited in American cities because its devotees, whose sincerity neither we nor the Bureau would question, have informed neither themselves nor the public as to the essential facts of community needs and government results. Checks and panaceas of every description have been tried—everything but a constant light; everything but consecutive, cumulative publicity of essential facts.

Wonder has been expressed that the Bureau of Municipal Research has received the unstinted coöperation of city officials such as Mayor McClellan, Comptroller Metz, Health Commissioner Darlington, etc. It has been suggested that such coöperation is fortuitous and likely at any time to cease suddenly. Two reasons will prevent: Cynics forget that a public official who has nothing to conceal and who wishes to serve the public can always be brought to see that it is to his interest to make known the facts and needs of his office; on the other hand, an official who has something to conceal and who wishes to serve his party, his friends or himself at the expense of the public, is almost without exception too clever not to see the advantage of a show of candor. The opposition of any self-opinionated honest man who resents criticism and scorns cooperation will be but short lived, for enough of significant official records are accessible to the public to make clear the character of such opposition. The time is past when any public official will be supported in an avowed policy of concealment. The problem, no matter how corrupt the city government, is to insure a constant demand for information such as that which the Bureau of Municipal Research represents. City officials under a searchlight or in the presence of a respectable company will act like any reader of THE INDEPENDENT under similar conditions. No official representative of the Republican or Democratic machines in any city will swear at or before an audience of tenement mothers; nor is there a corrupt or incompetent official who will put poison in a baby's milk, pile garbage on his neighbor's doorstep, put his hand in his neighbor's pocket, when his neighbor is looking. The Tammany chiefs of American cities have, for a hundred years, so conducted government that it destroyed babies' lives, poisoned milk, manufactured sickness and industrial inefficiency because neither these officials themselves nor their blind partisan followers nor the forces of righteousness have realized the connection between misgovernment and wretchedness, sickness, crime, poverty and industrial disorder. Mr Bruère maintains that all classes can be made to understand this connection if the facts are vividly and constantly presented to them.

The Bureau of Municipal Research seeks a permanent endowment. It believes that those who want "good government" are in the great majority; that when the majority votes wrong it is because it sees wrong; that nothing helps people to see right like the reiteration of facts; it would strengthen goodness, religious and moral motives and all reform impulses by emancipating these energies from ignorance. We commend the Bureau to the public spirited citizens of New York and its example to the good people of all other misgoverned American cities. What better field for a large endowment than one which will teach the art of self-government to the cities of America?

The Future of India

MR. MORLEY'S firm attitude as Secretary of State for India is already finding justification in the tone which comment in India itself is assuming. Of the two great native parties, the Moderate and the Extremist, the Extremist, which has been responsible for both the wild talk of revolution and the outbreaks of actual violence, is a small minority of the educated class, backed by ambitious princes, themselves for the most part scions of in-

truding dynasties. By far the larger number of the educated natives are in the Moderate party, and the ignorant multitude is on the whole sympathetically in agreement with the Moderate leaders. The Moderates are now declaring themselves frankly in support of Mr. Morley's position. At the same time, they are explaining in temperate terms to the English people and to the civilized world the precise aspirations and political demands of the educated class in India.

Thus, for example, the *Parsi,* an influential Moderate journal, by no means supports the extreme views of our Parsee correspondent of this week. It says that Mr. Morley is "needlessly obsessed" when he thinks that India demands that the British Government should retire from India and leave her alone. "We can assure Mr. Morley," the *Parsi* continues, "that, save a few hair-brained Extremists, there is not an Indian who demands the Briton to turn his back to India." From all reliable sources confirmation of this judgment is abundant. All in all, the people of India would probably subscribe also to the further declaration that "in the best interests of Indians themselves the Briton is needed in this land where he has a mission to fulfil." What India really wants, the *Parsi* assures us, is "only the satisfaction of her legitimate aspirations under the egis of the British."

These legitimate aspirations, it is well enough understood by those who know actual conditions in India, are both political and economic. The political ones spring in part from the economic, but partly also from the natural and commendable desire of educated natives to obtain a widening scope for their abilities in governmental activity.

England has not been ungenerous in her treatment of native Indians qualified to participate in law-making and administration. She has, indeed, by comparison with other colonial powers, especially the United States, been singularly conservative of Indian custom. Hindus, Mohammedans and Parsees have been placed in high executive office and given commission as judges of high courts. They have seats in the legislative councils, and laws of local applications are not enacted without patient attention first given to the voice of the people. A far larger share, however, will undoubtedly in time be accorded to Indians in all branches of the government; and the end toward which the Moderate party is directing its efforts is that of hastening the day when educated Indians will have a preponderating power in the determination of all questions affecting India only, and not properly imperial.

For the mass of the people, however, economic reforms and progress are far more pressing. We by no means credit all the statements in impressive statistical terms which are freely made by the critics of British rule—and some of which have been rather carelessly used in public meetings, recently held in America—relative to the alleged increase of Indian poverty. It is true that famines have been frequent and severe in recent years, and it may possibly be true that the actual economic condition of the Indian population of 300,000,000 is "appalling." But just such famines have always existed and still exist in China. That the average annual income is less than $6 a year per individual, and that a quarter of the people never know what it is to have their hunger satisfied, are statements in their face absurd, and no good can come to India from using them for propagandist purposes.

The really serious fact to be grappled with is that modern capitalism is exploiting India precisely as it exploits every other land that does not interpose proper governmental checks and regulations in the interest of civilization and humanity. And India, being in a state of industrial transition, is not in a good condition to resist the exploitation. The introduction of factory-made goods has proceeded more rapidly than the introduction of factory industries has created a demand for manufacturing labor. Consequently, just such distress as overtook England when the factory system was established there has fallen upon India, but on a larger scale. The household industries, such as the weaving of beautiful textile fabrics and the fashioning of beautiful wares of iron and silver and gold, have received a severe blow, and millions of humble folk once comfortable, if not prosperous, have been forced to turn to the land for a living, and the land, under existing methods of

cultivation, does not yield them an adequate subsistence.

What India most needs, therefore, is a wiser and more strenuous effort by the British Government to differentiate and promote modern industry in India, as well as to perfect agricultural methods. That such efforts are resisted and even blocked by British and American manufacturing interests is charged, and we fear the charge is too true. The immediate necessity, then, is to bring the actual facts, without exaggeration, to public attention. Let the light of publicity be turned on, and if selfish commercial interests are needlessly prolonging Indian suffering, let us know what they are and whose they are.

Roosevelt Not a Candidate

President Roosevelt, when he was informed of his election, in the most positive terms declared that he would not be a candidate to succeed himself. That ought to be enough, and yet the anti-Roosevelt press has been insisting that he has been pulling wires to secure the nomination, and that his support of Secretary Taft is a blind and a sham. This is not decent, and he is not required to keep repeating his words. But when this last week, in conversation with a Pennsylvania friend, he said as much it was represented as an unexpected announcement. And the same papers are bound to make it out that he is hostile to Governor Hughes just for some supposed personal slights, because Governor Hughes has not sufficiently recognized his influence in New York politics. Of course this is quite unwarranted and equally ungenerous. If Mr. Hughes should be nominated we doubt not that Mr. Roosevelt would give him the warmest support, the same support he would give Secretary Taft or Senator La Follette. We trust that all the toadying politicians who have been insisting that Mr. Roosevelt will be compelled to accept the nomination will at last learn that such conduct does not please the President.

A Waterway System

Millions of money have been paid by our Government for the improvement of rivers, but it has been done under no system, chiefly under political influence. The present design of the National Harbors and Rivers Congress is quite different. It asks fifty million dollars for a well devised general system, which is not a raid on the Treasury, but which plans to provide water communication for slow freight from North to South and from West to East. It is designed to utilize rivers where possible, and supplement them by canals. The first need is that of safe waterways down the Mississippi and its principal branches, and to connect the great Lakes with the Gulf. With the present congestion of our railways some such relief is absolutely needed, and quite as much the development of a canal system to reach the Atlantic. It is remarkable how far we are behind Europe in the matter of canal navigation, the cheapest and safest of all methods of internal commerce. For such improvements we can afford the cost, much better than for the many millions which it will cost to build an extravagant navy. We believe that Congress and the Administration will favor this policy.

A case came the other day before a city court of a hotel-keeper who refused to take a tenant because he was a Jew. In defense of the hotel it was claimed that "among the Christian element in the community there is a prejudice against living in community with Hebrews," and that, in recognition of this prejudice, owners of hotels and apartment houses often decline to receive Hebrews as tenants. In reply the judge, who is a Catholic, said:

> "I feel constrained to say that this contention is obnoxious to law and contrary to fact. While the prejudice may exist among ignorant, illiterate, and irreligious people, it certainly cannot be said that it exists generally among the genuine 'Christian element in this community,' nor could it find lodgment in the mind of any self-respecting American citizen. However, nothing would be gained by further considering this question of prejudice—it is not and never could be a matter whereof any court in our land would take judicial notice."

That is sound sense, or ought to be.

Coincidently with the much observed diminution in the use of alcoholic drinks in this country is the parallel diminution, not so much observed, in the use of tea and coffee, with the marked increase in the use of cocoa and chocolate. The

number of pounds of crude cacao imported has increased in five years from 63,351,294 pounds to 92,249,819 pounds. This increase may, however, be in part due to the use of chocolate in candy. In the same period the number of pounds of coffee imported, which was 1,092,344,170 in 1902, has fallen to 986,595,923 for the last year, while in five years the importation of tea has fallen from 108,574,905 pounds to 86,368,490 pounds. The population having increased meanwhile and financial conditions having been favorable, this indicates that our people are less depending on stimulants that do not intoxicate.

Swarthmore College will probably decline the millions offered on condition that it rule out intercollegiate athletics. It sought advice and got it. The presidents of Harvard, Cornell, Chicago, and Leland Stanford, Jr., universities agree that trustees should not so bind their successors. The presidents of Columbia and Princeton are non-committal. The presidents of Dartmouth, Brown and California regard freedom as the most valuable endowment of a college, and think it unworthy for a board of trustees to be purchased and paid in a way that will involve their successors. But it is to be remembered that the weight of the "dead hand" is an ancient subject of discussion, and legislatures have a way of lifting it when it becomes oppressive.

In describing the speech of Speaker Cannon in defense of the rules of order adopted in the House of Representatives, a New York newspaper which prides itself on its good English says that the substance of it was that "if you don't like it, you can lump it." Doubtless that is idiomatic if somewhat slangy. The Oxford Dictionary knows no derivation for *lump* in that sense, and thinks it unornate-poetic, like *grump*. It finds no illustration of it before 1833, and then from New England. One might almost suppose some Chinese tongue caught it from the Latin *"Si non lubeat rumpatur,"* which is found in Milton's reply to Salmasius.

The Jamestown Exposition has closed, not in a blaze of glory, but with confessions of failure. It was badly located, and the announcements of it as a naval show were not of the kind to draw the multitude to an inconvenient place. The Exposition as a whole goes into the hands of a receiver, but we notice that the committee in charge of the negro exhibit and building report that it will not fall into the hands of receivers, but has sufficient funds to reship the exhibits and meet all demands.

It is a matter of immense future influence that the Chinese Government is sending its youth for education to this country and not to Europe. There are four hundred such youth now in our schools, says our Minister at Peking, Mr. Rockhill. Each remains from four to seven years, and more are coming.

Another Russian actress is to come to this country to interpret Ibsen to us in her native language. Her name is Vera Feodorovna Kom-misarjewskaya. The theater in St. Petersburg that bears her name is one of the largest in all Russia.

Why the Japanese Government has recalled Ambassador Aoki we do not pretend to know, but there is no evidence that the appointment of his successor indicates any less friendly sentiment toward the United States.

Thomas W. Lawson, of Boston, has made a New Year's resolution which is of a characteristically novel character. He announces to the world that on January 1st he will quit reform and take to gambling.

The President's message is 30,000 words this time. His recommendation of the removal of the tariff on wood pulp for paper making is most timely.

Few women can write letters and few men can eat spaghetti without postscripts.

What is injurious to the community is wrong for the individual.

To err is human; otherwise it is a pianola.

Mr. Cleveland Before the Association of Life Insurance Presidents

THE annual meeting of the Association of Life Insurance Presidents took place last week at the Hotel Belmont, in this city. Some five hundred insurance men attended the opening session. Grover Cleveland, chairman of the association, presided and addressed the assembly at some length upon life insurance under the conditions imposed as one result of the past two years of agitation. He pointed out in the beginning of his remarks that the subject of life insurance in the United States presents features of development and evolution which constitute it one of the greatest wonders of our national advancement, whether we consider the radical and speedy change in our people's appreciation of its beneficent mission or the commanding place it has suddenly gained in American business and finance. Said Mr Cleveland:

"Thus it happens that the mass of the plain and common people of the land who have life insurance in mind, or at least those who think at all well of it, love to dwell upon it as a strong defender against the havoc of death and a compassionate benefactor against the deprivations of pitiless want. Whether you will or not, these are the relationships in which your companies stand to your fellow countrymen; and these relationships, closely interwoven, constitute a powerful cable binding life insurance to the immovable rock of popular confidence.

"You who manage life insurance companies cannot afford to risk weakness in a single one of its threads. Their disintegration thru breaches of good faith, thru broken promises or thru delusive misrepresentation means a loss of strength which no actuarial mystery or managerial calculation can repair."

Lack of space alone prevents more copious quotations from Mr. Cleveland's address, the whole trend of which was toward conservatism, the security of assets, co-operation, against unreasonable and vicious laws here and there which tend toward repressing instead of encouraging insurance, and toward a closer relation on the part of the insuring company with its policy-holders. Mr. Cleveland pointed out that the abuses uncovered by the Armstrong investigation had been remedied. He also advocated a less complex form of annual statement.

Mr. Paul Morton, president of the Equitable Life Assurance Society, spoke on the question of valuing the assets of insurance companies, to which some reference was made in our issue of November 28. Darwin P. Kingsley, president of the New York Life, took as his subject "New York and Life Insurance Legislation." George E. Ide, president of the Home Life, and John Tatlock, president of the Washington Life, also spoke, and John M. Holcomb, president of the Phœnix Mutual Life Insurance Company, and E. E. Rhodes, vice-president and actuary of the Mutual Benefit Life Insurance Company, were active in the discussions of the organization.

The New Building Code for New York City

A REVISED and much more stringent building code for New York, one of the features of which is a limit of 200 feet for skyscrapers, is now before the Board of Aldermen for approval. George W. Babb, president of the New York Board of Fire Underwriters, recently called attention to the fire hazard of the skyscraper, but it is very doubtful if the people of New York, not even the bankers and merchants, have a proper appreciation of the ever present danger of a great conflagration here. Were a great fire to sweep away the so-called Dry Goods District the values destroyed would be so great that but few, very few fire insurance companies, could pay more than a small percentage of the claims that would be made against them. The bulk of the tremendous loss would therefore fall upon the bankers holding mercantile paper. The Chamber of Commerce, under the leadership of Henry E. Evans, president of the Continental Insurance Company, and Anton A. Raven, president of the Atlantic Mutual Insurance Company, has become aroused to a proper sense of the impending danger and has not only endorsed the new building code but urged its speedy adoption. The value of the property destroyed by fire in the United States during the part five years was not less than $1,250,000,000, much of which could have been saved with safeguards such as the new code contemplates.

Financial

The Treasury Report

THOSE who read Secretary Cortelyou's annual report will quite naturally look first for what he says about the panic and the scarcity of currency. He makes no specific recommendation for new laws, but urges that action be taken promptly "to provide under Government guaranty a greater elasticity for the currency—something which shall be automatic in its operation, and which shall tend to equalize rates of interest not only in different sections of the country, but also at different periods of the year." He points out that little discretion is given to the Secretary with respect to the currency:

"In times of emergency his hands are virtually tied. If in such periods of stress, in an effort to avert calamity and to serve the interests of all the people, he is obliged to resort to unusual measures, criticism is unfortunately, in many instances, directed not to the inadequacy of the system, but solely to the effort to give relief, even tho it be successful in accomplishing that purpose. It should not be forgotten that he has to deal with the practical rather than the theoretical side of the currency question. The failure of the adherents of the various suggested plans of currency reform to co-operate or to agree upon a practical measure would hardly appear to be a sufficient reason for holding him responsible for their indecision and inaction."

Mr. Cortelyou evidently has in mind Congressman Fowler and the issue of 3 per cents. As to that issue, it may fairly be said that the effect of the announcement of it was excellent, and that the reduction of the total to $15,000,000 makes the entire interest charge not more than $450,000, which is a small price to pay for the effect produced.

For imparting elasticity to the volume of currency, Mr. Cortelyou says, simplicity of plan is needed. In our judgment the simplest plan is one that provides for emergency issues of heavily taxed notes. Official statistics show, however, that the Bankers' Association plan would permit an issue exceeding $300,000,000, and that a proposed issue limited to 50 per cent. of capital might exceed $400,000,000, altho, of course, restrictions would be imposed by the Comptroller. It would be better to have emergency issues made by some central authority, and this points directly to the creation of a central bank of issue. The advantages of such a bank were set forth in a public discussion at Philadelphia last week by Comptroller Ridgely, W. A. Nash, Isaac N. Seligman and other financiers. To this solution of the problem we may eventually come, but effort in Washington at the present time will probably be useless if made for anything more than legislation for carefully guarded and restricted emergency issues by the existing banks or by a central association of them.

....Owing to the financial situation, the American Finance and Securities Company, of which Edward B. Kurtz is president and Charles E. Ellis is secretary, and whose capital is $5,000,000, has decided to anticipate the payment of its semi-annual bond interest, due January 1st, 1908, and is now mailing checks for the interest due on that date.

....On January 1 the banking house of Baring & Co. (New York representatives of Baring Bros. & Co., Limited, of London) will be dissolved, but the business will be conducted in most respects as before by Kidder, Peabody & Co., the Boston agents of the Barings, who will open a house in New York. G. D. Hallock and A. L. Mason, both of whom are members of the present Baring firm (Mr. Hallock being the Exchange member), will become members of the New York house, and with them will be associated W. L. Benedict, who for many years has been in charge of the Boston house of Kidder, Peabody & Co.

....Contracts for the designing and engineering work on a projected iron and steel plant to be erected in India, at a cost of $10,000,000, have been given to the American firm of Julian Kennedy, Sahlin & Co., recently established in London. Mr. Kennedy (Yale '75) is a well-known blast furnace expert of Pittsburg, and Mr. Sahlin was trained in the mills of the Maryland Steel Company.

VOL. LXIII NEW YORK, THURSDAY, DECEMBER 19, 1907 No. 3081

Entered at the New York Post Office as second-class mail matter

Survey of the World

No Third Term for Mr. Roosevelt

The President, on the night of the 11th, gave to the public a repetition of the statement made by him immediately after his election in 1904, concerning a third term. As forwarded to the press, it was as follows:

In view of the issuance of the call of the Republican National Committee for the convention, the President makes the following statement:

"On the night after election I made the following announcement:

"'I am deeply sensible of the honor done me by the American people in thus expressing their confidence in what I have done and have tried to do. I appreciate to the full the solemn responsibility this confidence imposes upon me, and I shall do all that in my power lies not to forfeit it. On the 4th of March next I shall have served three and a half years, and these three and a half years constitute my first term. The wise custom which limits the President to two terms regards the substance and not the form, and under no circumstances will I be a candidate for or accept another nomination.'

"I have not changed and shall not change the decision thus announced."

It was generally admitted in both the great parties that this left no room whatever for doubt as to the President's purpose. Mr. Bryan said he was not surprised; he had assumed that the President would not be a candidate, and he thought some of the President's friends had done him injustice in suggesting that the decision announced in 1904 would be changed. On the 9th Representative Clayton, of Alabama, had offered in the House an anti-third-term resolution which was substantially a copy of the one introduced in 1878 by Mr. Springer and past by a vote of 233 to 16. That resolution was aimed at President Grant. On the 12th, following the announcement from the White House, Mr. Clayton offered another resolution congratulating the country and commending the President's patriotism.——On the 10th, after the Cabinet meeting, the text of Mr. Roosevelt's letter or order relating to the action of officeholders was given to the public. An imperfect copy, written out from memory by newspaper correspondents to whom parts of the order had been read, we printed in our issue of November 28th. The order has been sent to officeholders by heads of departments in the following form:

The following communication from the President is forwarded to you for your information and guidance:

THE WHITE HOUSE,
WASHINGTON, November 19, 1907.

I have been informed that certain officeholders in your Department are proposing to go to the national convention as delegates in favor of renominating me for the Presidency, or are proposing to procure my indorsement for such renomination by State conventions. This must not be. I wish you to inform such officers as you may find it advisable or necessary to inform in order to carry out the spirit of this instruction that such advocacy of my renomination, or acceptance of an election as delegate for that purpose, will be regarded as a serious violation of official propriety and will be dealt with accordingly.

Sincerely yours,
THEODORE ROOSEVELT.

Mr. Roosevelt's repetition of his original statement about a third term has been followed by the publication of much political gossip. It was reported that the managers of Secretary Taft's canvass complained to the President that First Assistant Postmaster-General Hitchcock, Internal Revenue Collector Capers and others were organizing the Southern delegates ostensibly for a third

term nomination, but really in the interest of Secretary Cortelyou, and that Secretary Taft for this reason was getting no support in the South. On the other hand, it was said that those who sought third term delegates in the South were sincere, desiring the President to stand for another term, and that if any work had been done by influential Federal officeholders for Mr. Cortelyou it was without his knowledge. A report that Mr. Cortelyou was about to resign was pronounced "preposterous" by the President, and declared to be untrue by the Secretary himself. Against published reports that the President and Mr. Cortelyou were no longer on friendly terms there was evidence from several sources that no estrangement had taken place. It was admitted, however, that some of Mr. Taft's friends were not on good terms with some of Mr. Cortelyou's friends in the Federal service. There appears to be a growing impression that Mr. Taft's political interests have not recently been in wise hands. Some of the politicians and some of the newspapers are saying that Governor Hughes's friends cannot expect to see him nominated if he has no political "workers" in the field. His friends reply that for him to strive for the nomination or to encourage the efforts of politicians in his interest would be at variance with his principles and his course in public life. At the dinner, last week, of the Pennsylvania Society of New York City, the Governor (a guest and one of the speakers) was cheered enthusiastically, with cries of "Our next President!" The name of Senator Knox, for whom Pennsylvania will vote in the convention, was greeted with much less applause. Speaking at a dinner (in New York last week) of the American Institute of Banking, Chancellor Day, of Syracuse University, attacked President Roosevelt in his customary manner and drew a contrast between his picture of the President and that of a "real statesman" who should be nominated, his allusions being so plain that his hearers at once gave three cheers for Governor Hughes. The Governor's friends say, however, that his views about the regulation of corporations are surely at variance with those of Chancellor Day.——The Republican National Convention will be held in Chicago on June 16th; the Democratic, in Denver, on July 7th. In the Democratic committee thirty-four votes were cast for Denver and twelve for Louisville.

Land Fraud Cases

It is asserted in the Denver newspapers that investigation concerning the killing of Joseph Walker, the Secret Service agent who was shot while collecting evidence at the Hesperus mine relating to land fraud cases, has disclosed a conspiracy in which at least ten men of some local prominence are involved. Walker was an important witness for the Government in cases soon to be tried. Valuable documentary evidence which he had been carrying on his person is missing. The men who killed him asserted that they acted in self-defense, but his wounds showed that he had been shot in the back.——At Carson City, Nev., on the 10th, State Senator Williams and his brother, George B. Williams, who had been indicted for taking Government lands unlawfully, pleaded guilty. Each was fined $100 and sent to jail for twenty-four hours. C. W. Riley and A. H. Harding, wealthy ranchmen of Humboldt County, have been indicted for similar offenses.——R. H. Mahaffey, a ranchman under indictment for conspiracy to defraud the Government of land, has pleaded guilty in Omaha. The sentence is $500 fine and forty-five days in jail.——At Globe, Ariz., five indictments have been found against Dr. L. R. Ricketts, formerly superintendent of the Old Dominion Mining Company and now general manager of the Green-Cananea Mining Company. One indictment is for perjury and four are for subornation of perjury, in connection with land frauds in New Mexico.——R. A. Ballinger, Commissioner of the General Land Office, says in his annual report:

> "The most rigorous effort is being made with the force at my command to restrain unlawful and fraudulent practices in the public land States and to secure evidence for the prosecution of those guilty of violation of the law. The field force is totally inadequate in numbers to reach all such offenses; hence the gross offenders are more particularly sought for."

He condemns as obsolete and absurd

some of the existing land laws, in particular the Act of 1873, governing the patenting of coal lands:

"Title having passed, the Government possesses no guaranty that a public utility, the coal, can be made available to supply the market; on the contrary, these lands have almost uniformly passed into the hands of speculators or large combinations controlling the output or the transportation, so that the consumer is at the mercy of both in the greater portion of the West. Inducements for much of the crime and fraud committed under the present system can be prevented by separating the right to mine from the title to the soil."

There are now 159 national forests (formerly called forest reserves), created by Presidential proclamation, and they embrace 150,831,665 acres.

The San Francisco Prosecutions

Tirey L. Ford, chief counsel for the street railway company in San Francisco, has been acquitted. He was tried for bribing the supervisors. At the end of his first trial the jury disagreed. There are thirteen more indictments against him, and he will be tried again. Jurors say they were influenced in his favor by the failure of the prosecutors to call Ruef as a witness. Ruef's testimony appears to be an essential link in the prosecution's case against several men. His price for it is full immunity, and the prosecution may decide to accept his terms. The trial of Patrick Calhoun, president of the street railway company, is set for January 7th. The grand jury has returned fourteen more indictments—against Schmitz, Ruef, Edward Graney, Willis Britt and others—in connection with bribery for an ordinance relating to prize fights, and is said to have recommended the dismissal of indictments against G. H. Umbsen, J. E. Green and W. I. Brobeck, who were charged with bribery in what is known as the Parkside trolley case. This grand jury has now been discharged, after making a notable record. It returned 441 indictments, involving 47 persons. In a long report it summarizes the work done, denounces the corrupt mayor and other officers, says that the corruption disclosed in the police force was almost incredible, and scores the police courts for their leniency toward strikers arrested for breaking the laws during the street railway strike. The railway company is also censured for negligence and criminal carelessness:

"We cannot even outline the vast amount of evidence received by us showing corruption and vice of the lowest kind, involving the greatest moral turpitude, such as the participation of the former mayor of our city in the profits earned by the prostitution of the lowest of fallen women, which constitutes a recital of seemingly inconceivable sin, shame, and violation of law."

District-Attorney Langdon made an address in New York, on the 13th, under the auspices of the Civic Forum, telling the story of the investigation and prosecution. In the course of his remarks he asserted that the present Governor of California was nominated by "the railroad machine," and that Ruef had delivered his group of delegates for the nomination in return for $14,000 paid to him by the chief counsel for the Harriman railroads. Mr. Langdon was interrupted by a man who said he was a lawyer and who gave the name of Franklin Leonard, Jr. This man proposed several questions which showed he was attempting to defend those now under indictment in San Francisco. In one it was asserted that Patrick Calhoun had had no opportunity to be heard. Mr. Langdon replied that Calhoun came before the grand jury, by invitation, before his indictment, and was asked to speak for himself; and that he refused, "by advice of counsel," to answer any questions or make any explanation. Mr. Langdon also said that two hours after his arrival in New York he discovered that "two human bull dogs," or private detectives, were continually at his heels. "They are in this hall tonight," he added.

Central American Peace Conference

In addition to the agreement for a permanent Court of Arbitration (of which we spoke briefly in our editorial pages last week), the five Central American republics, at their peace conference in Washington, have prepared six treaties, relating to extradition, the establishment of a pedagogical institute, etc. They recommend that a monetary conference be held in Honduras on January 1, 1909, to discuss rates of exchange and kindred topics. It is expected that the peace conference will

be dissolved on the 20th. Its great achievement is the agreement for the permanent international court, which is called the Central American Court of Justice. There are to be five judges, each republic appointing one, and the sessions are to be held in Costa Rica. The court's decisions are to be final, and its jurisdiction extends over substantially all international disputes or controversies which can arise in Central America. It is empowered to act with respect to the complaint of an individual in one republic against another republic, for violation of treaties, even if his own republic does not support his case, and also to consider such questions as any one of the republics may agree with some nation outside of Central America to submit to it. Honduras, which stretches across from one coast to the other, is made neutral ground, and this neutrality is to be guaranteed by the four other republics. All the agreements of the peace conference are embodied in formal treaties, which will be submitted to each of the five republics for ratification.

Many Killed in Coal Mines

Recent explosions in three bituminous coal mines have caused great loss of life. The first occurred at 8 p. m. on the 1st in the Naomi mine of the United Coal Company, which is situated three miles west of Fayette City, Pa., and thirty miles from Pittsburg. There were 49 miners at work, and at least 34 of them perished. At last reports 30 charred bodies had been recovered. Only 18 men are left alive in the little village of Naomi. Several of these had declined to work on Sunday. Others who attempted to enter the mine were turned back because they were intoxicated. One of the bereaved women in Mrs. John D. Harry, who lost her husband and her three sons. The entire family were about to return to England and had engaged passage on a steamship sailing from New York on the 10th. The miners complained to State officers a year ago that the mine was in a dangerous condition for lack of adequate ventilation.——At 10 a. m. on the 6th there were tremendous explosions in two mines of the Consolidated Coal Company (of Baltimore) at Monongah, W. Va., in which more than 400 men were at work. The company has a capital of $20,000,000 and owns about 100 mines. A branch of the Monongahela River flows between these two, both of which are said to have been examined by inspectors earlier in the week. As in the case of the Naomi mine, the force of the explosion (of gas or black damp) was so great that both mines were completely wrecked. At last reports 320 bodies had been taken out. Only 15 miners are known to have escaped, and it is believed that all their companions lost their lives. The general manager's record shows that 478 miners were checked off as having entered the mines, and with these were about 100 trappers, mule drivers and boys, but the number of those in the mines at the time of the explosion was less than 450. For the 1,000 children whose fathers were killed, the president of the coal company, C. W. Watson, will erect an orphan asylum at Monongah.

Immigration Statistics

The report of Frank P. Sargent, Commissioner-General of Immigration and Naturalization, for the year ending June 30th, 1907, shows that the influx of population from all parts of the world was greater than ever before in the history of the country. The total immigration for the year 1907, which was 1,285,349, exceeded that for 1906 by 184,614, and that for the year 1905 by 258,850, or an increase over the year 1906 of more than 17 per cent., and over the year 1905 of more than 25 per cent. It was distributed according to nationality as follows: Austria-Hungary, 338,452, increase, 73,314; Bulgaria, Servia and Montenegro, 11,359, increase, 6,693; France, 9,731, increase, 345; German Empire, 37,807, increase, 243; Greece, 36,580, increase, 17,091; Italy, including Sicily and Sardina, 285,731, increase, 12,611; Russian Empire and Finland, 258,943, increase, 43,278; Turkey, 20,767, increase, 11,257; England, 56,637, increase, 7,146; Ireland, 34,530,. decrease, 465; Scotland, 19,740, increase, 3,874; China, 961, decrease, 583; Japan, 30,226, increase, 16,391; British North America,

19,918, increase, 14,855; West Indies, 16,689, increase, 3,033. Of those admitted, 873,923 had less than $50 each in their possession, while 107,502 were able to show amounts in excess of that sum. The total amount of money brought into the country by arriving aliens was $25,599,893, or an average of almost $20 per person. The aggregate number of outwardbound passengers, 569,882, was 73,145 larger than in 1906. The immigration of Chinese has been practicably stopt but that of Japanese nearly doubled without including the surreptitious entrances effected thru Canada and Mexico. The Commissioner calls attention to the large increase in the number of immigrants landed at Southern ports.

A Further Papal Interdict

The new "Motu Preprio" issued by Pius X has appeared in full. It first quotes from Leo XIII's Encyclical of 1893 condemning Rationalists and the higher criticism, and then refers to his appointment nine years later of a Biblical Commission to study biblical questions that might arise. That Commission having, under Pius X, issued several decisions, one in favor of the text on the "three witnesses," and another on the authorship of the Pentateuch by Moses, the Pope finds that some refuse obedience to these decisions, and he says:

"Wherefore, We find it necessary to declare and prescribe, as We do now declare and expressly prescribe, that all are bound in conscience to submit to the decisions, regarding doctrine, of the Biblical Commission, which have been given in the past and which shall be given in the future, in the same way as the Decrees of the Roman Congregation approved by the Pontiff; nor can all those escape the note of disobedience or temerity, and consequently of grave sin, who in speech or writing impugn these decisions; and this besides the scandal they give and the other reasons for which they may be responsible before God, for other temerities and errors usually accompany such oppositions."

He then repeats excommunication on any who shall defend the errors of the last Syllabus, or who shall not accept his last Encyclical on Modernism, and he concludes:

"Wherefore, We again and most earnestly exhort the Ordinaries of the dioceses and the Heads of Religious Congregations to use the utmost vigilance over teachers, and first of all in the Seminaries; and should they find any of them imbued with the errors of the modernists, and eager for what is new and noxious, or lacking in docility to the prescriptions of the Apostolic See, no matter how they may be published, let them absolutely forbid the teaching office to such; so, too, let them exclude from sacred orders those young men who give the faintest reason for doubt that they hold the condemned doctrines and the pernicious novelties. We exhort them also to take diligent care to put an end to those books and other writings now growing exceedingly numerous, which contain opinions or tendencies of the kind condemned in the Encyclical Letters and Decree above mentioned; let them see to it that these publications are removed from Catholic publishing houses, and especially from the hands of students and the clergy. By doing this they will at the same time be promoting real and solid education, which should always be a subject of the greatest solicitude for those who exercise sacred authority."

The Trial of General Stoessel

The trial by court martial of the officers in command of the defense of Port Arthur took place in the auditorium of the Army and Navy Club, at St. Petersburg, this week, but verdict has not yet been rendered. Lieutenant-General Stoessel is charged with cowardice and treason in surrendering the fortress on the 1st of January, 1905. The indictment makes the following charges against General Stoessel:

(1) Disobeying Gen. Kuropatkin's order to hand over the command of the fortress to Gen. Smirnoff.

(2) Suspending the construction of the second and third lines of defense.

(3) Countenancing ironical and often abusive reports written by Gen. Fock concerning various officers in charge of the defense.

(4) Sending false reports to Gen. Kuropatkin and Admiral Alexieff regarding the battle of Tsin-Chau, May, 1904.

General Fock is charged with being responsible for the investment of Port Arthur by his retreat after the battle of Nanshan by falsely representing that the Russian troops were in a critical position. General Reiss, as Chief of the General Staff, is charged with conspiring with General Stoessel to surrender the fortress by exaggerating the weakness of the garrison and the defense. In his defense General Stoessel accuses General Smirnoff of undermining his authority thru envy. He says the fleet failed to co-operate with him and did not furnish him with sup-

plies. He feared that if he held out much longer the Japanese would become so infuriated that a general massacre would follow the capture, as it did when it was taken by the Japanese from the Chinese. Over one hundred and fifty witnesses among the veterans of the war have been called by the defense and the prosecution. The most important evidence that has been given in the trial is that of General Kuropatkin, who had charge of the Manchurian campaign. He declared that the plan of war was based upon the efficiency of the Russian fleet, and when this was crippled by the "treacherous opening attack of the Japanese," Port Arthur was left defenseless. If the Japanese had pushed forward energetically they could have taken Port Arthur by assault in the early days of the war. The slowness of the Japanese gave the Russians time to fortify the place and provide it with supplies.

Russian Revolutionists

The Russian Government is using its renewed power by punishing with great severity its opponents of the last few years. The Minister of Justice demanded of the last Duma the surrender of a large number of its members belonging to the Social Democratic party to be tried on the charge of treason. The Duma refused, holding that its members were immune from arrest, whereupon the Government dissolved the Duma, and replaced it by the present weaker and less revolutionary body. The case of forty-nine members of the Duma was tried last week by the judicial section of the Senate under Judge Deier, who presided at the trial of the assassins of Alexander II. The trial was conducted secretly, and neither the accused nor their lawyers were present. The prosecution charged that they formed and organized a conspiracy, the aim of which was to overthrow the existing Government and to institute a republic, and that they incited the soldiers to mutiny and the populace to insurrection. The counsel assigned for the defense said that Social Democracy was a legitimate political party, openly advocating its doctrines in all the civilized countries, and aiming to put them into effect by means of the ballot. The Social Democrats of Russia and of the countries united in a protest against the secret trial of the accused Deputies for their political opinions, and denied the existence of the alleged conspiracy on their part to overthrow the existing Government. According to the law sentence has to be pronounced with open doors, but tho this was literally complied with, the police kept the public from the room during the imposition of the severe sentences. Eight Deputies, including Annikin, Annismoff, Dzhaparidze and Prince Tzereteli, are condemned to five years' labor in the mines and subsequent deportation to Siberia; nine others, including Batasheff, Bielousoff and Kirienko, are sent to the mines for four years, and then will be deported. Ten Deputies are sent into perpetual exile in Siberia. The leaders of the military organization, Zapadnidke, and two women, Madame Morozva and Madame Subbotina, shared the heaviest sentence, five years in the mines and deportation, while six soldiers, who were accused of agitating among their comrades, were sentenced to four years in the mines and deportation. Ten Deputies, who succeeded in proving that they were not connected with the Socialist organization, were acquitted. Among the men condemned are three noblemen; their sentences must be approved by the Emperor.——Nicholas Tschaikovsky, who is well known in this country, where he has been recently lecturing and collecting funds, returned to Russia in disguise and has been arrested and confined in the fortress of St. Peter and St. Paul. He has many friends in the United States on account of his fine personal character and charm of manner, and active efforts are being made to prevent his being sent to Siberia. A petition signed by a large number of prominent men in New York and elsewhere has been sent to Baron Rosen, the Russian Ambassador, petitioning the Czar to show the greatest clemency in regard to him and also Catherine Breshkovsky. He is now sixty-five years old, and was the founder of the first revolutionary circle in St. Petersburg in 1875. He was imprisoned and condemned to Siberia, but he es-

caped to London. Later he came to America and lived in a socialist colony in Cedar Vale, Kan.

Disorder in Macedonia

The attempt of the Powers to maintain order in Macedonia, according to the Mürzteg program, has not resulted in any noticeable improvement of conditions in that unhappy country. General De Giorgis, the Italian officer in charge of the International Police, is reported to be entirely discouraged and anxious to resign on account of the difficulties and humiliations of his post. A new project has been devised by the ambassadors of the Powers at Constantinople and will be presented to the Porte. The scheme provides for the appointment of a number of inspectors, half Mohammedans and half Christians, who are to examine into the failures of administration and make recommendations to the Finance Commission. But there is little hope that this plan will be effectual even if the Turkish Government is willing to accept such an advisory body. During the past year there have been some four or five hundred deaths due to the raids of the bands of Greeks, Servians and Bulgarians upon the villages and the resulting conflicts. The Servian depredations are said to have the encouragement of the Turks because they serve as a barrier between the Bulgarians of the Principality and those in Macedonia. Both Russia and Great Britain have remonstrated with Bulgaria in regard to the activity of Bulgarian bands, but the Government has denied that the Bulgarians were fomenting racial conflicts and carrying out a national propaganda. It charges, on the other hand, that the disorder arises from Greek bands recruited in Crete, and the Bulgarian villages are simply acting in self-defense. Boris Sarafoff, the most celebrated of the Bulgarian leaders in Macedonia, was shot dead at the door of his house by an unknown man last week. Another revolutionary leader, Garvanoff, was killed at the same time. Sarafoff was only thirty-seven years old, but had been an avowed revolutionist ever since he was fourteen years old, when the Turks entered his home and in his sight tortured his father and grandfather and took them to prison. He obtained military training in the Bulgarian army and for the last twelve years has been engaged in revolutionary activities. It was his band that captured and held for ransom in 1901 Miss Ellen M. Stone, an American missionary. His siser, Zeleta, a student at the University of Geneva, on hearing of the murder of her brother, took the oath of vengence and will continue his work.

Anti-Foreign Movement in China

China and Great Britain are coming into strained relations on account of the disposition of the Chinese people to repudiate all concessions made to foreigners for railways and other projects of internal development. The question of the railroad thru the provinces of Che-kiang and Kiang-su is causing great embarrassment to the Chinese Government. This railroad, which was to connect the cities of Su-Chau, Hang-chau and Ning-po, was granted to an English company, but on account of the unpopularity of foreign concessions in these provinces, the contract was canceled by an edict of September 23d, 1905, and the construction transferred to the provincial native bureau. Since it is impossible to carry on the work on account of the lack of funds, the Chinese Government negotiated a loan from the Anglo-Chinese Syndicate. This, however, was likewise resented, and a strenuous protest forwarded to Pekin. The Government refused to countermand the loan, and the governors of the provinces and the Viceroy were advised that the employment of British capital for the carrying on of the construction must be regarded as an accomplished fact, otherwise it would mean serious injury to Chinese foreign relations. The leaders of the Nationalist party in the provinces threaten retaliation either by organizing the people to refuse to pay taxes or by sending a delegation to Pekin for the purpose of committing suicide before the gates of the British Legation by way of protest against the British loan. A similar situation exists in the province of Shan-si, where a British syndicate holds the most important mining concessions

in China, and a determined effort is being made by the Chinese to recover these rights. They express a willingness to pay back fifteen times as much as the syndicate has invested in the province. Yuan Shi-Kai, the leader of New China, is in danger of losing his popularity and power, because he insists upon the necessity of carrying out the agreements made with the English companies, and he has also incurred dislike by approving of the measures taken by the English to suppress piracy on the West River. Ten British vessels under the command of Sir Thomas Moore are patroling the river.

The Kongo Treaty

The treaty ceding the Kongo Free State to Belgium, which has been so hotly discussed and anxiously awaited all over the world, has at last been submitted to the Belgian Parliament and published. We give below its full text:

Article I.—His Majesty King Leopold II, Sovereign of the Independent Kongo State, hereby cedes to Belgium the sovereignty of the territories composing the Independent Kongo State, together with all the rights and obligations appertaining thereto. The Belgian State hereby accepts this cession, takes over and accepts the obligations of the Independent Kongo State as set forth in Schedule A, and undertakes to respect the existing interests in the Kongo, together with the legally acquired and recognized rights of third parties, native and non-native.

Article II.—The cession comprises all real and personal estate of the Independent Kongo State, and particularly:—

(1) The properties and all the lands belonging to its public and private domain, with reservation of the dispositions and obligations indicated in Schedule A of the present convention.

(2) All the shares and bonds and founder or interest shares mentioned in Schedule B.

(3) All the buildings, constructions, installations, plantations, and appropriations whatsoever, established or acquired in Africa and in Belgium, by the Government of the Independent Kongo State, personal goods of all kinds, and the cattle it possesses there, together with its pontoons and boats with their fittings and its military material, as described in Schedule B, sections II and IV.

(4) The forests, rubber, and other African products which are the property of the Independent Kongo State, as well the provisions and other merchandise belonging to it, as described in Schedule B (I and III).

Article III.—On the other hand, the cession includes all the liabilities and all the financial engagements of the Independent State, as set out in Schedule C.

Article IV.—The date upon which Belgium will begin to exercise her right of sovereignty over the territories mentioned in the first article will be determined by Royal decree. The revenue obtained and the expenses incurred by the Independent State from January 1, 1908, will be taken over by Belgium.

The schedules referred to have not yet been given to the public. The treaty is accompanied with an explanatory statement of over seven thousand words defining its provisions and giving the history of the Kongo, with which the glorification of the King Sovereign, who, it says, has endowed the Kongo with "an organization susceptible, no doubt, of improvement, but able to bear comparisons with colonies several centuries old." It refers to the favorable report on the administration of the Kongo made by the commission of inquiry, and adds that these conclusions

"gave rise on the whole to few criticisms. Some of its views concerning the action of religious missions provoked controversies which have contributed to make better known the efforts of missionaries to introduce Christian civilization into Africa, the difficulties of their task, and the results obtained."

The Crown Domain is subject, like the other territories, to the sovereignty of the independent State. After the annexation there will be in the Kongo, according to the report, no other sovereignty than that of Belgium. The State will have the option of buying back the forests of the domain, and upon its administration is imposed the obligation of providing for the erection of hospitals, schools and churches and the execution of hygienic and philanthropic measures. The financial report fixes the assets of the colony at about $24,000,000, the principal items being merchandise and produce, $2,800,000; flotilla, arms and ammunition, $3,000,000; properties in Belgium, $5,800,000; stocks and shares in concessionary companies, $12,000,000; the liabilities being the public debt and all other debts amounting to about $22,800,000, more or less. The judiciary authorities will be independent of the administrative, all decrees must be signed by the ministers responsible to the Belgian Parliament, and no concessions of any kind can be made unless by the approval of the Colonial Council.

Laveran, Discoverer of the Germ of Malaria

BY JAMES J. WALSH, M.D., Ph.D., LL.D.

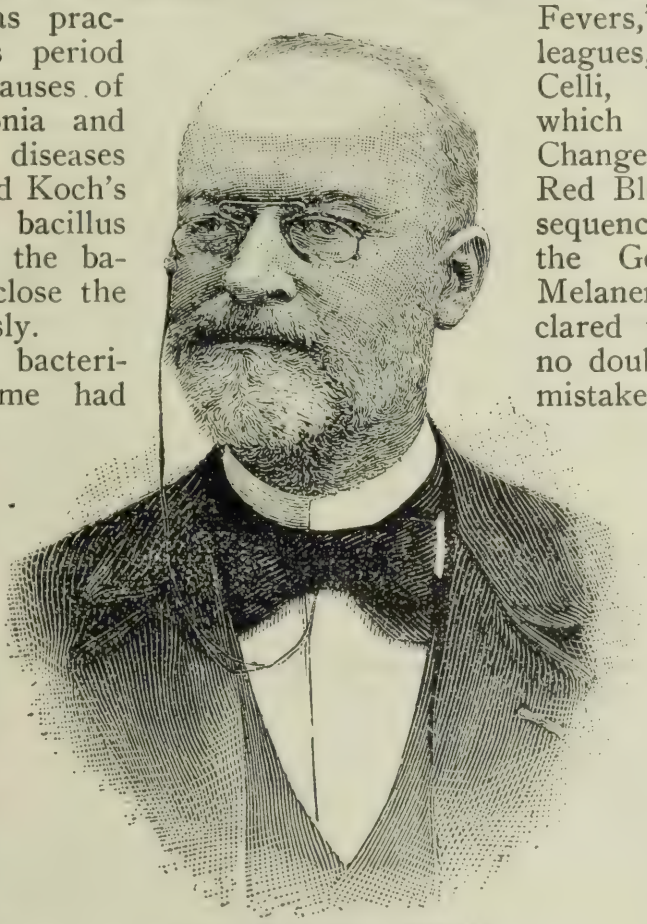
[Dr. Walsh is Acting Dean and Professor of Nervous Diseases and of the History of Medicine at the Fordham University School of Medicine of New York City. While at the Pasteur Institute in Paris in 1896 he met Professor Laveran, who was then teaching at l'Hopital Val de Grace, the great Military Hospital of Paris.—EDITOR.]

THE announcement that the Nobel prize for the best recent discovery in medicine has for this year been conferred upon Prof. Alphonse Laveran, the discoverer of the germ of malaria, will be eminently satisfactory to those who are in a position to know how much Laveran's work has meant for modern medicine. There is no doubt at all that the definite knowledge of malaria, initiated by Laveran's discovery of the *plasmodium malariæ,* has probably done more to extend the bounds of the habitable earth than anything ever accomplished by man. Until our recent acquisition of a scientific knowledge of malaria the tropics were practically unhabitable for white men, and those who did live there were in constant physical conflict with one of the most persistent diseases that human nature is heir to. Laveran's discovery had to be completed by the recognition of the fact that the malarial organism was carried by mosquitoes in order to bring malaria under control, but with that it makes an epoch in the history of the earth. Under proper sanitary and hygienic conditions the white man will now be able to live quite as well as our colored brethren in any part of the earth's surface.

Before Laveran's time it was generally supposed that malaria was, as the name indicates, a miasmatic disease. It was supposed to be due to bad air—mal-aria. The miasm which caused the disease was supposed to be gaseous or closely allied to gas in nature, was supposed to be diffused in the air, and consequently it was almost, if not quite, impossible to escape it. It was supposed to be particularly noxious at night, and hence the impression that it was extremely dangerous to leave one's windows open after sundown in a malarial country. The miasm of malaria was declared to be more abundant near swampy ground and wherever the soil had been recently turned up. Now we know as the result of finding Laveran's malarial parasite in the bodies of mosquitoes, that all these apparent proofs that malaria is due to a gaseous miasm carried by the air can without exception be explained by the demonstrated fact that the mosquito carries the disease. It is because mosquitoes breed in marshy, swampy districts more abundantly than elsewhere that these regions are malarial. It is because the mosquito does his feeding mainly at night that it is dangerous to leave the window open in a malarial country. It is the mosquito who is responsible for the bad name that the night air has. The night air is, in fact, a little purer than the day air, and does no harm, unless it serves to bear the mosquito to its victim. It is the mosquito finally who breeds in the pools of water that gather wherever the soil is freshly turned over, and it is because of this stagnant water and not anything that comes out of the soil that malaria establishes itself where it has not been before. We had striking experiences of this kind with malaria during the building of the

new Yale University and during the erection of the buildings of the World's Fair in Chicago. Malaria occurred where it had not existed for some forty years before. All this clarification of ideas as to malaria was made possible by Laveran's discovery, so that he well deserves the Nobel prize.

Prof. Alphonse Laveran was born in Metz, June 18th, 1845. He made his medical studies in Strasburg when that university was still French, and made his service in the hospitals there in 1866 and 1867. He joined the army military corps the year of his graduation. His graduation thesis, entitled "Experimental Researches on the Regeneration of Nerves," showed distinct originality. It contained some rather suggestive hints with regard to the trophic centers of nerves, as we have come to call them, and brought out the fact that degeneration did not always proceed from the center to the periphery, as might have been anticipated. For this thesis young Laveran had made a series of personal observations on rabbits and pigeons which showed very well that he knew how to arrange the terms of an experiment so as to bring out information, and in general gave a preliminary hint of his possibilities as an investigator.



He received an appointment to the Military Hospital of Val de Grace in Paris in 1874, when he was just entering his thirtieth year. His appointment at Val de Grace included the duty of training young military surgeons. This was probably the best possible rounding out of his own medical education that he could have had. As he said to me at Val de Grace, nearly twenty-five years later, that period of teaching was a very precious developmental influence. At the end of four years of service at Val de Grace he was sent to Algiers. As a rule French surgeons of the army did not care to be sent into the practically tropical climate of Algiers. The appointments for service in France were much sought for. Laveran's appointment to Algiers proved to be the opportunity of his life. One is tempted to think of Charcot, who, when the appointments to Paris hospitals were being made, asked to be sent to the Salpetrière, which was at the time scarcely more than an asylum for old women. All the other physicians to the hospitals had demanded the active service of a regular city hospital. At the end of twenty years, however, Charcot had remade, as the result of his studies on the old women of the Salpetrière, the chapter on nervous diseases in medicine. It was to be a considerably shorter period than that before Laveran was to do as much for the malarial diseases, and his discoveries were eventually to make the tropics habitable and make it possible for the white man to live in any part of the world.

The story of his discovery of the malarial parasite is rather interesting. In 1878 he was given the charge of a hospital at Bona, in the northeastern part of Algeria, not far from the Mediterranean. While the name of this town is comparatively unfamiliar to Americans, it is of reasonably good size and had probably more than 30,000 inhabitants at that time. Laveran had the opportunity to see a number of cases of malaria. His attention was attracted by their anemia and the occurrence of pigment in their blood. He examined very carefully these pigmentary granulations which abound in the liver, the spleen and the vessels of the brain, and noted that in the blood of those suffering from chronic malaria there seemed to be certain spherical bodies with ameboid movements and certain pigmented crescentic bodies which at that time he concluded must be parasites. During the next two years his attention was devoted to this subject. In 1880, while having a still larger service of malarial patients at Constantine, also in Algiers, he succeeded in demonstrating the flagellæ or curious little tails or lashes which may be seen on these pigmented bodies.

It was at this time, too, that he made the really primal discovery that these parasitic appearances were constant in the blood of malarial patients just before an attack of malaria manifested itself, provided the patient had not taken quinine. Between the attacks the pigmentary parasites, as he now considered them, were either absent or were very infrequent. The use of quinine served to lessen their number very much. These were observations of cardinal importance

and it is easy to understand that they increased his suspicion that it was parasites that caused malaria and that he was right on their trail.

It must not be thought that this was the first time that an observer had thought that he had found the parasitic cause of malaria. The period from 1875 to 1885 is one of the most important in our modern bacteriology, in the sense that at this time a number of the specific microbic causes of disease were discovered. It was practically during this period that the microbic causes of diphtheria, pneumonia and the various pus diseases were discovered, and Koch's observations on the bacillus of cholera and of the bacillus tuberculosis close the period very gloriously.

DR. CHARLES LAVERAN.
Member of the Academy of Sciences and Recipient of the Nobel Prize for Medicine.

Every working bacteriologist of the time had hoped to find the cause of some disease in the bacterion. It is not surprising then that Thommasi-Crudeli announced in 1879 that he had found a bacterium that was the cause of malarial fevers. When Laveran announced his discoveries then, they were received with skepticism by Italian authorities who had spent their life in observations upon malaria. It did not seem very likely that a young French surgeon (Laveran was about thirty-three when his observations began and he was scarcely more than thirty-five when he reached his conclusions) should have learned more about malaria in two short years in Africa than the Italians had learned in a number of years. The medical world generally sided with the Italian school and was inclined to think that this ardent young Frenchman had jumped to a premature conclusion. Marchiafava and Celli continued to write on malaria as if it were due to the *bacillus malariæ* as Thommasi - Crudeli's organism was called, and even when Laveran went to Italy and demonstrated his parasite they did not accept it. Not only these two but the Italian students of malaria generally declared that Laveran's so-called parasites were only degenerated erythrocytes—that is, dead or dying red blood cells—effects of malaria, not its causes.

When, in 1884, Laveran published his now famous "Treatise on the Malarial Fevers," his Italian colleagues, Marchiafava and Celli, published a paper which bore the title "The Changes which Occur in Red Blood Cells as a Consequence of Malaria and the Genesis of Malarial Melanemia." They declared that there could be no doubt that Laveran was mistaken. With the confirmation of Thommasi-Crudeli they said that there was a necrobiosis of the red blood cells, as a consequence of which the hemoglobin was changed into melanin, and there remained of the living red blood cells only the circulating corpses. In the meantime, however, a French observer in 1882 had not only confirmed Laveran's discovery, but had gone farther than the original discoverer in a very remarkable way. Laveran thought that the malarial parasites were outside of the red blood vessels but clinging to them. Richard declared that they were inside the red blood cells, and this we now know to be true. Indeed, this is as important a part of our knowledge as that of the existence of the malarial parasites themselves.

After the first setback, however, Laveran's work soon received the recognition that it so well deserved. Laveran's demonstrations of the occurrence of the same

parasite in Romaan fever as he had found in the malaria of Algiers left no doubt in the minds of medical scientists outside of Italy, and in Italy the tide soon turned in his favor. Within a year after their rejection of Laveran's discovery Marchiafava and Celli changed their opinion, adopted Laveran's way of thinking, and began a series of brilliant researches which have greatly contributed to the life history of our malarial parasites. It was they who suggested that the parasite should be called plasmodia or malarial hemo-plasmodia, because it resembled another organism to which this title had been given that produces a disease in turns. The term plasmodium is not a good one. A writer in *The Practitioner,* London, said some five years ago that it is perhaps one of the most inappropriate of all the names suggested for the parasite. A plasmodium is an irregular mass of protoplasm containing many nuclei, while the malarial organism has but a single nucleus. Metchnikoff, whose knowledge of these lower organisms makes him an authority in the matter, suggested the much better name *hemophillum malariæ,* but, as is so often the case with more appropriate names, whose introduction is suggested later, this was never adopted.

With a brilliant career before him in the military service, Laveran preferred to give this up about ten years ago in order to consecrate himself entirely to studies in bacteriology, which he has been pursuing at the Pasteur Institute. While his reputation depends on his discovery of the germ of malaria, Laveran has made a number of original observations on other hematozoa, which live inside the red blood cells of animals, and on the sporozoa and the trypanosomes. His studies in mumps, of which he has seen a number of epidemics among the young soldiers in the French army, have taught him much about that disease, which, so mild as a rule in children, not infrequently in young men and women proves serious in its effects. His article on "Mumps" in Dechambre's Dictionnaire is an important contribution to medical literature. His article on "Epidemic Diseases" in Bouchard's "Traité de Pathologie Générale" is another valuable work. While teaching hygiene he wrote a treatise on "Military Hygiene" which is really a compendium of his lectures for ten years at Val de Grace, and gives an excellent idea of his effectiveness as a teacher.

His French colleagues soon recognized the supreme merit of Laveran's discovery. In 1884 he was named professor at the Military School of Medicine at Val de Grace. Five years later, in 1889, a number of observers in many parts of the world having confirmed his discovery, the French Institute, on the recommendation of his distinguished colleague, Professor Bouchard, conferred on him the Bréant prize for a distinguished discovery in medicine. In 1893 he was elected a member of the Academy of Medicine, and in 1895 a corresponding member of the Academy of Sciences. In the meantime the German medical world had honored him with the gold medal of Cothenies, which is decided by the Academy of Naturalists of Halle. He was made an Officer of the Legion of Honor by the French Government, and many of the important French scientific societies considered that they were honoring themselves by counting him among their honorary members. He was made an honorary member of the Imperial Military Academy of Medicine at St. Petersburg and of the Medical and Surgical Society of London.

Laveran is a distinguished original thinker in medicine and a great benefactor of mankind. He is, besides, that most charming of men, a French gentleman, who has made many friends, who will rejoice, as indeed does the medical profession of the world, at this merited recognition of his service to humanity and to medical science, which has come to him in this year's Nobel Prize.

New York City.

"Each roome with ivie leaves is drest
And every post with holly."

Specimen illustration from "A Christmas Carroll" by George Wither, reproduced by permission of the publishers, G. P. Putnam's Sons, for the Holiday Book Number of *The Independent*.

A SELECTION FROM THE YEAR'S HOLIDAY BOOKS

By W. G. BOWDOIN

Christmasse Tyde. Being a collection of seasonable quotations. Chosen and arranged by Jennie Day Haines. Title page bordered in red with ecclesiastic type. Frontispiece in color. Paul Elder. $2.00 net.

A Christmas Carroll. By George Wither. With pictures and text drawn by Frank T. Merrill. Title page and many illustrations in tint. Colored frontispiece reproduced in this issue of THE INDEPENDENT. Putnam's. $3.00 net.

Jesse ben David, a Shepherd of Bethlehem. By James M. Ludlow. Illustrated title page. Colored frontispiece. Decorations in tint. Revell. $1.00.

The Story of the Other Wise Man. By Henry van Dyke. Decorated by Enrico Monetti. Decorated and illuminated thruout after the fashion set by monkish scribes in their manuscript volumes. Edition de luxe. Harper's. $5.00.

The Little City of Hope. A Christmas story. By F. Marion Crawford. With illustrations by W. Benda. Marginalia in green and brown. Macmillan. $1.25.

The Dawn at Shanty Bay. By Robert E. Knowles. Illustrated by Griselda Marshall McClure. Green chapter heads and marginalia engraved, rubricated and green tinted title page. Revell. $1.00.

Blottentots and How to Make Them. By John Prosper Carmel. If you've never read a Blottentot this book will help you quite a lot! Engraved title page. Paul Elder. 75 cents net.

The Romance of an Old Fashioned Gentleman. By F. Hopkinson Smith. Illustrated in color by A. I. Keller. Scribner's. $1.50.

Velasquez. By S. L. Bensusan. Illustrated with eight reproductions in color. Engraved title page. Stokes. 65 cents net.

Reynolds. By S. L. Bensusan. Illustrated with eight reproductions in color. Engraved title page. Stokes. 65 cents net.

Portraits and Portrait Painting. Being a brief survey of portrait painting from the Middle Ages to the present day. By Estelle M. Hurll. Illustrated. Rubricated title page. Boston: L. C. Page. $2.50.

Gods and Heroes of Old Japan. By Violet M. Pasteur. Decorated by Ada Galton. Title page in tint. Philadelphia: Lippincott. $3.50 net.

The Quest of the Colonial. By Robert and Elizabeth Shackleton. Illustrated with many photographs and with decorations by Harry Fenn. Engraved title page. Frontispiece in color. The Century. $2.40 net.

Little Journeys to the Homes of Eminent Orators. By Elbert Hubbard. Pericles, Antony, Savonarola, Luther, Burke, Pitt, Marat, Ingersoll, Henry, King, Beecher, Phillips. Illustrated. Rubricated title page. Putnam's. $2.50.

Cathedral Cities of France. By Herbert Marshall, R. W. S., and Hester Marshall. With sixty illustrations in color by Herbert Marshall, R. W. S. Rubricated title page. Dodd, Mead. $3.50 net.

A Spring Fortnight in France. By Josephine Tozier. Numerous illustrations. Title page with green tinted border. Dodd, Mead. $2.00 net.

Little Pilgrimages. Among Old New England Inns. Being an account of little journeys to various quaint inns and hostelries of Colonial New England. By Mary Caroline Crawford. Illustrated. Title page decorated and rubricated. Boston: L. C. Page. $2.00.

Old Steamboat Days on the Hudson River. Interesting tales and reminiscences of the stirring times of early steam navigation. By David Lear Buckman. Illustrated with many pictures of famous river boats. Rubricated title page. The Grafton Press. $1.25 net.

In Olde New York. Sketches of old times and places in both the city and the State. By Charles Burr Todd. Illustrated with many interesting old and modern pictures. Rubricated title page. The Grafton Press. $1.50 net.

In Olde Massachusetts. Sketches of old times and places during the early days of the Commonwealth. By Charles Burr Todd. With illustrations. Rubricated title page. The Grafton Press. $1.50 net.

Browning's Italy. A study of Italian life and art in Browning. By Helen Archibald Clarke. Illustrated title page in red and black. Baker, Taylor. $2.00 net.

Holland Sketches. By Edward Penfield. Illustrated in color. Title page with windmill motif. Scribner's. $2.50 net.

Poets' Country. Edited by Andrew Lang. Contributors: Prof. J. Churton Collins, E. Hartley Coleridge, W. J. Loftie, F.S.A.; Michael Macmillan and Andrew Lang. With fifty illustrations in color by Francis S. Walker. Philadelphia: Lippincott. $5.00 net.

Venice. By Beryl de Sélincourt and May Sturge Henderson. Illustrated by Reginald Barratt, of the Royal Water Color Society. Ornamented and rubricated title page. Dodd, Mead. $3.50 net.

Our Country Home: How We Transformed a Wisconsin Woodland. By Frances Kinsley Hutchinson. With nearly two hundred illustrations from photographs by the author. Rubricated title page. Chicago: McClurg. $2.00.

Dame Curtsey's Book of Novel Entertainments for Every Day in the Year. By Ellye Howell Glover ("Dame Curtsey"). Illustrated. Chicago: McClurg. $1.00.

The Maxims of Methuselah. Being the advice given by the patriarch in his nine hundred sixty and ninth year to his great grandson at Shem's coming of age in regard to women. By Gelett Burgess. With Illustrations, decorations and cover design by Louis D. Fancher. Tinted marginalia. Stokes. 75 cents.

The Teddyssey. By Otho Cushing. A book of cartoons in classical style. Title page designed and drawn by the author. Life Publishing Co. $1.00.

A Ball of Yarn: Its Unwinding. By Robert Rudd Whiting. The illustrations in color by Merle Johnson. Engraved title page. Paul Elder. 75 cents.

Mother Goose. In silhouettes. Cut by Katharine G. Buffum. Illustrated title page. Boston: Houghton, Mifflin. 75 cents.

The Astonishing Tale of a Pen and Ink Puppet; or, The Genteel Art of Illustrating. By Oliver Herford. Scribner's. $1.00.

Betel Nuts: What They Say in Hindustan. Rhymed in English. By Arthur Guiterman. The frontispiece after an oil painting by Will Jenkins. Here's frolic truth in Oriental guise; A verse may find him who a sermon flies. Text and decorations in brown ink. Paul Elder. 75 cents net.

In Old School Days. By Will Carleton. Illustrated in color by James Montgomery Flagg. Text on tinted pages thruout. Moffat, Yard. $1.60 net.

The Hanging of the Crane. By Henry Wadsworth Longfellow. Holiday Edition. Illustrations in color by Arthur I. Keller. Designs by Florence W. Swan. Engraved frontispiece in green tint. Houghton, Mifflin. $2.00.

Sonnets of a Budding Bard. By Nixon Waterman. Drawings in tint by John A. Williams. Title page illustrated and rubricated. Chicago: Forbes & Co. 75 cents.

The Comedy of Life. Full page illustrations reproduced from Life. Quarto. Life Publishing Co. $2.00.

J. Archibald McKackney (Collector of Whiskers). Being certain episodes taken from the diary and notes of that estimable gentleman-student, and now for the first time set forth. Edited by Ralph D. Paine. With illustrations by Wallace Morgan. Rubricated title page. Outing Publishing Co. $1.25.

Our Girls: Poems in Praise of the American Girl. With illustrations in color by Howard Chandler Christy. Text and title page on red bordered pages. Moffat, Yard. $2.50 net.

The Harrison Fisher Book. A collection of drawings in colors and black and white. With an introduction by James B. Carrington. Scribner's. $3.00 net.

Abelard and Heloise: The Love Letters. A poetical rendering. By Ella C. Bennett. The frontispiece done in photogravure from an oil painting by Will Jenkins. Engraved title page. First edition limited to 500 copies. Paul Elder. $1.50 net.

Immensee. Translated from the German of Theodore Storm. By George P. Upton. Illustrated and decorated by Margaret and Helen Maitland Armstrong. Colored illustrations. Title page in three colors. Chicago: McClurg. $1.75 net.

The Rivals. By Richard Brinsley Sheridan. With an introduction by Brander Matthews. Illustrations by M. Power O'Malley. Colored frontispiece and eighteen illustrations in photogravure. Crowell. $2.50.

The Story of Sir Launcelot and His Companions. By Howard Pyle. Illustrated. Engraved title page. Scribner's. $2.50 net.

The Ingoldsby Legends; or, Mirth and Marvels. By Thomas Ingoldsby, Esq. Illustrated by Arthur Rackham, A. R. W. S. Engraved and tinted title page. Contains twenty-four illustrations in colors, twelve printed in tint and over sixty in line. Dutton. $6.00 net.

The Grandissimes. By George W. Cable. With illustrations in photogravure by Albert Herter. Rubricated title page. Scribner's. $2.50.

The Sea Fogs. By Robert Louis Stevenson. No. 1 of the Western Classics. With an introduction by Thomas Rutherford Bacon. The photogravure frontispiece after a painting by Albertine Randall Wheelan. Engraved title page. Decorated pages thruout. Paul Elder. $1.50 net.

Tales of a Wayside Inn. By Henry Wadsworth Longfellow. The Thumb-Nail Series. Engraved and tinted title page. The Century. $1.00.

The Seven Poor Travelers and the Holly Tree. By Charles Dickens. The Thumb-Nail Series. Rubricated title page. The Century. $1.00.

Travels With a Donkey in the Cevennes. By Robert Louis Stevenson. The Thumb-Nail Series. Engraved and tinted title page. Frontispiece modeled in bas-relief by Augustus St. Gaudens in 1887, during the author's illness in New York. The Century. $1.00.

Shakespeare's Christmas Gift to Queen Bess, in the Year 1596. By Anna Benneson McMahan. Title page in red and green. Chicago: McClurg. $1.00 net.

The Parables. Edited by Lyman Abbott, D. D. Illustrations by Arthur E. Becher. Decorations by Arthur Jacobson. Title page and other pages in tint. Appleton. $2.50.

A Book of Joys. The story of a New England Summer. By Lucy Fitch Perkins. With illustrations in color by the author. Rubricated title page. Colored frontispiece. Chicago: McClurg. $1.75 net.

The Queenly Mother in the Realm of Home. By Margaret E. Sangster. With drawings by Griselda Marshall McClure. Frontispiece from a photograph of Mrs. Roosevelt, printed in tint. Title page also in tint. F. H. Revell. $1.50 net.

Gallantry. An Eighteenth Century Dizain in Ten Comedies, with an afterpiece. By James Branch Cabell. Illustrated in color by Howard Pyle. Title page decorated and rubricated. Harper's. $2.00.

The Woman's Exchange of Simpkinsville. By Ruth McEnery Stuart. Forget-Me-Not Edition. Illustrated. Title page in black and double tint. Harper's. $1.25.

The Old Peabody Pew. A Christmas romance of a country church. By Kate Douglas Wiggin. With illustrations in color by Alice Barber Stephens. Title page and other pages with green Borders. Houghton, Mifflin. $1.50.

An Encore. By Margaret Deland. Illustrated by Alice Barber Stephens. Title page in tint. Tinted marginalia thruout the volume. Harper's. $1.50.

The Crimson Conquest. A romance of Pizarro and Peru. By Charles Bradford Hudson. With frontispiece in full color by J. C. Leyendecker. Rubricated title page. Chicago: McClurg. $1.50.

Aunt Jane of Kentucky. By Eliza Calvert Hall. Illustrated. Color plate reproduced in this issue of THE INDEPENDENT. Boston: Little, Brown & Co. $1.50.

Arizona Nights. By Stewart Edward White, with frontispiece and six illustrations in color by N. C. Wyeth. One of these plates reproduced in color is published in this issue of THE INDEPENDENT. McClure. $1.50.

Her Son. A Chronicle of Love. By Horace Annesley Vachell. Frontispiece in color by Walter H. Everett. Dodd, Mead. $1.50.

Edwin Davis French. A Memorial. His Life and Art. Edition limited to 575 copies. With press work by Theodore L. De Vinne & Co. Illustrated. Privately printed: Ira H. Brainerd, 92 William Street, New York City. $7.50 net.

A Collection of Book Plate Designs. By Louis Rhead. With portrait of Mr. Rhead, a corner in his studio, and other embellishments, besides the reproduction of twenty-five of his book plates. Title page and initial letter in delicate blue tint. Limited edition. Boston: W. Porter Truesdell. $2.00.

A Booklet Devoted to the Book Plates of Elisha Brown Bird. Being a collection printed in photogravure. With portrait of Mr. Bird and an especially designed title page. Limited edition. Boston: W. Porter Truesdell. $3.50 net.

Ex-Libris. A collection of book plate designs by Herbert Gregson. Rubricated title page. Many of the reproduced book plates are printed in color. Limited edition. Boston: W. Porter Truesdell. $2.00.

The Graphic Arts and Crafts Year Book, 1907. The first American annual review of the engraving, printing and allied industries. Edited by Joseph Meadon. Hamilton, Ohio: The Republican Publishing Co. $5.00.

Women's Thoughts for Women. Chosen and arranged by Rose Porter. The whole forming a calendar for the year. A. Wessels. 50 cents.

A Tennyson Calendar. Selected and arranged by Anna Harris Smith. Rubricated title page. Half-tone portrait of Lord Tennyson as frontispiece. Crowell. 50 cents net.

The Lincoln Year Book. Axioms and Aphorisms from the Great Emancipator. Compiled by Wallace Rice. Contains half-tone portrait of Mr. Lincoln as frontispiece. Title page in two tints. Chicago: McClurg. $1.00 net.

The Franklin Year Book. Maxims and Morals from the Great Philosopher. Compiled by Wallace Rice. Contains half-tone portrait of Mr. Franklin as frontispiece. Title page in two tints. Chicago: McClurg. $1.00 net.

The Optimist's Good Morning. Compiled by Florence Hobart Perin. Boston: Little, Brown. $1.00 net.

John Greenleaf Whittier. A sketch of his life, with selected poems. By Bliss Perry. Houghton, Mifflin. 75 cents.

Any of the books reviewed or advertised in this number will be sent by THE INDEPENDENT on receipt of price.

THE stream of books that flows from the various publishing houses is quite as great this year as last. Possibly it is greater. The manufacturing details are as a rule technically good. The illustrations are in many cases colored and many of the holiday books are made gorgeous with decorations in tint and by means of marginalia. Some private presses, like The Village Press, the Marion Press and such publishers as Alfred Bartlett, Richard G. Badger Ivan Somerville & Co. and Thomas B. Mosher, have produced some notable books which while in strictly limited editions are yet characterized by beautiful and very artistic *format.* Omission from the present selection does not necessarily signify that the book is unworthy.

SILHOUETTE OF LINCOLN
In Wallace Rice's "The Lincoln Year Book."
A. C. McClurg & Co., Chicago.

Some of the most important art works that have appeared during the last few weeks have been reserved for review later when space can be given to their critical consideration.

Christmas without a collection of Christmas carols as gathered together in *Christmasse Tyde* would naturally be like the play of "Hamlet" minus Hamlet. The compiler has gleaned a mass of material from here, there and everywhere, and into the collection has gone good, bad and indifferent carols.

The singing of Christmas carols as a part of the observance of Christmas no longer obtains as formerly, but a Christmas season without a carol in book form would be an undesirable novelty. This year George Wither's *A Christmas Carol,* written close upon three centuries since, appears as a holiday offering and from which we reproduce the frontispiece in full color. It suggests the steaming wassail bowls of long ago, and with the poem before us the old-time Christmas comes trooping back with its routs and revels that went to celebrate the season until we are ready to exclaim with Wither:

"Hang sorrow! Care will kill a cat.
And therefore let's be merry."

Once more the story of what the shepherd told the wise men concerning "The Star of all the Ages" has been retold in *Jesse ben David.* Something of the mysticism and light of Bethlehem's star finds lodgment in the story that goes to make up the book. The old story in its new dressing of Oriental colors makes a strong appeal to those who read its pages.

Van Dyke's popular and inspired parable, *The Story of the Other Wise Man,* is a beautiful example of book making. It follows the lines laid down by the old monkish scribes as to style in so far as types can do it, and the decorations add much even to the text of the veteran author. With its wide margins and rivulets of text in special type set off by caligraphic decorations by Enrico Monetti in duotones the book is a delight to the eye.

For the first time in some years Marion Crawford lays the scene of his writing which takes the form of a Christmas story, and is called "*The Little City of Hope,*" in America. As usual with him the theme is delightfully worked out

and *The Little City of Hope* will make a charming gift book.

The Dawn at Shanty Bay takes its heroes from the common people who might easily have lived next door to the reader and out of such material the author makes a very readable Christmas story of the *genre* type.

The Christmas season affords an excuse for such a book as *Blottentots and How to Make Them.* The making of them by folding over a paper while the ink is fresh has always been a favorite amusement of and for children, but no one ever thought it worth while to make a book about them before.

LAS MENINAS.
From Velazquez (Stokes).

Further evidence of the cleverness of F. Hopkinson Smith was not required, but we have it nevertheless in *The Romance of an Old Fashioned Gentleman,* that he has delightfully written this year for the Christmas season. The story has pathos mingled with romance and thru it all runs the atmosphere of art. It is a painter's romance, delightfully thought out and skilfully told. Incidentally, but unobtrusively, it teaches the reader a great moral lesson.

Two more volumes in the *Masterpieces in Color Series,* as edited by T. Leman Hare are features among the holiday books this year. One is on *Velazquez,* and the other on *Reynolds.* In the first named the author has pointed out that Spain, in spite of her recent great political decline, still exercises great influence in the art world thru Diego de Silva Velazquez. By merely glancing thru the little volume under consideration it will be possible to understand something of this influence and the reason for it. In the reproduction printed in this issue of his *Las Meninas,* considered one of his greatest works, much is lost by the translation of his transcendent color into black and white. In the companion volume there is a brief but comprehensive sketch of Sir Joshua Reynolds.

The Inherited Kettle. From Shackleton's "The Quest of the Colonial." (Century.)

Under the title of *Portraits and Portrait Paintings,* Estelle M. Hurll gives us this year a survey of the subject based for the most part on the old masters and their several schools. In her concluding chapter she touches lightly upon modern painting as applied to portrait painting. Among the Americans she devotes most of her space to Whistler and Sargent, altho she confesses there are others, and her outlook for American portrait art is on the whole optimistic.

When the ordinary person looks at an old Japanese color print the handling of its color effects nearly always pleases if the observer has any eye for color. Such a person loses much of the charm that is

"An Almighty Exciting Race"

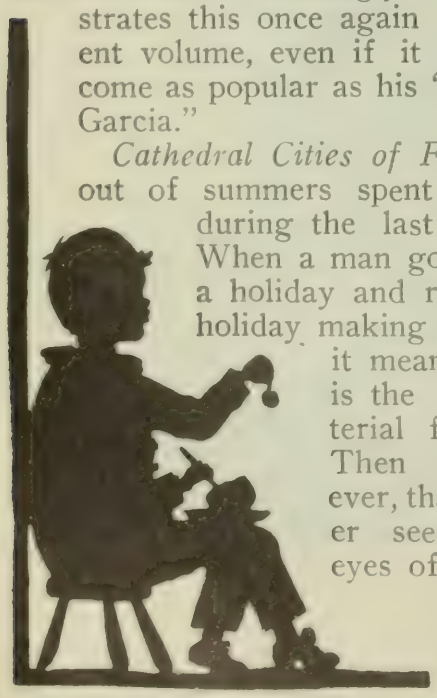
for the Holiday Book Number of *The Independent*.

inherent in the color prints that have come down to us from the old masters of Japan, simply because the Japanese



"THESE STILES SADLY BOTHERED ODILLE."
By Arthur Rackham.
From "The Ingoldsby Legends." (Dutton.)

legends are very largely unknown to most of us. In *Gods and Heroes of Old Japan* there is an attempt made to popularize these legends and the folk-lore with which the work of most of the Japanese artists is charged. We may here read of the mythical and other Japanese heroes which are quite as dear to the citizens of the flowery kingdom as were

the old Greek heroes to the Greeks. We see the expression of the Japanese ideals as influenced by their worship of the spirits of the dead and if we can come to a comprehension of their heroes and their gods as set forth in the present volume the Japanese print that seemed dull and meaningless before will in the light of the new knowledge hidden in the text take on a wonderful vitality and a broader significance.

Collectors of old furniture ought certainly to read *The Quest of The Colonial*, by the Shackletons. Influenced by the spell cast upon them by the inheritance of a kettle and the purchase of a pair of candlesticks, followed by the gift of a Shaker chair, the authors have written down a very pleasing account of the joys incident to the collecting of mahogany, walnut, brass and the china of Ye Olden Tyme now so popular. The man who collects enjoys many things that are as a sealed book to the non collector, something of which is set forth in the Shackleton volume. The chapter on "Fakes" is helpful.

Elbert Hubbard has made more "little journeys," about which he has now written under the title of *Little Journeys to the Homes of Eminent Orators*. Whatever else may be said about Hubbard certain it is that he knows how to write and to write interestingly. He demonstrates this once again in the present volume, even if it fails to become as popular as his "Message to Garcia."

LITTLE JACK HORNER.
From "Mother Goose in Silhouettes."
(Houghton, Mifflin.)

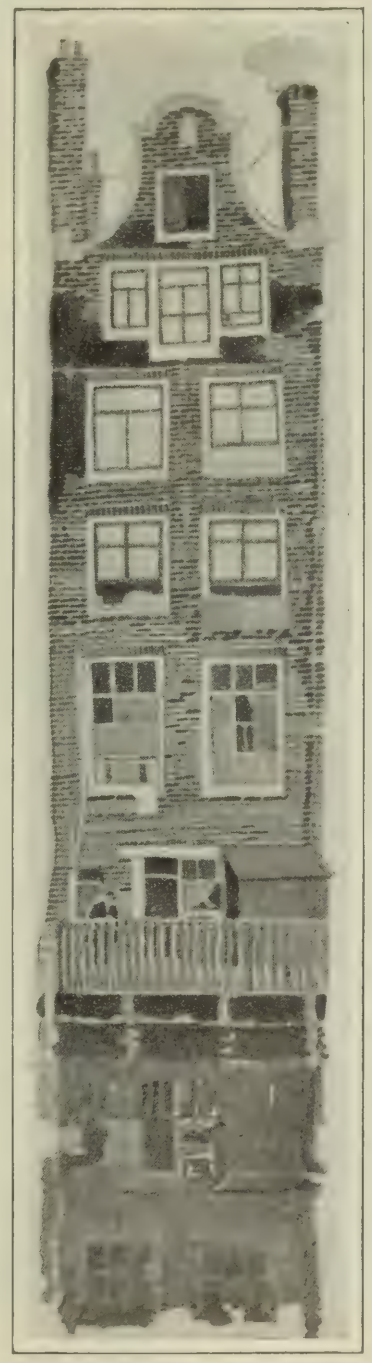
Cathedral Cities of France grew out of summers spent in France during the last five years. When a man goes away on a holiday and revels in his holiday making notes about it meanwhile there is the best of material for a book. Then it is, if ever, that the reader sees with the eyes of the writer, and when the illustrations are like those in "Cathedral Cities of France," the book stands out among the hundreds of holiday publications with an air of distinction and individuality. Those who enjoy travel will have a rich treat in this book. If one has journeyed where the author has, the joy of reading will be intensified.

Josephine Tozier has taken journeys to Le Mans, Angers, Saumur, Poitiers, Argenton, Brive, Rocamadour, Albi, Carcasonne, Arles and Tarascon, all of which she has pleasantly described under the title of *A Spring Fortnight in France*. Bits of life and amusing experience in French provincial towns crowd the pages of this volume with much to repay perusal, and the book will be found especially valuable to those contemplating a tour in France. The stay-at-home traveler may also extract much that is pleasing and informing out of the Tozier book.

A great deal of the romance that clusters round and about New England is brought out in *Little Pilgrimages Among Old New England Inns*. The author has followed in the footsteps of Alice Morse Earle with good results and many a country house in New England has been made to yield up an interesting story. The deserted rooms have in many instances been repeopled and we are enabled to make merry with the old time occupants. The book is crowded with interesting lore.

In the Grafton Historical series there have been several new books included. Among them may be mentioned *Old Steamboat Days on the Hudson River, In Olde New York, and In Olde Massachusetts*. In all the volumes named the same general method has been followed, which has been to include sketches of old times and places and interesting tales and reminiscences bearing on or connected with the subject of each book. The series is admirably conceived to preserve recollections of men, things and places that are fast passing away and the recall of which will be increasingly difficult with the added flight of time.

One reason for the alleged obscurity of Robert Browning's poetry is the lavish use of allusions to history, art and literature. This is especially the case with the large number of his poems that have



Italy as theme or setting for there are few of us familiar enough with Italian life, past and present, to catch the significance of all his light touches. The volume entitled *Browning's Italy* does not attempt anything like a complete annotation, but it will be a great help to the reader by putting the poems into their historical framework.

The inspiration for *Holland Sketches* has been a journey to the Land of Wind Mills undertaken by Edward Penfield, who fortunately took his sketching pencil with him. Dutch men, Dutch maidens, Dutch babies, Dutch houses, Dutch cats, Dutch fishing craft, Dutch cows, the Zuyder Zee, everything is there and all done as only Penfield himself could do it.

The *Poet's Country* as edited by Mr. Andrew Lang is intended to show the influence of the environment on the poet, whether native or travel in foreign lands. Byron was inspired by foreign scenes and events, Wordsworth and Scott by home land. It is illustrated in full color by Francis S. Walker. An unusual feature of the book is an offer it contains on the part of the illustrator to sell his originals.

Thirty full page illustrations in color by Reginald Barratt, of the Royal Water Color Society, appear in *Venice*. Something of the poetry of Venice seems to have crept into these luminous illustrations, showing "The Queen of the Adriatic" as the city is today. The book touches upon the history and traditions of Venice as well as its modern aspects.

A chronicle of the planning, building and the arrangement of an attractive country place has been given the title of *Our Country Home*. Notes in this connection on the succession of flowers, shrubs, the coming and going of birds, something about other animate life and quite a lot about the pleasures that belong to such a home that has come into existence step by step conspire to make this book interesting to a very large class in the community.

IN THE CITY OF AMSTERDAM.
From Penfield's "Holland Sketches." (Scribner's.)

The woman who entertains much or little often finds herself at a loss for novelty in the way of entertainment that counts for so much for or against the success of even a modest function. In *Dame Curtsey's Book of Novel Entertainments* for every day in the year will be found many things that are exceedingly valuable in the way of suggestion to the entertaining hostess.

The proper management of women is a problem that is solved by but very few men. It has been said that if you let a woman think that you think she will, then she will not, and if you let her think that you think she will not, then she will. *The Maxims of Methuselah* sheds much light upon this problem, and no young man seeking to dominate even one of the fair sex should be without a copy.

President Roosevelt has achieved an honor rarely given to heroes while they live. In *The Teddyssey*, however, certain of the Rooseveltean achievements are very cleverly presented by Otto Cushing in mock heroic outline sketches, happily conceived and well executed after classic models.

Humor is such a composite thing that while there are some persons in the world who will think that *A Ball of Yarn; Its Unwinding*, is very dreary

stuff that lacks spontaneity, there are others who will revel in it and feel sorry the book does not contain more material. And who shall say which of the two is correct? The only proper way will be to read the volume and then judge for yourself, which is after all just what the publishers are hoping you will do.

Mother Goose in Silhouettes cut by Katharine G. Buffum appeals to grown-ups quite as much as to children. Possibly it makes a stronger appeal to adults because they will appreciate more fully the cleverness of the silhouettes. The book contains only a selection of the most popular of the Mother Goose rhymes.

No one but Oliver Herford who frequently spends whole days in polishing a single word could possibly have written *The Astonishing Tale of a Pen and Ink Puppet.* He has in his present skit caricatured the prevalent society pictures of our novels and magazines, showing how few lay figures will answer for all these characters. Possibly his highest exploits as an illustrator are reached in the present book by his masterly illustration of paragraphs XIV and XXI. It is safe to say that in these two instances he reaches his apogee of achievement as an artist.

Arthur Guiterman whose sprightly verse has appeared from time to time in the New York *Times* and elsewhere, now issues a volume of rimes entitled *Betel Nuts.* The following extracts will perhaps serve to show something of plan and scope:

A day or a minute? A year or a moon?
Now which does he mean when he says,
"Pretty soon!"

I live between perils, abandoned by friends,
Like an ant on a fire-stick lit at both ends.

No more he dances, feasts and sings;
The Married man is bound to Toil.
His mind is full of Other Things,—
And those are Salt and Wood and Oil.

The versification of Will Carleton in his new book *In Old Schooldays* lacks the brilliancy of some of his earlier work, but mothers and fathers will read it with appreciation.

The Hanging of the Crane has been reproduced and illustrated with color plates by Arthur I. Keller. The old poem and new illustrations go well together, and the volume is far better than the ordinary gift book.

The following selection from *Sonnets of a Budding Bard* is typical of the others:

Sonnet wrote whilst thinkin' of our parents in the Garden of Eden.

O Adam and O Eve! How very nice
It must have been to live where you was at.
No neighbors anywhere with whom to spat,
Nor any one to give you free advice.
Ma says she'd gladly pay 'most any price
For such a lay-out. And she's certain that
Because there were no servants in your flat
Is how you camest to call it "Paradise."

And pa says that if Eve hadst drest the way
Our women do we shouldst have mist the fate
Of goin' forth into the world to stray,
For she'd be somewhere, still, inside the gate
Delayin' things, as women dost today,
A-tryin' for to pin her hat on straight.

The Comedy of Life consists of a selection of sketches from the pages of that sprightly publication called *Life,* by such artists as Gibson, Hutt, Bayard Jones, Read, Foster, Blashfield, Cady, E. W. Kemble and Montgomery Flagg, accompanied by brief poems and jokes.

J. Archibald McKackney (*Collector of Whiskers*) is a pleasant satire on the modern tendency toward research in curious fields. The idea of tracing musical vibrations in human whiskers and of the employment of such vibrations to the discomforture of students of acoustics and harmony as gravely set forth in the book is funny in the extreme.

Our Girls are an inspiration in the flesh. They are scarcely less so in the book bearing this title. The verse extols them and sings prettily of their many charms while Christy draws them and paints them in many moods all of which are delightful.

The Harrison Fisher Book is concerned with Harrison Fisher and his art. Some idea of this book is derivable from the reproduction from it which we published in THE INDEPENDENT of November 21. Mr. Fisher loves to portray the lighter side of life. His women are very smart looking and his sentiment pleases.

Abelard and Heloise ranking with the few great historic lovers of the world, most happily inspires one of the present season's holiday books. The love of

COPYRIGHT, 1907, BY LITTLE, BROWN, & COMPANY

AUNT JANE OF KENTUCKY

Drawn by Beulah Strong

Frontispiece from "Aunt Jane of Kentucky," by Eliza Calvert Hall. Reproduced by permission of the publishers, Little, Brown, & Co., Boston, for the Holiday Book Number of The Independent.

Heloise was sublime in its intensity, romantic in its constancy, appealing in its pathos, and tragic in its suffering.

McClurg's edition of that Standard German Classic, *Immensee* is characterized by pages decorated in green tinted borders with well executed color plates. The book has a good cover. It is daintily made and the decorators have been successful in the work they have done upon it.

An edition de luxe of Sheridan's *The Rivals* with photogravure illustrations is a feature of this year's book offerings. *The Rivals* is as interesting to read now as when the brilliant Sheridan dashed it off in 1775. Those of us who have seen the late Mr. Jefferson as Bob Acres in his revivals of this play will read the present book with much reminiscent interest.

The Story of Sir Launcelot and His Companions is the third in the "Stories of King Arthur and His Knights," which Mr. Pyle is writing and illustrating. It is interesting to notice Mr. Pyle's graphic interpretation of the text of these immortal stories by means of both pen and pencil. The drawings are vigorous and beautiful.

The Ingoldsby Legends of Mirth & Marvels as devised by Thomas Ingoldsby half a century ago and retaining all the wit they ever had, all the humor and all the intimate knowledge of the slang that was then current, are newly issued with illustrations by Arthur Rackham as a holiday offering this year. Those who hold to the idea that when a new book is issued it is time to read an old one may indulge themselves thus with infinite delight with the *Ingoldsby* volume.

A new holiday edition of *The Grandissimes* has been prepared with illustrations in photogravure by Albert Herter. The tale remains the same and it deals with the South and Southern sentiment as before, but to the atmosphere that

A GONDOLA.
From Browning's "Italy." Baker & Taylor.

Cable has given the story Herter has added much in his illustrations, which somehow make the familiar text take on something of new life and interest. A reproduction of one of the illustrations appeared in our issue of November 21st.

The *Sea Fogs* (Stevenson) is now issued as number one of the Western Classics, a series to consist of notable selections from the literature of the Pacific Coast. It is a very pleasing specimen of book making, and shows what can be accomplished in edition binding in the way of individuality of design when some one with artistic taste puts a little thought upon a book's *format.*

Tales of a Wayside Inn, The Seven Poor Travelers and The Holly Tree, and *Travels With a Donkey in the Cevennes,* are the present season's addi-

From Stuart's "The Woman's Exchange." Copyright, 1893, by Harper & Brothers.

tions to the dainty Thumb-Nail Series that the Century Company issues. These little books with their stamped leather bindings and very convenient size make excellent Christmas offerings to those who love good books artistically made.

The production of "The Midsummer Night's Dream" in the year 1596 is realistically described under the title of *Shakespeare's Christmas Gift to Queen Bess.* An "Old Time Christmas Carol" is also given a place in the book, which is copiously illustrated and printed in black and green.

The Parables as selected and edited by Lyman Abbott are delightfully printed with borders and tinted decorations. The illustrations give modernity to the parables, as they all represent scenes from everyday life.

A Book of Joys will particularly appeal to women since it presents an intimate view of the soul of a typical American woman. Many men in despair of a proper understanding of women may also read the book and thus take hold on knowledge that could not otherwise be so readily obtained.

Mrs. Sangster's contribution to the annual volume of books this year is entitled *The Queenly Mother,* dealing with the realm of home, of which topic Mrs. Sangster is mistress.

There is swift movement in *Gallantry.* Howard Pyle's illustrations are full of

warm tones, vivid and dramatic scenes, and illustrate the text as is not always done by every illustrator. A black and white type derived from this book was reproduced in our issue of November 21.

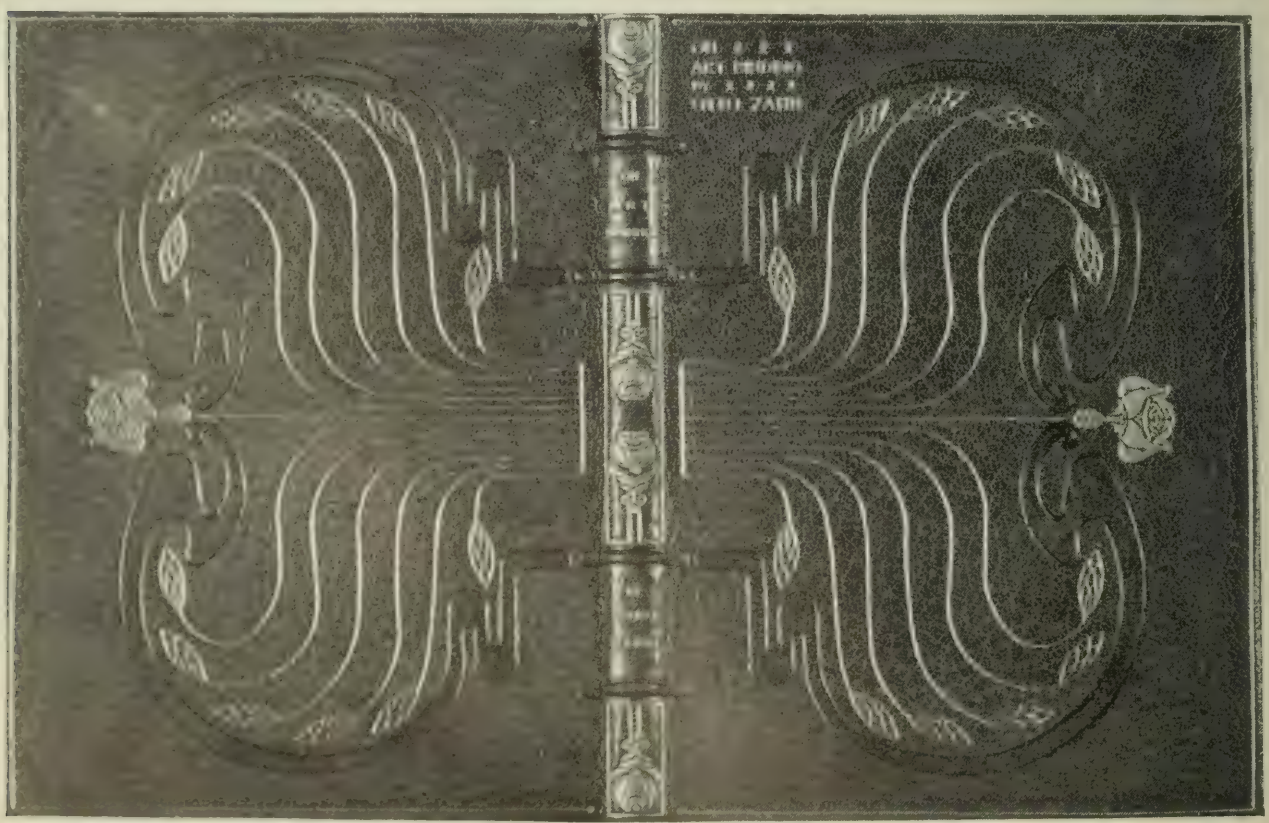
The Woman's Exchange of Simpkinsville is a clever little story as told by Ruth McEnery Stuart. It deals with a couple of maiden ladies who tried to help out their impaired income by advanced methods and what happened in consequence. The touch introduced thru the mention of the brother who was a naturalist and of the fortune that came out of his collection of supposedly useless birds is an exceedingly happy incident in the story.

The Old Peabody Pew is a Christmas story that contains an account of a country courtship written preëminently Wigginesque. A delightful touch of realism has been given the tale and the discussion of the worn church carpets, smoky chimneys and leaky roofs and other homely themes will awaken dormant memories on the part of many readers, to whom it will recall, as it were, a leaf out of personal experience of life in a New England village.

BOOK PLATE OF E. B. BIRD.

Margaret Deland in *An Encore* continues her former triumphs in "Old Chester Tales." Delicate humor and mellow atmosphere characterize the present story quite as much as has ever been the case with Mrs. Deland in her former stories. The book in consequence particularly appeals to a holiday audience.

The Crimson Conquest is a romance of some ability, with its scenes laid in the Land of the Incas. Some of the characters are well drawn, especially those of Pedro and Christoval. The interest of the story is sustained, but the book would have gained in strength by being shorter. The descriptions are good and some of the scenes quite thrilling.



Aunt Jane of Kentucky, from which we reproduce a color plate in this issue, was reviewed in THE INDEPENDENT of May 23d.

Stewart Edward White is the chief rival of Owen Wister as an interpreter of Western scenery and life to the effete East, catching in his kodak films impressions of an era now fast disappearing. This volume is largely a catena of camp-fire stories of cowboys, rustlers, Indians, remittance men and greasers, including some details too gross to make pleasant reading. It is illustrated with seven full page color plates, one of which we reproduce in this issue.

Her Son is well termed "A Chronicle of Love." The romance lacks something as to structure and technique, but the story contains much that is infinitely pleasing. The theme is not always a pleasant one and the sacrifices the girl made for the sake of love are many of them Quixotic in the extreme, but the interest is constantly and uniformly well sustained. The atmosphere is distinctly English and the characters are fairly well drawn. The tale also has the merit of being a novel one.

A considerable and very valuable contribution to book plate literature has been made this season in *Edwin Davis French, a Memorial,* which is issued in accordance with the preliminary announcement made last July. Mr. French held a remarkable place among book plate engravers, few having approached and none having surpassed him as an engraver of these marks of book ownership. Mr. French's personality was very pleasing, and all the book plates he produced were marked by technical perfec-

tion which is at once the marvel and the delight of all those who are interested in the subject. The present book has been compiled with infinite care and an immense amount of correspondence, the idea having been to present in a biographical sketch something which should approach an ideality in considering the personality of the artist. The Memorial volume brings together for the first time a comprehensive list of Mr. French's miscellaneous plates, scenes in New York, society certificates, title pages and other work engraved by Mr. French. The book contains a comprehensive selection of Mr. French's work taken from the original copperplates on india proof paper, and printed as finely as it is possible to print copper plates. Other publications on this subject are by W. Porter Truesdell, of Arlington, Massachusetts. Mr. Truesdell has published three volumes of ex libris material for the holidays, as follows: *A Collection of Book Plate Designs by Louis Rhead, A Booklet Devoted to the Book Plates of Elisha Brown Bird, Being a Collection Printed in Photogravure,* and *Ex Libris, A Collection of Book Plate Designs by Herbert Gregson.* These three books are all fine specimens of bookmaking, and the examples shown of the work of each artist represented is fairly typical. The book devoted to the book plates of E. B. Bird is easily a marked example of the artistic in bookmaking, since it has been printed at the Village Press and has all the distinguishing earmarks of this notable private press. The Goudy type has been used and the photogravure illustrations reproduce the book plates themselves very faithfully and brilliantly. Good descriptions of the reproduced plates make a strong appeal to collectors of these too often unconsidered trifles, these engravings in little. The reproduction of Mr. Bird's personal plate that appears in this issue loses much in the printing medium necessarily used. The Bird book is limited to an edition of 110 copies. The other books are in small editions.

REPRODUCTION OF A RECENTLY EXECUTED ART BINDING, BY OTTO ZAHN.

Mr. Zahn has chosen as his Binding Subject his m onograph on Art Binding, with an introduction by W. G. Bowdoin, as issued by him at Memphis in 1904. The book has been bound in full brown crushed Levant Morocco and the darker portion of the design is inlaid and blind tooled. The gold tooling introduces conventionalized roses and their buds very pleasingly wrought out as *motifs*. The book contains an admirable *dublee*, in which the rose *motif* is still further amplified. The book here reproduced is now on exhibition at the National Arts Club and is No. 32 of seventy-five copies printed on Japanese vellum. It has not hitherto been reproduced.

There was a field for *The Graphic Arts and Crafts Year Book* for 1907, and Joseph Meadon, who edited it, has put between the book's covers much in the way of material that will not only interest but also instruct the average reader. There is a great deal of fascination about the art that is preservative of all arts, and if Johannes Gutenberg could have foreseen the wondrous development of his invention he would have been even more enthusiastic over his first proof than was the case when he took it in the fifteenth century. The book is notable for its typography and for its many excellent examples of well executed color work, making it decidedly interesting to those concerned with printing.

Mr. Perry's little volume on Whittier is especially useful in preparing centenary celebrations in schools and elsewhere. There is an interesting biographical sketch of thirty pages and twenty of his most popular poems.

There are a large number of year books, booklets and calenders this season. They offer a striking contrast with the annuals and friendships offerings that were common in 1830 and thereabouts. Some of the best of the present season come from E. P. Dutton & Co., many of which are printed in Bavaria. *Lays of Ancient Rome* and *Evangeline* are among these. *The Battle of Life* (Dickens), printed in Edinburgh, is another of Dutton's books. This concern also issues *Tennyson Gems, Shakespeare Gems, Havergal Gems,* and *Gems of Praise from the Psalms* in the twenty-five cent class. *A Calendar for Saints and Sinners,* at $1.00, is published by Forbes & Co. (Chicago). *Women's Thoughts for Women,* containing quotations for every day in the year, will appeal to the feminine contingent. The same idea is carried out with especial reference to quotations from Tennyson in *A Tennyson Calendar.* Lincoln and Franklin have been drawn upon respectively for the quotations that go to make up *The Lincoln Year Book,* and *The Franklin Year Book.* Little, Brown & Co. present *The Optimist's Good Morning,* which contains only material that breathes of hope and joy and gladness. McClurg & Co. are issuing new editions of Dickens's Works and the Waverley Novels in their Prairie Edition among their specials for the 1907 holidays ($1.00 each). Some of the Duffield publications are *Lincoln's Gettysburg Address, The Declaration of Independence, The Rubaiyat of Omar Khayyan, The Constitution of the United States,* and *The Canticle of the Sun of St. Francis of Assisi,* convenient in form and neat is dress (60 cents each). Four numbers of the Abbey Classics come from Paul Elder & Co. They are, respectively, *The Cotter's Saturday Night* (Burns), *Ode on the Morning of Christ's Nativity* (Milton), *The Vision of Sir Launfal* (Lowell) and *The Building of the Ship* (Longfellow), at sixty cents per volume. Crowell's Thin Paper Classics, in a very convenient size and light weight include *Essays of Elia* (Lamb), *Cloister and the Hearth* (Reade), *John Milton, Thomas Moore, Dante's Divine Comedy* and *Eugene Sue's The Wandering Jew,* bound in limp leather. Dodd, Mead & Co. issue *Dream Children* and *Mrs. Battle's Opinions on Whist* (25 cents), while Henry B. Damon, of Katonah, N. Y., presents *Gems of Thought,* which is by no means of the highest type as to typography (50 cents). *Doggerel Dodgers,* in polychrome, designed for den decoration, and *Doggerel Dodger Post Cards,* as published by Paul Elder & Co., belong in this class of publications. Hugh and Margaret Eaton, at the Valhall Studio, Brooklyn, are again issuing a line of privately printed and hand colored Christmas cards and booklets that are at once dainty and artistic. Some of these are hand illumined.

The Christmas Book-Shelf for Children

BY MONTROSE J. MOSES

Author of "Children's Books and Reading"

THERE can be no attempt, where there is a mass of material which has to be given separate treatment, to educe any critical tendency in Yuletide literature for children. After months of sorting, I have reached the point of an oversoaked sponge; I can appreciate the terror of that boy whose wish that it might rain down gold dollars came true. I emerge from a vast area of books, well nigh four hundred, and my conscience tells me that I have given them all a fair show to attract my regard, to force me to make mention of them. I have had to sacrifice many because of the lack of space. We have reached the era of the world's best literature for children indicated by editors and by librarians. At a later date there will be more to say in these columns about Eva March Tappan's nine volumed anthology of the best in prose and poetry, published generously by Houghton, Mifflin & Co., under the title of "The Children's Hour," but here it must be noted that a cursory glance thru the pages of this collection indicates, even to the uninitiated, that the field of children's books is very rich, that it is some fault outside of the mere art of writing which today creates the endless mediocrity of our average story books for children. Compare the samples of old fashioned tales in volume six of this "Children's Hour" series, or the selections in Lucas's quaint volumes of "Stories of Long Ago," with the present-day book. The emphasis now is not on morals, but on education; not on the permanent, but on the transitory; not on the imaginative, but on the practical, the readable, the fact, so that when the appeal is heard thru the land—the appeal, not to librarians or teachers so much as to parents—to look before they buy, such an appeal should be recognized by them as an obligation. In all these books before me there is too much grown-up theory, too little real human fun. Yet there is much to attract the eye, and some bright spots to praise.

Manuals.

Education by Plays and Games. George Ellsworth Johnson. Ginn. 90 cents.

Day by Day in the Primary School. Alice Bridgham. Barnes. 3 vols. $4.00.

Child Religion in Song and Story. A Manual for Use in the Sunday Schools or in the Home. By Georgia L. Chamberlain and Mary R. Kern. University of Chicago Press. $1.00.

School manuals always attempt to suggest the most illuminating way of bringing to the minds of children the riches of the ages. We remember Mrs. Houghton's excellent treatise on "Telling Bible Stories" (Scribner's, $1.25); and this recalls Sarah Cone Bryant's "How to Tell Stories to Children," which is a volume wise librarians should maneuver to have wise mothers read. But common sense should tell us that not everyone is gifted with the ability to hold a group of young folks by means of verbal narrative. No one, however, can gainsay Miss Bryant's ability, for in her *Stories to Tell to Children,* (Houghton, $1.00 net), besides her very interesting prefaces which deserve more careful comment than space here permits, she gives the text for fifty-one stories that have been successfully tried by her.

Mr. Johnson's manual, *Education by Plays and Games,* with its many interesting photographs, is full of possibilities

for fun, indoors and out. The science of play is interesting, but should never overbalance the joyful instinct itself.

There are many ingenious suggestions thruout *Day by Day in the Primary School* covering the seasons month by month, almost hour by hour. Lazy teachers will welcome these diurnal doses of undoubted use, in some instances showing what to do, in others indicating what to avoid. Yet method is individual after all.

Child Religion in Song and Story is one of a series of constructive Bible studies. It suggests to our minds the question as to the significance of the Bible in modern education, as an ethical source. The lessons in this book cover forty Sundays, and regard the Scriptures from various viewpoints. There are many themes, a working introduction, and a section devoted to sacred music. Altogether the manual is compact.

Biography.

A Child Story of Hans Christian Andersen. Paul Harboe. Duffield. $1.50.

Theodore Roosevelt: The Boy and the Man. James Morgan. Macmillan. $1.50.

Life of Lincoln for Boys. Frances C. Sparhawk. Crowell. 75 cents.

David: Warrior, Poet, King. Edited by the Rev. W. S. Richardson, Paintings and Decorations by Arthur E. Becker. Appleton. $2.50.

Tho I have commented often on the poverty-stricken realm of biography for children, my cry seems not to have been heard. Authors like to write many lives in one volume, short chapters of a man's career in such manner as Charles Morris has done in his *Heroes of the Army in America* (Lippincott, $1.25). But not many have grasped the secret of how to develop a character nobly and truthfully, without placing this character in the midst of untrue situations, or in contact with people of small significance. For instance, the style in which the life history of *Hans Andersen* is told by Paul Harboe seems condescending, and that is ruination to an author's story. It is neither flesh nor fowl—it is neither biography nor narrative in the true sense of the word.

ABBIE ANN.
From Martin's "Abbie Ann." Copyright, 1907, the Century Co., N. Y.

Many have tried and failed in biography, either because they have not seen the human in the fact, or because they have used a fact out of proportion, thus sacrificing the spirit. Mr. Morgan's study of President Roosevelt is worthy of attention; its treatment is honest and straightforward; he gets the most out of a life already rich in romantic incident, and pregnant with moral significance. He does not lower his standard of style in the name of simplicity. The outcome is that he has written a volume with appeal to young and old alike. We wish that this were not an isolated biography; we would like to see a series under sane and healthy editorship—a kind of youthful "men of letters series," in which writers were chosen because they could tell a story without sacrificing dignity, because they believed in the life they were writing as Mr. Morgan believes in the President.

We started out, thoroly interested in Miss Sparhawk's new account of Lincoln; we liked the way anecdote and quotation were balanced with the original matter. But soon we began to be irritated by the ungovernable sectionalism, far from the spirit of charity toward all, and wholly antiquated in these days.

The story of *David* as told in the Scriptures cannot be too often read and in the new work by Dr. Richardson, the eye is at once centered upon the rich cover of gold and white. There is a fairly discriminating analysis of the psalmist's character, written by the editor and then follows the biblical text.

ILLUSTRATION BY JESSIE WILLCOX SMITH.
From Helen Hay Whitney's "Bed-Time Book." Duffield.

printed in narrative form. The illustrations show understanding and spirit.

History.

Heroes of American History: Magellan, Amerigo Vespucci. Frederick A. Ober. (2 vols.) Harper. $1.00 each.
Sea Yarns for Boys. W. J. Henderson. Harper. 60 cents.
Strange Stories of the Revolution. Molly Elliott Seawell, etc. Harper. 60 cents.
Strange Stories of the Civil War. General Forsythe, etc. Harper. 60 cents.
Adventures of Uncle Sam's Sailors. Commander Peary, etc. Harper. 60 cents.
Adventures of Uncle Sam's Soldiers. Capt. Charles King, etc. Harper. 60 cents.
The Free Lances. By Captain Jack Brand. McClure. $1.50.
Northwestern Fights and Fighters. Cyrus Townsend Brady. McClure. $1.50.
When America Was New. Tudor Jenks. Crowell. $1.25.

Carlyle's assertion that history consists of the biographies of great men warrants our passing to the next section thru a series of books which belong to both spheres.

Mr. Ober is an assiduous historian of Spanish-America, and the volumes which he has published within the past few years are written picturesquely and entertainingly. Apart from a minute critical judgment of the way he handles fact, he very successfully presents the personality of his subject, and develops the spirit of the time. His volumes on *Magellan* and *Vespucci* are neatly and compactly issued, and the authorities quoted indicate considerable research among recognized sources.

The Harpers have issued a set of strange stories and adventures which contain variety of unusual excellence. They are very commendable in scope, and far above the average in the narrative. They are written by skilled story tellers, and the incidents will supplement admirably the reading of history. Particularly striking are the introductions, which indicate the historical setting.

The cover design of *The Free Lances* will assuredly attract boys of all ages, who will get a plentiful amount of piracy in the accounts. The historical tone to the book is in no way interfered with, while the illustrations are full of dash and spirit.

Northwestern Fights and Fighters is the fifth in a series by Dr. Brady. In its scope it is excellent, being a collection of stories or accounts as told by the chief participants in the engagements. Boys will find Chief Joseph's description of the Nez Percé War full of excitement and full of human consideration. The general desire of Dr. Brady as editor seems to be to vindicate the army, which has so often been under unjust critical fire. That, however, is an ulterior purpose. The book, as a whole, is full of adventure and is real into the bargain.

History is being studied more and more in the light of economics and sociology, and we are glad to find Mr. Jenks treating of America's early colonization from the standpoint of the life of the colonists. This new volume, one of a series, bids fair to be a most commendable addition to historical literature for children; the author is a man of seasoned reading, and his whole plan is well thought out. In his *When America was New* he is compactly stating what others have said in larger volumes, and there is just sufficient running commentary of fact to locate and fix generalizations. The overcritical may not like the lack of light narrative, but that is a justifiable omission. We welcome the maps, the table of dates and the bibliography as being of great service in all books of travel and of history.

Classic Legend.

The Iliad for Boys and Girls. A. J. Church. Macmillan. $1.50.
Tales of Troy and Greece. Andrew Lang. Longmans. $1.50.

Perhaps there are some who will think

JOSEPH SOLD IN BONDAGE AMONG THE EGYPTIANS

Illustration from "Stories from the Old Testament for Children," by Harriet S. Blaine Beale. Reproduced by permission of Duffield & Company for the Holiday Book Number of The Independent

me overexacting in my demands for children's literature. Many of Dr. Church's adaptations have come to me, and I cannot claim that they have added much to my respect for Homer. I always feel that I am backed up when I declare that in this retelling process, the large ruggedness which rightfully belongs to the classic is lost in the mild care we take of the sensitiveness of children.

One is immediately drawn to *Tales of Troy and Greece* by its cover design. It is written in better style than the previously mentioned book. Mr. Lang treats of Ulysses, Mellager, Theseus, Perseus, and puts into his text more substance than is found in the ordinary adaptation or rewritten classic.

Fairy Land.

Ted in Mythland. Hermine Schwed. Moffat, Yard. $1.00.
The Olive Fairy Book. Edited by Andrew Lang. Longmans. $1.60 net.
Magic Casements. A Second Fairy Book. Edited by Kate Douglas Wiggin and Nora Archibald Smith. McClure. $1.50.
The Wonderful Adventures of Nils. Selma Lagerlöf. Doubleday, Page. $1.50.
The Arabian Nights. Edited with an Introduction by W. H. D. Rouse; ill. Walter Paget. Dutton. $2.50.
Fairy Tales from the Arabian Nights. Edited and arranged by E. Dixon: effectively illustrated by John D. Batten. Putnam. $2.50.
Favorite Fairy Tales: The Childhood Choice of Representative Men and Women. Ill. Peter Newell. Harper. $3.00.
The Princess and the Goblin. George MacDonald. Illustrated by Maria L. Kirk, and by the original wood engravings after Arthur Hughes. Lippincott. $1.50.
Fables in Feathers. G. Ten Eyck Bourke. Ill. J. M. Condé. Crowell. $1.00.
How to Find Happyland. Jasmine Stone Van Dresser. Pictures by Florence E. Storer. Putnam. $2.00.

Legend and myth imperceptibly fade into fairy land. Yet Hermine Schwed with a lack of restraint, bungles into all three at once in her *Ted in Mythland.* This is one out of countless volumes where an effort is made, under the guise of a myth within a myth, to familiarize youngsters with gods and goddesses. Even tho some might approve of the method, there is a lack of artistic handling in this book which forces both prose and poetry to become the vehicle, nor can we say much for the verses, which lack spirit. Far better Miss Abbie Brown's treatment of the giants of old.

By now we ought to know what to expect in Mr. Lang's yearly volume of folklore; in his preface he tells of the Cabinet des Fées, in which are gathered the tales of Perrault, of the Countess d'Aulnoy and others of that school, and he declares that his intention, in the variegated series which he and his wife have been arranging for so many years, is to gather together a sort of "Cabinet de Fées pour les jeunes." The desire is excellent, but undoubtedly there is much of the Oriental, of the Danish—in fact, of the Continental, which, even tho possessing a folklore value, is far from healthy. Besides, the unity in the blue, red, yellow, green, etc., collections is so slight as to leave an indistinct variegated impression of fairyland. We ask, How many more volumes are to come? Already, roughly computing, there must be three hundred odd tales in this series, every one of which we could sacrifice to save Perrault or Andersen or Grimm!

Magic Casements is a second volume which carries youthful understanding of fairy lore one step higher than "The Fairy Ring." The tendency started by Mr. Lang and Mr. Jacobs to cull from the field of folk tales in all directions is here very evident by a glance at the table of contents. There are all nationalities, an interesting emphasis being placed upon the Scandinavian. In view of the fact that so many library students from Denmark, Norway and Sweden are studying method in our country, this Scandinavian tendency, however small, has some significance. The editors of *Magic Casements* have compiled a wealth of material, but the judiciousness of their selection should be supplemented by careful consideration before reading. For the closely-printed pages are folklore, and as I contend the time is coming when we will have to put a stop to what is often told in folklore's name.

I had occasion to speak of the author of *Nils* to two Swedish ladies; their enthusiasm was sincere; they told me that Selma Lagerlöf was held in high esteem in the Far North and that undoubtedly she had woven legend and history with certain charm and naturalness in this book of hers, translated for English readers by Velma Swanston Howard. Nils, the run-away, has remarkable times in his flight. The illustrations to this American edition are marginal, and the end papers consist of richly colored landscapes—an idea largely in vogue among

London publishers. I should advise parents to give the book an examination, for its foundation is built upon national characteristics.

Most readers recall the well-thumbed

"E IS THE EXIT."
From Herford's "The Peter Pan Alphabet."
Scribner's.

Arabian Nights of their early years—pages a mass of diamond type, and woodcuts of startled acrobatic ladies and baggy gentlemen. Walter Paget's idea is different in the book which he illustrated. The attractive cover to this edition invites inspection; it is an individual taste that dislikes glazed paper, but here the whole effect, illustrations and type, is agreeable. An interesting tho slight introduction telling of the different versions, precedes a select number of the stories, which are simplified. The editor is prompted by Utopian desires—to have the stories told by word of mouth rather than read; his text to be used as a basis.

There is another edition, larger and more sumptuous, based upon the popular text of Gallaud, first printed in 1821; the editor's aim is avowedly to design an edition *virginibus puerisque;* have any of our readers ever seen a 1001-taled volume?

Every person, man or child, has his likes and dislikes. Peter Newell's illustrated *Favorite Fairy Tales* would emphasize this to any one prone to disbelieve it. The volume is delightful in form, tho more ornamental than useful. Of undoubted excellence are the stories therein contained; for even tho the ethics of cruel grandmothers, and the brutality of bears and wolves have been discussed by educational upholders of the mild adaptations, the immortal stories remain immortal. It speaks well for our literary men who voted on the admission into this hall of fame in the shape of a book. The editorial policy is amusing; psychologists might find some scientific meaning in William J. Bryan's liking for "The Ugly Duckling" and in Mark Twain's preference for "Aladdin." Undoubtedly, the aggregate represents a favorite choice. But an eminent name of the present attached to an eminent tale of the past is like giving something with a pound of tea. It often fools people into buying poor tea. In this case the tea is good.

We never begrudge the publisher praise when he reprints something good. This subject brings to mind John Habberton's *Helen's Babies* (Moffat, Yard $1.50) which has been pictured by Cory Kilvert. George MacDonald's *The Princess and the Goblin* is another very welcome reprint of a story by one who knew how to tell a story. Readers of "At the Back of the Northwind" will turn with unfailing delight to this other story. The new illustrations may be nice in color and large in design, but how wrong to supplant Hughes and Tenniel, who have become so closely identified with MacDonald and Lewis Carroll. In the present case the wood engravings are far better.

Instead of using the Kipling form of "How the Camel Got his Hump," Mr. Bourke, in his very agreeable collection of *Fables in Feathers* narrates *"why* the robin wears a red breast," *"why* the owl can't see in the sun" and important facts like that. The stories are well told, and the moral *effect* well conceived. They are most certainly not ordinary fables; they display innate skill of the born *raconteur.*

On the other hand there is *How to Find Happyland,* artificially told by Jasmine Van Dresser. This author has made the antiquated mistake of preaching; of pinning onto her stories, morals that are blemishes because they are so evident. The book is attractively published and for that reason all the more disappointing.

Fiction.

Sunnyside Tad. Philip Verrill Mighels. Harper. $1.25.
Abbie Ann. George Madden Martin. Century. $1.50.
Captain June. Alice Hegan Rice. Century. $1.00.
Two Royal Foes. Eva Madden. McClure. $1.25.
The Camp-Fire of Mad Anthony. Everett T. Tomlinson. Houghton. $1.50.
The Spirit of the School. Ralph Henry Barbour. Appleton. $1.50.
Four Afloat. Ralph Henry Barbour. Appleton. $1.50.
Roy and Ray in Mexico. Mary Wright Plummer. Holt. $1.75 net.
Boys and Girls from Thackeray. Kate Dickinson Sweetser. Pictures by George Alfred Williams. Duffield. $2.00.
The Daughters of the Little Grey House. Continuation of *The Little Grey House.* Marion Ames Taggart. McClure. $1.50.
The Little Colonel's Knight Comes Riding. Annie Fellows Johnston. Page. $1.50.
Betty Baird's Ventures. A Sequel to Betty Baird. Anna Hamlin Weikel. Little, Brown. $1.50.
A Girl from America. L. F. Meade. Dutton. $1.50.
The Friendship of Anne. Ellen Douglas Deland. Wilde. $1.50.
Big Brother. Annie Fellows Johnston. Page. $1.25.

Yearly, we approach fiction as a horse without blinders approaches a post. We shy because of the gray shadow, the endless length of mediocrity, of sameness—stories cut from the same pattern; stories of girl life, all the same; stories of football almost indistinguishable. The deluge has been larger than ever before, and every type of story is represented. Like Polonius, we may say, there are the history-biographical, historical-narrative, adventurous-historical and the other various combinations. What grown people read, children read in milder form, and like the spawn of the deep, the literary egg hatches forth the "series." It has been impossible to deal with all the stories in one article; necessity has forced a summary arrangement into lists. But a few have been individualized as representative of the many. You may say that by constant reading my sense of appreciation is dull; granting that I see the dead level, the tired mind grasps at the unusual in the landscape, or the hopeful elevation along the skyline. There are no peaks this year; the horizon has hardly changed these three yule-tides past.

The author of "Bruvver Jim's Baby" has told in *Sunnyside Tad* a very pathetic circus story, in which the trials and strange adventures of the hero are brought to a romantic end, as all stories of this kind invariably end. There is a tendency on Mr. Mighels's part to become over-sentimental, and to over-accentuate scenes; unfortunately, a verboseness results in some pages that drag considerably; otherwise circus life on the road is very appealingly described and the spirit of the book is sweet. The author's love for children is very keenly felt.

Miss Martin's *Abby Ann* is a story of a fascinating little girl whose character is full of faults, yet who is very lovable. She is sent off to school at an early age, because her mother is dead and her father wishes her to have the influence of women around her. Of course, the school happens to be the one where her mother went before her, and there our heroine meets with very dissimilar old ladies whose hearts she wins in ways set forth in a clever little story. The book is well written.

Captain June, by Mrs. Rice, ran as a serial in *St. Nicholas* magazine. It has a simple plot of Japanese life, in which a small boy, whose name indicates that he is the junior member of the family, meets an old soldier. This man is involved in a mystery of a mild sort, which June aids in solving, so that all ends satisfactorily, as the steamer points its way to American shores.

There is a certain very charming German atmosphere thruout Eva Madden's *Two Royal Foes,* and yet we are baffled. For without condemning it, we needs must criticise it for its diffuse story, for

SIMPLE SIMON.
Illustrated by G. G. Wiederseim. From "Nursery Rhymes from Mother Goose." Scribner's.

its over-exact narration of Napoleon's ravages in Prussia, and for the very slight juvenile strain in its pages. The author has been a faithful student of the clash between the little Emperor and the much loved Queen Louisa, "the heroine of the German struggle for liberty." But shall we call it a novel, a child's story or history in narrative form? Miss Madden has missed the mark.

Mr. E. T. Tomlinson is so seasoned a writer that he has already won a following which probably would not stop for criticism, however often it might be given. The present story, entitled *The Camp-Fire of Mad Anthony*, is built on historical foundation; this the author always tries to vouch for in prefaces and occasional footnotes. But invariably a story used as a vehicle becomes stereotyped, and Mr. Tomlinson's strength does not lie in his plots. If he would write less and take more care; if he would carefully observe those requirements which he declared many years ago should dominate every juvenile book, if he would avoid the commonplace motive and situation, he might tell a distinctive narrative, but are we not all getting tired of the marvelous young heroes who outrank the greatest by their greatness?

The genre of literature designated as the college story is rampant. Unfortunately, Mr. Barbour has joined the ranks; he has a formula all to himself; his cover designs tell you the story before you have read it. In *The Spirit of the School* the motive is honesty in athletics, and the author criticises those larger colleges which should set a worthy example to small institutions. The poor boy and the rich boy, the mean boy and the good boy, are all familiar figures; we have met such types in countless other tales. Mr. Barbour's *Four Afloat* is based on mystery, and contains sufficient action to please most boys.

There is another type of narrative which carries travel along with it. These stories usually bear all the earmarks in the title, like Miss Plummer's *Roy and Ray in Mexico.*

Such a volume to come from a director of a library school is rather a shock than a pleasure. Investigation has shown me that this type of book is considered antiquated, a form librarians are loath to accept for circulation. The method was worn out by Knox and Butterworth; why preserve it?

I cannot help but feel that if the literary boys and girls, such as one finds in Thackeray, Dickens and George Eliot, are worthy at all as human studies, as children of an author's fertile imagination, they ought not to be introduced to readers—however skillfully maneuvered—by any other hand. I doubt whether Thackeray in slices or Dickens sandwiched, even by Mrs. Kate D. Sweetser, is legitimate—and very often the effect of such retelling is opposite of what is planned. One's love for David Copperfield should be had from "David Copperfield" and so with the others.

When Marion Ames Taggart wrote "The Little Grey House," the result was an exceptionally bright story which really needed no sequence. But the latter had to come, and it is a relief to find *The Daughters of the Little Grey House* above the average.

In the new story the characters are all grown up, and they are developed in a very human way, and as centers of pleasing incidents, told much after the fashion of Miss Alcott. The philosophy is wholesome and cheerful. The same author has written "Six Girls and the Tea Room," a continuation of "Six Girls and Bob" (W. A. Wilde, $1.50). In an interesting manner there are depicted the efforts of a family of young folks and their mother to get along in New York. The story introduces some clever suggestions regarding apartment life emphasizing the necessity for neighborliness.

Mrs. Annie Fellows Johnston has written some nine volumes dealing with the "Little Colonel," and in the face of the great popularity of the series, we have to charge the little Kentucky girl with being very inane, and the incidents in her life thoroly commonplace. Had Mrs. Johnston contented herself with writing one story, instead of a Christmas annual, there might be some reason for comparing "The Little Colonel" with "Little Women," but to do so now is farfetched and uncritical. The present volume, *The Little Colonel's Knight Comes Riding*, is a sentimental narrative—a diluted novel.

Anna Hamlin Weikel's meaning in *Betty Baird's Ventures* is hard to reach

—presumably the difficulty of settling a girl in her proper sphere after graduation. It is commonly to be expected that parents attend to this, but Betty's are too inconsequent to be of much help. So their little daughter weeps thru the chapters.

L. F. Meade's *A Girl from America* gives such distorted views of American girlhood that it cannot be recommended. There is an obvious moral saturating the pages, which number 300.

Ellen Douglas Deland is another author of never-failing regularity. This time her story, *The Friendship of Anne,* is one of boarding-school life, with a hidden misfortune. Her girls are types that have little real blood in them. Here is the generous one, the impulsive one, the good one, the shoddy one. With such characters it is not a surprise to find the narrative developing mechanically—a striving to be clever.

Stories for Tiny Tots.

The Happy Heart Family. Virginia Gerson. Duffield. $1.00.
The Bed-Time Book. Helen Hay Whitney. Ill. Jessie Willcox Smith. Duffield. $1.50.
Friends and Cousins. Abbie Farwell Brown. Houghton. $1.00.
Wee Winkles and Her Friends. Gabrielle E. Jackson. Harper. $1.25.
Kitty-Cat Tales. Alice Van Leer Carrick. Lothrop, Lee. $1.00.
The Adventures of a Doll. Nora Archibald Smith. Ill. Dan Sayre Grosebeck. McClure. 75 cents.
The Cozy Lion. Frances Hodgson Burnett. Century. 60 cents.

This season's deluge has provided generously for very young readers.

A popular demand caused the reprint of Miss Gerson's very quaint conceit, *The Happy Heart Family*—the life history of inverted hearts told for youngsters; it showed to us before, in type arrangement and in the narration, a felicity unusual in books of this character.

The verses written by Mrs. Whitney in *The Bed-Time Book* are of average quality—precocious and falsely Stevensonian. Mrs. Smith, in her usual manner, depicts child-life in a haze of feminine feeling which begins to pall when it is seen so often. It is the fault underlying most of the work of that art school —very original grouping with over-sentimental effect.

Let us hope that Miss Abbie Farwell Brown is not going to be drawn into the series class of writers; let us also hope that she will soon realize how close upon condescension her style is bordering, especially in her volumes of three years past. But it is a relief to find *Friends and Cousins* less weak than "Brothers and Sisters," tho the same tendency is evident in each to be ethical in the midst of playing "treasure trove." We speak thus plainly because Miss Brown has gained a library foothold thru her verses and her myth tales. Her new vein lacks spontaneity and imagination of a high character.

Wee Winkles and her Friends will appeal to some children. At times it is foolishly sentimental and impossible in its practical suggestions and unimaginative playfulness, but there is sufficient story attached to win readers. Mrs. Jackson has a manner of talking down in this series that is thoroly false.

In *Kitty-Cat Tales* a kitten tells the stories each night to a little girl whose aunt does not understand the necessity for bed-time "send-offs." In this way, nine legends of some note are heard by the little heroine. They are written simply and directly; the type in which the book is printed is commendable.

In Nora Archibald Smith's *The Adventures of a Doll* there is a poor unfortunate "child" subject to seven melodramatic happenings that thrill the heart of a little highland lassie. Miss Smith tells the stories in a breezy manner, but alack! does she think to follow this volume with another? Why not rest content with this small sheaf which is bound together in a very "Scotchy" cover!

The Cozy Lion is a delightful bit of nonsense written by one who is possessed of the rare gift of story telling. In all lines of fiction Mrs. Frances Hodgson Burnett excels. The absolute absurdity of a ferocious lion being reduced to maudlin adoration of children is worked up in a most charming manner. It is a story which would bear telling excellently to a library group of children, but, as Mrs. Burnett says, the narrator *must* know how to roar.

Other Books for Little Ones.

Father and Baby Plays. Emilie Poulsson. Century. $1.25.
Book of Plays for Little Actors. Johnston and Barnum. American Book Company. 30 cents.
Improving Songs for Anxious Children. John and Rue Carpenter. McClurg. $1.50.

The father's relation to the baby at play is here very fetchingly illustrated, in picture, rhyme and song, thruout Miss

Poulsson's *Father and Baby Plays.* To toss, to jump, to climb, to ride, on chairs, on the floor, culminating in quiet plays —these are all treated by the author, who possesses a seasoned hand at child study. Fathers would do well to glance this book over; it will afford them ideas for many agreeable, even tho they be active, moments. The child requirements, physically, are well grouped.

Books of Plays for Little Actors is undoubtedly an attractive title, but with the usual disappointing inside, since it is intended for the classroom.

In size *Improving Songs for Anxious Children* is ungainly, and it is disappointing both in musical scope, in illustration and in verse. The latter contains a sarcastic tone that is far from childlike—Stevenson reduced to unrecognizable power.

Poetry and Verse.

The Golden Treasury of the Best Songs and Lyrics in the English Language. Palgrave. With an Introduction by Edward Hutton and Illustrations by Robert Anning Bell. Dutton. $3.00.

Pinafore Palace: A Book of Rhymes. Edited by Kate Douglas Wiggin and Nora Archibald Smith. McClure. $1.50.

The Golden Staircase. Poems for Children Chosen by Louey Chisholm, with pictures by M. Dibdin Spooner. Putnam. $2.50.

Another Book of Verses for Children. Edited by E. V. Lucas. Ill. F. D. Bedford. Macmillan. $1.50 net.

Hymns Every Child Should Know. Edited by Dolores Bacon. Doubleday. 90 cents net.

A Book of Nursery Songs and Rhymes. Edited by S. Baring-Jones. McClurg. $1.50.

Nursery Rhymes from Mother Goose. Mrs. Wiederseim. Scribner. $1.50.

The Peter Pan Alphabet. Oliver Herford. Scribner. $1.00 net.

Anthologies come and go, but Palgrave holds his own, and it is simply because he was an anthologist in the true sense of the word. He was fortunate in realizing concretely what Matthew Arnold stated abstractly regarding criticism and its functions—to find the best in expressed thought. Of course Palgrave was fortunate in having Tennyson's advice; none of his anthologies were characterized by what might be called one man's taste. It is this very narrow individual note in our modern collections that makes them inferior to the few that show deep sensibility and a clear understanding of the best. The colored plates in the sumptuous volume of *Best Songs and Lyrics* must have been expensive to make; we only wish that the publishers had saved themselves the expense.

The title, *Pinafore Palace,* is very indicative of the age appeal. Two other volumes belong to the series, edited by Mrs. Wiggin and Miss Smith, and now the publishers are able to announce stepping-stones to the appreciation of good poetry. We cannot wholly recommend the judicious selection, nor do we thoroly approve of the fanciful departments under which the verses are arranged.

A very hastily gathered series of steps is *The Golden Staircase*—two hundred in number—with many examples from out a golden treasury and with the inclusion of many that have no reason for being selected. The volume is beautifully made; it is indeed a pity that the amateur spirit should so prevail in the editorial choice.

As a whole, Mr. Lucas's *Another Book of Verses for Children* lacks the appropriateness which the first book possessed. It is an historical record of verse rather than thoroly adapted in itself to the tastes of young folks. While it is full of rich matter, arranged in superficial groups, it is to the student of juvenile literature, rather than to the juvenile reader, that the book will appeal. It lacks restraint, wisdom, purpose in selection.

The editors of the *Every Child Should Know* series have very curiously bordered upon the realm of what every child should *not* know. We remember we called attention to this curious inclination before on the part of Mrs. Bacon in her volume of songs. Inclusive anthologies are very easy to piece together; you are bound to hit upon gems in an incongruous collection. First, in this new volume of hymns, we deplore the lack of accompaniment, while praising the concise histories at the heads of each selection. Secondly, we condemn the confounding of adult comprehension with childlike appeal.

We wish that the border decorations which the title page indicates were cut on wood, had never been stamped on the margin of Baring Gould's *Book of Nursery Songs and Rhymes.* Running your finger rapidly along the edges, the whole presents a funereal appearance. Apart from this, some historical attitude is taken by the editor in the arrangement of our nursery songs. Scholars

might criticise Mr. Baring Gould for the slight way in which he discusses the significance of form, and the incomplete manner in which his notes indicate sources. Take these away, and I cannot see the *raison d'être* for the volume. Dr. Furnivall's collection is far more permanent. I cannot believe in half-hearted scholarship, and on the other hand I fail to recognize the need for scholarship in relation to rhymes and jingles in a book for young folks.

Mrs. Wiederseim has entered excellently into the spirit of incongruity to be found in *Nursery Rhymes from Mother Goose.* It takes genuine fun to illustrate genuine fun, and the drawings in this large book are saturated with such quality. Many people who have been to see "Peter Pan" have come away with poetry in their hearts, and no ability at the point of the pen. But Mr. Herford is favored by the gods in being able to draw and to write his appreciation.

MISCELLANEOUS.

Whose Home Is the Wilderness. William J. Long. Ill. Charles Copeland. Ginn. $1.25 net.

What Shall We Do Now? 500 Children's Games and Pastimes. Dorothy Canfield and others. Stokes. $1.50.

A Child's Life of Christ. Mabel Dearmer. Dodd, Mead. $2.00 net.

Under the general head, Miscellaneous, we have to group various isolated volumes that are not sufficiently large to stand alone. Science, nature, practical books are always represented on our Christmas shelves, but never in such small quantities as this year.

In this space we cannot cope with the "nature question." However scientists may decry the sentimentalizing of animal habits, the popular writers have at least been successful in creating a spirit of the deep woods which the specialist has not done. Dr. Long has been under fire but he continues to write, and in his new volume, *Whose Home is the Wilderness,* attractively printed in the Seton fashion, he is very picturesque in his descriptions of wild habits. There is, however, a tone of guarded analysis which shows that the recent fight with scientists has been, and, perhaps, still is. *Tenants of the Trees,* by Clarence Hawkes (Page, $1.50), stretches the nature question a point further in respect to popular treatment. Mr. E. V. Lucas compiled a book some time ago bearing the title *What Shall We Do Now?* It was popular and became well known among teachers and librarians; then the publishers allowed it to go out of print, issuing this new volume, which undoubtedly is based upon its predecessor. *Rainy Day Diversions,* by Carolyn Wells, is a peculiar volume, with very few suggestions for so many pages. Those who are mathematically inclined will like it, but to tax the brain with "short" cuts, and especially under the confusing form of conversation, is too much like work. Miss Wells has been more original in some of her other things. The youthful inventor will find *Harper's Electricity Book for Boys* very suggestive, for the directions seem to be explicit and there are numerous illustrations. The text is a guide and does not attempt the historical side, a very valuable aspect of Mr. Tudor Jenks's volume on electricity, published by the Stokes.

Every young scientific American whose ambition it is to become an engineer, will eagerly look thru this very full history of the advance of steam toward acquired speed and toward electricity. The volume bears the significant title of *The Boys' Book of Locomotives.* The text will appeal to older folks—men and boys of sixteen, but the pictures, showing the locomotive in all stages of its development, will draw every one's attention. The descriptions are explicit and have been designed with evident care.

In these days of the discounting of the Bible in its true form, the retold class is better than nothing and two new volumes supplement each other: Harriet Beale's *Stories From the Old Testament* and Mabel Dearmer's *A Child Life of Christ.* In a democracy and especially in public institutions, it is perhaps well to guard against conflict of creed, but more stress should be placed by church and school upon spiritual training in education. Stories from the Bible cannot go

far wrong in spirit, however far away they may be in style.

Because I am limited in space, I think it best to desist from making any further comment about individual books, other than a line or two of general indication. The following groups will at least serve to draw attention to subjects in several directions.

Additional Groups.

Stories.

The Sandman: His Ship Stories. William J. Hopkins. Page. $1.50. There are many readers who have welcomed before the sandman stories of farm life, and who will be prejudiced in favor of this volume which deals with the sea.

The Young Acadian. C. G. D. Roberts. Page. 50 cents. A story of the raid from Beauséjour, written by one whose style is picturesque and whose feeling is earnest and sincere.

Little White Indians. Fannie E. Ostrander. Page. $1.25. The child instinct to "play Indian" is appealed to in every story.

Some of the Irrepressible "Series."

Treasure Seekers of the Andes; or, American Boys in Peru. Edward Strathemeyer. Lothrop, Lee. $1.25. We are told that this belongs to the "Pan-American Series."

Randy's Prince. Amy Brooks. Lothrop, Lee. $1.00. This closes the series of eight volumes, known among admirers as "The Randy Books." There is a light sprinkling of love.

Five Little Peppers in the Little Brown House. Margaret Sidney. Lothrop, Lee. $1.50. A revamped story, published because of a demand. "Peppers" are to be had at all seasons.

Helen Grant, Senior. Amanda M. Douglas. Lothrop, Lee. $1.25. This is No. 5 of the brand "Helen Grant Books." Amy Brooks, of "Randy" fame, is the illustrator. In the progress of this heroine to the grave, we may well ask—What next?

Marion's Vacation. Nina Rhoades. Lothrop, Lee. $1.25. All's undoubtedly well that ends well, as the author says in the last chapter. We would agree if it was the end, however doubtful some of the moral quibbling.

Priscilla of the Doll Shop. Nina Rhoades. Lothrop, Lee. $1.00. One among many known as "The Brick House Series."

The Great Year. A. T. Dudley. Lothrop, Lee. $1.25. This belongs to the "Phillips Exeter Series." A tale of rivalry and college sport. To follow the ball honestly is not a high, however it might be a healthy, ambition.

Ruth Erskine's Son. Mrs. G. R. Alden. Lothrop, Lee. $1.50. Everyone has heard of "Pansy": she is a perennial flower, blossoming in every conceivable series.

Four Boys in the Land of Cotton. Everett T. Tomlinson. Lothrop, Lee. $1.50. This belongs to a series where heroes become subject to the customs of locality. They are annually learning about our own land, and fall into traps which constitute the story.

Stories of Adventure.

The Treasure of the Canyon. Joseph B. Ames. Holt. $1.50. The locality is Arizona and the author follows the usual formula of extravagant adventures and escapes.

The Boys of Crawford's Basin. Sidford S. Hamp. Wilde. $1.50. A story of Colorado ranch life of the early '70's. The chapter headings are a fair indication of the plot.

The Young Train Dispatcher. Burton E. Stevenson. Page. $1.50. The cover design is an index to the story. The frontispiece is suitable for a five-cent newspaper, and the motive of the whole is wrong, even though railroad life is fairly depicted.

Ungara Bob. Dillon Wallace. Revell. $1.50. A winter's tale dealing with the fur trappers.

Stories with Historical Basis.

At the Mikado's Court. Henry H. Lewis. Appleton. $1.50. Descriptive of three American boys in Modern Japan, with pictures for the first third of the story. The marvellous adventures end in hints of diplomatic service. Of course, there are plots.

The Young Trailers. Joseph A. Altsheler. Appleton. $1.50. A tale of early Kentucky which means Indians, scouts, etc.

Buck Jones at Annapolis. Richard Pearson Hobson. Appleton. $1.50. Author, text, pictures, cover, title, all stamp this as a navy story.

On the Trail of the Arabs. Herbert Strang. Bobbs-Merrill. $1.50. This successor to Henty tells of heroic deeds in Africa. A thick and closely printed volume, told in the usual style.

Defending His Flag; or, a Boy in Blue and a Boy in Gray. Edward Stratemeyer. Lothrop, Lee. $1.50. The usual effort to do justice to both sides. The author asserts in a preface his historical accuracy and believes his view the faithful one.

Napoleon's Young Neighbor. Helen Leah Reed. Little, Brown. $1.50. The author of the Brender Books describes a friendship between the Emperor and the heroine. The object is to teach history thru story.

Long Knives. The story of How they Won the West. George Cary Eggleston. Lothrop, Lee. $1.50. A combination of history and adventure. In some places, data is drawn exactly from memoirs. It is to be deplored that Mr. Eggleston does not write legitimate biography.

Boys of the Border. Mary P. Wells Smith. Little, Brown. $1.25. Belongs to the "Old Deerfield Series" and covers a period in the French and Indian wars, 1746-1755. The appendices give the historical settings.

Additional Stories.

Harry's Runaway. Olive Thorne Miller. Houghton. $1.25.

Little Miss Cricket's New Home. Gabrielle E. Jackson. Apleton. $1.25.

Day: Her Year in New York. Anna Chapin Ray. Little, Brown. $1.50.

Mrs. Tuckerman's Nieces. Helen Dawes Brown. Houghton. $1.50.

Theodora. Katharine Pyle and Laura Spencer Porter. Little, Brown. $1.25.

Little Girl and Philip. Gertrude Smith. Harper. $1.30 net.

Additional Fairy Tales.

American Indian Fairy Tales. Margaret Compton. Dodd, Mead. $1.50. A decorative volume of legends based on Government reports of Indian Life preserved by the Smithsonian Institute.

Russian Fairy Book. Translated by Nathan Haskell Dole. Ill. Bilibin. Crowell. $2.00. Mostly based on folk lore.

The Wind Fairies and Other Tales. Mary De Morgan. Dutton. $1.50. A fanciful collection of stories with some doubtful illustrations.

Fanciful Tales.

Ozma of Oz. L. Frank Baum. Reilly & Britton. $1.25. Another story of that peculiar land of mechanical humanities.

The Jeweled Toad. Isabel M. Johnston. Pictures by W. W. Denslow. Bobbs-Merrill. $1.50. An Oz type of story with Oz colors to the pictures.

Large Books.

Little Travelers Around the World. Pictures by George Bonawitz. Text by Helen Coleman Barnes. $1.50. Here is geography told in the sight seeing coach style. It is about as thoroly artificial in intent and in effect as the Cook's tours are. A very odd omission is a map which would at least have added an element of usefulness to the chapters. The merchant flags reproduced in color are interesting. But we shouldn't buy a thick book for the sake of two pages.

More About the Roosevelt Bears. Seymour Eaton. Stern. $1.50. The verses here have the same spirited jingle to them as are to be found in the

Brownie adventures. But the pictures lack the light playfulness and the active fun of Mr. Cox's little men. These bears are doing in a clumsy fashion what others have done before them; such books have a popularity, because the newspapers have created a demand for them. It is unfortunate.

Garden-Land. Robert W. Chambers. Appleton. $1.50. One of a series in which useful information is dealt out in easy dialog. The children are thoroly artificial and the scientific value slight.

Son Riley Rabbit and Little Girl. Grace MacGowan Cooke. Stokes. $1.50. A number of rabbit stories for young folks of five and six years.

Uncle Remus and Br'er Rabbit. Joel Chandler Harris. Ill. by J. A. Condé. Stokes. $1.00. Chiefly consists of pictures illustrative of the important events in Br'er Rabbit's life.

According to Grandma. Alice Calhoun Haines. Ill. by B. Cory Kilvert. Stokes. $1.50. The most important part of this book are the pictures by Mr. Kilvert. They are quaint in idea, and it was a mistake not to reproduce them all in color. Possibly the publishers have in mind for later on a suitable calendar. The present book is very strikingly bound in figured cloth.

The Golliwogg's Christmas. Florence K. Upton and Bertha Upton. Longmans. $2.00. This hideous creature of red, white, blue and black proportions is an annual visitor, more familiar than subtle.

Childhood. Millicent and Gatha Sowerby. Duffield. $1.50. The color plates are feelingly thought out and well reproduced.

OTHER BOOKS FOR TINY TOTS.

Little Mother Series: The Stories the Three Baby Bears Told. The Three Baby Bears. The Toy Bearkin's Christmas Tree. The Baby Bears' Picnic. The Little Toy Bearkins. By John H. Jewett. Illustrated by various artists. Each 50 cents. Nister, Dutton. In form these are very excellent little volumes. But the verses are strained, and carry the story lamely.

Little People's Story Box. Containing Fairy Tales from Grimm, Fairy Tales from Andersen, Nursery Rhymes, Nursery Tales. Nister, Dutton. $1.00 per sent. These little volumes are very attractive and so are the pictures, altho the blue and red give them the appearance of crudity. But in small space the booklets contain some enjoyable moments. As an inexpensive gift, they hold a variety of good things for small children, which cannot be said of the average publication in large type and easy words.

Let's Pretend. Cubitt, Bingham. Nister, Dutton. $1.00. Suggestions in pictures and rhymes for outdoor fun.

Our Picture Book. Nister, Dutton. $1.25. Not so successful in execution, but yet full of color.

The Little People's Scrap Book. Nister, Dutton. $1.50. Every page is crammed with very clever pictures of all kinds, done in color. It contains much amusement, and suggestions for many story hours.

Noah's Ark. Nister, Dutton. 50 cents.

Jack and Jill and Other Nursery Rhymes. Nister, Dutton. 25 cents.

My Pussy Cat Book. Nister, Dutton. 50 cents. Richly colored paper volumes with simple pictures. The latter is especially artistic and will delight grown up youngsters as well as small people.

The Toy Model Book. Nister, Dutton. 25 cents.

The Farm Yard Model Book. Nister, Dutton. 50 cents. Two works for children who like to cut out things with scissors. It is a clever and legitimate move on the part of publishers to increase sales. The Stokes Co. also issue volumes of the same character. It is certainly a better way of wasting money than fireworks.

Any of the books reviewed or advertised in this number will be sent by THE INDEPENDENT on receipt of price.

The Night-Rider's Reason of Being

BY MARTHA McCULLOCH-WILLIAMS

[The writer of this article has visited the field of these outrages and studied the conditions.—EDITOR.]

TOWARD midnight, Friday, December 6th, three hundred masked men, heavily armed, rode into the town of Hopkinsville, Ky. It is a fine, thriving town, the capital of Christian County, which is one of the richest in the State, and raises yearly the biggest crop of tobacco. The town is well built, has sewers, gas and water works, electric lights, telephones, railroads, even automobiles. There are perhaps ten thousand inhabitants, white and black. The foreign element is so small as to be negligible. There is much and varied business, but the backbone of it is tobacco. There are possibly a dozen big warehouses and factories concerned in the handling of that staple.

The masked men had come to burn these tobacco houses—at least some part of them. They did the work thoroly, setting guard over the fire company so there should be no interference. Only a windless night saved the whole town from burning. The night-riders had driven out the telephone operators to prevent calling help from the outside. They encountered some resistance. One citizen was killed, and two night-riders so sorely wounded that they have since died. Another man, an independent tobacco buyer, was severely whipt, after he had refused

to obey orders to leave town and never come back to it. By way of finish the night-riders shot out windows. Those in the *Kentuckian* office suffered most. The *Kentuckian* is one of two daily papers, and its editor, C. E. Meacham by name, is also Mayor of the town. Thus he had had the chance to foil a similar attack, planned a year earlier. He has sinned further, in speaking out as editor, man and citizen, against the night-rider and all his works.

The night-rider, of course, has a reason for being. It is the rattling fight raised over tobacco prices. It has raged for three years past, almost ever since the formation of the Planters' Protective Association, which was organized in 1904, and called into being by the fact that tobacco sold for less than it had cost to raise it. The Trust was answerable for the price, said the tobacco growers—there was nothing for it but to pool the crop and hold it for more money. This was done in part—but only in part. Otherwise there would never have been excuse for night-riding.

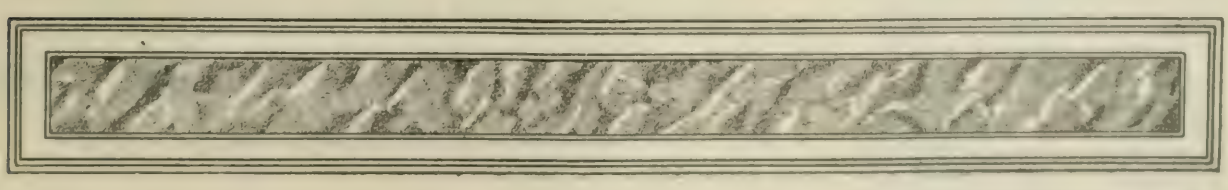
At present the association has twenty-seven thousand members, and controls the biggest part of the export tobacco crop raised in Western Kentucky and Northwestern Tennessee. Prices have risen amazingly. The association takes the credit of raising them. No doubt it deserves much of it, tho other things have helped. Where the shoe pinches is that they have risen most for the hill-billys. Hill-billys are the tobacco-growers who stay outside, and are rewarded for their contumacy by the independent buyers. They are not so plenty as they were—the night-rider has done effective missionary work. Officially the association condemns him, and no doubt speaks sincerely. Those at the head of it can not fail to see that if unchecked he may provoke its destruction. Indeed, some of those in authority say he is not working for the association but against it—that the Trust incites him to do his work, with the express purpose of destroying and discrediting the association.

In proof they adduce the fact that the only depredators who as yet have been punished, a white man and a negro, serving penitentiary sentences for scraping plant beds, have confessed that they were hired to do the scraping by folk in Trust employ. Against that take the fact that with outrages running beyond a thousand, the perpetrators, who are bound to be known, go scot free. Hopkinsville is not the only town which has been raided and suffered burnings. Upon Thanksgiving night, 1906, Princeton, the capital of Caldwell County, was captured by masked men, who set fire to two big tobacco houses, and held the town in check until they were destroyed. Other factories and warehouses have been burned, or blown up, at Trenton, Elkton, Fredonia, and smaller villages. Barns have been burned, too, and the tobacco hanging in them pulled down and trampled. Tobacco beds have been scraped just as the plants were ready for setting out, live stock killed, young tobacco pulled up, threshing machines burned or blown up, sacked wheat burned, tobacco hogsheads rolled into rivers, or hacked open and the contents destroyed. Even this is not all; sleeping families have been shot up by yelling mobs, men whipt, and warned, either to join the Association or be more faithful to their Association pledges, or else—this more rarely—to leave the country, and leave quick.

Those who have suffered are either hill-billys or Association men suspected of being lukewarm in the faith. The provocation is that the hill-billys, the hill-billys only, stand between the Association and complete control of the situation. Moreover, they are a menace to it—a club in the Trust's hands for its destruction. Therefore, say the unreasoning, if they will not come in of themselves, they must be brought in. Whip them? Why not? By thus standing out against the general good they have forfeited all right to consideration.

This is not the Association's attitude, rather that of the heady, the turbulent, the tyrannical among its members. But it is undeniable that men who would not do such work, not even on pain of death, fail to condemn it explicitly when it is done under cover of darkness. Indeed, the Association faith is after a sort an obsession. No doubt there is a reason for the faith—things were sad and bad

when the Association came to better them. Poor folks working hard—tobacco raising spells hard work thruout—got less than thirty cents a day—and found themselves. Naturally, they are heart and soul for the thing which has helped them up from the slough of debt and despond. As naturally it makes them bitterly angry to see the hill-billys, who have refused to help in the great work, reap the biggest profit.



Hopkinsville has been reckoned thruout the fight a stronghold of the Trust—hence the attack. The money loss inflicted runs up to several hundred thousand dollars; the Governor sent troops and kept the community for some days under martial law. In that he was very wise. Earlier outrages had shown him something supine. He was then a man of ambitions. Now a Senator-elect he perhaps feels himself a man of fruitions. However that may be, he has done well. So has the Governor of Tennessee, whose offered rewards for night-riders aggregate four thousand dollars. Tennessee's tobacco counties have had the same sort of lawlessness, but not quite reaching the Kentucky degree.

Two months back there was promise and prophecy of peace thruout the tobacco region. The present trouble is a curious echo of the panic. The panic, of course, pretty well stopped advances on tobacco, and made hard lines for those who had no other way of raising money. Men who had pledged their crops to the Association had to wait the moving of the financial waters. Those outside could sell right off, get the money from the Trust, and go about jingling it in their pockets. So there was great temptation to quit the Association and sell independently. Somehow the night-riders got a notion that the panic was superinduced on purpose thus to break up their organization and the many similar ones among other sorts of farmers. There was but one remedy, a dreadful and drastic one—to drive out the Trust, root and branch, likewise the independent buyers allied to it. Then the hill-billys must perforce come into the Association—as, in turn, whoever wanted tobacco must come to it to buy.

They would come—because they could not help themselves. Tobacco controlled by the Association is export or shipping leaf. Foreign markets demand it—it is so thick and gummy and flavorous. Furthermore, in many countries — Italy, Spain, France and Austria-Hungary—the business of tobacco importation is a government monopoly, productive of revenue, the governments cannot do without. Even before the Trust came, the agents of these governments did much to depress prices. With no other available source of supply, they would have to pay what the Association pleased to ask—if only it could make itself supreme.

Faulty reasoning, perhaps—but convincing enough to men wanting to believe it. They are proving their faith by bitter works. What they do deserves consideration by the whole people. It is portentous of bitter work to come unless there are brought to pass different conditions. Night-riding is wholly, utterly, entirely indefensible—those who do it are enemies of the common weal—yet it is born of a deep, dumb conviction that, since the Trust either owns the law or is beyond its reach, the only recourse of the plain people is to be thus a law unto themselves. Beliefs are contagious. Should this one by any chance spread to even half the eighty-odd millions in these United States, the results might be such as would truly stagger humanity.

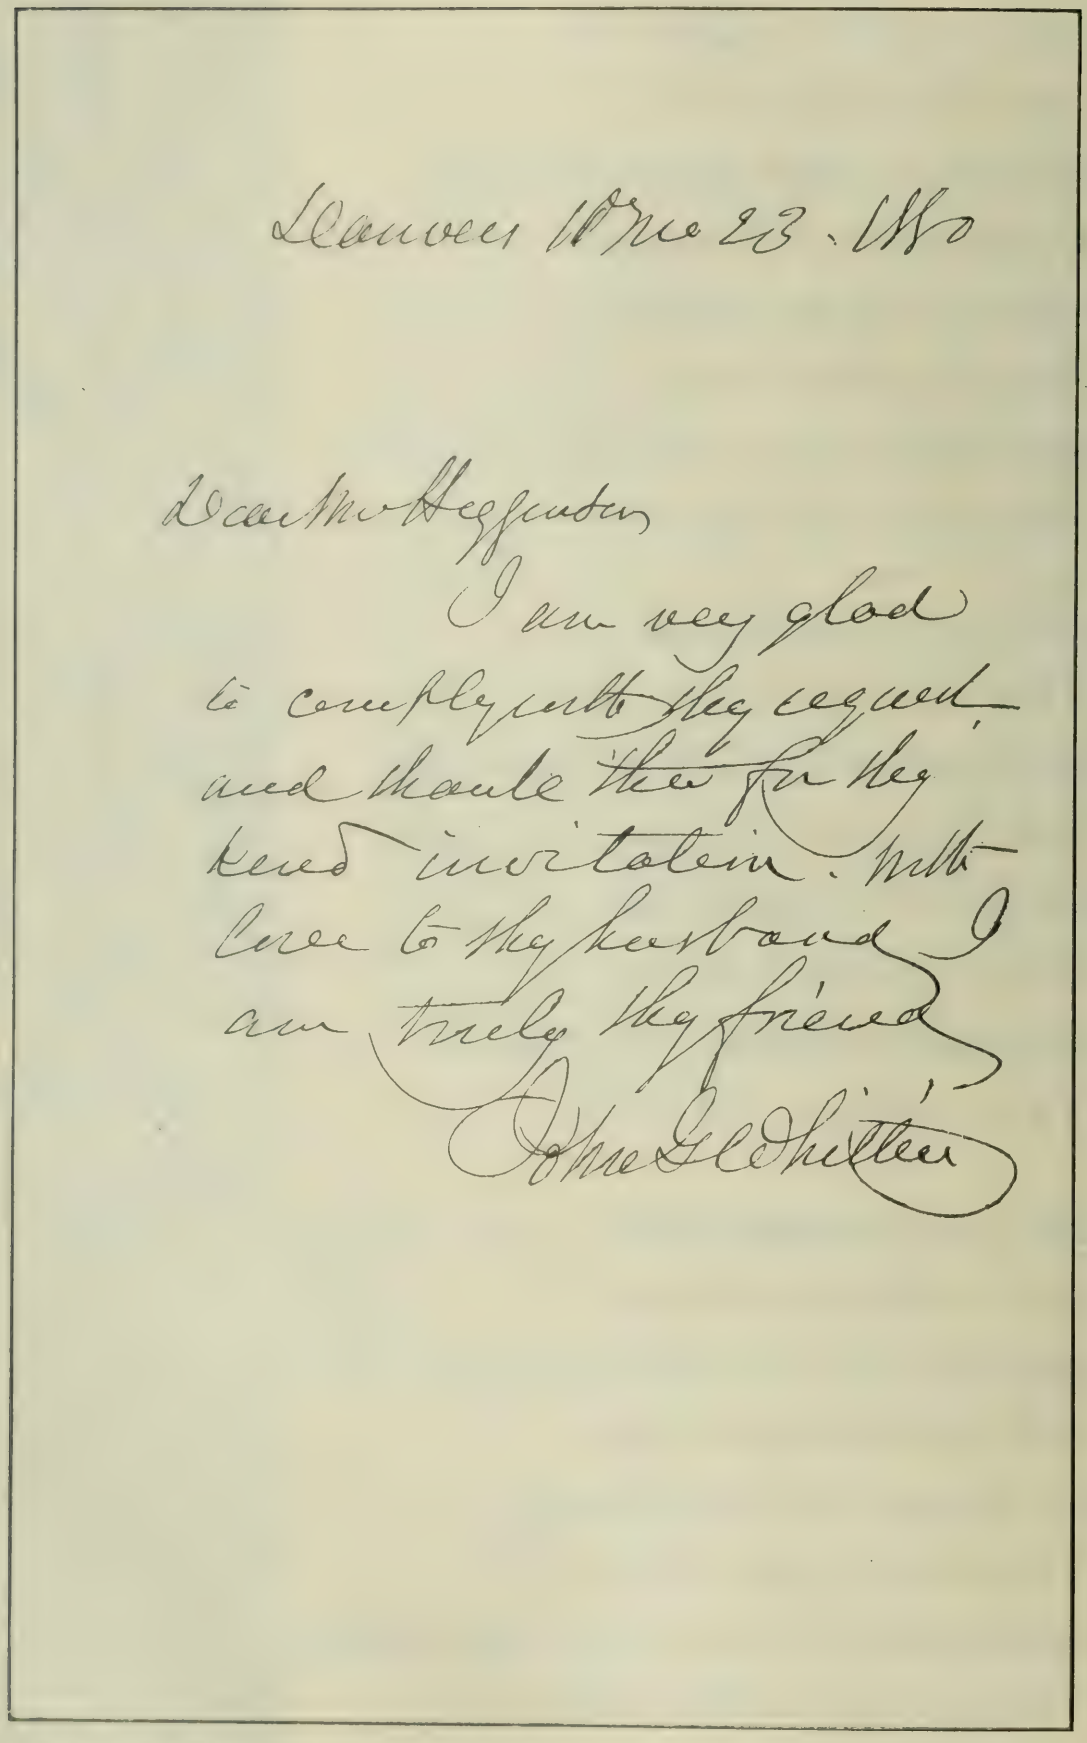
New York City.

'SEVENTY-FIVE

BY JOHN GREENLEAF WHITTIER

[The *Sunbeam*, a weekly political journal, published at Hartford, Conn., in its issue dated April 3d, 1841, contained the following poem of Whittier's, which has never been collected and which I have never seen elsewhere. I think these warlike verses were written by the Quaker poet many years before the date of publication given above; for nothing in their tone is to be found in what he wrote after the great change that came over his spirit when he was about twenty-five years of age. All references to warlike scenes that occur in his poems written after 1832 are tempered with deprecation of war. It is curious to compare this poem with one upon the same theme, written in 1875 for a centennial occasion, entitled "Lexington, 1775." My impression is that these lines were written in 1825, on the occasion of the fiftieth anniversary of the battle of Bunker Hill, but like the eulogy of Alexander I., published in "The Independent." December, 1905, and like his "Lafayette," issued in 1906 on a leaflet, he withheld them from publication. His "Song of the Vermonters" was a boyish effervescence to which he did not attach his name, and which he did not acknowledge till late in life. I cannot believe he sent the following lines to the *Sunbeam* in 1841, but think it likely that while editing a Hartford paper in 1830 he gave some friend a copy of them, and that they were published without his consent, and probably without his knowledge.

SAMUEL T. PICKARD.]



Amesbury, Mass.

IT broke on the hush of morn—
It startled the dull midnight;
Like the stirring peal of a battle-horn,
It summoned them forth to the fight.
It rose o'er the swelling hill,
By the meadows green it was heard,
Calling out for the strength of the freeman's will
And the might of the freeman's sword!

The rivers heard the noise—
The valleys rung it out;
And every heart leaped high at the voice
Of that thrilling battle-shout!
They sprang from the bridal bed,
From the pallet of labor's rest,
And they hurried away to the field of the dead,
Like a tardy marriage-guest.

They left the plow in the corn,
They left the steer in the yoke;
And away from mother and child that morn,
And the maiden's first kiss, they broke!
In the shower of the deadly shot,
In the lurid van of the war,
Sternly they stood, but they answered not
To the hirelings' wild hurrah.

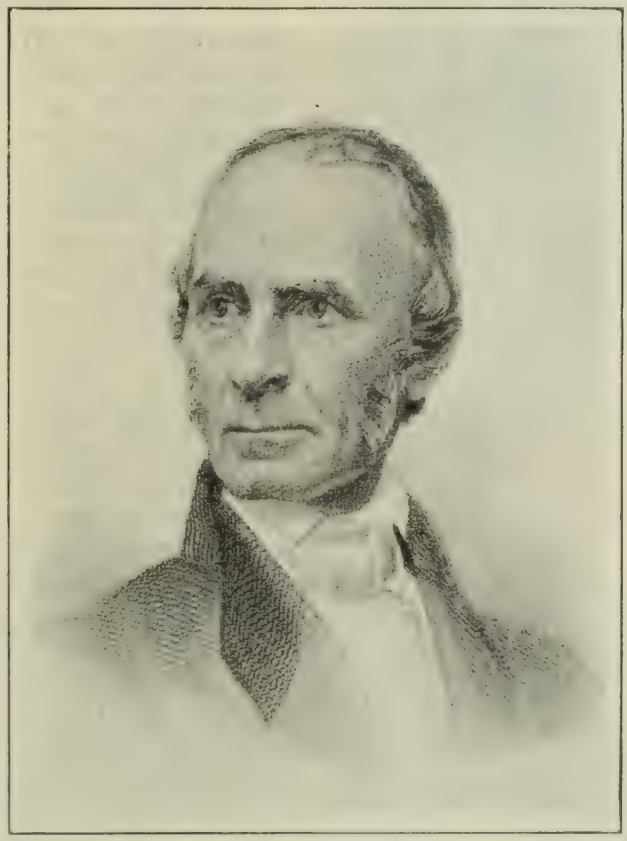
But still as the brooding storm,
Ere it lashes ocean to foam,
The strength of the free was in every arm,
And every heart on its home.
Of their pleasant homes they thought—
They prayed to their fathers' God—
And forward they went till their dear blood bought
The broad free land they trod!

Amesbury 10th mo 23. 1880

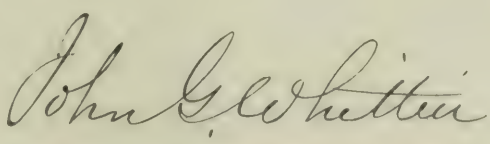
Dear Mrs Higginson,

I am very glad
to compliment thy request,
and thank thee for thy
kind invitation. With
love to thy husband I
am truly thy friend

John G. Whittier



FACSIMILE AUTOGRAPH LETTER OF WHITTIER TO COLONEL HIGGINSON.

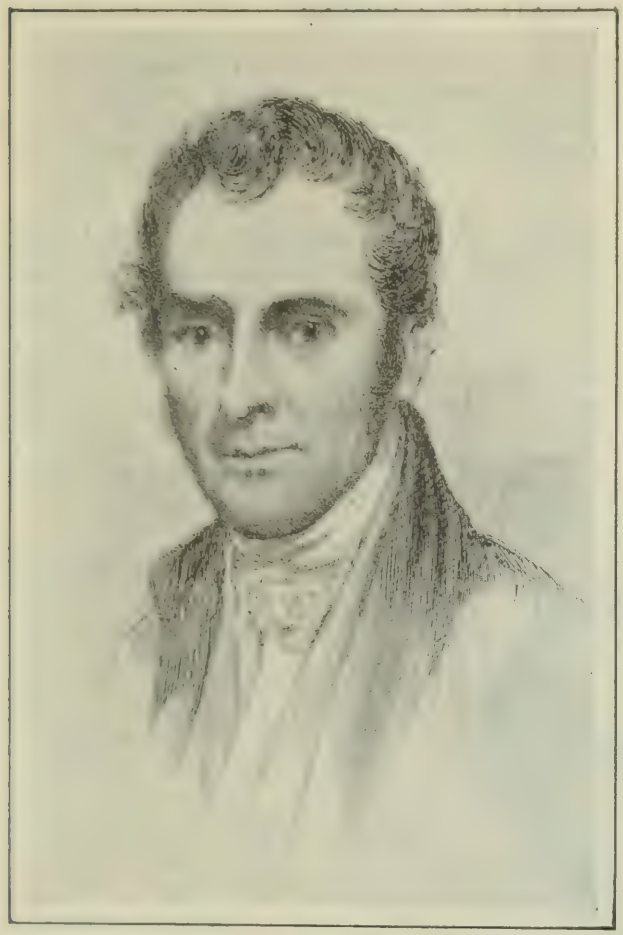


John Greenleaf Whittier

BY THOMAS WENTWORTH HIGGINSON

[No other living friend of the poet Whittier is so competent to give us a picture of him as is Colonel Higginson, whom we would have long remain with us to connect our generation with that of Longfellow and Holmes and Lowell and the Quaker poet and reformer. This week is the one hundredth anniversary of Whittier's birth, and we are glad to publish also an early poem by Whittier hitherto unrecognized as his.—EDITOR.]

THE birth of John Greenleaf Whittier took place on December 17, 1807, and its centennial anniversary is upon us this year. It seems a curious fact that Whittier's birthday and Longfellow's should come so near together; and it is also a striking fact that the celebration of their memory should fall mainly in the cities, in one case, and in country towns, in the other. The two poets may in a manner be classed among those human extremes which proverbially meet. Their old family homesteads were within five miles of one another and their maturer lives were passed within thirty-five miles. Their habits of life were diametrically opposite in some respects, while very similar in others. Each in his own way was both reticent and companionable. At dinner parties, to which the authors of that day were addicted, these two might very possibly sit side by side and each very likely be quite silent, tho each of them relished and remembered every bright saying that came from elsewhere. With Lowell at one end of the table and Holmes at the other, no one else was really needed for the conversation. Yet when the talk finally took a serious tone, either Whittier or Longfellow could do his part. Thus Bayard Taylor wrote to a friend (on July 22d, 1850):



After an engraving on steel by H. W. Smith from a photograph by Hawes.

"Friday morning, early, Lowell and I started for Amesbury, which we reached in a terrible north-easter. What a capital time we had with Whittier in his nook of a study with the rain pouring on the roof and the wind howling at the door."

Not less lively, I am sure, was the conversation when the two Cary sisters, Alice and Phœbe, coming from Ohio, descended during Whittier's abscence upon his dear old mother, and being told that he was in Boston announced with what was then called "Western frankness," that it was no matter; they would cheerfully come in and stay over night in the hope of meeting him the next day, which is what actually happened.

He, at another period, went thru two sessions of the Massachusetts Legislature without once getting on his feet, yet

past or defeated measures by his quiet power. His type of character was recognized by strangers, if not always by

WHITTIER IN YOUTH.
From a portrait owned by Colonel Higginson.

neighbors; and Edmund Gosse, the well-known English author, says of him:

"I think it would be difficult to form in the imagination a figure more appropriate to Whittier's writings than Whittier himself proved to be in the flesh."

It is very unfortunate that there remains no portrait of him in his early youth, when he was a singularly handsome man. I find a description of him by myself, written many years ago and giving my first sight of him in these words:

"He was a very handsome man, perfectly erect, well formed, with jet black hair, rich brunet complexion and brilliant eyes. He and Webster had eyes somewhat alike, tho Webster's head was much larger than his."

Lowell's early friend Miller McKim wrote thus of Whittier a little later:

"He wore a dark frockcoat with standing collar, which with his thin hair, dark and sometimes flashing eyes and black whiskers, not large, but noticeable in those unhirsute days, gave him, to my then unpracticed eye, quite as much of a military as of a Quaker aspect."

Better than either of these is the terse and unsurpassable description given by Robert S. Rantoul, of Salem, who speaks of Whittier as having even in later life "the reticence and presence of an Arab chief with the eye of an eagle."

The life of Whittier in Amesbury was essentially that of the typical village poet among the village people. He was their pride and their leader, taking it as simply as any one could; was careful and abstemious, reticent rather than exuberant in manner, and met them wholly on matters of every day. He could sit on a barrel and talk politics with the people who came to the village store, but he did not read them his verses. I was once expressing regret for his ill health when talking with one of the leading citizens of Amesbury, whereupon my companion could not agree with me; he thought that Whittier's ill health had helped him in one way, for it had kept him from engaging in business, and had led him to writing poetry instead. He himself, having enjoyed good health, had written no poems. He spoke of poetry as if it were a second choice, but still a fairly good investment; and suggested the Edinburgh citizen who thought that Sir Walter Scott might have been "sic a respectable mon" had he stuck to his original trade of law advocate.

Nothing is more vivid to me, after more than fifty years of memory, than my occasional visits to the house of Whittier when I, too, lived on the Merrimac. His placid mother presided with few words at the tea-table whose cloth and napkins rivaled her soul in whiteness, and with her was Whittier's brilliant sister, Lizzie, so unlike her brother in temperament that they seemed, as it were, to complete each other's deficiencies and make up one well-balanced soul. She was as plain in feature as he was handsome and her great dark eyes were much more luminous and expressive than his, always flashing with fun or soft with emotion, and often changing with lightning rapidity from one expression to the other. Her nose was large and aquiline, while his face was almost Grecian and she had odd motions of the head so that her glances seemed shot at you like javelins from each side of a

prominent barrier. Her complexion was sallow, not rich brunet like his; and while he was reticent, her gay raillery was unceasing and was enjoyed as much by him as by anybody. They had a delightful old-fashioned parlor fire which a lady who had been long a neighbor thus described:

"That fire was a perpetual source of pleasure and annoyance to us all. It was an old-fashioned Franklin stove, that smoked on the slightest provocation, and scattered the ashes over the hearth. At the same time it had a habit of throwing out the most charming gleams and shadows, especially if driftwood was being burned. Mr. Whittier was very jealous of any one else tending or poking the fire. Often I have unconsciously taken the tongs to touch up a brand, when his hand would stay mine, and he would say, 'Thee must not touch that, it is just right,' and perhaps the next minute he would have the tongs and do just what I had attempted. I have frequently gone in at twilight and found him lying on the lounge, watching the flitting shadows, and repeating aloud from some favorite author, generally Scott or Burns. His mood and conversation at such times were particularly delightful. The beautiful poem, 'Burning Driftwood,' was doubtless inspired by such experiences."

Whittier always regarded it as a misfortune and, indeed, the only disadvantage resulting from his early poverty, that his first books were published at great disadvantage, thus preserving the class of juvenile poems which Longfellow wrote almost as early, but was better able to drop. Whittier's first volume, for instance, called "The Legends of New England," appeared when he had been five years before the public as a writer and had printed more than one hundred poems in various periodicals, only twenty of which are now to be found in any final edition of his works. Whenever, in later life, he obtained possession of a copy of this book, he destroyed it, sometimes paying five dollars for it. He said he looked it thru and "it seemed like somebody else." There was, as Mr. Pickard justly states, "a sudden and even startling change" in the character of his poetry when he made up his mind to champion the cause of the slave. Even that, however, brought him no safety from too zealous friends. While he was in New York in 1837, Isaac Knapp of Boston, who published *The Liberator,* issued without consulting him a volume of more than a hundred pages, entitled "Poems written during the Progress of the Abolition Question in the United States between the years 1830 and 1838. By John G. Whittier." This was the first edition of his collected poems. Even in this he confesses that there were pieces which he would willingly have let die. He tells us, himself, in the introduction that "many of these were written with no expectation that they would survive the occasions which called them forth."

WHITTIER'S BIRTHPLACE, NEAR HAVERHILL, MASS.

They were "protests" and "trumpet-calls," he says, and he quoted Thomas Jefferson, who, in his terrible denunciation of slavery, in the "Notes on Virginia" says, "It is impossible to be temperate and pursue the subject of Slavery."

The climax of Whittier's popular fame was found, of course, as unmistakably in "Snow-Bound," as was that of Longfellow in "Evangeline," each being based distinctively on an American theme, but Whittier's having the charm of personal association with the locality. He wrote to his publisher on August 28, 1865,

"I am writing a poem 'Snow-Bound, a Winter Idyl,' a homely picture of old New England homes. If I ever finish, I hope and trust it will be good."

He wrote the poem largely as a memorial of his mother and his sister; and as a result, Mr. Carpenter, one of his biographers, says of him truly that:

"Such was his art, there is no other family in the world whose members are so widely known among the people who speak the English tongue."

Compared with this, the unexpected profit of ten thousand dollars on the very first edition was to him trivial and perhaps, conveyed a pang because of the departure of those for whose sake the increased worldly fortune would have brought some especial value. It needs no added praise and I turn by preference to his praises given to others, in this case still of Longfellow.

I know of no place where Whittier fulfils with more delicate precision this same candor in his spiritual message to the world than in his review of "Evangeline," which fell under my notice during our recent Longfellow jubilee. Whittier reads the spirit of the poem so truly that before he reaches the end of it he avows himself quite reconciled to the author's forbearance, defends him against those who had demanded of him a sterner denunciation of wrong, and pronounces the poem itself rather a "psalm of love and forgiveness." He adds:

"The gentleness and peace of Christian meekness and forbearance breathe through it. Not a word of censure is directly applied to the marauding workers of the mighty sorrow which it describes just as it would a calamity from the elements,—a visitation of God. The reader, however, connot fail to award justice to the wrongdoers."

Yet in spite of all this praise, this friendly critic cannot help saying that the outburst of the stout Basil in the church at Grand Pré was a great relief to the whole affair; and he closes the criticism with an emphatic reproof of the early New England spirit of persecution, such reproof as might well be expected from the man who kept a John Brown memorial hanging on his wall.

Whittier wrote in later life an autobiographical letter, which he afterward had printed privately, for use in correspondence, and thus sums up his self-analysis in the closing paragraphs:

"I have been a member of the Society of Friends by birthright, and by a settled conviction of the truth of its principles and the importance of its testimonies; while, at the same time, I have a kind feeling towards all who are seeking, in different ways from mine, to serve God and benefit their fellow-men.

"Neither of my sisters are living. My dear mother, to whom I owe much every way, died in 1858. My brother is still living, in the city of Boston. . . .

"My health was never robust; I inherited from both my parents a sensitive, nervous temperament; and one of my earliest recollections is of pain in the head, from which I have suffered all my life. For many years I have not been able to read or write for more than half an hour at a time; often not so long. Of late, my hearing has been defective. But in many ways I have been blest far beyond my deserving; and, grateful to the Divine Providence, I tranquilly await the close of a life which has been longer, and on the whole happier, than I had reason to expect; altho far different from that which I dreamed of in youth. My experience confirms the words of old time, that 'it is not in man who walketh to direct his steps.' Claiming no exemption from the sins and follies of our common humanity, I dare not complain of their inevitable penalties."

Whittier undoubtedly divides with Longfellow, among American poets, the leading applause of the English-speaking world; an achievement relatively greater in his case than in Longfellow's, from the fact that he never quitted his own country in person. The reason which he once gave to me for this lay in the fact that while he always took the greatest interest in all books of travel, yet each filled his mind so vividly that he dropped the subject of that country and went on to interest himself in some other country. Somewhere in some undescribed region he in-

terests himself now. It takes more than a hundred years after a man's death to judge whether his fame is to be permanent. Even if he gains it, how limited it is at the best! Strictly speaking, there is no literary fame worth envying, save Shakespeare's; and Shakespeare's amounts to this, that Addison wrote "An Account of the Greatest English Poets," in which Shakespeare's name did not appear, and that, of the people one meets in the streets of his own country, the majority may not even be well acquainted with that name. It was well said by the racy old English poet, Daniel,

"How many thousand never heard the name
Of Sidney or of Spenser, and their books;
And yet brave fellows, and presume of fame,
And think to bear down all the world with looks."

Happy is that author, if such there be, who, altho his renown be ever so small in his lifetime, does not greatly concern himself about it, being so occupied with some friendly thought or hope for mankind that his own renown is a matter of slight importance. It is for this that Whittier always expressed gratitude to the anti-slavery agitation, because it had kept him free from the narrowness of a merely literary ambition. He would have said with that high minded French radical, Proudhon, "Thou God, who hast placed in my heart the sentiment of justice before my reason comprehended it, hear my ardent prayer. . . . May my memory perish, if humanity may but be free!" This, and nothing less than this, might stand as Whittier's spiritual message.

CAMBRIDGE, MASS.

Men We Are Watching

BY A WASHINGTON JOURNALIST

SENATOR THOMAS P. GORE, OF OKLAHOMA.

THE advent of the Sixtieth Congress has called more new men to the Senate than often come down all at once upon that non-expiring fold. There are other peculiar features: an unusually large proportion are men who have already gained more or less national repute—men who have already been watched and on whom the eye of curiosity at least is still fixt, wondering how they will make out in the sedately sacred chamber. Almost all of them have come loaded to the muzzle with one hobby or another, and some of them propose to ride rough shod—or unshod—right down the center aisle of the Chamber. Some of the new ones will be less entertaining and less well watched before the session is over, but among those who promise to grow, rapidly, in public interest and attention is Thomas P. Gore, the blind Senator from the new State of Oklahoma.

Simply to pass him on the street, without knowing him, would instantly suggest that his is an intensely interesting personality. It is not at all due to the fact that he is totally blind, though it surely makes more remarkable the success and triumph he has already attained. He is rather tall and powerfully built. He stands straighter than the proverbial arrow, for his broad shoulders incline backward. There is no appearance about him of cautiously feeling his way. He walks and acts and looks and talks like a man who has established an irrefragable confidence in himself.

He is the youngest member of the Senate and was present to take the oath at the opening of the session; but he came by Governor's appointment, as the new State Legislature only met the middle of December. When the question of credentials came up, the Senate committee discovered that the Constitution conferred the appointing power on the Governor when vacancies occurred between sessions of the Legislature. This being the first session there was no "between," and Gore and his colleague, Senator Owen, were told that they must wait their election by the Legislature. It was not much of a wait, for they were sure of election December 7th, but it was hard on Gore because December 2nd, when he wanted to take the Senate oath, he was only thirty-six, while the seventh, when the Legislature elects, is also his thirty-seventh birthday. An

SENATOR GORE.
The Blind Senator of Oklahoma.

inch, if it's on a man's nose, makes a difference. Senator Burrows, chairman of the Committee on Elections, is a stickler for the rites, but also a man who desperately hates to disappoint, and to mend matters if he could, he offered to present a bill to the Senate postponing Gore's birthday.

Senator Gore is well up in the class of men whom it is distinctly pleasant to meet. He likes to be met. His strong hand gives you the real Southern grip. The face lights up with a pleasant smile and an exceptionally musical voice convinces you at the start that you are *persona grata* until you prove yourself unworthy.

The smooth-shaven face is decidedly classic. The head is large, covered with light brown hair, well shaped for the vigorous machinery it contains and the material it turns out.

Gore comes to the Senate with the reputation of being one of the leading orators of the South. There is nothing ostentatious about him, but he has brought his shore of hobbies, which he is ready to ventilate at the earliest opportunity, and he is among a very few of the new ones who may hope to be listened to, for a time, by something better than empty armchairs. The hobby which is nearest his heart seems to be the removal of the restriction on the sale of Indian lands, but parenthetically he told me, the other day, that since he had been in Washington he had discovered another pressing need which he hoped to get Congress to rectify. Said he: "We positively must have more hours in the

HON. JOHN BARRETT.
Director Bureau of American Republics.

day and more days in the week. I cannot possibly get through all that I want to accomplish."

Senator Gore has the merry heart that doeth good like a medicine, and goodness knows there's need of it where the togas float and every one takes himself so frightfully seriously. His lips are always ready with a quiet smile and his keen, forceful individuality and quick mental qualities will keep him among the striking personalities of the Senate.

SENATOR CHARLES A. CULBERSON.

The searchlight of the Sixtieth Congress has brought out some old ones as well as new ones—Culberson, of Texas, among them, who slid up a peg or two to keep the Texas delegation on the line when Bailey got tangled up in that home disruption, last session, and slipt down a bit.

The Democrats have made Culberson Minority Leader, and many a time will come, this session, when the minority can make itself something to be reckoned with, if it is well led and follows well. The question is, can Culberson do it and will the rest be led?

Culberson is colossal on infinitesimal details. He is great on minutiæ. Possibly he is too prone to turn on the microscope—there are some who hint it. Probably that was all the President meant when he called Culberson a rather inferior name, some while ago. But Culberson took it to heart and there are those who think they see indications, now and then, that he has not yet forgotten. Neither has he reformed. He has breadth, of course, and depth, of course, and exceptionally keen political perception. Possibly he will make none the less effective leader because he loves to use the microscope. He has started in aggressively enough to please the most anxious.

SENATOR CULBERSON.

As a man, in the abstract, Culberson is a combination. It is easy for impressions to lead one astray about him. He stands straight up and down and carries his head with mathematical deference to base and equilibrium. It is not impossible that to some, at first glance, he suggests a rather slim, rather wiry, not in the least overgrown New England clergyman from the rural districts. He uses his New England eyes right at you, works his lips with that proverbial puckered precision and manipulates things with his hands in a way to bear out the impression. But he is Southern to the bone—born in Alabama fifty-two years ago—and has lived in Texas since he was one year old. He is a lawyer if he is anything—a lawyer and son of a lawyer. He was Attorney-General and Governor of Texas in the course of his climb to the Senate to which he was elected with only three opposing votes and where he has been since 1899. His smooth, shaven face has something of a Greek cast about it and his slow-coming words and quick-coming motions are carefully constrained by unobtrusive dignity. His abundant crop of curling gray hair and crinkly brows set off the intensely clear and active eyes in a way suggesting merriment, jovial cordiality. Possibly out from the somber shadow of the toga, Culberson lives up to indications. It has never been my fortune to see him at such times. To me it is always a new surprise and more or less of a disappointment to continually refind him so far the other way. He is rather proud of the fact that in both physical and mental makeup there are, beyond question, incidents recalling memories of Thomas Jefferson.

Culberson is a graceful and fearless orator. He has a thoro knowledge of the minute details of parliamentary

tactics, and of the vital topics of the day, but he is wofully lacking in personal magnetism and consideration. It will be uprightness and downrightness, acumen, not tact, which win out for him if he wins. But from whatever partisan viewpoint one watches, he feels more curious than sympathetic interest, as the natural reflex of the man who has assumed the difficult task which taxed his predecessors, Blackburn and Gorman.

THE DIRECTOR OF THE BUREAU OF AMERICAN REPUBLICS.

There is no man in public life, to-day, holding a position demanding more vital and able energy, or one so pregnant with possibilities of benefit to the entire hemisphere, yet who is so utterly out of the limelight of popular appreciation and applause as John Barrett, Director of the International Bureau of American Republics.

We all watched Barrett when he went as American Minister to Siam—the youngest man who ever represented the country in that high diplomatic office—and we saw him make one of the most effective ministers America ever sent anywhere. Then we saw him thru his difficult task as Minister to Argentina, to Colombia and to Panama, smoothing the roughness which attended the purchase of the canal zone. Everyone knew that the Bureau of American Republics was in good hands when Barrett was appointed Director. Everyone indorsed Carnegie's confidence when he expressed it in the gift of $750,000 for the construction of the beautiful white palace of peace which is now under way, in Washington, as the future home of the Bureau. But Barrett himself was practically swallowed up in the tremendous things he was accomplishing, till the Peace Congress of the Central American Republics, now in session in Washington, under the protection of the Bureau, again called public attention to him.

As a matter of fact, there can hardly be a time when John Barrett will be of greater, more vital importance to the hemisphere than now; or such an influence in making the history of the American Continent. He is at least in the line for enduring fame.

The foundation of the Bureau is of recent date, but it has become the clearing house of commerce, diplomacy and public and private relations, bringing the American Republics into much better understanding and closer touch. The Governing Board consists of the diplomatic representatives of the various American nations stationed in Washington, and is supported by appropriations from each country. Barrett came to the directorship through a past which perfectly portrays the man. He's a New Englander by birth—of the stanch old Barrett stock—and worked his own way through school and college, just as he has worked his own way ever since, and worked it well. He was eating luncheon with one hand, signing papers with the other and talking to half a dozen people between bites, the last time I saw him. Some friends from the West called, to whom he was anxious to show some courtesy, and he asked them to dinner. They accepted and he said: "To-night, at the New Willard, at ten o'clock." To a gasp on their part he smiled and added: "I hope it isn't too late. Why, I shall have to come back here and work for an hour or two after that."

With your first glance on meeting John Barrett, comes the conviction that you are facing a man who knows, who can and who will. He is tall and broad and strong. There's something gigantic about him, physically and atmospherically. He has dark hair and dark eyes of the quick, piercing kind, with a big, broad forehead from which the hair has fled. His skin is dark. His face is smooth-shaven and as strong as the rest of him. From head to heel he bristles with energy. Everything about him suggests intense dynamic force, betrays the secret of his remarkable accomplishments and infects all those who come in contact with him. You go from a chat with John Barrett instinctively looking about for some mountain which you can pluck up by the roots and cast into the sea. He is strenuous.

WASHINGTON, D. C.

The Independent

A Weekly Magazine. Entered at the New York Post Office as Second-Class Mail Matter.
Publisher, Clarence W. Bowen
Owner, The Estate of Henry C. Bowen
130 Fulton Street, New York
TERMS OF SUBSCRIPTION, PAYABLE IN ADVANCE
One Year, $2.00 Single Copies, 10 Cents

Single Copies over six months old twenty-five cents. Postage to any Foreign Country in the Postal Union, $1.75 a year extra. To Canada $1.00 extra.
Order for the change of an address should be received one week before change is to take effect; the old as well as the new address should be given.
Persons desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, in that case, hold ourselves responsible for their return. Authors should preserve a copy.

The Nobel Prizemen

On December 10th, the anniversary of the birth of Alfred Nobel, there was assembled in the Stockholm Academy of Sciences an American, a German, a Frenchman and an Englishman, the four men that had been selected in accordance with his will as the greatest benefactors of mankind by their achievements in physics, chemistry, medicine and literature. At the same time were awarded by the Premier of Norway, at Christiania—for the separation of the brother peoples split the Nobel Foundation—the prize for the promotion of peace, divided between a Frenchman and an Italian. Most of the names had been previously announced, and we have discussed their work in the preceding issues of The Independent, but the apparently authoritative telegram from Stockholm three weeks ago that the chemistry prize was to be given to Sir William Crookes proves to have been erroneous, for that prize was awarded to Professor Eduard Büchner, of the Agricultural College of Berlin.

Professor Büchner is distinguished for having a few years ago led a raid into the disputed borderland of the micro-organism and captured for chemistry a large territory which Pasteur had annexed to biology a quarter century before. Pasteur showed that the decomposition of animal and vegetable matter was due to micro-organisms, bacteria and such low forms of fungi as yeast and mold. If milk or fruit is freed from these by "pasteurizing" or heating to a certain temperature and protected from them by sealing in cans, it will keep indefinitely. It was natural to think that these transformations were effected directly by the organism; that the yeast plant, for example, used sugar as its food and excreted it as alcohol and carbon dioxid. But Büchner proved that the fermentation was due to a non-living chemical compound that the yeast plant excretes, and he prepared from brewers' yeast a cell-free juice which would carry on fermentation as well as the living yeast. According to his latest view there are two of these substances concerned in the operation; one, "zymase," first splitting the sugar into lactic acid, and the other, "lacticidase," splitting this further into alcohol and carbon dioxid. The further transformation of alcohol into acetic acid as in the manufacture of vinegar, is likewise not effected by the direct vital processes of the *bacterium aceti,* but by the chemical action of one of these peculiar substances. They are known in general as "enzymes," and are remarkable for their ability to do a great deal of business on very small capital. A minute quantity of an enzyme will decompose a large amount of other substances and remain itself in the end unchanged and undiminished, just as a dollar bill may settle an unlimited number of accounts. The enzymes are very numerous and play a most important rôle in the chemical processes of life and death in the animal and vegetable kingdoms. Tho they are organic compounds of very complex composition their action may often be imitated in the laboratory by the use of inorganic substances such as acid and alkalies, or even finely divided metals such at platinum black.

To Dr. Laveran, who received the Nobel prize for medicine and whose work is described by Dr. Walsh on another page, we owe an especial debt of gratitude. If it had not been for him and his successors our boys in Panama would now be dying as rapidly as the French did twenty years ago, and we should have to fill their ranks by conscription.

That the United States has never before received a Nobel prize in science, that for all our fine new laboratories and

research endowments we had produced no man thought worthy to be included among the thirty most distinguished investigators of the world, has been something of a humiliation. There will be few to dispute the right of Professor Michelson, of the University of Chicago, to be the first on that roll of honor. As Lord Rayleigh, president of the Royal Society, said on November 30th, in awarding to him the Copley medal, he has had the courage to attempt what no one else had dared, and his success has been equal to his courage. We gave some account of his work in the determination of the velocity of light in our issue of December 5th. In personality Professor Michelson is quite the opposite of the traditional conception of the scholar—that of an ill-dressed and absent-minded recluse. He is tall and has something of a military bearing, from his training and service in our navy. In the afternoons he may be seen leaving the Ryerson laboratory for the tennis court, where he demonstrates to the students that gather along the side lines that the laws of moving bodies are not so simple as they seem in his blackboard diagrams. Any one who has stood in the opposite court knows that his balls do not travel with uniform velocity in straight lines, and that when they bound the angles of incidence and reflection are never equal, and the path of the ball does not lie in any plane whatsoever.

The awarding of the peace prize is evidently a perplexity to the committee of the Norwegian Storthing that has it in charge. Last year the conspicuous part played by President Roosevelt in bringing about the Peace of Portsmouth made his selection practically inevitable, but usually the prize has been given to the officers of the various national societies for the promotion of internationalism. This year the prize is divided between Italy and France. Ernesto Teodoro Moneta receives half of the $38,000 as a leader of the Italian peace movement. He is chairman of the Lombard Peace Union, and in 1906 presided over the Fifteenth Universal Peace Conference, held at Milan. "Moneta the Good," as he is called by his fellow countrymen, is now seventy-one years old, and much beloved on account of his services in the cause of Italian unity. The other half of the peace prize goes to Louis Renault, of France, Professor of Law in the University of Paris. He was born at Autun in 1843, and educated at the School of Law in Paris. He has been consulting legal expert of the Ministry of Foreign Affairs since 1890 and a member of the Permanent Court of Arbitration of The Hague since 1900. He was one of the delegates of the French Government at both of the Hague Peace Conferences and of the conference held in 1906 for the revision of the Geneva Convention. He is a member of the French Institute, and was in 1894 elected president of the Institute of International Law. He has written a great deal upon international law and prepared a compendium of commercial law and a collection of the "Treaties of the Twentieth Century." It was said at The Hague last summer that the Conference was really managed by three men—Martens of Russia, Bieberstein of Germany, and Renault of France.

There are still those among us who will be startled to hear that Rudyard Kipling has been chosen as the foremost idealist among the writers of English. To them he has been a realist of coarsest type, catching popular fancy for a time by tricks of style such as repeating "but that is another story" and making a sentence out of a relative clause. Yet no other living author has done so much to show to the world the real idealism which even in this assumedly prosaic and sordid age is the motive power of our day's work. He alone has been capable of mastering the machine in poetry as we have mastered it in modern life. "The Miracles" and "McAndrews's Hymn" show what may be done with this new and crude material by one courageous enough to handle it. He has preached in verse and story the gospel of service, of obedience and of stubborn fulfillment of duty with the spirit and often the phraseology of the Hebrew prophets. Patriotism is still a high and inspiring ideal; imperialism of the Kipling kind is a still grander one, to be supplanted only by the poet of internationalism when he comes. Until then

such words as these are good to listen to:

"Fair is our lot—O goodly is our heritage!
(Humble ye, my people, and be fearful in your mirth!)
For the Lord our God Most High,
He hath made the deep as dry.
He hath smote for us a pathway to the ends of all the Earth!

"Keep ye the Law—be swift in all obedience.
Clear the land of evil, drive the road and bridge the ford.
Make ye sure to each his own
That he reap what he hath sown:
By the peace among Our peoples let men know we serve the Lord."

President Roosevelt's Withdrawal

Our readers know that we have never believed that President Roosevelt would go back on his last election pledge and allow himself to seek or accept a nomination for a third term. He said then that he would not, that he regarded the three and a half years of his service as his first term, and that at the end of this second term he would withdraw for his successor. That was a reasonable and right interpretation of the rule of only two successive terms which has held from the days of George Washington, a rule right in itself, whatever Mexico has done. To have broken his pledge and sought or accepted the nomination for a third term would have been a violation of faith, of his own faith, and of the faith he owed to other possible candidates and to the people. It would have been a most dangerous precedent, which in times of public excitement might have had perilous results; for, while we are in no danger of a dictator or a king, yet we are not quite free from the danger that such a following might be secured or such a machine created that the evils of royalty might possibly accrue. But Mr. Roosevelt was not the man to break his word.

Why, then, did they not believe him? The great body of the people did believe him. It was the sycophants that hang on office and favor who thought they might hold their positions or secure favor that were very ready to believe that they would please him by shouting for his renomination. That is one of the bad results of our system of Presidential appointments to office, that those thus appointed are likely to feel that they serve not the people, but the man who appointed them. They must fawn on him and lengthen his term of service.

Then there are others, more in number, who are so pleased with the President's honesty and vigor in conducting his campaign against "predatory wealth," that they will trust him and no other man, and would have him and nobody else. It is not strange that they felt so, but that was no reason why they should attempt to force the nomination upon him against his will and pledge. He is not the only trustworthy and able man in the country or in the party. Were they to succeed in such an effort it would be only to make him chargeable in the minds of half our people with hypocrisy and perfidy, and their conduct in this matter has been both imprudent and reprehensible. It has compelled the President to repeat his pledge, when the repetition ought not to have been needed.

Now, what next? Who are the available or probable Republican candidates?

The country expects Mr. Bryan to be the next Democratic candidate, but it does not expect him to be elected. Because there is so little chance of Democratic success, there is no rush of Democratic candidates. The candidates that might be are willing to allow Mr. Bryan to suffer the defeat to which he is already inured. But there is and will be no dearth of aspirants for the Republican nomination.

Secretary Taft stands first in the line. Practically he has been nominated by the President, who regards him as the true exponent of his policies. This is unusual, and to some extent the fact that he has been presented as representing Mr. Roosevelt is not to his advantage. It is known that he would have preferred a place on the bench of the Supreme Court, but the President has persuaded him to look for honors in the Executive department of our Government. That he would make a most excellent President no one need doubt. He has ability, activity, intelligence, experience and the highest purpose. He knows, as no other man knows, some of our most difficult problems. He has the widest outlook, and his management of our colonial possessions, whether in Porto Rico or Panama or the Philip-

pines, has been both prudent and generous. He believes in men, even men of another race, and in treating them with justice, as those who can be expected to claim and deserve the full rights of self-government. President Roosevelt is charged with mercurial and unconsidered judgment. That has never been charged against Mr. Taft.

Mr. Taft's full and varied record will bring him enemies. At present the negro vote, which is important in some Northern States, is turned against him on account of his relation to the Brownsville affair. They do not remember that in the absence of the President he withheld for a time the order dismissing the soldiers, waiting for further evidence of their guilt. Nor do they remember that as a member of the Cabinet he could do nothing else than to carry out the order, which was that of the President, and not his own. We believe that should Mr. Taft be nominated next June, it will not be difficult for him, after withdrawing from the Cabinet, to make clear his position in this matter and secure and deserve the vote of those who now are offended on this account.

Perhaps more difficult will it be to persuade a section of the members of the labor unions to accept his nomination. The fact that so many of them naturally belong to the Democratic or Socialist party makes this of less importance, and we believe that it will not be, as it ought not to be, difficult to make those who regret his decisions while on the bench of two cases in which labor unionism was involved see that it was his business to interpret the law as it existed, and not consider his own opinions, or those of any one else, as to what the law ought to be. His record in the Cabinet has been such as to prove that he is not the advocate of wealth as against labor.

Strange as it may be, the candidate next to Mr. Taft before the people is one who has never lifted a finger to seek it. Governor Hughes has created no claque, has no organ, refuses to consult his advocates, and attends solely to his business as Governor of the Empire State. The people have learned to leave Cabinet officers and Senators, and look as candidates to the men next to the people who have secured bouncing majorities as Governors, and have in that office proved their integrity and executive ability. Such a man is Mr. Hughes. His drastic dealing with the misdoings of great corporations first turned the heart of the people to this efficient, but undemonstrative, man, who does things with no display of goodfellowship, and who as Governor has conquered the situation against the strongest political forces of selfishness, and has shown an iron will to do what needed to be done, and has been content with his present duty. He is something of a new figure in politics, and altho he has absolutely no experience in the conduct of national affairs, the people have been able to gage his length and breadth, and they say that he will be their second, if not their first, choice for the nomination.

At his age this is the last chance for Speaker Cannon. He will be the favorite son of Illinois, and every one knows him to be a positive and honest man of wide experience. So Indiana has her favorite son in Vice-President Fairbanks, Wisconsin in Senator LaFollette, and Secretary Cortelyou has his friends. If Mr. Cortelyou really aspires to the Presidency, he should retire from the Cabinet. Their chance now seems to stand in the case that neither of the two leading candidates can secure the necessary majority in the convention. In that case either the Speaker or the Secretary of the Treasury might secure the prize.

But what is the matter with the Democratic party? The Republicans have a plethora of available talent, while the Democrats are reduced to one man. The lack of ambition for the nomination is explicable in the small chance of Democratic success, but why this long monopoly of Bryan, in a party which fights monopoly?

Intellectual Individualism

When, somewhat more than a generation ago, that destructive German theologian, David Friedrich Strauss, near the close of his daring and industrious life, gave to the world his "Old Faith and the New," and called it "A Confession," even his bravest disciples gasped. His "Life of Jesus" had outdone the most radical New Testament criticism that any repu-

table scholar had previously ventured to put forth, and only a few eager intellects, here and there, had been daring enough to accept the Tübingen conclusions. "The Confession" out-Heroded Herod. It did not stop at undermining historical Christianity. It asked, "Have we still a Religion?" and answered, "It all depends."

The undisguised naturalism of the book, however, was not the only thing in it that made its readers draw short breath. Exploding and scattering to the four winds the most venerable of all faiths, and its central dogmas of belief in God and immortality, its iconoclastic old author revealed a curious unwillingness to break with the almost equally respectable tradition of monarchical government. He presented an ingenious argument in defense of the proposition that thought and art can be most free under the paternalistic rule of an hereditary house, partly because, when gifted men are given no opportunity to participate in political affairs their thoughts will turn to intellectual and artistic interests, partly because the masses cannot be trusted to deal as liberally as an enlightened monarchy may do with other than sordid interests.

This notion was generally dismissed as an old man's vagary. But doubtless, from time to time, it has arisen in the mind of more than one among those who read the "Confession" on its appearance as a disturbing thought, and the question has from time to time forced itself upon attention whether, after all, there may not be something substantial in the apparent paradox.

An element of truth it unquestionably contains. It is not historically true that thought or creative art has been more free under monarchical than under republican or democratic institutions. Athens was Great Athens in her most democratic days. The Elizabethan age and the Victorian age, in England, were periods of popular liberty, and in the despotic days of the Stuarts there was little achievement in the realms of science and imagination. The freest days of Florence were her most glorious ones, and Germany gave to the world her noblest creations before the consolidation of the empire under William I and von Bismarck.

Nevertheless, it is when political affairs are so well settled and ordered that gifted men, however patriotic they may be, and however interested merely as citizens they may be in public affairs, can, without distraction, give their time and their attention to things artistic or scientific, that the noblest achievements of the nation are assured. In these modern times this condition is better preserved under an essentially democratic system than it ever has been under any monarchy.

But political distractions are not the only ones from which the creative mind must be set free. Economic distractions may be quite as serious as a condition inhibitive of the highest effort; and we have recalled to memory the curious contention of Strauss, because it has a value at the present moment greater than that which it had for the political days in which he wrote, and one which probably he did not foresee.

The most earnest effort of mankind today is being directed upon the task of emancipating the nations from the crushing and deadening force of poverty. The problem of maximum production is not yet solved, and the problem of right distribution is very far indeed from practical solution. And because bad distribution reacts disastrously upon production, thoughtful men are asking whether it will not be necessary to work continuously toward some approximation to economic solidarity and equality, precisely as it was necessary, in the interest of the general safety and public order, to establish that political equality and solidarity which rests on universal suffrage.

Whenever this proposition is seriously presented, however, it is met by the objection that economic solidarity would create an intolerable uniformity of life; that it would destroy individual initiative and responsibility, and thereby, in the long run, make an end of that process of differentiation, that production of fine individuality, which is the chief end and glory of nature's processes of evolution.

Now, this objection is plausible but unsound. It is met precisely and adequately by the apparent paradox of

Strauss's argument. It is neither in the political nor in the economic realm that human individuality can find its noblest opportunity. It is in the realm of intellect, the realm of sentiment, the realm of imagination, the realm of conduct that man finds supreme self-realization. Only when, thru closer co-operation than he has as yet learned how to maintain, he has solved his merely material problems, will he be able to attain the best and highest individuality.

The world has been making, it is still making, an unfortunate mistake in identifying individualism with an economic scheme. Not in the things of wealth, not in the realm of property is the true sphere of individualism to be found. In that realm, it works not more for good than for ill. It there creates not only possessions, but also cruelties and sordidness of mind. Individualism belongs to the realm of intellect, of the creative spirit. So long as life in that realm is untrammeled, there will be no repression of individuality, "for a man's life consisteth not in the abundance of the things which he possesseth."

Archbishop O'Connell's Pastoral

BECAUSE we had published more than one article in criticism of the Pope's late Encyclical we thought it only fair that we should, if we might, print a defense of it by some authoritative Catholic, and we could find none more competent for the work than the new and accomplished Archbishop of Boston, who has the favor of the authorities at Rome. Indeed he was named as Archbishop by going over the nominations canonically made by the priests of the diocese and the bishops of the province. But to our regret Archbishop O'Connell found himself too busy to write the article, but referred us to his coming pastoral letter, which now lies before us. We may add that we had similar ill success when we asked another distinguished bishop to write such an article for us. We had said in our letter that for our readers it was not so important that the theological teachings of the Encyclical should be expounded as that a defense should be offered of that last portion of it which interdicts the reading of the incriminated books or the allowing them or their teachings to come into theological seminaries, and requires bishops to report triennially that these instructions are faithfully carried out. In reading the Archbishop's pastoral letter we observe that he says not a word about the interdicts, and does not say what he will do to enforce them against dangerous instruction. He simply, and in an able way, and in language which in some parts we could approve, condemns teachings against supernaturalism and in favor of disguised pantheism, but that which gravels Protestants he quite passes over.

To be sure, he says, what they will all say, that "the Modernist system has few, if any, open advocates in America." It is meant for Italy and France and Germany, they will all tell us, not for Catholics in this loyal country. Even when Leo XIII published his Encyclical against Americanism they declared that there was nothing of the sort described in America. So they hope that in five years this Encyclical will be forgotten, as Americanism is, and that meanwhile there will be no need to take any active measures to search out the Modernist heretics.

Archbishop O'Connell's pastoral letter might well earn him the Cardinalate, which is the next coveted ecclesiastical honor. For no one could exalt the Pope and his Encyclical more highly than he does. Modernism, he says, is "a spirit rather than a system":

> "Modernism grew in the dark, and no one had completely described this noxious plant until Pius spoke. . . . The votaries of Modernism, too cowardly to be frank, covered their designs by subtle suggestions and vague allusions. . . . But Pius, with singular insight and clear delineation, in striking contrast to the obscurity of Modernist writers, has given it complete expression."

Thus he describes Modernism:

> "It is the spirit of a school of perverse and misguided men who, assuming a right not theirs, would reconcile the Catholic Church with what they imagine the modern age demands."

That they assume "a right not theirs" he makes plain by the authority of the Church. Of himself he says: "We were sent to rule this Church of Boston." The authority of a few men over reason and faith could not be more radically expressed than in the following:

> "As the school of Catholic belief and per-

fection can never be found in the opinions of weaklings who are influenced by the unbelief about them, neither can it be found in the sporadic views of some opinionated ecclesiastic. Priest and people as well must find the only rule of faith in the teaching body which Jesus Christ established to guard the deposit of faith—the Pope, and, under him, the bishops to whom is committed the government of the Church of God. Their teaching, and theirs alone, is the true norm of faith and morals."

How easily that saves priests and people the trouble of thinking for themselves!

But however vigorous the language against Modernism, and however full the exposition of its errors and dangers, and however superlative its praise of the wisdom of the Encyclical, we yet miss the important thing in it, for there is not a word as to the methods to be employed, by the Pope's direction, in suppressing Modernism. Perhaps it is because, while we are told that non-Catholic institutions are full of it, "it has few, if any, open advocates" among Catholics in this country. Such is really the fact; those infected by it must lie low and keep silence. But the Encyclical directs bishops to ferret them out, to drive from seminaries any who seem inclined that way, to appoint inquisitors for this purpose, and to take the greatest pains to exclude Modernist books from the hands of students. We are curious to observe that this effective and practical portion of the encyclical, that which most interests us, is quite overlooked—which is well. Talk is loud and cheap; it is the enforcement that proves the talk to be serious. Pius is serious in his Encyclical and in his later announcement of excommunication for those who question it; we wonder if American bishops will take it as seriously.

That Pius is very serious and determined is illustrated by an incident told in the last number received of *Rome,* a Papal journal published in Rome. It tells of a German university professor who visited the Pope recently, and after some conversation remarked that he did not believe Moses wrote the Pentateuch. Then:

"A change had past over the Pope's face—he had not grown angry or impatient with the bumptious, beadle-like personage before him, only he had risen to his feet and was saying very quietly: 'There is no decree imflicting a censure on this opinion of yours, but you cannot be a professor for Catholic youth. You must resign at once—here, now.' The professor resigned."

Indian Funds for Sectarian Schools

NEITHER the trust nor the treaty funds of Indian tribes are "public moneys" is the recent decision of the Court of Appeals of the Supreme Court of the District of Columbia. Unless the case should be further appealed, this settles in its favor a point for which authorities of the Catholic Church have long been contending, viz., that sectarian schools among Indians may lawfully be supported out of tribal trust or treaty funds, notwithstanding the enactment of Congress, ten years ago, that Government appropriations shall not be used to educate Indians in any sectarian school.

A tribal trust fund is money in the United States Treasury from which the tribe receives an annual interest income, usually 3 or 4 per cent. A treaty fund is a certain amount which must be appropriated annually for the tribe in fulfillment of a treaty obligation.

In the discussion as to the application of these funds the President, the Attorney-General, the Indian Office, the Bureau of Catholic Indian Missions and the Indian Rights Association have all taken part. The President was clear as to the availability of the trust fund early in 1905, and he gave specific instructions as to how the wishes of the Indians should be ascertained in regard to the use of those funds for the support of contract schools. The Attorney-General delayed giving his opinion as to the use of the treaty funds. Meanwhile the Indian Rights Association, with the cordial acquiescence of the Indian Office, brought the matter into the courts. In May, 1906, in the name of some Rosebud Sioux, Reuben Quickbear and others, a suit in equity was filed in the Supreme Court of the District of Columbia, asking that the Commissioner of Indian Affairs be enjoined from using either the trust or treaty funds of the Sioux in making a contract with the Bureau of Catholic Indian Missions for the education of Sioux children in St. Francis's Mission School. The court granted the injunction as to the treaty

funds, but not as to the trust funds, and both sides appealed. The appellate court has now decided that both funds are available for sectarian education.

The tribes which have such funds to any considerable extent are the Sioux, Osages, Menominees and Northern Cheyennes; and contracts were made in 1906 aggregating nearly $100,000 for the support of Catholic contract schools out of those funds. The only duty of the Indian Office now is to see that the petitions of the Indians for the diversion of their funds to sectarian education are genuine, and that each Indian makes his own choice as to how his *pro rata* share of the tribal school money shall be applied. There has been no notice of further appeal.

Agriculture in Common Schools

THE stages thru which our common schools have already evolved have been: (1) The consolidation of rural schools, bringing together the pupils of half a dozen poorly-equipped district schools into a well-equipped town school. In the new central building we find graded courses, covering not only what was taught in the district schools, but the first year or two of the high-school course. This reform has spread over all the New England States and nearly all the Western States. It has involved a higher grade of teachers and town supervision. The central school building is the center of town life, and the superintendent has gradually risen to an important position in civic affairs. The school building is used for night schools, art schools, concerts, lectures and whatever else pertains to the general intellectual and moral welfare of the town. This system cannot be said to be completed, nor do we yet know all that may come from it. In some cases, in rural districts, the school building is practically a town church.

(2) The creation of agricultural colleges was a leap in the dark. They preceded preparation. There was nothing in the lower schools pointing toward them. The curriculum of the common school was and is still preparatory for classical colleges. The very existence, however, of industrial colleges became a suggestion and a stimulus. They fitted to the growing industrialism of the age. What they taught began to have its effect upon our productive industries. "The raising of a bushel of corn fifty years ago cost a farmer four hours of hard work; now it takes him forty-one minutes." We find the agricultural college and the experiment station modifying every department of home life and every field of labor. They have brought farm life up from depression to its old average of intellectual purposing. What next?

(3) Several of the States have found it essential to create agricultural high schools. Minnesota has a school of agriculture, at St. Anthony Park, with junior and senior high-school work. Professor Hays, of Minnesota, insists that we can do a good deal with agriculture even in our city schools; not by making the curriculum more complex, but by simplifying it. It is not impossible to surround our city schools with gardens or to plant them in the parks. In Canada what is called the McDonald Consolidated Rural School has been opened in each of the Provinces. New York State has repeatedly considered a bill creating agricultural high schools, but has wisely waited to find out whether the present curriculum may not absord nature study. Commissioner Draper believes that no other schools are needed than such as are now in existence, provided they are wisely directed.

There are two questions that have to be answered at this point, and they will have to be answered very soon. The first of these is, Do those who advocate agriculture in the common schools expect to teach the sciences that underlie agriculture? And the next is, Where will you find teachers capable of giving adequate instruction along such lines? The answer is simple. These sciences are really the fundamental thought and talk of children. When they pick up pebbles and play in the sand they are beginning the study of geology. When they plant flower gardens and discuss flowers they are studying botany. Ornithology is no more than the love of birds finding expression in observation. We are finding lately that there is nothing that the child takes hold of more easily than nature study—that is, the

study of plants, insects, birds and animals.

As to the question of teachers, some of our normal schools are already solving that problem by planting gardens and requiring accurate observation on the part of the pupils, with notebook at hand. When these pupils receive their certificates they will have in most cases become enthusiastic lovers of our common everyday sciences. To teach these sciences will be quite as simple as to teach mathematics, or history, or physiology. The trouble is more apparent than real. In fact, we have been working our common schools on the basis of the more abstruse studies, omitting the simpler and more natural.

Associated with school buildings we must hereafter have well-furnished workshops and operative kitchens. In these can be carried on those branches of education that pertain to home making. Books may occupy one-half of the day and hand work or hand education the other half. In this way study will be constantly applied and facts will be used as soon as acquired. Even mathematics can be applied to measuring and surveying and grammar to pleasant conversation and accurate communication—matters that are quite too much overlooked in common-school culture. The board of education in one of the counties of Indiana is arranging, for use in all the schools, a course including plant culture, plant diseases and plant treatment. Practical demonstrations constitute a part of the work. At the same time the subject of dairies and sanitary housekeeping will be considered. This will require a large amount of outdoor studying.

There is no one thing that we need more to apprehend than that education does not consist in the mere accumulation of facts and data; but that it consists largely in the use of the same. The school lot should be rich soil, well drained and sanitary; and if it is not already such the pupils can be admirably employed in correcting the defects. The shop should be furnished not only with agricultural tools, but with mechanical, including a good gasoline engine and turning lathes. In some cases power can be had from a trolley plant or some electric light plant. A town has not fulfilled its duty by building a schoolhouse when it has no power to furnish heat and light. It is very clear that any such refronting of education brings the school and the home into closer affinity and alliance. It will necessitate a deeper interest on the part of parents. It will send the children home with an affinity for work and a power for helpfulness.

Any such change as we are suggesting does not imply that common-school pupils will be disqualified for other employments than farming. Rural schools will not be narrowed, but broadened, by any system that gives them a keener sympathy with nature and a fuller knowledge of what is going on about them. The teaching of everyday sciences does not naturally trench upon the study of history and language. Language is a mind tool; hoes and trowels are hand tools. Brains and hands must be taught to co-operate in life, and the true aim of education is to prepare pupils for efficiency in carrying out their acquirements of learning. Still we must allow that the change outlined will bring nature study and land culture to the front. The tendency will be toward strong individuality and self-reliance. It will make the world more beautiful and labor more honorable. The value of such an education can be measured not only in personal power, but in social usefulness—in terms of citizenship. Perhaps best of all will be the tendency to enliven education and make it attractive. Study will be the one most delightful occupation that a young person can conceive; by the affiliation of home and school the adult population will never cease to have a personal interest in the schoolhouse and in school work.

It Is Finished

THE year goes sadly, at the best, for no one cares to live away from a joy—and in many ways each year manages to make itself memorable for its blessings. 1907 will be remembered for its large, but not banner, crops, and for its remarkably high prices. This has told well for the farmer, who today stands head and shoulders above the whole crowd of industrialists. Ten years ago

it was agriculture depressed. Today it is agriculture at the front. But the "laboring classes" have so much more to pay—high bread, high potatoes, high apples, high coal, balanced by high wages. On the whole, no class is without reasonable compensation for honest effort, put forth with tact and educated skill.

How the year worked at its loom! The threads flew fast to make warp and woof, and the pattern no man could quite foresee. But no year ever more clearly demonstrated that man is master of conditions and circumstances, if he is first master of himself. The new farmer is a man of accurate knowledge; he is trained to combat. From early to late, each month brings its problems, and the ignoramus is helpless. The day has gone by for giving our best schooling to our preachers and lawyers while the landowner must content himself with the three R's. The old-fashioned farmer, with his narrow outlook, might work upon such a basis, but he is displaced by the scientist. The new farmer is to constitute the highest educated class in the nation. He owns a university in every State, and the only school of experimental philosophy and research, for today the only philosophy that reckons with the people is that of applied science.

It is finished, and one can see what has been woven. There has been altogether a year of peace. The wars in Central America and in Africa have been merely skirmishes. Russia and England have come to terms on a century-old struggle in Asia, and the Cape-to-Cairo railroad is well under way. In this country we are certainly making some progress with the Panama Canal, but better progress with a great internal waterway system which will bind together the interests of every section of the United States. The Hague Conference stood for a world longing, and it gave less satisfaction because the peace sentiment has grown so strong as to become an age conviction. The common people will soon decree a cessation of war. We need all our energies and all our acquisitions to keep ourselves well on the road of higher civilization and enlightenment.

At home more closely we have a new democracy coming into power. The autocracy of capital is broken. The all-powerful trust has become weaker than a single man with a generous principle and a manly aim. Better even than this, a new order of statesman has loomed up. It began with those selected by the people to enforce law. Folk, of Missouri, led the way; it was a simple path, that of duty, and the people made him Governor. In New York, Charles Evans Hughes was made of the same stuff, and the people approved him. The machine is broken — it appears to be without possible recovery. The new maxim of statesmanship is Trust the People. It was a strange, and, on the whole, a wonderful affair, the political machine—ramified into every hamlet and almost every home, but its futility, as compared with honor and trust, has been demonstrated. Be honest, fair and frank with the people, and they will return your confidence.

1907 will be remembered for its cold weather. But such abnormal conditions are occasionally needed to divert evil as well as breed or foster the helpful. Insects that were dominant and determined have been so checked by the cold as not to be feared, while some of them have been obliterated. The long autumn compensated for the slow development of the summer, and so we have nearly a full corn crop and little damage in our vineyards. At any rate here we are, thoroly prosperous on the threshold of a new prosperous on the threshold of a new year, and ready to try what another twelve months has to demand of us. As a people we are facing a new sort of future. Internationalism cannot be escaped. We are only four days from Europe. Washington's Farewell Address can no longer guide us in our relations to European people. Our trade is inevitably tangled with that of Germany. Our educational and our religious life are affected by transcontinental logic and legislation. World economics are sure to displace American economics. Tariff cordons are no longer able to protect a people in its exclusiveness.

The financial terror of October was simply a reaffirmation of the fact that man is afraid of himself. His vast schemes have grown so fast that they give him the nightmare. He wakes up occasionally with an uncontrollable im-

pulse to draw in his tentacles and content himself with less far-reaching purposes. It was a Babel tower that scattered original civilization. Put into modern language, the result was going back to Nature. The great town builders got tired of their scheming and building sought for cottages and suburbanism, and so the country grew upon the city. Today the same happy cry goes up, and the tide is away from congestion, toward liberty.

No, we are not glad to say good-by to 1907. We shall hold some of its achievements, as we shall some of its lessons and warnings, as invaluable. As a whole the nation has faced about in more ways than one. Spectacular perhaps, yet nobly impulsive, and struggling ever for the public good, we have had a new sort of President. While becoming more worldly wise, we have been generous to our dependents, and have won their good will. We have not disgraced the name of republic, nor have we increased in the militant spirit. The American home is growing more homeful, and the American character has lost none of its strength, while it has added to its gentleness. From a literary standpoint our achievements have not been remarkable, but this is notable that the American people is fast becoming a free thinking folk, with a fine art of expression.

Yet all hail 1908! All hail the love that over all, and in all, points forward, and forever repeats, On earth peace, good will to man. All hail the political life that is more truly democratic as the years roll by. All hail the Christian life that is more and more that of the simple Jesus. All hail the new school of industrialism. All hail the years that lead on to an alliance of hands and brain, in constructing a character of self-surety and a society of mutual helpfulness—a humanity of love and faith, as well as hope.

The New Central American Court

The five little Central American States which have been holding a peace conference in Washington of late have now produced a treaty which is theoretically at least the farthest step in advance yet taken in world federation. Altho the treaty does not provide for any organic union, each State still retaining its sovereignty, yet as each agrees to refer all its disputes to a court which is judicial rather than arbitral, the nations have created a very real germ of an international constitution. In this court we see the able hand of Secretary Root, for it was he who inspired our delegation at The Hague to introduce a similar one for the world, modeled after the Supreme Court of the United States, and it was unquestionably his advice that has been followed in drafting the present Washington treaty. In some respects the Pan-American Conferences have gone farther ahead for North and South America than have The Hague Conferences for the world. In all respects the present international Central American Court seems to surpass the Hague Court. There were no abler statesmen at the recent Hague Conference than Barbosa, of Brazil, Drago, of Argentina, and Triana, of Colombia. In the Constitution of Brazil is a clause unique among the constitutions of the world, which prevents that great Republic from going to war until after an offer of arbitration. Chile and Argentina alone among world States have begun to disarm, as the bronze statue of Christ on the summit of the Andes eloquently testifies. Thus does Latin America lead the world in the peace movement.

Baptist Unions

At the Baptist Congress, in Baltimore, November 12th-14th, organic union with free Baptists and Disciples, its desirability, present status, and how to make it effective, were discussed by leading men, Dr. Powers, of Washington, D. C., and Professor Gates, of Chicago University, Disciples; President Mauck, of Hillsdale College, Michigan, and Professor Anthony, of Bates College, Maine, Free Baptists; Professors Hobart, of Crozer Seminary, Pennsylvania, and Horr, Newton Center, Mass., with Doctors Partridge, Pittsburg, Pa., and Goodchild, New York, Baptists. These gentlemen might have exchanged their thoughtful papers so at one were the points urged as each voiced his own convictions in favor of organic union. The next steps translate advice into action urging deputations between associations and conventions; ministers

to exchange pulpits and pastorates also, as the way opens; churches to dismiss and receive members freely, and if two feeble churches exist in one town to make of the twain one strong church. The immediate results were agreeing to publish a full report of the discussion for these bodies, and the Congress General Committee inviting the others to join in membership and to make effort for one Congress. Baptists are coming back in two points at least to the Free Baptist position. Legal difficulties may hinder speedy action; yet as one said, with the evident support of the congregation, they could afford to forfeit bequests but not to be untrue to the spirit of Christ. Genuine union was worth more than gold. A practical union, we observe, in the baptism in a Baptist church at Montclair, N. J. of two grandchildren of Alexander Campbell, the founder of the Disciples denomination.

A Prize College Song

Yale did not have an adequate serious college song, tho it had plenty of "Drink Her Downs" and "Boola-boolas," but it had nothing to rank with Princeton's "Old Nassau." To be sure, "Bright College Years" was otherwise satisfactory, but the music is so difficult that it can be adequately sung only by a glee club. So a prize of $50 was offered for a really worthy Yale song, and when none appeared for several years, the prize was increased to $300. A committee of the Faculty has awarded this prize to a song of two verses, which is as follows, without the music:

MOTHER OF MEN.

Mother of Men, grown strong in giving
Honor to them thy lights have led—
Rich in the toil of thousands living,
Proud of the deeds of thousands dead;
We who have felt thy power, and known thee,
We in whose work thy gifts avail—
High in our hearts enshrined enthrone thee,
Mother of Men—Old Yale!

Spirit of Youth, alive, unchanging,
Under whose feet the years are cast—
Heir to an ageless empire, ranging
Over the future and the past—
Thee, whom our fathers loved before us,
Thee, whom our sons unborn shall hail,
Praise we today in sturdy chorus,
Mother of Men—Old Yale!

It has not supreme poetic merit. It begins feebly. "Mother of men" is good, but "grown strong" is unmusical, while it is not true that she has "grown strong in giving honor" to her sons. She gives them instruction, inspiration, and they get the honor later. "Thy lights have led" is very faulty; "thy light has led" would be much preferable. The third and fourth lines are good, the best in the whole poem. In the fifth line "and known thee" is, for rhyme's sake, a weaker repetition of "felt thy power." In the sixth line, "We in whose work thy gifts avail" is a further redundance which has the demerit of a boast for themselves instead of for their Mother. The three last words of the next line, "High in our hearts enshrined, enthrone thee" lack musical fluency. The last line, "Mother of Men—Old Yale" is good. In the second verse "Spirit of Youth" is, of course, another designation of Yale, but she is far from "unchanging," we are glad to say. We observe another leading feminine rhyme in *ing*, which is undesirable. The first half of this verse somewhat lacks quick clarity, but the last half is good, unless some may object to the unmusical "sturdy." The music may carry this song perforce for awhile, but a worthier one is yet to be desired.

Adhesion to the Encyclical

As was to be expected the ecclesiastical authorities in this country are sending in their adhesion to the last encyclical. They always do it; a failure is not known. They all did it when the encyclical condemning "Americanism" was issued, and declared there was no such error held in this country. That may not have been true, but it was good ecclesiastical politics. Just so the bishops of the province over which Archbishop Farley, of New York, presides have sent a message to Rome saying that they all and the seminaries under their charge are in full accord with the encyclical's teachings. Now the trustees of Washington University, composing the archbishops and various bishops of the Church, have written their full adhesion and the alumni of the important St. Mary's Seminary, in Baltimore, have cabled their "cordial acceptance" and "loyal obedience." There is no other voice uttered. A correspondent of a London paper tells of a reputed liberal priest who, on being directed to

visit Rome, asked a Roman ecclesiastic what he should do if required to sign anything, and received the reply, "If they ask you to sign that two and two make five, do it; and tell them that if they wish you to say that two and two make six you will do it with equal readiness."

Progress in Korea

These are great days for Korea. Who would have dared to predict that what has happened would happen even within the next decade? The Korean Empress has actually ridden out, in an open carriage, with the Emperor. Dressed in her usual beautiful robes of silk gauze, her head covered only with the insignia of her rank, she drove side by side with her imperial husband across the city of Seoul to their new home. The distance is about one and one-half miles from the palace which up to now has been their home. That a Korean lady, and especially *the* lady of the land, should appear without the head covered, seems incredible. The Empress was attended by her ladies-in-waiting, they also only wearing their insignia of rank on their heads. What were they thinking of as they thus publicly made their first acquaintance with things outside of their daily knowledge! For these ladies have been carefully sheltered from even the sight of any one or anything not in their own small inner court. This wonderful thing happened on the 13th day of November, 1907. On the 14th the Crown Prince and His Excellency Prince Ito of Japan proceeded to the Young Men's Christian Association building, now in process of erection, and laid the stones of the arch, the young Prince writing with his own hand the date. This boy is a clever, quick-witted lad, dignified and pleasant. He is a son of the ex-Emperor, and has his father's pleasant way and manner. His Excellency Prince Ito accompanied the Prince and was kind and attentive in every way. He prepared the small writing brush himself and in his manner to the Prince one could see that he had a real regard for him. The Crown Prince of Korea has his lines placed in good and able hands. Americans in Japan have the deepest respect for this great man, Prince Ito, and believe that he is working for the best for the people of Korea as well as of Japan.

The Rhodes Scholars

The annual report of the trustees of the Rhodes Foundation gives an interesting account of the record made by the scholars now at Oxford. It is not strange that as a class these men should achieve prominence, for they are carefully selected from the communities they represent, and are already, in a measure, picked men. This does not detract from the credit of their excellent showing in scholarship, however, eight men winning honors of the first class, seventeen of the second class, and fourteen of the third class. Of the eight first class honors, five were won by Americans. The distribution of the scholars in the different colleges is well proportioned, Balliol and Christ Church leading with fourteen each. The total number of scholars now in attendance is 160. The number entering in 1907 is 73, of whom 45 are from the United States. Three of our States have as yet failed to send qualified representatives. In athletics, six scholars played on the Oxford rugby team, and one of them was elected captain for the coming year. In the track meet with Cambridge six competitors were Rhodes scholars. A scholar from Michigan, in the freshman sports, won four firsts and one second. These scholars at Oxford are representatives of a great idea of a great man and should be keenly alive to the better influences of the place, and receptive to all that is highest in its teaching. They should not herd together, but mingle among the other students and absorb as much as possible of the atmosphere of Oxford. The formation of an American club, which was agitated by our representatives, we hope will be a short-lived effort. Such an organization would defeat the very object of the foundation. The Rhodes scholars have much to live up to, both as undergraduates and in their subsequent careers.

Japanese Ethics

In the 23d year of Meiji (1890) the Emperor of Japan issued a rescript on education in morals with orders that it be sent to every school in the Empire and that it be read and expounded on special occasions in the schools. The Japanese Department of Education has lately had this carefully translated into English, the only foreign language required to be taught

in the schools. It is so brief and comprehensive that it is worth while to reprint it here. It will be observed that it avoids all religious assumptions:

"Know ye, Our subjects:

"Our Imperial Ancestors have founded Our Empire on a basis broad and everlasting and have deeply and firmly implanted virtues; Our subjects ever united in loyalty and filial piety have from generation to generation illustrated the beauty thereof. This is the glory of the fundamental character of Our Empire, and herein also lies the source of Our education. Ye, Our subjects, be filial to your parents, affectionate to your brothers and sisters; as husbands and wives be harmonious, as friends true; bear yourselves in modesty and moderation; extend your benevolence to all; pursue learning and cultivate arts, and thereby develop intellectual faculties and perfect moral powers; furthermore advance public good and promote common interests; always respect the Constitution and observe the laws; should emergency arise, offer yourselves courageously to the State; and thus guard and maintain the prosperity of Our Imperial Throne coeval with heaven and earth. So shall ye not only be Our good and faithful subjects, but render illustrious the best traditions of your forefathers.

"The Way here set forth is indeed the teaching bequeathed by Our Imperial Ancestors, to be observed alike by Their Descendants and the subjects, infallible for all ages and true in all places. It is Our wish to lay it to heart in all reverence, in common with you, Our subjects, that we may all thus attain to the same virtue."

It would be difficult to add much to this. It includes obedience to parents and the State, love, helpfulness, self-sacrifice, self-restraint, diligence, studiousness, patriotism. It embraces duties to one's self, to one's family, to the nation and to all people, the full ethical system of Christianity, under whose influence it was largely drawn up; for "the wise sayings and deeds of the ancients were soon found inadequate," as we are told in the statement accompanying the translation.

Conditions in the Philippines

The following communication to THE INDEPENDENT from David P. Barrows, Director of Education in the Philippines, explains itself and corrects a strange misrepresentation:

SIR.—In your issue of September 19th I find quoted an opinion of mine to the effect that a request by the Philippine Assembly for unconditional independence would result in action being taken to that end by the American nation. This extract was taken from an interview with a representative of the Philippine paper *La Democracia*, and was part of a general discussion of the existing dangers to the continuance of American support for these Islands. The extract cabled to the United States, taken out of its setting, has apparently given an impression exactly contrary to that which was sought in the interview itself. What was in fact a warning against radical action is made to appear as an encouragement to such action.

As I should deeply regret being misunderstood in this matter, permit me to say that my personal opinion, as on other occasions expressed, is: That the separation of the Philippines from the United States at the present time would mean only disaster; that, in spite of the extremely encouraging progress being made by the Filipino people, the time is remote when an independent government can exist here; that, in spite of the gathering impatience of the American people toward their effort here, this is no time to cease that effort; that, while the aspiration for Philippine nationality is a perfectly legitimate aspiration and has been so treated by the American Government, there is no short road to its realization; and finally that, for the period which will embrace the effort of any of us who are at present engaged here, Filipinos or Americans, the only honorable or possible policy is the policy which the American Government has pursued and is pursuing.

Some of those who object to immigration on the ground that Italians would be dangerous members of society may find relief in some figures collected by the Rev. Louis J. Bristow in the *Baptist Courier* of Charleston, S. C. He seems to show that even the worst of Sicilians would not increase the average danger to life in that State. During seven days ending October 24th, 14 homicides were committed and 9 other cases of deadly assault. During nine weeks ending October 19th, 54 homicides were reported in the daily papers. Since July 1st, 95 homicides have been reported, 51 of negroes and 44 of white men killed. The leading journal of the State suggests that if these figures were made known to the Italians very few of them would dare to make South Carolina their home.

There is an innocent rivalry between the English, French and British excavators to see which will find the most valuable ancient manuscripts in the land of Egypt. Very lately the French have found Menander, the Germans Jewish documents of biblical interest, and now Messrs. Grenfell and Hunt, for the English, report fragments of an uncanonical gospel relating a conversation of Jesus with the Pharisees about purity; also part

of a new ode of Pindar on the simple life, and a long fragment of a history probably by Theopompus concerning events nearly 400 B. C. We begin to wonder how much of the contents of the Alexandrian Library may yet be found.

Here are a few facts gathered from the report of the Commissioners of Education for 1906, just issued. Our total expense for education during the year was about $400,000,000, of which about $308,000,000 was paid from public funds, or more than one-fifth of the entire public expenditure of the nation, the States, and all minor diversions; while of the total amounts expended for all purposes by the States, counties, towns, etc., more than two-fifths was paid for common schools. The enrollment in schools of all sorts for the year 1905-6 was 18,434,847. One in five of the population is in the public schools, and the average attendance of those enrolled is over 106 days, while it was but 78.4 in 1870. The average cost of instruction for each pupil is 17.4 cents a day.

The Associated Press correspondent at Manila will bear investigating again, as Bellairs was investigated in 1903, in consequence of a paragraph in THE INDEPENDENT. His reports frequently show "manipulation," as lately during the Taft visit. Such stories as those about the bomb prepared to be thrown at Taft, about his saying he would return in two years "as a private citizen," and about his "ordering" Governor-General Smith to serve no intoxicating drinks at the reception for him show evidence of a purpose to damage Mr. Taft's chances for the Presidency, and were apparently fixt up by some of the American newspaper men (so-called) in Manila who dislike Taft.

Just at this season of the year on many a city street corner will be seen a man with a red stripe on his cap ringing a bell which asks the passer-by to drop a nickel in the iron pot hung on a tripod, that a dinner may be given to the poor on Christmas day. We have a serious question whether this is a wise form of charity. We fear it encourages as much beggary as it relieves. Certainly it is not an ideal way of providing for those in want. Doubtless many who would not give to a wise systematic charity will satisfy their conscience by throwing money in a pot, but does it do ultimate good?

There is a Sunday closing law in Illinois, and the Mayor of Chicago says he will not enforce it:

"The Council years ago sent a communication to the Mayor requesting him to pay no attention to the State law for Sunday closing, and I will not close the saloons unless ordered to do so by the courts or unless the people by a majority vote ask that the saloons be closed on Sunday."

There is nullification for you, which South Carolina could not surpass.

The Pacific fleet sails this week. Why it sails, or why it goes thru the narrow Straits of Magellan, is not clear to the uninstructed lay mind. But it is as it is, and we must accept it as official wisdom as yet undisclosed. It is a magnificent fleet, and when it reaches Manila, whither doubtless it will be sent to return by the Suez Canal, it is likely to make the impression desired, that peace is that excellent thing for which we all must labor.

The Senate on its dignity, and insisting that it do not receive drafts of desired bills from members of the Cabinet *motu preprio,* but advice only from the President, is not an impressive sight. Even a cat can mew before a king, and it would seem as if a Cabinet officer, or any other citizen, should be freely allowed to formulate his advice, which the Senate may take for what it is worth.

For the benefit of our readers who want to compose limericks, but do not know exactly how, we quote the following definition from a professor of prosody:

"In the strophe the first, second and fifth lines are simple nonanacrusistic amphibrachic tetrameter acatalectic, and the intervening dipodies are plain nonanacrusistic anapestic dimeter acatalectic."

As an example of "taste" in head lines we call attention to the way in which *The Detroit News* announces the death of the sovereign beloved by so many of the people of its State:

KING OF SWEDEN
FINALLY CASHES
IN HIS CHECKS

Insurance

The Columbian National Life Insurance Company, of Boston, Mass., and Its New President

THE Columbian National Life Insurance Company, of Boston, Mass., one of the younger insurance companies, was organized in 1902. It has a capital of $1,000,000. Arthur E. Childs sometime Boston vice-president, has just been elected president of the Columbian National Life, succeeding Percy Parker. Mr. Childs is a well-known Boston capitalist. He has been prominently identified with the Massachusetts Lighting Companies and with a number of other local enterprises in that city. He has during recent years devoted considerable attention to life insurance and the many problems connected therewith. As vice-president Mr. Childs took an active interest in the management of his company and is well equipped to assume supreme control. He is resourceful, energetic, a fluent speaker and a facile writer.

William H. Brown continues as secretary and treasurer of the company.

Accidents and Accident Insurance

THERE is, it appears from investigations made by M. Legoyt, of the General Statistical Department of France, at the present time, a marked increase of accidents. It has been found that even the man who remains at home does so at considerable peril. Casualty and even mortality on our street car lines are altogether too common. The Public Service Board has compiled figures which show that nearly 5,000 accidents in this city were reported on local car lines during October of this year. Many more accidents took place during August and September. A writer in *The Trackman* recently stated that "there is not a railway in the United States today that employs enough men to properly do the repairing and keeping in repairs railway tracks." This is a startling arraignment, but in the face of the increasing record of accidents it would seem to have some basis of fact. If the management of transportation lines will not safeguard their patrons the use of accident insurance must increase as a merely precautionary measure. The Preferred Accident Insurance Company, of which Kimball C. Atwood is president, originated the idea of double benefits for conveyance accidents in 1889. Conveyance accidents have been held to mean accidents in railroads, street cars, steamboats, etc. Thru the agency of double benefits if a man carries an insurance of $1,000, all he has to do is to suffer an accident which would ordinarily entitle him to the face of his policy in order to be awarded $2,000. Other companies have since followed the lead of the Preferred Accident. The cost per $10,000 is so low that most men can afford to carry such insurance.

The Co-Insurance Clause

IT is well known that the co-insurance clause is the cause of many misunderstandings between the insurance company and the assured. Unfortunately for the insurer and insured alike there is a widespread prejudice against fire insurance companies which should not exist. On the contrary, there should be a more cordial understanding between the two parties concerned which will provide for the stability of the insurer as well as secure for the insured absolute indemnity against financial ruin in case of fire. Quite often does a merchant apparently economize on his insurance, neglecting to note the conditions of the co-insurance clause attached to his policies.

The co-insurance clause means simply that the assured is required to carry *at least* a certain percentage of insurance or be an insurer himself for the deficiency. For illustration, in the case of the 80 per cent. co-insurance clause, say the value of a certain property is $10,000. The insurance required by the clause is $8,000. If $8,000 or more insurance is carried then the condition of the clause is complied with and the clause

becomes inoperative, the insurance company paying the full amount of any loss, but say the insured carries only $7,000 insurance, and has a loss of $4,000, then the insurance company pays seven-eighths of $4,000, or $3,500, and the insured loses one-eighth of $4,000, or $500. Often the ignorance of the agent or broker is responsible for the deficiency.

The writer had occasion to solicit the insurance account of a merchant in a small city, and after looking over his policies asked him what he thought he would receive from the insurance companies in case of a $10,000 loss. With a look of disgust he replied: "$10,000, of course." He was carrying $12,000 on a stock valued at $20,000, with the 80 per cent. co-insurance clause attached to all of his policies. When I carefully explained to him the meaning of the 80 per cent. clause and showed him that the company required him to insure at least 80 per cent. of the value of his property and that he would get from the company only twelve-sixteenths or three-fourths of $10,000 he was amazed. He then called in his broker, who openly confessed his ignorance of the conditions of the clause.

The insurance companies are perfectly justified in using the co-insurance clause and thereby protecting themselves against covering a large risk with a small percentage of insurance, the rates being based on the total value. For example, a $100,000 plant could sometimes be conservatively covered by a $25,000 insurance policy without the 80 per cent. co-insurance clause, for if the property was situated in a city with first-class fire protection the chances would be very small of more than a partial loss; therefore the rate if applied to a $25,000 policy would necessarily be greater than if applied to the full amound of $100,000.

Bonding Chauffeurs

In the growing effort to exercise some kind of control over automobile drivers many expedients have been tried, from ropes stretched across the road to deputies armed with repeating rifles. In most cases fines for speeding have proven without the deterring influence it was fondly hoped they would exert. Many municipalities have long required a bond for certain classes of licensees, such as auctioneers, plumbers, pawnbrokers, employment agencies, dealers in second-hand goods, etc. It might be a good idea to take a leaf out of the book of such procedure and extend the practice of bonding to chauffeurs, whether they be owners of the driven cars or merely hired operators of the horseless carriages of our day and generation. San Francisco proposes to lead in a movement of this kind and to require such a bond from every applicant for an automobile license. If the penalty for speeding was made the absolute forfeiture of the license to operate the arrogance of the auto car owners toward horse drivers and others would doubtless tend to decline.

There is a great deal to be said against the prevailing practice of subjecting a town to an extra and needless fire hazard because the local volunteer fire department participates in a fireman's parade in a neighboring town. The idea of a fire department is to protect property from loss in case a fire breaks out, and if at such a critical moment the department has the fire-fighting apparatus removed from the danger zone for the useless purpose of parading, it appears quite like tempting Providence that we sometimes hear about. It would seem to be only common sense to prohibit the removal of fire apparatus from the town or village limits under any pretext whatever. The insurance companies might easily exert a wholesome influence looking toward something like this. It is cases of the kind to which reference is here made that show the wisdom of those of old time who originated the saying "An ounce of prevention is worth a pound of cure."

The Presbyterian Ministers' Fund for Life Insurance, which was organized in Philadelphia in 1715 and incorporated in 1759, and is therefore the oldest life insurance company in the United States, gave notice last May that it would insure Episcopal, Congregational, Baptist and Methodist ministers as well as Presbyterian, which announcement, we are informed, has met with a cordial reception

Financial

Hoarding by Banks

DURING the financial disturbance there has been much complaint in newspapers of the interior and in statements evidently inspired by some of the interior bankers that the banks of New York were selfishly hoarding cash and were not responding properly to demands for it from the interior's banking institutions. The sharp decline of the New York banks' reserve, until it fell more than $50,000,000 below the 25 per cent. required by law, should have been a sufficient answer to these assertions, but it was not. Then came the official report of the Chicago banks to the State Government of Illinois, showing that they had increased their reserves to about 30 per cent. and were holding much more than before the beginning of the panic. This evidence was followed by boasts, published in various parts of the interior or far West, that the banks in certain States had very largely increased their reserves. For example, the leading newspaper of Oregon asserted proudly last week that twenty-seven of the forty-five national banks in that State, outside of Portland, were carrying an average cash reserve of 44 per cent. Reserves have been increased in Omaha, Minneapolis, Louisville, New Orleans and other cities, but the largest additions appear to have been made in small towns. Official evidence of all this is now coming out in the reports recently called for by the Comptroller of the Currency. Clearly, there has been hoarding of cash by banks, but not by the banks of New York. Much of the hoarding was by banks in places where unjust complaint against the New York banks was made and is still heard. Those who criticise the banks of New York should be fair in their criticism and should not ignore facts which are of common knowledge or can easily be ascertained.

Trade With Germany

IN the Senate, Mr. Gallinger has begun the attack upon the new tariff agreement with Germany by introducing a resolution calling for a statement of the trade between Germany and the United States in July, August and September of the present year, the first three months during which the agreement was in force. It happened that at about the same time the Government issued for the information of the public a statement covering not only those months, but also October. Comparisons are shown in the following table:

Four months.	Imports from Germany.	Exports to Germany.
1903	$40,772,825	$60,055,812
1904	41,296,379	62,518,286
1905	45,597,525	73,485,705
1906	52,664,498	74,055,025
1907	56,983,389	78,071,690

There has been an increase over last year's totals of about $4,000,000 on each side. Opponents of the agreement will probably contend that the increase of imports has been due to that part of the agreement which permits the use of German "export prices" in making the valuations on which duties are based, but there was a larger increase last year. Senator Gallinger's inquiries will eventually, we predict, draw from the President a description in detail of those "vicious and unjustifiable practices" and "gross and discreditable abuses" which, he said in his recent message, characterized the methods formerly used in our custom houses for determining the dutiable values of German goods.

....The number of immigrants entering this country in October was 111,513. In the ten months ending with October, 1,029,168 arrived. For some weeks past, however, the number of those returning to Europe has severely taxed the capacity of outgoing steamships.

....Direct communication by rail between Los Angeles, Cal., and Guatemala City before January 1st, 1908, is promised by J. P. Neeland, general manager of the Pan-American Railway. For the line from the Isthmus of Tehuantepec to the Isthmus of Panama subsidies have been granted by all the Central American republics except Guatemala.

The Independent

VOL. LXIII NEW YORK, THURSDAY, DECEMBER 26, 1907 No. 3082

Entered at the New York Post Office as second-class mail matter.

Survey of the World

National Politics

Following Mr. Roosevelt's announcement of the 11th that his determination not to accept a nomination for another term had not been changed, there was much gossip in the press to the effect that Secretary Cortelyou's friends had been trying to obtain delegates for him under cover of a movement ostensibly for a renomination of the President. Therefore the Secretary, who was ill, gave to the public, on the 17th, the following statement:

"I do not know that I am called upon to make a statement at this time, but in view of the various rumors in circulation as to the alleged political activity of friends of mine in my interest, I will say that I have not been a candidate for anything but the confidence of the people in the discharge of my duties as Secretary of the Treasury.

"I have not in person sought, nor have the friends whose names have been mentioned in this connection sought, to influence political movement in my interest; I have not, nor have they, used any influence, directly or indirectly, to secure political support for or against any candidate for the Presidency, and accusations that such has been done are unqualifiedly false.

"In no office, in no one of the three departments with which I have been connected, have I authorized or permitted officials or employees to attempt to influence any such movements, nor shall I do so.

"In common with many other citizens, I have decided views as to policies and as to candidates, but I shall refrain from expressing them until I believe it is proper for me to do so.

"Upon this statement I am entirely content to leave the people to draw their own conclusions regarding such rumors as those to which I have referred. If in the future I shall decide to be a candidate for any office I shall be prepared to say so frankly and state the grounds upon which I ask for support. In the meantime I shall try, as I have tried in the past, to conduct the Treasury Department for the benefit of the people of the whole country, and absolutely without regard to whether any action I may take in the line of my duty may adversely affect my personal or political welfare.

"GEORGE B. CORTELYOU."

It is asserted by several newspaper correspondents that the pleasant relations of Secretary Cortelyou with the President have not been disturbed. There were reports that First Assistant Postmaster-General Hitchcock was the influential friend of the Secretary who had been striving to obtain support in the South for his candidacy. Concerning the Secretary's statement, Mr. Hitchcock says:

"It disposes of the charge that I have been in any manner disloyal to President Roosevelt. That charge is absolutely false; in fact, the President has told me that he knows it to be false. I do not care to discuss the matter further."

Commenting upon the President's announcement, Mr. Bryan says he has acted wisely, "for he has nothing to gain by another term, and a defeat would be disastrous." The opposition of Democrats to his candidacy, he continues, "was not on account of his popularity," but for the reason that his candidacy would make it imposible for them to secure the support of Roosevelt Republicans:

"The natural fight is between the Democratic party and the reactionary element of the Republican party, for in such a fight the Democrats can take advantage of the educational work that President Roosevelt has done and

the issue ought not to be in doubt. Senator La Follette would poll the radical strength of the Republican party, but would lose even more than President Roosevelt would among the standpatters.

"Secretary Taft will, if nominated, straddle the issues and seek to hold the two wings of the Republican party together. He can not hope to hold all the radicals that the President would hold or La Follette would hold, neither would he alienate as many of the standpatters. With him as a candidate the aim of the Democrats would be to show that he does not stand for any reforms worth mentioning, and that his administration, if in line with his utterances thus far, would be colorless."

Secretary Taft returned to his office in the War Department on the 21st, and at once resumed the work laid aside nearly four months ago.——On the 15th, State Senator Martin Saxe, of New York, sent to Governor Hughes a letter, saying that it was his purpose at the approaching meeting of the Republican County Committee to offer a resolution "to the effect that it is the belief of the committee that the Republican voters of the county of New York desire your name presented for President at the national convention." Being unwilling to pursue any course which might be distasteful to the Governor or embarrassing to the plans of those who were in his confidence, he asked for some expression to guide him. The Governor replied:

"Your letter of the 15th has been received. I do not think it proper for me to make any suggestion as to what the county committee should do, or should not do. I stated my attitude in my speech before the Republican Club, and by that I stand. It is of the highest importance that the work of the Administration shall be disinterested, and I shall do nothing to influence the selection or vote of delegates. I assume that the party representatives will take such action, whatever it may be, as they believe to be best. They have their duty, and I have mine. I think my position is clearly understood."

At the meeting of the committee, on the 19th, the proposed resolution was offered, and, upon the motion of a friend of Chairman Parsons, was laid over for action at the meeting to be held one month hence. The newspapers say that Chairman Parsons, well known as a friend of the President, prefers Secretary Taft.——Governor Johnson, of Minnesota, denies a recent report that he had told a friend he was a candidate for the Democratic nomination.

Congress

The past week in Congress has been devoted to the preliminary work of referring bills to the committees appointed by the Senators and by the Speaker of the House, as no serious business can be done until after the holidays. This was the occasion of a sensational fracas on the floor of the House, just after adjournment, between the Democratic leader, John Sharp Williams, of Mississippi, and Mr. De Armond, of Missouri, his rival for the leadership, over the assignment of a colleague of the latter to a committee. Mr. De Armond gave Mr. Williams the lie and the latter struck him in the face, and there was a fight until they were separated. Among the resolutions presented, one which secured most attention was offered in the Senate by Mr. Tillman, instructing the Interstate Commerce Committee to report some measure that would insure the State's police power to control the commerce in liquors that come over their borders. There was discussion as to what committee it should be referred to, and Senator Knox stated very clearly the difficulties involved, in that the United State Supreme Court has decided that liquors are legitimate subjects of commerce between the States over which Congress has supreme control, and that the right to sell in the original package is an incident of the right of interstate commerce. Senator Knox added that under the later Wilson act the Supreme Court has decided that, while liquors must go to the original consignee, the State has the right to forbid this consignee to sell them even in the original package. He may import his case of liquor, or his bottle, and drink it at home, but not sell it. Mr. Knox then suggested to Mr. Tillman that a resolution was unnecessary, and that all that was necessary was to present a bill, which Mr. Knox accommodatingly drew up for him, surrendering to the States the right to control liquors from the moment they cross the State line, and before they reach the consignee. This would allow a prohibition State to exclude entirely the importation of intoxicating liquors within its territory. It is an interesting fact that thus Senator Tillman, who was the father of the State dispensary system in South Carolina, and who bitterly opposed, but unsuccessfully, the

effort to overthrow that system, now helps to make prohibition more drastic, altho some assert that the object of those who favor this extreme measure is to make the law so unpopular as to cause a return to the license system. The bill, as drawn up by Mr. Knox, is as follows:

"That all fermented, distilled, or other intoxicating liquors or liquids transported into any State or Territory, or remaining therein for use, consumption, sale or storage therein upon arrival within the borders of the State, and before or after delivery to the consignee, in such State or Territory, be subject to the operation and effect of the laws of such State or Territory enacted in the exercise of its police powers, to the same extent and in the same manner as tho such liquids or liquors had been produced in such State or Territory and shall not be exempt therefrom by reason of being introduced therein in original packages or otherwise."

Railroad Rate Compromise

It is now expected that the passenger rate controversy between the Southern Railway and the authorities of several Southern States will be settled upon the lines of a compromise agreement, the terms of which were made known on the 19th by Governor Glenn, of North Carolina. This agreement, to which the Governor and the Southern Railway are parties, provides that the general rate on all passenger business, interstate and intrastate, shall be 2½ cents per mile; that 2,000-mile books for the use of firms and a limited number of their employees, and also for the use of families, shall be offered at 2 cents, and that 500-mile books may be obtained by families for a rate of 2¼ cents. Legislative action is needed, of course, but it is said that Governor Glenn expects that the approval of the Legislatures of North Carolina, South Carolina, Georgia, Virginia, Tennessee and Alabama will be granted.

Labor Questions

President Roosevelt has directed that the troops under command of General Funston be withdrawn from the mining camp of Goldfield, Nev., on the 30th. This decision appears to be the result of the inquiries made at Goldfield by the special commission which he sent to the place, and which was composed of Commissioner Herbert Knox Smith, Commissioner Charles P. Neill and Lawrence Murray. The mine owners were in great fear of the Western Federation of Labor. On the 17th, the President sent to Governor Sparks a long telegram, part of which was as follows:

"I sent the troops at your request, because, from the tenor of your telegram and from the representations made me by the two Senators from Nevada and the member of the Lower House of Congress from Nevada, it appeared that an insurrection was imminent, against which the State authorities would be powerless. The troops have now been in Goldfield ten days, and no insurrection has occurred, and seemingly no circumstances exist to justify your now calling on me for action by the troops under the provision of the Constitution.

"The troops were sent to Goldfield to be ready to meet a grave emergency which seemed likely at once to arise, and not to provide a substitute for the exercise by the State of its police functions."

As the Legislature of Nevada had not been convened, he added, he was bound to assume that the peace officers of the State could maintain order. Three days later, having received no answer from the Governor, he sent another telegram, in which he said:

"I am informed by the three representatives of the Department of Commerce and Labor, who are in Goldfield by my order, that you have stated to them in writing that you will not convene the Legislature to consider call for troops nor take the necessary steps to form a safe military force.

"Their report further satisfies me that there is no disturbance threatened which the Government of Nevada ought not be able to control if it starts to work with a serious purpose to do so, but that no effort is being made by the Government of Nevada to take the steps necessary in the matter."

Justice Gould, of the Supreme Court of the District of Columbia, has granted an injunction forbidding the American Federation of Labor to boycott the Bucks Stove and Range Company, of St. Louis, or to print in the Federation's official organ the company's name in "Unfair" and "We don't patronize" lists.

The Departure of the Fleet

The fleet on its voyage to the Pacific left Hampton Roads on December 16th, and is now making good time down the Atlantic Coast. The commander-in-chief, flag officers and captains took breakfast with the President on board the "Mayflower," and at ten o'clock the signal flags spelled out the order "pro-

ceed upon duty assigned," and the great battleships swung into line. The "Mayflower" accompanied the fleet into the open sea, and off Cape Henry the sixteen vessels past in review before the President on the bridge. The vessels were steaming 450 yards apart, and each fired twenty-one guns as she past the presidential yacht. The "Dolphin," carrying the Secretary of the Navy and other officials, accompanied the "Mayflower." The fleet was constituted as follows:

Commander in Chief, Rear Admiral Robley D. Evans.

First Squadron.

first division.

Connecticut (flagship of Commander in chief), 16,000 tons; Capt. Hugo Osterhaus commanding; Lieut. Commander Robert B. Higgins, fleet engineer.

Louisiana, 16,000 tons; Capt. Richard Wainwright commanding.

Kansas, 16,000 tons; Capt. Charles E. Vreeland commanding.

Vermont, 16,000 tons; Capt. William P. Potter commanding.

second division.

Read Admiral William H. Emery commanding.

Georgia (flagship), 14,948 tons; Capt. Henry McCrea commanding.

Virginia, 14,948 tons; Capt. Seaton Schroeder commanding.

New Jersey, 14,948 tons; Capt. William H. H. Southerland commanding.

Rhode Island, 14,948 tons; Capt. James B. Murdock commanding.

Second Squadron.

Rear Admiral C. M. Thomas commanding.

third division.

Minnesota (flagship), 16,000 tons; Capt. John Hubbard commanding.

Ohio, 12,500 tons; Capt. Charles W. Bartlett commanding.

Maine, 12,500 tons; Capt. Giles B. Harber commanding.

Missouri, 12,500 tons; Capt. Greenlief A. Merriam commanding.

fourth division.

Rear Admiral C. S. Sperry commanding.

Alabama, 11,525 tons; Capt. Samuel Ten Eyck Veeder, commanding.

Illinois, 11,525 tons; Capt. John M. Rowyer commanding.

Kearsarge, 11,525 tons; Capt. Hamilton Hutchins commanding.

Kentucky, 11,525 tons; Capt. W. C. Cowles commanding.

fleet auxiliaries.

Culgoa (supply ship), 5,725 tons; Lieut. Commander John B. Patton commanding.

Glacier (supply ship), 7,000 tons; Commander William S. Hogg commanding.

Panther (repair ship), 3,380 tons; Commander V. S. Nelson commanding.

Yankton (tender), 975 tons; Lieut. Walter R. Gherardi commanding.

The torpedo boat flotilla has left Port of Spain, Trinidad, and will join the fleet at Rio Janeiro by January 11th. The Brazilian Government is making preparations for a series of entertainments for officers and men during their ten days' stay at that port. At Magdalena Bay, Lower California, the Atlantic fleet will join the Pacific fleet, bringing together fifty American men-of-war in one of the largest harbors of the Pacific Coast. A wireless message from Rear-Admiral Evans gave it as his personal opinion that the fleet, or part of it, would return from the Pacific next summer by the way of Suez. European papers of all languages comment extensively and variously on the voyage of the fleet. The London *Times* confesses that the misgivings which it formally expressed on the inopportuneness of the cruise have been dispelled by Secretary Taft's visit to the Far East and the admirable temper and restraint shown by the Japanese Government and people. In regard to President Roosevelt the *Times* says:

"His attitude must command the respect and approbation of Englishmen. We admire the resolution with which he clings to his naval policy not less than the broad wisdom by which it is inspired."

Many of the Paris papers, in discussing the "American Armada," speak of it as the first act in the struggle between Japan and the United States for the supremacy of the Pacific, and compare the naval strength of the two nations to the advantage of the Japanese. Admiral Rojestvensky, who conducted the Russian fleet to the Sea of Japan, says:

"The Japanese personnel, man for man, is now undoubtedly more efficient than the American; this is due to practice in battle, but the American ships so exceed the Japanese in strength and numbers that there is no question of American superiority."

Naval experts of Germany, France and England comment on the fact that the American vessels in their journey from one American port to another are obliged to depend upon foreign coaling stations and colliers, nine-tenths of which are British vessels, and on the difficulties of the passage of the Magellan Strait by such a large fleet. Viscount Hayashi, the Japanese Foreign Minister and Admiral Togo, express their good wishes for the voyage and promise a hearty and friendly welcome to the

American battleships if they extend their cruise to Japan.

The Central American Peace Conference

The Peace Conference of the five Central American States of Salvador, Honduras, Costa Rica, Nicaragua and Guatemala, convoked by the United States and Mexico, closed its labors last week after signing eight treaties. The most important results of the conference have been the establishment of an international court —judicial, not arbitral, in character—to which all disputes of whatsoever character must be submitted, the provision that the Presidents of the various republics shall not be eligible to perpetual re-election, the neutralization of the territory of Honduras, and the prevention of one country from interfering in or instigating a revolution in another republic, or recognizing a new government until its stability is well established. If these provisions are carried out in good faith Central America is assured of internal peace from this time forward, for they safeguard existing governments, prevent the much-dreaded dictatorship, and abolish the chief cause of revolutions. John Barrett, the Director of the Bureau of American Republics, says the conference "was one of the most important international gatherings ever held in the Western Hemisphere, if not in the world, and the most progressive step toward absolute arbitration of disputes of nations that has been recorded in history." To Secretary Root and Ambassador Creel are due the credit for the great success of the conference.

The New Cardinals

The Pope has created four new Cardinals, and took the opportunity to rebuke those who in an open way or by dissembling attack his late condemnation of Modernism. The four new Cardinals are Mgr. Pietro Gasparri, secretary of the Congregation of Extraordinary Ecclesiastical Affairs; Mgr. De Lai, secretary of the Congregation of the Council; Mgr. Ludovic Henry Lucon, Archbishop of Rheims, and Mgr. Paul Pierre Andrieu, Archbishop of Marseilles. The Pope also made Mgr. Kennedy, rector of the American College at Rome, and Mgr. O'Connell, rector of the Catholic University at Washington, titular bishops—that is, bishops of extinct sees, so that they have the rank of bishops, but without exercising the usual episcopal functions. It is observed that the four Cardinals appointed are all from Latin countries, two Italian and two French. Under the Concordat there were usually eight French Cardinals. These are the first appointed by Pius X from France, and there are now six. Thus the three great Catholic countries—France, Spain and Austria-Hungary—have each six Cardinals; Germany has only two since the death of Cardinal Steinhuber; the United States, South America, Belgium, Portugal, Ireland, Australia, have one Cardinal each, and all the rest are Italians. There is some little expression of disappointment in American Catholic journals that the Latin countries, in which Catholicism is declining, should be so favored with Cardinals, while the United States, with so strong and loyal and generous a Catholic population, should be allowed only one. The Pope's encyclical, with its severe penalties, followed by the last pronouncement making the decisions of the Biblical Commission binding, seems to work fairly well. Not a recognized Catholic journal anywhere ventures to print a word in criticism, or anything modernistic. In Florence the *Stadi Religiosi* is about to cease publication. The editor, Dr. Minucchi, a priest, is a fine biblical scholar, and his review has been a credit to the Church.

French Church Property

The completion of the separation of Church and State in France has been effected by the passage in the Chamber of Deputies of the Government bill transferring to the State departments and communes all property forfeited by the Church. Opposition was chiefly directed against the clause providing that funds given to the Church for masses and other pious purposes should go to the support of public charities, except where direct lineal descendants bring suit for their recovery. Collateral heirs are not entitled to claim these legacies. An attempt was made to amend the bill by providing that the departments and communes should fulfill the conditions of the legacies by hiring a priest to say the masses; but M. Briand, Minister of Education and Pub-

lic Worship, refused to accept this amendment on the ground that it was tantamount to a renewal of the Concordat. He stated that the Church had had an opportunity to retain its funds by establishing cultual associations in accordance with that law, but refused to take advantage of this opportunity. The bill was passed by a vote of 354 to 177. So far the State has not become enriched thru the acquisition of the Church property. At the beginning of the agitation the value of the property of religious orders was said to be a billion francs. This growing accumulation was regarded as a menace to the State, and it was proposed to use the confiscated property to establish a fund for old age pensions, but in carrying out the law very little property of value has been found tangible. Liquidation has been ordered in the cases of 677 associations and has been completed in 115. In these legal proceedings the Government has expended over $200,000, and the balance in favor of the Government from these cases so far amounts to only $38,000. According to the reports of the Ministers of Finance and Justice, the suppressed orders

"have carried almost all their fortune with them to foreign countries, raising money on their real property to such an extent as to leave an important deficit and diminishing its value by every means, including an unprecedented abuse of procedure."

The city of Paris has become responsible for large expenditures to keep in repair the churches of the city. An appropriation of $360,000 will be needed next year for the repairs on Notre Dame and other old buildings. Church property, except real estate, is required to pay taxes, but the revenue of the city from this source during the past year was only $90. In order to suppress the schools of the religious orders which have been, in many cases, carried on by priests and nuns in lay garb, a bill has been introduced by Deputy Massé excluding clericals from the control and instruction of private schools. The bill also provides that any private educational institution can be closed by a simple ministerial decree without reference to Parliament, "in case an institution instructs contrary to morals, to the constitution or to the laws."

The Persian Parliament

Popular government is not working smoothly in Persia. Four times in the last fifteen months the Shah has been forced to give his approval to a constitution and to express his satisfaction with all that Parliament has done and intends to do. Each time, however, the Constitutionalists have renewed their efforts to increase their power in the Government and the court party has resumed its policy of reaction and intrigue. An armed conflict in the capital seemed inevitable this week, when the Assembly Building was surrounded by the well-armed and drilled soldiers of the Constitutionalists, while the regular troops of the Shah, augmented by levies of villagers, were stationed in Artillery Square. The Shah ordered the arrest of the Premier, Nasir el Mulk, and other leaders of his party, but Parliament refused to surrender them. But the crisis was averted thru the intermediation of the priests and a new cabinet formed, with Nizam-es-Sultan, Governor of Ispahan, as Premier. The new Government was approved by the Shah and Parliament, and the troops on both sides were withdrawn. Germany has looked with uneasiness at the situation in Teheran, where her financial interests are considerable, but the representatives of Great Britain and Russia acted in harmony, according to the recent treaty, and the control of affairs was left to them. The extravagance and corruption of the former reign placed a heavy burden of debt upon Persia. The foreign and domestic loans amount to $30,000,000, and the total revenue of the Government is $7,500,000. Last year there was a deficit of $2,000,000. It is reported, however, that the Finance Committee of Parliament has succeeded in augmenting the revenue and reducing the expenditure so it will be possible to make both ends meet. It is a striking indication of the revolutionary temporary temper of the people that Abbas Agha, who last August assassinated the Atabeg, Mirza Ali Asghar Khan, and then committed suicide, is held up to the people as a martyr and a model of patriotism. His grave was visited by a hundred thousand people, including military officers and members of the National Council.

Governor Hughes

BY JACOB GOULD SCHURMAN, LL.D.

[Now that the field is open for the Presidential election of 1908 we are glad to print the following article on Governor Hughes from the President of Cornell University, where Governor Hughes was formerly Professor of Law. We shall follow this article with others on the leading candidates of both parties.—EDITOR.]

IN complying with the request of the editor of *The Independent* to write an article on Governor Hughes I have assumed that what is desired is, not an intimate account of his personality, but an estimate of his attitude and career as a public man. Even for this purpose, however, a brief sketch of his life will prove a helpful introduction.

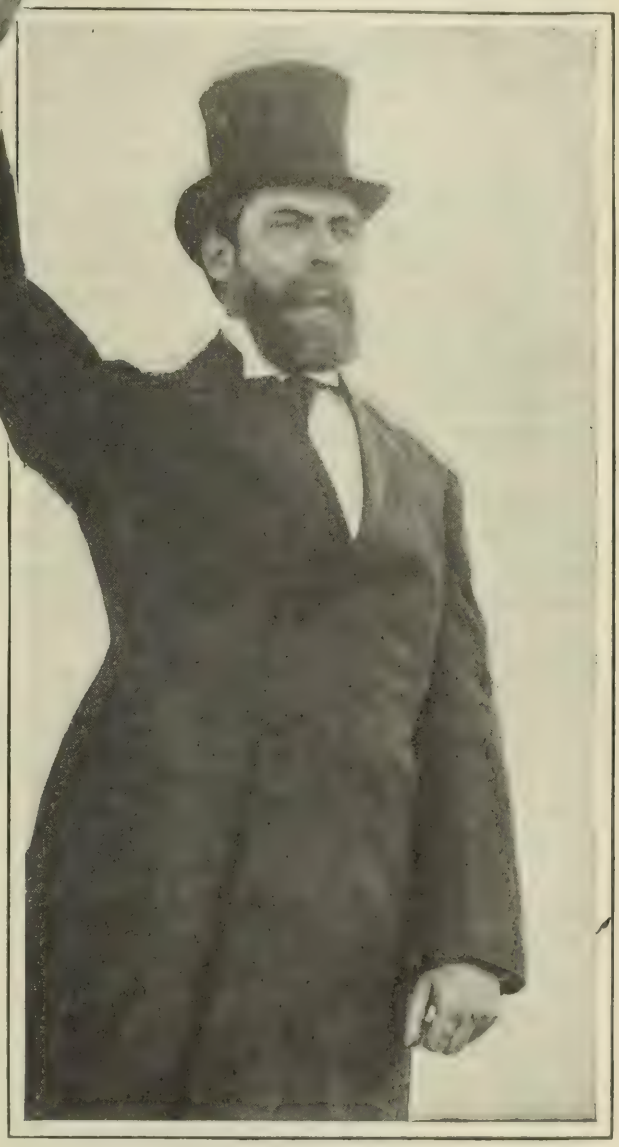
Charles Evans Hughes was born at Glens Falls, New York, on April 11th, 1862. On the father's side he is of pure Welsh stock, on the mother's side in the maternal line of pure Holland Dutch stock and in the paternal line of Irish, English and Scotch blood, with a predominance of Irish. At the time of the son's birth the father was a pastor of the Baptist Church at Glens Falls, tho he had formerly been a teacher. The mother had also enjoyed a superior education and had an unusual aptitude for mathematics, which was transmitted to her son. During his early years the boy studied at home under his parents, and at the age of fourteen he entered Madison—now Colgate—University. After two years he migrated to Brown University, from which he graduated in 1881. His high standing was attested by his election to the Phi Beta Kappa Society; he received honors in the classics and in English literature; and scholar as he was, he was also known among the students as a good fellow, who not only enjoyed social intercourse but participated in the amusements, pranks and innocent follies of youth.

Graduating at nineteen years of age, he taught school for a year to earn the means necessary o begin the systematic study of law, which meanwhile he read out of school hours in the office of a friendly lawyer. Then he entered the Columbia Law School, from which he graduated in 1884 with the highest honors. For the next three years he was clerk in a law office in New York City, while in the evenings he gave some instructions to law students. In 1888 he became a member of the firm of Carter, Hughes and Cravath, from which he withdrew in 1891 to accept a professorship of law in Cornell University, where his extraordinary abilities and attainments as a scholar, teacher and lawyer were immediately recognized. At the earnest solicitation of Mr. Carter he joined him again in 1893 in the practice of law. And until his election as Governor he was continuously engaged in the active practice of his profession.

I may here record some of the impressions made by Mr. Hughes on those who knew him at Cornell University and have since known him as a lawyer in New York City. In his physical build he was about six feet in hight, slender rather than stout, but sturdy, tough and wiry. Then, as now and always, he was a most indefatigable worker; in this respect indeed he excels any man I have ever known. His mental outfit is not less remarkable. To understand things is a necessity of his nature. Like Lord Bacon he must have the "dry light" of reason on whatever he deals with—the truth, the whole truth and nothing but the truth unaffected by any distorting or discoloring rays of passion, prejudice or emotion. He possesses a powerful intellect, which is at once acute in action and comprehensive in range. Analysis is the mark of the great lawyer, and Mr. Hughes has this faculty in its highest potency. Not less admirable is his ability to grasp quickly a complicated mass of facts and arrange them in logical order. I have seen him work himself into new questions, feel his way to the heart of them, then gradually marshal the facts with reference to some fundamental principle or some significant circumstance until the whole situation became

*Photographs copyrighted, 1907, by Brown Bros., New York City.

luminous even to the mind of a layman; and all this time the speaker talked literally "like a book," and what he said might have been printed almost without change in a treatise on law or a commentary on cases. But this gift of intellectual divination and synthesis marks the creative mind. Mr. Hughes is not only analytic and critical but creative and constructive. His friends, his associates at the bar, and the judges of the courts have long admired this remarkable combination of gifts. And the general public have become aware of them also since Mr. Hughes followed up his wonderful gas and insurance investigations with drafting remedial legislation, and especially since as Governor he framed his Public Utilities Bill as a solution of the gravest question of public policy now before our people.

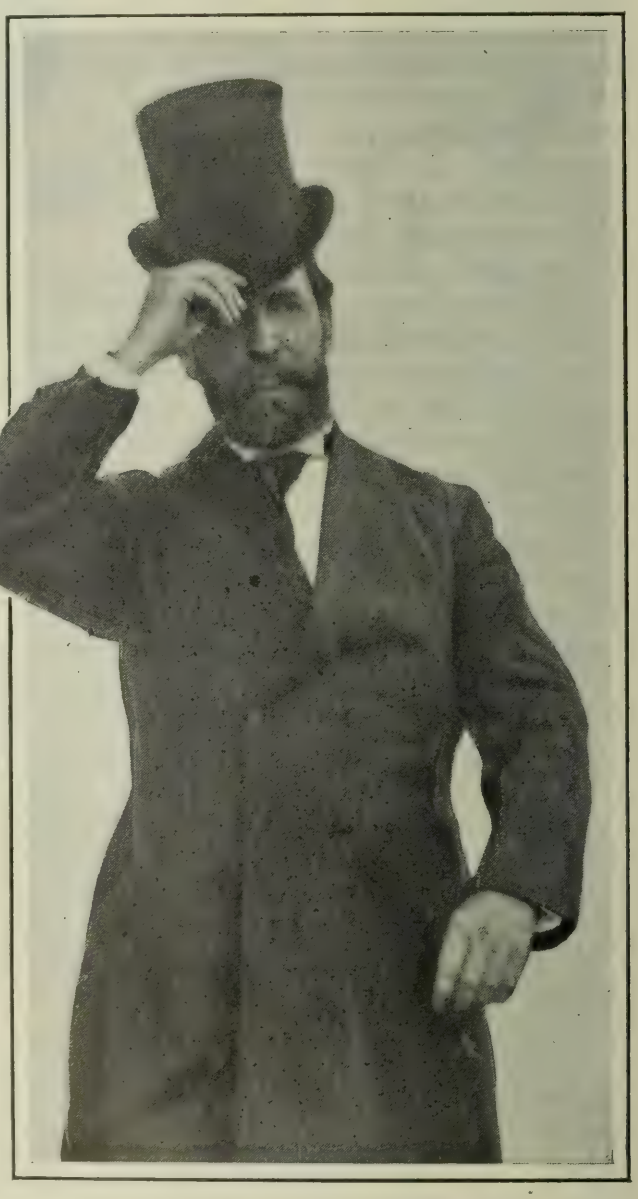


Quite as remarkable as his intellectual gifts is his sense of justice and fair play. This was impressively recognized the other day by Mr. Ahearn when, at the close of his examination, he said that, whatever the finding of the Governor, he desired to thank him for the courtesy and fairness of the examination. Similarly, Mr. Hughes's fearlessness and independence have for many years been well understood by those who know him. And his firm attitude toward hostile politicians and legislators since he became Governor has given open proof of these characteristics to the public. Indeed, the moral attributes of the man are quite on a par with his intellect, powerful and capacious as that is, even if they do not surpass it. For Mr. Hughes has always been distinguished by absolute integrity of character and fidelity to duty. It is no accident, but the deepest instinct and conviction of his nature, that has made him the exponent and champion of the sacredness of fiduciary obligations alike in business and in politics. His own personal life is built on that foundation and his own professional practice as a lawyer has been regulated by that principle. It meant fidelity to all his clients, but subserviency to none. He never accepted general retainers involving his commitment to any and every kind of service. Both his integrity and his sense of independence forbade truckling to any client and condoning dubious or crooked ways.

I have said that Mr. Hughes is a marvelous worker; he also becomes absorbed in his work so that for the time being nothing outside the range of his duties can greatly interest, much less excite him. It is not merely power of voluntary concentration, but involuntary absorption in the object of his activity. His work literally takes possession of him and has at command the best that is in him. It is consequently impossible for him to do anything he undertakes in a half-hearted or slipshod manner. Whether teaching law, defending a client or administering the affairs of the State of New York, he

gives himself to the duty in hand with such whole-souled earnestness and devotion that no energy or interest is left for outside matters which do not concern him. And this circumstance, along with a large natural endowment of common sense and excellent practical judgment will explain why his course as a public servant has been so sure-footed and unerring. Few men have entered on public office surrounded by so many dangerous pitfalls; I recall no man who has made fewer mistakes. In view of it all one might say that he is not only safe and sane, but almost infallibly sagacious.

He has clearly defined to himself the scope and functions of his office as determined by the Constitution and the laws. So much the intellect of the man imperiously demanded. Then, having made clear to himself what ought to be done, he has dedicated all his powers to the service of the State; at the same time he has rigidly and inexorably drawn the lines which separate the office of Governor from the functions of the Legislature on the one hand and of the Judiciary on the other. And being Governor, he has felt it incompatible with the dignity of the office or the duty he owes to all the people of the State to give any attention whatever to party politics or to party organization and management. While he was nominated by a party, he holds himself since his election the servant of the people and of the people alone.



Mr. Hughes is under no illusions concerning his nomination and election to the Governorship. He knows that the party leaders in general were opposed to him. They accepted him only because it was finally recognized that no other Republican nominee could win victory at the polls. My own personal belief is that no one contributed more effectively to the enforcement of that view than President Roosevelt. As a most sagacious party leader, the President recognized in the hero of the gas and insurance investigations a name to wrest victory in a critical contest in his own State. I believe that in the interest of the party he urged the nomination, and that this pressure was the deciding influence in the convention. But all the while Mr. Hughes stood aloof as tho the matter were no concern of his. And indeed he regarded it as no concern of his. He would not say he desired the office; he would not authorize any one present to present his claims or herald his availability. It was a matter solely for the people of the State to decide.

In the Latin language *ambition* meant a candidate's going about to solicit office. Of such a quality Mr. Hughes is absolutely devoid. It is one thing to fill an office and another thing to get an office. To get an office has never been Mr. Hughes's aim or desire. His opportunities of public service have come to him unsought. It is not that he regards himself as superior to other men or that he does not value the good opinion of his fellow-citizens. He does appreciate the

confidence and esteem of his fellows. But if they want him for public service he feels that the call should come from them; and if they do not want him he does not desire the office; so that in any event there is absolutely nothing for him to do. And he is so far from cherishing any illusions as to his comparative standing with other men that he recognizes very clearly that his nomination to public office was due to a combination of circumstances which made him, in the estimation of his party, the most available man. He is the last man in the world to think himself a Moses, he knows he is not essential to the State, he does not pretend to be a leader with a mission, he claims only to be an everyday American citizen, who was selected for the Governorship (out of a number of others any one of whom might have been chosen) because of his prominence in the insurance investigation, which he had undertaken, not on his own initiative, but at the request of a legislative committee. As he would have nothing to do with getting the nomination, as the coming of the nomination to him was no concern of his, so there remained open to him only one way of showing his appreciation of the confidence which had been vouchsafed to him by the people of the State, namely, by discharging the high duties to which they had called him with all the ability, wisdom and virtue he could command. To thank any person or persons for the nomination would have been tantamount to the confession that these persons had done him a favor. But from Mr. Hughes's way of looking at a nomination as a call of the people to serve them, with which he had no concern, it will be obvious that such a procedure would have been a stultifying of himself. On the other hand, inclination, duty, pride and self-respect all conspire to move him to make a record as Chief Executive, which shall amply justify the wisdom of the convention and the confidence of the people.

"A disposition to preserve, and an ability to improve, taken together, would be my standard of a statesman," says Burke. Whether Mr. Hughes is in the habit of reading Burke I do not know. But his record since he became Governor admirably illustrates Burke's conception of a statesman. Recognizing that government is a marvelous contrivance of human wisdom to provide for human wants, that it embodies the collective judgment, intellectual, moral and practical, of many generations, including individuals wiser and juster than any now alive, and that the government of the United States, in particular, is the best

and noblest system which the political genius of mankind has yet produced, a statesman of the type described by Burke would look with suspicion on all sorts of projects and projectors of innovation that threatened the constitution and the well-established institutions of the country. But he would also recognize with Burke that "a state without the means of some change is without the means of its conservation." The principle of correc-

tion is as essential as the principle of conservation. But changes are not to be made at random, still less for the satisfaction of some abstract theory or dogma. Every change is to be made for the remedy of some definite evil, and it should be confined to the peccant part only and not extended to unoffending members or healthy functions. And as it is circumstances which render every civil and political scheme beneficial or noxious to mankind, every proposal of reform should be considered on its own merits and especially with reference to its suitability and potency to remedy some particular evil in the existing system.

Now look at Governor Hughes's utterances and official acts. "Human society," he declared at Chautauqua in August last, "cannot be stable unless it is progressive." The republic, like every other living and growing organism, must by successive changes adapt itself to its environment. But these affect, as it were, the outer parts of its organization. In itself considered, the republic, the Governor went on to say, "may be likened to a man of excellent constitution and native vigor who finds there is no evidence of decay in his vital functions, and that there is every indication of fundamental soundness and of steady improvement." The analogy will be complete if we suppose this fundamentally sound man "determined by a proper system of hygiene and suitable rules of conduct to correct some disorders in his system and come as closely as possible to perfect health." And the first hygienic rule laid down by the Governor is "to avoid undue excitement of the nervous system." A most characteristic precept!

Happily we are not concerned with organic evils in the body politic. There are, indeed, functional disorders to be corrected. To diagnose them and to prescribe remedies is the business of reason and judgment. The first step is a knowledge of the facts. But this is not to be found in "scrappy sensationalism or distorted emphasis," still less in shrieking hysteria. It is a work of quiet, careful and painstaking analysis and reflection. And till the truth regarding both the existing evil and the proposed remedy is accurately and exhaustively known, no healthful or sensible action can be taken. Consequently, the reign of reason in government implies patience. And the need of patience "is the hardest lesson for a democracy to learn." Yet Governor Hughes has no vague fears about the outcome. He has a profound belief in the ability of the American people "to cure existing evils without disturbing their prosperity." This is because the vital parts of our political organization are not impaired and retain efficiency to regenerate any defects. Thus conservation and correction go hand in hand. And the way of salutary correction of reform is always by patience, by deliberation, by wisdom, by truth, by justice and fair play, as Governor Hughes never wearies of proclaiming.

But we may submit the Governor's theories to the test of actual practice. How has he in his official acts managed to combine reform—not merely specious, but thorogoing and effective—of notorious abuses with a tender and reverent conservation of the Constitution and the existing institutions and machinery of government?

A test case is found in the Governor's policy of regulating the Public Service Corporations. It was for the State the problem which President Roosevelt had stamped upon the consciousness of the nation, and solved in a way that will give him a permanent place in American history. "By his vigorous administration," said Governor Hughes in his speech before the Republican Club of New York City, "his virility, his broad humanity and his determined opposition to notorious abuses, our fellow citizen, the distinguished President of the republic, has won the hearts of the people. We have not only his example, but we know that he is and has been in cordial sympathy with every effort for efficient administration for the correction of evil and for the improvement of our laws."

But not only the interests concerned, the legislators of both parties were at first opposed to the Governor's measure of reform. The Governor, on the other hand, was deeply persuaded that it was the duty of statesmanship "to remove the causes of unrest which lie in abuses of public privilege." A fundamental purpose of his measure of reform was to "vindicate the adequacy of our institu-

tions to put an end to abuses without tumult or disorder, without injustice or demagogry." The measure itself provided, to the fullest extent consistent with constitutional requirements, methods of investigation and redress thru which the public obligations of reasonable, impartial and adequate service could be enforced and public safety and convenience be conserved. In a speech delivered at Utica on April 1 the Governor explained his measure to the public, and four days later he defended it against criticism in a speech at Glens Falls. The proposed bill for the regulation of the public service corporations was, I might perhaps not incorrectly say, based on the recognized principle that the tenure of their property was the performance of some duty. The Governor calmly, dispassionately, but with logical impressiveness, pointed out "that the people, without animosity toward the rights of property, but with a just insistence upon the performance of public obligations, demand that the State shall exercise its power over its creatures and compel due regard for the duties which are correlative to the privileges it has granted." Every power which a corporation has is derived from the Legislature, which creates it. A public service commission is an administrative board, which represents the Legislature in the supervision and control of these creatures of the laws, its function being to secure for the public safety, impartiality, adequacy of service and reasonable charges. Nor is the existence and exercise of this power inconsistent with property rights. For "the property of a public service corporation has been acquired subject to this power." And as no person can, under the Constitution, be deprived of his property without due process of law, the courts will protect the corporations against regulation which has the effect of confiscation. The Governor objected to giving the courts power to review *all* orders of the commission, first because this would overwhelm the courts with business of a purely administrative character, and secondly, because it would in effect make the legislative commissions purely advisory bodies and the courts themselves the final ruling administrative authority. There were other explanations equally broad and convincing, but I have space to quote only one paragraph from the speeches, which is, however, an example of the Governor's manner of statement, argument and logical appeal:

> "Those who desire to insure the stability of honorable business enterprise; those who desire to maintain an orderly society, secure against the success of insincere and inflammatory appeal; those who desire to maintain our institutions, with their guarantees of equality before the law and with their blessings of opportunity, realize that the time has come when the State must assert its power firmly and justly in putting an end to existing abuses, both in the administration of government and in the management of those concerns which derive their vitality from public franchises. Those who oppose this just sentiment chant their own requiem."

With those speeches the Governor left the fate of his bill to the people and their representatives in the Legislature. There was no longer doubt of the result. And today the people of the State of New York have a model law providing for the just and effective regulation of their public service corporations.

The Governor's bill for the regulation of our public service corporations is, so far as I know, the most thorogoing and radical measure of the kind that has ever been enacted by any Legislature in America. Its justification is that it rests on sound principles of law, on justice and expediency. It is a real remedy for real evils, and in its operation it cannot but promote public tranquillity and enhance respect for law, order and just government. I have already spoken of its affiliation to President Roosevelt's measures for the regulation of interstate railways. It is interesting to observe that Governor Hughes's bill gives the State Commissions power to control the issue of stocks and bonds by public service corporations, a power which, as the Governor explains, is necessary not merely to protect the investor, but to prevent the crippling of the public service or the demand for extortionate charges. It is a similar power which President Roosevelt desires to confer upon the Interstate Commerce Commission. In the fundamental policies of their administrations—the public regulation of railways—President Roosevelt and Governor Hughes are of identically the same mind.

But while Governor Hughes can be a thorogoing radical in correcting serious

evils in the administration of government, nothing could be more foreign to his nature than the arts of the demagog or the acts of passion, folly and injustice in which those arts are so constantly exhibited. Governor Hughes is a man who would follow his own sense of truth and justice even at the peril of popular displeasure. The guardian of the interests of the people, he has courage and magnanimity enough to protect those interests by measures which, thru the influence of misrepresentation or the first impulse of uninformed judgment, the people themselves might hesitate to endorse or actually condemn. But, as Alexander Hamilton said in defining in *The Federalist* the qualifications which are necessary in a national chief executive:

"The republican principle demands that the deliberate sense of the community should govern the conduct of those to whom they intrust the management of their affairs; but it does not require an unqualified complaisance to every sudden breeze of passion, or to every transient impulse which the people may receive from the arts of men, who flatter their prejudices to betray their interests."

Governor Hughes's courage was strikingly evinced in his veto of the two-cent railroad fare bill. Other States had passed such measures. In this State there was dissatisfaction with existing conditions. A wave of resentment against the railways was sweeping over the country. The two-cent passenger act had come to be regarded as a test of loyalty to the cause of the people, and no Governor anywhere, whatever his views, had been strong enough to resist the overwhelming pressure. Under these circumstances Governor Hughes sat down and wrote an able and dispassionate message in which, on grounds of justice, public policy and practical expediency he vetoed the bill. Here are some of the grounds on which he based his action:

True to his character, the Governor first made the point that facts had not been ascertained before the passage of the bill. There had been no official investigations, no reports, no collecting of statistics. The Legislature had acted without information and without suitable deliberation. It is of the utmost importance indeed that "the management of our railroad corporations should be subject to strict supervision by the State, and that regulations compelling the observance of the law and proper and adequate service should be rigidly enforced." Nevertheless, the Governor was convinced that the bill under consideration represented "a policy seriously mistaken and pregnant with disaster." The railroads have indeed been guilty of treating the public unfairly, "but injustice on the part of the railroad corporations toward the public does not justify injustice on the part of the State toward the railroad corporations. The action of government should be fair and impartial, and upon this every citizen, whatever his interest, is entitled to insist. We shall make matters not better, but worse, if to cure one wrong we establish another. . . . In dealing with these questions democracy must demonstrate its capacity to act upon deliberation and to deal justly."

The Governor recognized that a maximum two-cent passenger rate might not be unreasonably low. It might be high enough in many cases—possibly in all. The fact was, however, that no one knew and that the Legislature, before acting, had not secured the necessary information. And to enact legislation involving property rights in ignorance both of the

conditions of the business concerned and of the effect upon it of the policy proposed was something that the just, deliberate and law-abiding mind of the Governor could not by any possibility have approved.

"I deem it most important," the Governor went on to say, "that the policy of dealing with matters of this sort arbitrarily, by legislative rule of general application, without reference to the demands of justice in particular cases, should be condemned. Every workingman, every tradesman, and every citizen believing himself to have aught at stake in the prosperity of the country, should determinedly oppose it. For it not only threatens the stability of business enterprise, which makes our prosperity possible, but it substitutes unreason for sound judgment, the ill-considered demands of resentment for the spirit of fair play, and makes impossible patient and honorable effort to correct abuses."

The constructive mind of the Governor could not, however, rest satisfied with the mere negative result which his veto would produce. The evils it was proposed to remedy by this hasty and ill-digested legislation could, he pointed out, be remedied in "a better way." The Legislature had provided agencies for the redress of these evils in the Public Service Commissions it had just created. These Commissions had under law the power, and it would become their duty, to investigate the subject of passenger rates charged by railways in the State of New York. What the Legislature had attempted with haste, without information, and possibly with injustice, they could undertake with deliberation, with full knowledge and with perfect impartiality. When their inquiry is complete, "if a passenger rate of two cents a mile is just and reasonable, it can be fixt; if it is not just and reasonable, it should not be fixt." True, the work of the Commissions would require time and investigation, but democracy must learn the lessons of patience and deliberate inquiry before action. A right result is of infinitely more importance than a sham remedy. For the rest, it is most dangerous to encourage "impatience with the orderly processes of inquiry."

A courageous and honest public servant always meets with his reward. On second thought people approve of what he has done. This is notably the case when the man is sensible, open-minded, judicial and statesmanlike, as Mr. Hughes has proved himself since he became Governor. And so even the advocates of the two-cent passenger bill not only recognized the force and justice of the Governor's arguments against that particular measure, but suddenly perceived also that the very thing they were contending for as a just and reasonable reform must, if it were actually found on investigation to be just and reasonable, come to them thru the action of the State Commissions which Governor Hughes himself had induced the Legislature to establish for the handling of those very problems. The difference in procedure is an argument in favor of the Governor's method. For, unlike a Legislature, a State Commission can regulate a public service corporation intelligently, deliberately and with scrupulous justice. And this is what the American people want. "They are," says Governor Hughes, "a thoughtful and canny people, truth-loving, and desirous of getting at the heart of things; appeals to reason are more cogent than many think."

That eminent lawyer, jurist and leader of the American bar, the late James C. Carter, has left behind him a work on the "Origin, Growth and Function of Law" (which has just been published), in which he deprecates the exaggerated estimate entertained by most people of the possibilities for good which may be realized thru the enactment of law. Such a wealth of legislation testifies, indeed, to the "benevolent vanity" of our rulers, but also to their impotence. There is, however, another and more serious aspect of the case. "Among the evils which oppress society" says Mr. Carter, "there are few greater than that caused by legislative expedients undertaken in ignorance of what the true nature and function of law are." The analytic habit of Mr. Hughes's mind, his mastery of the science of law, and his large experience as a practical lawyer would seem to have predisposed him to the same view. At any rate, it is a fact that as Governor the number of measures of new legislation which he has advocated is very small, tho it goes without saying that every one of them was well considered and carefully drafted. This moderation in the use of legislation is a characteristic of all wise constructive reformers.

In the universal demand for new legislation which Mr. Carter deprecates it is constantly overlooked that the Chief

Executive, whether State or national, has, under the Constitution, nothing to do with legislation except to recommend measures to the Legislature and approve or veto the bills which the Legislature, in the plenitude of its wisdom and discretion, may enact. As Hamilton put it in *The Federalist:*

"The essence of the legislative authority is to enact laws—or, in other words, to prescribe rules—for the regulation of the society; while the execution of the laws and the employment of the common strength, either for this purpose or for the common defense, seem to comprise all the functions of the executive magistrate."

That the execution of the laws is the principal business of the Governor of the State has been clearly apprehended by Mr. Hughes. He not only understands it, he has proclaimed it, and what is more important, he acts upon it. Nay, he goes further. He claims that a perfect administration of every office would dispel almost all the problems which now perplex us. The irrepressible and multitudinous activities of our legislatures are in the main but devices to atone for defects in administration. Here is the Governor's own language, taken from his address at the opening of the Civic Forum in Carnegie Hall, New York City, on the 20th of November:

"Matthew Arnold tells us that conduct is three-fourths of life. Certainly the administration of office is at least three-fourths of political life. And if we could secure the administration of every office in accordance with its obligations and in adequate fulfillment of the fair intent of the Constitution and statutes creating it, we should find almost all our problems solved. That which is right in our system of government would appear revealed in the beauty of perfect adaptation, leaving no excuse for the use of legislative drugs to cure defects caused by lack of administrative exercise; and, on the other hand, such imperfections as existed would stand out in such bold relief as to leave little room for doubt as to the necessary remedy."

The crowning aim, the supreme effort, of Governor Hughes is to be a good administrator of his office and executor of the laws of the State. The Governor is the chief servant of the people; he is not the delegate of a feudal suzerain who permits him to promote personal or directs him to promote party ends; he is his own master, dedicated to a service which is perfect freedom, because it satisfies his own conscience, fulfils the law and advances the welfare of the people. Disinterested, devoted and strenuous service has been rendered by Governor Hughes. Like another Governor—I mean Mr. Roosevelt—he has faced the bosses and beaten them; like Mr. Roosevelt, he has made fitness and merit the qualifications for office; and, like Mr. Roosevelt, he has been a terror to evildoers in office.

The greater part of administration is local. But the Constitution provides for removal by the Governor, upon charges and after a hearing, of specified local officers elected by the people. Few of us have any adequate conception of the amount of work even one of these cases makes for a conscientious and painstaking Governor. In the case of Mr. Ahearn, Governor Hughes spent weeks in going over testimony, listening to cross-examination of witnesses, studying briefs and weighing evidence—working from early in the morning till late at night—tho he might have turned the whole matter over to a commissioner, as would have been necessary had not the Governor also been an excellent lawyer. Why did the Governor undertake these herculean labors? The answer is obvious: In the interest of good administration in every office in the State. Mr. Hughes is the trustee of the people of the State of New York for the maintenance of good administration in his own office and under certain circumstances in other offices in which the Constitution gives him jurisdiction. And as he said before the Civic Forum, "The lesson of today, both in business and in politics, is the lesson of fidelity to trust." As his insurance investigations were a moral tonic to the business world, so these investigations into the administration of public office cannot fail to elevate the standards and quicken the sense of responsibility of all officeholders in the State. It is fortunate that the Governor, with his usual candor and justice, is able to compliment the service with the declaration that it would be difficult to point to a time "when a larger proportion of public officers were striving honestly to do their duty." This is the reward of the people for putting in the highest office in the State a man who preaches, practises and demands honest, disinterested, efficient and energetic service for the benefit of the people of the State.

The Governor summed up his own position in a couple of pregnant sentences in his address before the Republican Club in New York City on the 18th of October:

"With reference to matters of administration, it has been sought to conduct the public affairs solely in the interest of the people, and not in behalf of any special interest or for selfish purposes, and not for partisan advantage save as fidelity and efficiency may have their due reward in public confidence. . . . If there is one thing more than another for which I desire the present administration to stand, it is for disinterestedness in public service."

It was in this same speech that the Governor indulged in a personal vein of talk on other matters. "I do not seek any public office," he said, and then added these memorable words:

"To me public office means a burden of responsibility—a burden of incessant toil at times almost intolerable—which, under honorable conditions and at the command of the people, it may be a duty and even a pleasure to assume, but it is far from being an object of ambition. I have not sought nor shall I seek, directly or indirectly, to influence the selection or the vote of any delegate to any convention."

Here are one or two more intimate confessions:

"I want simply to be Governor during my term.

"I have asked no man for favors, but, on the contrary, I have constantly insisted that the work of government shall be carried on, not with reference to the selfish advantage of any one, but exclusively in the interest of the people."

Facing an audience of Republican Club politicians he frankly stated and squarely answered the charge that he had neglected the party politicians in appointments to office. It had been hinted in a half-serious way that he regarded political activity as a disqualification for public office. Here is the Governor's irrefragable reply:

"I esteem those who in an honorable manner work for the party. Political activity, by virtue of the experience and knowledge of affairs gained in it, so far from being a disqualification, may be a most important qualification for office. But I want that political activity to be of such a character as to leave a man free and independent in the dignity of his manhood to perform the duties of office, if appointed, unembarrassed by improper influences and unaffected by accumulated obligations."

Again, he tells these politicians that he does "not aim to be a party boss." Nay, such is his conception of the duties of the Governorship that he would not think it proper to indulge even in political management. And, to crown all, he declares that "as a party man he will serve his party best in office by adhering strictly to his duties and maintaining the highest standards of impartial administration."

And yet this efficient servant of the State and trusted popular leader never forgets to pay his tribute to the party to which he belongs:

"The Republican party has been a party of ideals, of masterful leaders and of constructive power. We are proud that we are members of it."

It has been said that Governor Hughes, if not too self-reliant, is too chary of receiving advice. But it must be remembered that when he was elected Governor on the Republican ticket all the other State officials elected were Democrats. Furthermore, the leaders of his own party were in the main either indifferent or hostile to him. Thus he found himself in a new, difficult and vastly responsible position without natural advisers, and he was compelled "to play a lone hand." The manner he had to assume for self-protection gave rise to the silly report that he was cold and unsympathetic. His friends know what a caricature this is of a naturally friendly, kind-hearted and affable gentleman. Even the critics are now discovering their mistake. And the Governor is gradually discovering whom he can trust. Gradually, too, the old leaders have come to him, and he has listened patiently to their recommendations, tho reserving to his own judgment and conscience the right and duty of final decisions. Of course, his situation is different from that of a President of the United States who has a Cabinet to advise him on all matters and Senators to make recommendations on appointments that have no force without their consent and approval. Nevertheless Governor Hughes has made excellent appointments, and as a Governor who has been at once a public servant and a public leader he has made amazingly few mistakes. Indeed, I do not hesitate to affirm that tho our State has had illustrious names in the list of its Governors, including the names of Grover Cleveland and Theodore Roosevelt, it has never had a greater Governor than Charles Evans Hughes.

ITHACA, N. Y.

The Gifts

BY COLETTA RYAN

THE Christmas bird flew by me
With his fair and frosty wings,
And I sighed: "He will not spy me
With his burden of bright things!"

Thru the mist he answered: "Dreamer,
To earth's children I belong;
But I leave you the Redeemer
And the spirit of sweet song!"

BOSTON, MASS.

The Year in Finance and Trade

BY FRANK D. ROOT

[Mr. Root, a member of the staff of THE INDEPENDENT, has for years devoted much attention to the general course of financial and industrial affairs. Within the limits of this article, all the details of the record of American financial and commercial activity during the current year cannot be set forth, nor can there be any elaborate analysis. His aim has been merely to touch upon the leading points in the record and to direct attention to a part of the statistical evidence which deserves to be considered.—EDITOR.]

A CONTINUOUS upward movement in 1905 was followed by favorable conditions in 1906. Crops were large, wage payments were increased by at least $100,000,000, foreign trade for the first time reached $3,000,000,000, the iron and steel industry showed large and solid growth, and the railroads were overwhelmed with traffic. But the great advance in the prices of securities in 1905 could not be continued in 1906. At the end of the latter year, a majority of the representative securities showed declines, those of the Harriman railways, however, being notable exceptions to the rule. The year 1907 opened with activity in trade, prevailing prosperity, and good prices for commodities. General conditions were, on the whole, favorable, but security prices declined almost from the beginning. Partial recovery after the sharp fall of March 14th was soon followed by further loss, until a very low level was reached in the panic days of October and November. Below are shown the net changes in 1906, prices at the beginning of 1907, the low figures reached on March 14th, the lowest quotations of the year (on certain days in October and November), and the closing prices of December 21st:

SECURITIES.	Net change in 1906.	Jan. 2, 1907.	Mar. 14, 1907.	Lowest, 1907.	Close, Dec. 21, 1907.

Tennessee Coal, Iron & Railroad Company's shares ceased to be quoted, the company hav-

ing been taken over by the United States Steel Corporation during the panic at $84 per share, in bonds.

When the panic was precipitated in the third week of October by the removal of Heinze, Morse and the Thomases from their banks in New York, general conditions thruout the country had been continuously favorable, and there is no proof that speculation had been greater in volume than in 1906. We shall point to some of these conditions. First, the crops. While these were not quite so large as those of 1906, their farm value was greater. Here are the Government's figures, hay being measured by tons, tobacco by pounds, and the other products by bushels:

CROPS.

	1907.	1906.
Corn	2,592,320,000	2,927,416,091
Wheat	634,087,000	735,260,970
Oats	751,443,000	961,904,522
Barley	153,317,000	178,916,484
Rye	31,566,000	33,374,830
Buckwheat	14,299,000	14,641,937
Flaxseed	25,851,000	25,576,146
Rice	18,738,000	17,854,768
Potatoes	297,942,000	308,038,382
Hay	63,677,000	57,145,959
Tobacco	698,120,000	682,428,530

FARM VALUE OF THESE.

1907	$3,408,967,000
1906	2,926,227,071

Output at the iron furnaces had exceeded that of 1906, and the record for one month was broken in October, when the panic began. In November there was a sharp reduction:

PIG IRON, TONS.

1904	16,497,033
1905	22,992,380
1906	25,307,191
1907—	
January	2,205,617
February	2,045,068
March	2,225,175
April	2,216,568
May	2,294,005
June	2,231,575
July	2,255,660
August	2,250,410
September	2,183,487
October	2,336,872
November	1,828,125
Eleven months	24,072,562

It is noticeable that in the second quarter of the year the United States Steel Corporation established a new high record for net earnings, and that the total for the third quarter (ending just before the panic) was also very large:

STEEL CORPORATION'S QUARTERLY EARNINGS.

	1905.	1906.	1907.
First	$23,025,896	$36,634,490	$39,122,492
Second	30,305,896	40,125,033	45,503,705
Third	31,240,582	38,114,624	43,804,285
Fourth	35,278,688	41,744,964	.....
	$119,850,282	$156,619,111	

In the reports of commercial failures there were no indications of a dangerous situation. Failures for the first half of the year were less in number than in the first half of 1906, altho the total of liabilities was larger by 10 per cent. For nine months the number was less, but the liabilities were $116,000,000, against $84,000,000 in the preceding year. Up to the beginning of the panic the number of failing banks or similar institutions was only half as large as in 1906. The Fall River cotton mills had again increased wages and were declaring unprecedented dividends. This was shown at the end of their third quarter and also at the close of their year. Dividends for the year averaged 11.09 per cent., against 6.83 in 1906 and 3.34 in 1905. These were in addition to stock dividends of $2,000,000.

Railroad gross earnings were increasing. Altho for the calendar year 1906 the addition had been estimated at $240,000,000, or 12 per cent., the earnings for the first half of 1907 were said to exceed by $140,000,000 even those of the highly prosperous year preceding. But net earnings were restricted by heavier expenses of operation. Clearings were quite satisfactory. Up to November they were less than those of the corresponding ten months of 1906 by 4¾ per cent., but there had been an increase outside of New York. This was also true for the eleven months ending with November, the totals being $135,481,625,304 for 1907 and $145,734,250,714 for 1906.

Reports of business done on the Stock Exchange prove that the panic was not preceded by broad speculation. On the other hand, the figures show that for some months trading had been carried on within conservative limits:

STOCK EXCHANGE TRANSACTIONS.

	Shares, Number.	Bonds, Par value.
1904	187,312,065	$1,040,146,455
1905	263,081,156	1,024,418,770
1906	284,298,010	674,452,850
1907—		
January	22,702,760	51,226,700
February	16,470,972	32,093,500
March	32,208,525	53,742,300
April	19,235,652	43,162,900
May	15,827,245	34,099,000
June	9,479,415	21,738,000
July	12,811,354	25,268,500
August	15,561,583	30,259,800
September	12,223,541	36,780,900
October	17,333,783	63,627,000
November	9,677,494	70,284,450
Eleven months.	183,802,334	$462,283,150

The general course of the stock market was downward from the first days of January, with sharp dips on March 14th and in August, and panicky depression in October and November. The sharp fall of March 14th was not due to the condition of industry and trade. From the beginning of the year officers of railroad and other corporations that had been indicted had uttered gloomy predictions. In certain financial publications there was a continuous flow of assertion that the effect of the Hepburn Rate Act could not fail to be disastrous.

If we look at the weeks immediately preceding March 14th we shall see many pessimistic predictions in print. A letter was published in which Vice-President Brown, of the New York Central, said he did not believe any man of ordinary prudence "would for a moment think of investing money in a business [the railroads] against which every man's hand, from the President's down, seemed to be raised." The investigation of the Harriman railroads was in progress in January and February. At the beginning of March it disclosed what has been called the "looting of the Alton," and Mr. Harriman refused to answer questions about his dealing in stocks. On March 4th the prosecution of the Standard Oil Company before Judge Landis was begun.

Transactions on the Stock Exchange on or about the 14th did not appear to be such as mark a natural liquidation. On the 12th the sales were only 800,000 shares, but heavy hands were thereafter laid upon the market. Sales on the 13th rose suddenly to 2,300,000 shares, and on the 14th to 2,540,000, of which one-half were furnished by Union Pacific, Reading, Amalgamated Copper and Steel. There were indications of large sales for the decline, and in the subsequent brief reaction these "short" sales appear to have been covered.

On April 13th, the Standard Oil Company was found guilty in Judge Landis's court, and the question of the size of the fine was taken up. In May a severe report upon the Standard's dealings with railroads was published by the Commiscite combination and the Tobacco Trust. Passage of the bill for a Public Utilities Commission, in New York, was followed by a decline of New York street railway shares. An investigation of these railways was to come later. The great fine of $29,240,000 was imposed by Judge Landis on August 3d. This was followed by further liquidation and additional "short" sales, and the decline was assisted by the falling price of copper. A few months earlier, the price of this metal had been held at 26 and 25 cents; in September it had dropped to $15\frac{1}{2}$, and in December it is $13\frac{1}{8}$. Copper companies whose shares had been prominent in speculation were sharply affected. It was after the break in August that Mr. Roosevelt, at Provincetown, suggested that the Government's determination to punish "certain malefactors of great wealth" might have caused them to make as much financial stress as possible, in order that thus the Government's policy might be discredited and a reversal of it be secured. On October 6th, President Ripley, of the Atchison road, predicted the approach of hard times and deprecated investment in States traversed by his lines.

To the depressing effect of gloomy predictions by influential railroad financiers was added that of the unwise legislation of States, relating to railroad passenger charges, and of their collision with Federal authorities in attempts to enforce unwise laws. Mr. James J. Hill was one of the pessimists. He remarked that the sails of prosperity were being reefed, and that it would soon be necessary for the Government to lend its credit to the railroad companies. All this tended to promote speculation for the decline, and to make the public apprehensive. How much "short" selling there was no one can tell. One young man boasts that his profits on

the long fall were $6,000,000. Other persons, with greater advantages and larger resources, may have gained much larger sums. There was no sufficient warrant in the condition of business and industry for the decline which preceded the panic.

In the first weeks of October the industrial and mercantile conditions were good. There is no evidence that there was any unusual financial weakness or any excessive expansion. Demand for consumption had been meeting the great current output of products, but there were some signs of restriction where the influence of the talkative pessimists was felt. There was no indication that the distribution of profits was to be checked. Indeed, the dividends and interest to be paid on January 1st next, $185,500,000, will exceed last January's payments by $4,500,000. But the people were apprehensive. They had been made so by the life insurance investigations, the disclosures of the Harriman railway inquiry, the allegations of the Government in pending suits, and the shameful facts brought out by the New York street railway investigation, then in progress. The pitiful failure of the Heinzes to corner the stock of their own copper company, on the 14th, would have been forgotten in a few days, even by the "curb" traders, if the Heinzes had not owned a national bank. When this bank, altho clearly solvent, asked the associated banks for temporary help, and when help was granted upon condition that President F. A. Heinze should resign, the panic was born. The ousting of Heinze, Morse and the Thomases from their banks caused alarm, which became fright when the Bank of Commerce declined, on the 21st, to act longer for the Knickerbocker Trust Company, and President Barney was deposed. Thereafter, the panic, originating in New York, ran its course thruout the country.

No attempt will be made here to show what that course has been. In THE INDEPENDENT the story has been told from week to week. But it is asserted here that the panic was not caused by general overexpansion of credits, by demand from the interior upon the New York banks for money to move the crops, or by the destruction of capital in recent wars. Because three or four bank presidents were summarily removed, the people in New York took fright and began to demand their deposited money. People elsewhere followed their example. Many banks in the interior sought cash and hoarded it. Business was at once paralyzed or greatly restricted. Strenuous efforts to fill the place of the locked-up currency were made by importing gold and issuing more banknotes. The money that was withdrawn is now returning to the channels of trade, and the fright is passing away.

There never was a financial panic with less of reasonable cause. But the cost of it has been enormous. When normal conditions shall have been restored, there should be gained, as compensation in part for the losses, the suffering and the suicides, new safeguards for trust company deposits and loans, new provisions for keeping banks and trust companies out of the hands of reckless speculators, and new laws for imparting elasticity to the most rigid volume of national currency known to civilized nations.

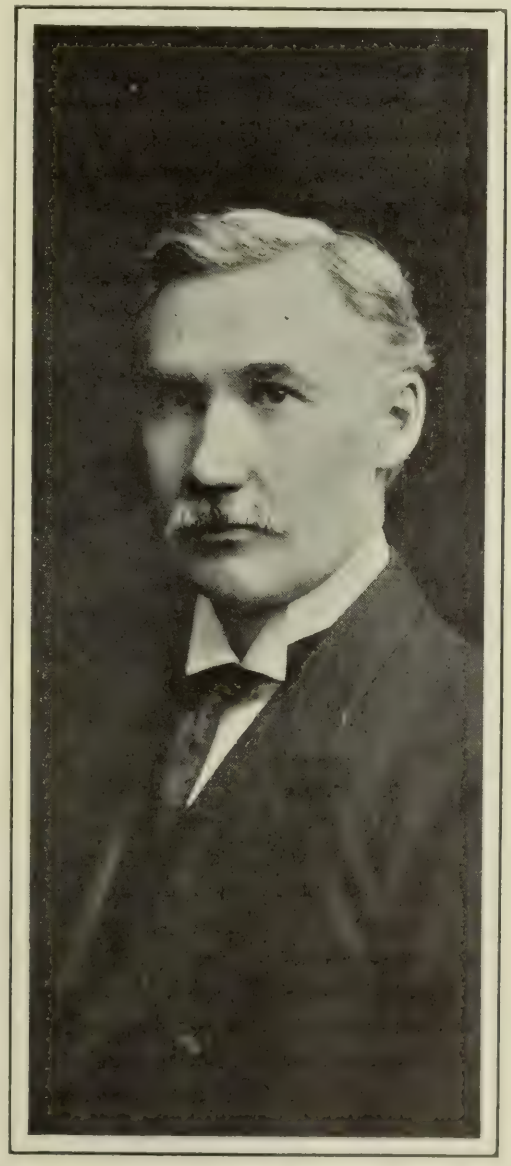
NEW YORK, December 21st.

Christmas Wreaths

BY CLINTON SCOLLARD

DRUID ivy twine,
And the holly spray!
This is the divine
Natal day.

'Tis for Faith they glow,
Hanging high above
With the mistletoe
That's for Love!



CLINTON, N. Y.

A Central Bank

BY GEORGE E. ROBERTS

President of the Commercial National Bank of Chicago

THE events of the past weeks have so conspicuously shown the defects of this country's monetary system that even the most conservative must be satisfied that something is wrong about it. We have for years in this country laid all emphasis upon having every dollar of our money "good," meaning thereby, equal in value to gold, but while this quality is undoubtedly of the first importance, it is apparent that something else is worth thinking about. The demand for money varies from year to year, and with the different seasons of the year, but no provision exists by which the supply may be readily adapted to these changing needs. With our numerous banks of deposit, located as they are in every village, the ordinary business of the country is carried on with a small percentage of cash. By far the greater portion of the exchanges are accomplished by means of checks and drafts which meet in the Clearing Houses and practically offset and cancel each other. But all these check and drafts and the charges and countercharges which they represent are by their terms actually payable in money, and when credit is paralyzed and an attempt is made to collect them in money, panic and disaster are inevitable.

GEORGE E. ROBERTS,
President, The Commercial National Bank, Chicago.

The very fact that there are no means by which the supply of money may be rapidly expanded to meet an emergency creates an abnormally sensitive situation whenever money becomes tight. People know that in the event of a panic there is no relief to be had, and as there is nowhere near money enough to go around, self interest prompts them to get in first with their demands. The way to prevent panics is clearly to provide a method by which an authorized currency may be rapidly issued thru the banks, which are always the point of attack, based upon their regular commercial assets, and thus amounting temporarily to the conversion of these assets into cash. Moreover, although present interest in the subject is centered upon the usefulness of such issues in time of panic, it ought not to be overlooked that a degree of elasticity in the currency supply which would make it more responsive to current needs, take the sharp edges off the money market and make the interest rate more uniform and reliable, would be of constant advantage to the business community.

The first thing to be said for a central bank of issue and re-discount is that it would furnish an elastic note system under the immediate supervision of the Gov-

ernment, directed by trained bankers, with complete publicity, and subject to the constant criticism of the entire financial world. The regular statements of the great banks of issue of England, Germany, France, Austria-Hungary, Russia, Japan, and the other important countries of the world, are scrutinized and commented upon by the press, by the banking fraternity, by trained economists and by every interested class. The conduct of such a semi-public institution in the bright light that beats upon it must necessarily be conservative and along the traditional lines of public policy pursued by such institutions in every other country in the world. The best proof of this is to be found in the experience of practically every other country of this world, and in the fact that in none of them is there any thought of abandoning the central bank. To intrust the note-issuing function to such an institution, upon terms and with regulations similar to those which have successfully governed like institutions elsewhere, is a very different thing from vesting the power in over six thousand independent institutions scattered over the country, which can evidently have no common or coherent policy and must inevitably be governed by self-interest, and whose operations by reason of their multiplicity can have no close supervision or scrutiny.

A central bank for the United States need not enter into competition with the local banks for business at the hands of the public. The business of the great foreign state banks is largely with private banking institutions, and as the open commercial field here is already occupied it would be better to make the central bank for this country strictly an institution supplementary to and completing our national banking system. Let the national banks furnish the capital for it by an allotment based upon their capital, and let it be a federated organization thru which they may perform certain functions, serviceable to the public, more effectively than they can be performed by the individual banks.

The central bank could amply meet the needs of every part of the country by rediscounting the bills receivable of local banks or loaning upon such collateral. The notes issued in making these loans would have behind them, first, the original borrowers; second, the endorsement of the local bank; and third, the responsibility of the central institution. The latter should have authority to examine local banks applying for loans and by so doing would serve as an additional supervising authority over them and exert a most salutary influence upon the whole banking situation. When fully organized the bank should have a dozen or so offices located in the more important cities of the different sections of the country, in order to be convenient of access for the local banks of all sections. Instead of being adapted only for times of panic, like most of the plans now offered, this system of note issues would be useful at all times and serve to equalize interest rates over the different seasons of the year, and to some extent over the different sections of the country. The notes of the central bank should gradually become an important part of the common circulating medium of the country, eventually taking the place of the present national bank circulation as the public debt is retired, and increasing in volume with the growth of the country. They would be a more economical medium of exchange for the country than gold or gold certificates. They would not, like a recognized emergency currency, be in themselves a sign and symptom of financial trouble. As soon as country bankers were accustomed to the regular practice of rediscounting current bills receivable, and it became recognized as a perfectly legitimate method of aiding local customers, instead of being regarded as discreditable, the central institution would prove itself to be of great service to every part of the country, and particularly to those sections which produce the great agricultural staples but lack the free capital to handle them every year. They can furnish unquestionable security and the central bank could supply all the currency needed.

Another great function for the central bank, following the successful example afforded by other countries, is that of handling the Government's receipts and disbursements and holding all moneys belonging to the Federal Treasury. The United States is the only country that

follows the antiquated practice of making all collections and payments in cash and theoretically keeping its money in a strong box. In practice the Treasury has been obliged to very much modify the theoretical policy upon which it is organized, because its operations have become so large that, conducted as planned, they would be a constant menace to the business world, but the modification consists only of giving to the Secretary of the Treasury the arbitrary power to make deposits in national banks, where, when and as he sees fit to do so, subject to a vague provision that it shall be distributed equitably to the different sections of the country. The practical effect of this is to give every one of the more than 6,000 national banks a fair claim for a share of the deposits, and subject Senators and members of the House to constant importunity for aid in securing such favors. We have just seen the Treasury, with over $200,000,000 scattered in more than 1,200 banks, needing money and scarcely daring to withdraw any for fear of precipitating disaster. The country is familiar with the frequent appeals to the Secretary of the Treasury to come to the relief of the money market, and must be convinced that an automatic disposition of the public funds, where they will never disturb the money market and always be available for use, is very greatly to be desired. It deserves to be emphasized that all of these plans for emergency issues and for issues by independent banks leave the Treasury's relations to the money market unchanged, altho this is one of the features of our present fiscal system most needing treatment.

The objections to a central bank are two in number, to wit: First, that it will be a monopoly managed to promote private interests; second, that it will get into politics. The objections can both be met and overcome in the plan of organization. If the stock is distributed to the existing national banks on the basis of their capital, and provision is made that no bank may vote more than its quota of stock, it cannot fall into the hands of a few. In order to assure all sections of the country of proper representation upon the directorate, members of the board should be elected by territorial districts. To say that the stockholders in the different sections of the country, all themselves bankers, would not elect capable and representative men who would guard the interests of their respective sections and of the whole country, is to say that a very intelligent body of the American people lack the qualifications for self government. Their personal interests would be comparatively small, but the position of director would be one of trust and honor, and there is every reason to have confidence that men of banking experience and high character would compose the board.

But, in view of the fact that the bank would be for some purpose a part of the Treasury of the United States, and because of the note-issuing powers vested in it, the Government should be directly represented in its management. I would suggest that above the board of directors in authority, or in co-operation with it, be placed a general council of five members, of whom the Secretary of the Treasury, Controller of the Currency and Treasurer of the United States should be three. The principal executive officers should be named by the board of directors, subject to confirmation by the general council. The Government should be represented by its own sworn officials in every office of the bank. The board of directors, by division into committees, should supervise in a practical manner the routine conduct of the institution. The combination of public authority and private interest, together with the publicity constantly attending its operations, may be counted upon to guard the institution from the two perils predicted for it, private manipulation and political management. In completing its monetary and fiscal system by the establishment of a central bank the United States will simply adopt a system to which, one by one, all the other important nations of the world have come, and from which no one has ever changed.

CHICAGO, ILL.

THE NEWLY DISCOVERED WASHINGTON(?) PORTRAIT.

GEORGE WASHINGTON.
After a portrait by C. W. Peale, 1772—owned by the family of General George Washington Custis Lee, Lexington, Va.

Is It Washington?

BY CHARLES HENRY HART, A.M., LL.B.

[We present to our readers this week a picture of the supposedly new portrait of Washington recently discovered in Glasgow. We sent to Mount Vernon, where the portrait now is, to have a special photograph taken of it, and the picture we publish is now seen for the first time by this generation in America. Mr. Hart, who is an authority on historical portraiture, and is the author of "Portraits of Washington," "Catalog of Engraved Portraits of Washington," "Frauds in Historical Portraiture," etc., has kindly furnished us the following comment. We also reproduce for purposes of comparison Peale's early portrait of Washington.—EDITOR.]

THE daily press has been widespreading the find by "R. W. Austin, United States Consul at Glasgow," of a painting in "The People's Palace, a Glasgow art museum," which Mr. Austin believes to be a whole length portrait of Washington, "painted by a colonial artist when the father of his country held the rank of major in the Virginia militia, in 1753." According to these accounts Mr. Austin "was not able to purchase the portrait from the Glasgow municipality, but borrowed it for an indefinite period," and has brought it to this country and taken it to Mount Vernon, where THE INDEPENDENT had the photograph made here reproduced. As the only apparent ground for supposing the portrait to be that of Washington is the general similarity of the uniform to

the uniform in the portrait of "Washington as a Virginian Colonel," painted by Charles Willson Peale, in 1772, which is the earliest authentic portrait of Washington that we have, the Peale portrait is reproduced here for comparison. Both pictures have much the same pose and both have the Wolfe hat, the gorget, the cambric neckerchief, the long waistcoat and the scarf, the latter, however, being over the left shoulder in the Peale portrait and over the right shoulder in the Glasgow picture. The coats are markedly different. But it would be curious iconography to name an unknown portrait by the similarity of its dress to another portrait, when hundreds of persons may have worn precisely similar dresses, and in the present instance I am uninformed as to the colors of the uniform in the Glasgow painting. The true question is, Where is the similarity of feature, contour, general character and likeness between the portrait under consideration and the putative subject of it?

If the Glasgow portrait is of Washington, and painted, as Mr. Austin supposes, when he held the rank of major, then it must have been painted in the field, between December, 1753, and May, 1755, in which latter month he received his commission as lieutenant-colonel. And if painted at that period, by whom was it painted? Mr. Austin's theory is that it "might have been painted by one of two colonial artists, John Smibert or John Watson." Smibert died in 1751, when Washington was nineteen and two years before he held any commission in the colonial service, so that he is out of the running. And Watson as an artist has not left a single known work painted with the brush, some pencil miniature portraits having given him his place in the history of American art, his chief occupation having been that of a money lender. We must therefore look elsewhere for a limner, and judging from a large photograph of the bust of this whole length—I do not know if the canvas is life size, or cabinet, or what its dimensions are—it is a painting of some merit and decidedly British in its manner, which are very important factors in considering American colonial portraiture. But to come back to the resemblance of this Glasgow portrait to Washington. Fortunately we have a most minute and exact description of Washington at this very period. His friend and companion in arms, George Mercer, thus draws his pen portrait:

"He may be described as being as straight as an Indian, measuring six feet two inches in his stockings and weighing 175 pounds when he took his seat in the House of Burgesses in 1759. His frame is padded with well-developed muscles, indicating great strength. His bones and joints are large, as are his feet and hands. He is wide shouldered, but has not a deep or round chest; is neat waisted, but is broad across the hips, and has rather long legs and arms. His head is well shaped, though not large, but is gracefully poised on a superb neck. A large and straight rather than a prominent nose; blue-gray penetrating eyes, which are widely separated and overhung by a heavy brow. His face is long, rather than broad, with high round cheek bones and terminates in a good firm chin. . . . His mouth is large and generally firmly closed. . . . His features are regular and placid, with all the muscles of his face under perfect control, tho flexible and expressive of deep feeling when moved by emotions."

From this vivid pen portrait it will be seen that, while Peale's portrait answers its most minute details, the Glasgow picture conforms in no respect to it or to what we know of Washington's physiognomy from the many portraits that we have of him.

PHILADELPHIA, PA.

Christmas

BY L. J. SANDERSON

EACH ear may hear the angels sing,
Each eye may see the shining star,
Each hand a gift of love may bring,
It is not far.

Each heart may to the manger go,
Each soul may to the sweet Babe cling,
Each voice may whisper sweet and low,
"Jesus, *my* King."

WINCHESTER, MASS.

The Parade to the Pacific

BY PARK BENJAMIN

[An elaborate article will appear in the January Number of *McClure's Magazine* pointing out the defects in the naval ships, the advanced age of the officers, the neglect of battle tactics, etc. The readers of THE INDEPENDENT will no doubt remember that all of these strictures have been printed in our columns—some of them years ago—by Mr. Benjamin, who single-handed has led this fight to which a large section of the press is at last awaking. —EDITOR.]

DURING last spring the newspapers reported, 1, that Japan was actively purchasing military material in Europe in excess of that needed to repair the losses of the late war, or to meet the requirements of her army and navy; 2, that Japanese spies were overrunning the Philippines; 3, that public feeling against the United States caused in Japan by the action of the San Francisco authorities concerning the school children and by the mob attacks on Japanese residents had resulted in diplomatic representations to the State Department couched in terms so unusual as to be characterized as "hectoring."

When such proceedings are regarded as suggesting a possible disturbance of the peace, a reaction by the nation affected is not unusual, one form of which is a change in the disposition of the national forces, so that the place where trouble seems likely to begin may be adequately guarded. But nothing is more characteristic of a civilized community than the scrupulous care with which, in such circumstances, it avoids precipitate or ostentatious action, the doing of things likely to be invidiously interpreted or anything akin to "bluff" or a demonstration in force.

Just when the above noted situation had become most acute and while efforts both official and private were being unsparingly devoted to assuring Japan of the unaltered friendship of this country, rumors were published that the sixteen battleships recently massed on the Atlantic Coast would be forthwith sent to the Pacific. To the great relief of the thoroly dismayed people who were trying to keep the peace, and who saw in this step only a repetition of the precipitancy which advocated sending out ships to attack the Spanish fleet before any war had begun, these reports were promptly denied. Shortly afterward, on July 4th, the secretary to the President announced that the fleet would go on a "practice cruise," route not determined. On the same day, the Secretary of the Navy, at his home in California, not only confirmed the report of the transfer of the battleships to the Pacific but stated that the President had so ordered a week earlier. Whatever the explanation may be, the destination of the fleet thus became known under conditions, to say the least, conflicting and mysterious, and so to the inopportuneness of the moment was added something of the evasion or secrecy incident to a war measure.

By dint of unremitting labor, the ships were enabled to begin their voyage on December 16th. No such powerful armada has ever before undertaken so long a journey; for even the Russian fleet, which Admiral Rodjesvensky led to disaster in the Sea of Japan, was not only far less formidable in gun fire, but measured a hundred thousand tons less in displacement. No other nation, Great Britain alone excepted, can display so tremendous an aggregation of homogeneous battleships.

It is reported that the equipment of the vessels is on a war footing, that armor piercing projectiles, harbor mines and war paint are on board in ample supply and on the very eve of departure the newspapers announced the sensational and sudden putting ashore of all the Japanese mess attendants by orders from Washington. Finally, Rear Admiral Mahan, discussing "the true significance of the Pacific cruise," informed the country that "the movement of the United States battleship fleet . . . is precisely the kind of movement which the fleet of any nation may, and usually will, be required to make in war." And just before sailing, a manifesto was issued to the public by Admiral Evans, in which he assured us of "the absolute fidelity" of every officer and man to the "trust imposed upon him in small things as well as in large," which, as a prelude to a peaceful "practice cruise," is extraordinary.

All of the ships carry the heaviest guns. Nine of them, the "Connecticut," "Kansas," "Louisiana," "Vermont," "Georgia," "Virginia," "New Jersey," "Minnesota" and "Rhode Island," are new; the others, the "Ohio," "Maine," "Missouri," "Alabama," "Illinois," "Kentucky" and "Kearsarge," are from four to seven years old. The new "Nebraska" and the "Oregon" are already on the Pacific Coast. Eight great armored cruisers, each capable of 22 knots speed, are also massed there. And to this array are to be added the smaller vessels of the regular Pacific fleet.

The whole Japanese battleship force includes but nine modern ships all now in commission; namely, the "Satsuma," the "Katori" and the "Kashima," all new, the "Asahi," used in the war, the "Mikasa," sunk and subsequently raised and repaired, together with the "Hizan," formerly the Russian "Retzivan," the "Suwo," formerly the "Pobeida"—both the prey of torpedoes off Port Arthur—and the "Iwami"—the old "Orel" of dismal memory, struck forty times at the Battle of Tsushima and surrendered. Japan has also ten armored cruisers. The overwhelming superiority of the American battleship fleet, to which three more vessels of the newest type (the "Mississippi," the "Idaho" and the "New Hampshire") may shortly be added, needs no demonstration.

The sending of this huge naval force over a distance of 14,000 miles and at this time is open to much criticism. At the outset, the measure plainly exhibited a deplorable readiness to resort to the *ultima ratio regum*—altho both then and subsequently it has never appeared that the usual methods of diplomacy would be inadequate to dispose of all disputed questions. Three days before the fleet left, our Ambassador at Tokio announced that every issue had been satisfactorily settled. Still less, has there been any need of giving the proceeding the air of a "naval demonstration" of the sort with which Great Britain occasionally favors Turkey.

The Navy Department and more especially the Construction Bureau has recently been strongly attacked because of serious defects in the design of the battleships. It has been shown that the heaviest armor belts have been placed so low on the hulls as to be submerged when the necessary weights are on board and hence to furnish no proper protection, and it is alleged that this error is being persisted in in the designs for the new Dreadnoughts" and despite the repeated protests of the sea-going officers. Admiral Evans said last July: "I believe the water line armor belt is a mistake in any ship unless it is so placed as to give maximum protection possible by water line armor when the fleet goes into action. This is not possible when the armor belt is submerged or nearly so." It has also been shown that the four frightful "accidents" which have happened in the battleship turrets have been due to the direct communication of turrets and ammunition rooms, and that this arrangement, with inexplicable obduracy, has also been persisted in despite similar protests. The writer has seen no satisfactory defense to the first charge, but rather a tendency toward evasion; and as for the second, a Board of Officers has substantiated it in a report crushingly condemnatory of the existing turret construction. Rebuilding of the turrets and ammunition hoists is necessary. Such a disaster as that which lately occurred on the "Georgia," if happening in battle, puts the turret out of action and greatly reduces the fighting power of the ship. This rebuilding, says the *Navy*, editorially, "has to be done on every one of the ships now about to leave for the Pacific, every one of the new armored cruisers now on the Pacific, and on the 'South Carolina' and 'Michigan,' which are not yet finished—most of which vessels were built after these defects were recognized and had been called to the attention of the Bureaus." Nevertheless, it is true that in the hight of the controversy the Chief Constructor of the Navy—the principal party assailed—has been reappointed for a new term of four years.

It has been strongly urged that the ships should not be sent away from the Atlantic Coast, where the best facilities for rebuilding and repairs exist, until these shortcomings can be remedied—and the list of such shortcomings is a long one and can mainly be read in the official reports of the Bureau Officers just published. It includes weak guns built for brown powder and not for the modern smokeless explosive, too nu-

merous and too complicated electrical devices, lack in many instances of fire control apparatus, inadequate supply of ammunition and magazines, so small that at the present rate of speed of fire, a battleship can exhaust them in half an hour—and so on thru a category of troubles all more or less urgent.

There is also among the older officers of the Navy a strong disapproval of the present voyage. The "muzzling paragraph" in the Navy regulations prevents their speaking publicly—but they make no secret of their views in private conversation. Some of them lay stress on the unpreparedness of the fleet, as indicated by the above-mentioned shortcomings, others and with more emphasis dwell upon the neglect of competitive squadron practice—the so-called "battle tactics"—now recognized in all navies as absolutely necessary rehearsal to fit the fleet for war service. All of them, so far as the writer's observation has extended, ridicule the official designation of the voyage as "a practice cruise." This designation of it is, however, supported in an eleventh-hour defense by Rear Admiral Mahan, who holds that the huge fleet should be sent on a fourteen thousand-mile journey in order to find out whether the Navy Department people "can get it ready as soon as contemplated" and hence that "it will be no small gain to the Government to know the several hitches—each small but cumulative," which is a little surprising in view of the fact that the Navy Department people are already charged with neglect and inefficiency in *not* having the fleet ready because of "hitches," not "small," but exceedingly big. The distinguished author also says that the voyage is "not only advisable but imperative," and that it should not be "a single spasm of action but a recurrent procedure" and "annual" —appealing as usual for support to Lord Nelson, who died in October, 1805. Unlike both Lord Nelson and Rear Admiral Mahan, the active officers of the Navy who hold different opinions have had much experience in modern battleships.

No one doubts that the fleet has gone to the Philippines, or that these islands were its objective from the beginning, altho we are now undergoing a process of gradual preparation for the announcement. Why it goes there is not a matter of names, but of fact. It is sent either because real danger is apprehended on that frontier of the United States, or it is not. If it is that reason is all-sufficient, and the present is no time to talk about defects or lack of preparation any more than war time would be. In such emergency we have got to use the ships as they are—and haste is important, since the military force in the Philippines can hardly be expected to hold them for more than a few weeks in event of attack. Nor will calling the voyage a "practice cruise" deceive anybody—least of all the Japanese.

If, contrariwise, the voyage is not necessitated by any peril, and is nothing but a mere naval pageant, then it is not only useless, but distinctly harmful. We have been trying for over a quarter of a century to build up the navy. However much difference of opinion there may be as to the proper size of it, there is no dispute that it should be efficient and that its units should be equal to, if not better than, the best in other navies. To bring so complex a weapon into this condition requires constant work, constant education of men in the handling of fleets, squadrons, ships and guns under battle conditions; constant trial of new ideas and improvements in armor, armament, range finding, fire control and ship construction, and that sort of work is what the other navies are doing. Any interruption in that work, any distraction, means also delay in progress. Hence, when we take the ships away from the navy yards, factories and workshops of the East, from their maneuvers and drills and send them to expositions, reviews, or the like, we are doing harm for reasons known to every man who understands the value of sustained uninterrupted effort in any field of human endeavor. So grave was the interference with the work of the fleet, incident to sending it as an "attraction" at the Jamestown show, that officers of the navy publicly protested, and this without official rebuke. "Is it supposed," demands Lieut.-Comdr. Ridley McLean, one of the ablest gunnery experts in the service, and now ordnance officer of the fleet, in the semi-official *Proceedings of the Naval Institute*,

"that had the Commander in Chief of the Atlantic Fleet been free to act he would have

stopped the target practice of five new ships and have gone to the Jamestown Exposition voluntarily on April 15th; that during the entire summer he would have kept ships lying there at anchor or would have broken in on repairs or maneuvers to have ships attend an 'unveiling' or would have done hundreds of other things which directly interfere with preparation for war? *These things are political; they interfere with efficiency, but cannot be avoided.*" (My italics.)

What we have done now is simply to provide for a still longer and still more thoro interruption—one that may last indefinitely—and during which the English fleet and the French fleet and the German fleet and the Japanese fleet, which are not subject to such interferences, will continue to make progress. Rear-Admiral Sir Percy Scott, the leading gunnery officer of the British navy, recently objected, publicly and by signal, to his ships being taken for even a brief period from their practising to be made to "look pretty" for the benefit of the German Emperor. He was properly disciplined for his mode of expression, but public opinion none the less supported his protest.

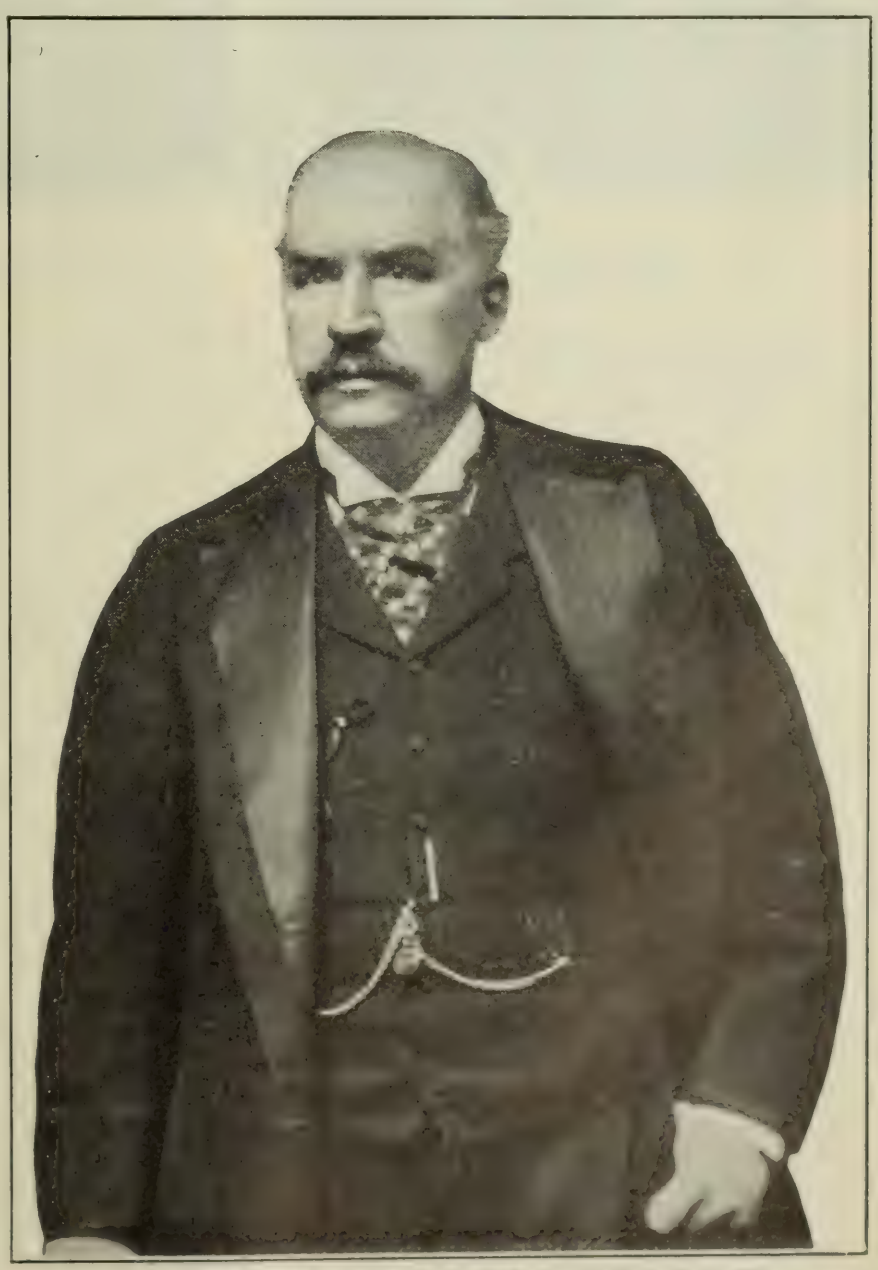
As the ships are going at the most economical speed and most direct route it is difficult to see how, with the provided fuel supply, maneuvers and battle tactics can be also carried on—unless, as Admiral Evans sententiously remarked the other day, the crews are expected to go ashore at Punta Arenas—the halfway point—and cut wood. Nor is it clear why, "plugging along at ten knots per hour" (to borrow the expression from the *Army and Navy Journal*) around a continent is any more instructive than the usual steaming between Bar Harbor, Hampton Roads and Culebras. In the days of sail—Nelson's period, whence Admiral Mahan derives so many latter-day lessons—when the wind took the place of fuel, the people of cruising vessels had to practise all sorts of seamanship all the time they were under way, no matter whether the cruise was called a "practice" one or not. But this is not true of modern sailless steamers going from port to port. Of course merchant steamers do not travel in fleet formation, but as it is now reported that the intervals between Admiral Evans's ships are to be materially increased over ordinary cruising distances, for the sake of safety, even the practice value of the voyage in this particular seems somewhat minimized. The expense of maintaining the ships, it is true, goes on whether they be practising battle tactics in the West Indies or traveling to the antipodes, but in one case the money is spent for work vital to preparing the fleet for war service and in the other it is not. Besides, coal on the Atlantic Coast does not cost ten dollars a ton, nor would the fuel bill of the fleet for a cruising period equal to that required to circumnavigate South America amount to a million and a quarter dollars, nor would we be subjected to the humiliation of having to transport that fuel over great distances in foreign bottoms. The incurring of avoidable expense, whether national or individual, does not commend itself to this community at the present time.

Grant that there is no danger to be apprehended, and the comments of the Japanese press since the sailing of the fleet indicate that there is none, then this "practice cruise" simply resolves itself into another step in the progression which began with Oyster Bay reviews, advanced to the Jamestown Exposition, and now sends fourteen thousand men and sixteen battleships in spectacular parade around the South American continent. What next?

How a navy hampered by diversions of this sort and not merely prevented from proper drills and maneuvers, but with its work stopped in the navy yards and its skilled workmen discharged can be expected to progress it is impossible to see. Nor can that result be secured by renewed demands for more and more big ships, even tho the annual addition to their number advocated last year is quadrupled this year.

The fleet, having started, must continue, for no one, however cogent he may deem the reasons against its going, will advocate its recall. Such a course would be open to misconstruction by Japan and besides be humiliating to ourselves. We know, danger or no danger, that we have no object at heart but the maintenance of peace. In that consciousness and in the achieved fact of the fleet's departure lies, apparently, the only support for the Pacific parade. Beyond this it is simply a halt in the development of the navy.

New York City.

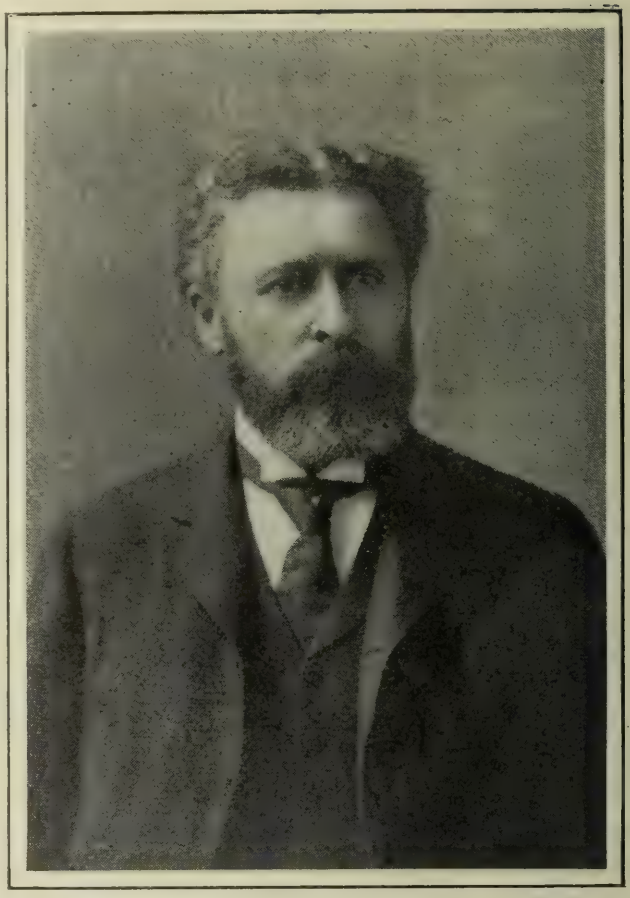


New York Bankers

BY JOHN P. RYAN

[Mr. Ryan is connected in business with the financial district and has written much on the subject. The illustrations show a few of the prominent bankers.—EDITOR.]

IT would be an extremely difficult matter to estimate properly the importance of the private banking houses of the country, and particularly of New York, in our financial and commercial development. Yet in days of financial calm and public confidence their position is scarcely appreciated, and it is only when some big plan is developed, some successful promotion announced, or when confidence wanes and panic signs appear, that the great resources, effectiveness and importance of these private banking institutions are appreciated. The late panic has many examples, and it is the untold parts of the story that would illustrate the points most specifically. Who can tell the extent of the resources pledged quietly to help those publicly in the breach to stem the tide of panic? There is no record that will be ever published of the money and credit of domestic and international houses made available for use at the critical moments of the struggle.



Corporate banks and banking institutions differ in many respects from the private banking houses, altho in some respects the internal mechanism may be the same. The private banking house is not subject to the legal restrictions under which the ordinary national bank, State bank or trust company operates. In fact, its restrictions are primarily only those dictated by conservatism and sound business sense. The field of the private banker is broader, one in which distinctive individuality is shown, and where the training is thoro, consistent with the traditions of the house and broad enough to eliminate every element of provincialism. The private banker, such as we know him in New York, is an international figure, vigorous, virile, broad minded, and a dominant factor in the world of credit,

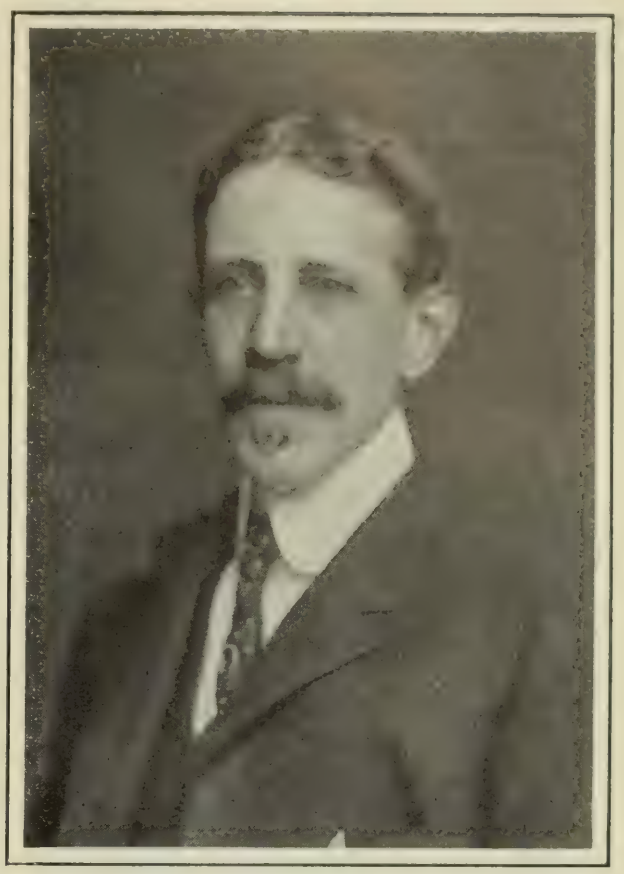
Of Mackay & Co.

which knows no geographical confines. National banks are organized under definite rules embodied in the National Bank Act, which is almost needlessly specific in reciting what the bank may do and may not do, defining its functions, limiting its powers and reducing to a minimum the possibility of initiative. The State banks are organized and carried on under the banking laws of the State, which are assumed to be most effective and conducive to safe banking when most stringent. And this is good theory, which has been demonstrated in the recent trouble. The institutions have public functions; they are created and protected by the laws, and should be subject to the requirements deemed necessary. The trust companies had an exceptional amount of leeway, which unfortunately wrought evil, and emphasized the theory that restrictions should be increased.



There are some minor restrictions to which private banking houses must conform, but in the main sound judgment, financial acumen and command of capital are the primary influences directing these banking houses. There is a certain similarity between the organization and methods of all these banking houses, but some are limited in scope, some are specialists in one particular phase or another, while others are dominant factors in half a dozen departments of finance.

Logically, the private banking house is the legitimate promoter, either in the case of new or old enterprises. The flotation of a foreign loan, the consolidation of various companies, the organization of a new company and the sale of its securities, the marketing of blocks of bonds for existing corporations, these are logically the functions of the private banking house. The logic is obvious. The funds involved are private funds, private credit is pledged, the money belongs to men of wealth or houses of powerful resources. It is not the money of individual depositors that is utilized without specific knowledge and consent, and, furthermore, the success of the undertaking is advanced somewhat by the mental as well as financial resources of the men who are back of the plan as syndicate underwriters, or promoters, as you choose to call them.

No more interesting phase of the de-

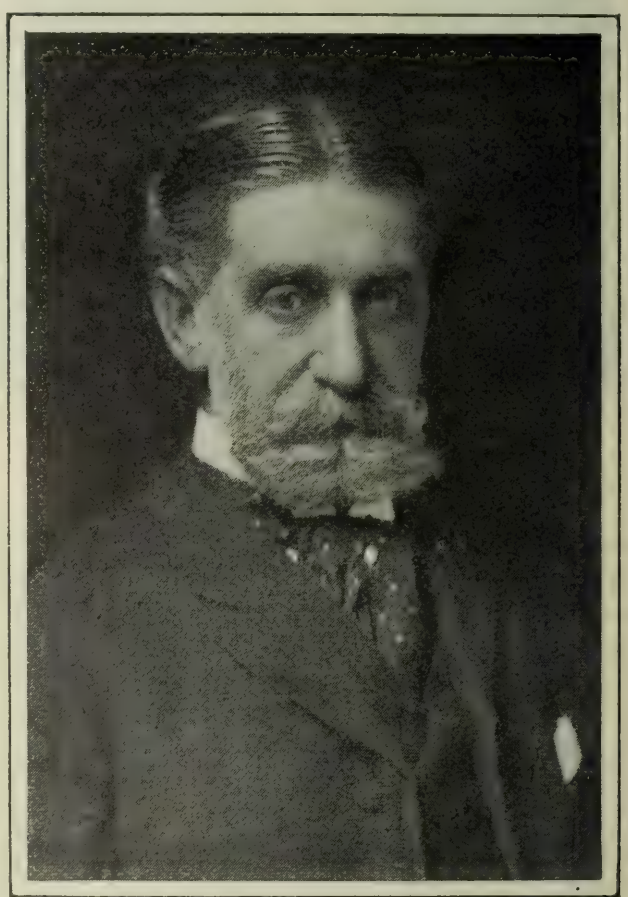
velopment of private banking in conjunction with the organization and maintenance of great corporations can be imagined than the underwriting syndicate. It has made possible some of the spectacular financing of the past decade, and it may be worth a word of explanation with regard to the general scheme. When the directors of a railroad decide that in order to make necessary improvements, maintain equipment, extend the lines or for some other reason, an issue of several million dollars' worth of bonds must be made, they do not, as a rule, make a direct offering to the public. Rather do they go to a banking house, submit the facts, discuss the subject, and make a net price to the banking house, which they will accept and do accept. That ends the concern of the railroad with the bonds. Then the banking house selects a list of other houses and individuals which usually participate in such syndicate, and offer them a participation, specifying the price at which the bonds were bought and the price at which they are to be sold to the public. For example, the banking house bought the bonds at 95, they might be offered for sale at 97½. The banking house is constituted syndicate manager, for which it receives, perhaps, one-half of 1 per cent. This leaves a profit of 2 per cent. to be distributed to the syndicate participants in the event of the successful sale of the bonds. The banking house acting as syndicate manager usually heads the list, taking its proper participation.

There is a regularly drawn syndicate agreement, which designates the manager, who can act absolutely for the syndicate. This agreement in most cases gives the subscriber the right to withdraw his bonds if he wants to do so. at a fixt price, the cost of the bonds to the syndicate plus the manager's commission. But there is usually a supplementary agreement requiring the subscriber who withdraws his participation not to sell his bonds at less than the syndicate's selling price, during the life of the syndicate, not including extensions.

Payment of part of their subscriptions may be called at any time by the syndicate managers, and these payments may run from 10 per cent. to 25 per cent. It is the privilege of the syndicate managers to place the bonds, together with



the syndicate agreements, as collateral for a loan. Assume the bonds bought at 95, and 20 per cent. of the purchase price paid on the first call by the syndicate underwriters. That would leave $760 on each bond still to be paid. The syndicate agreements are practically the notes of each underwriting subscriber, and the bonds with these agreements make satisfactory collateral for a loan at 76 on the bonds. As the bonds are sold, the loan is cancelled.

If the syndicate is to run for a year or any other period the loans are always made for less time. When the syndicate agreement expires, and there is a portion of the bonds unsold, they must be taken up pro rata according to proportion of subscription by the members of the syndicate. Profits are distributed, if there be any, when the syndicate is closed either by expiration of agreement period or by reason of sale of bonds.

THE SELIGMAN BUILDING,

Recently erected at the junction of South William, William and Nassau Streets, facing Delmonico's, the Corn Exchange Bank, the Cotton Exchange and the Farmer's Loan & Trust Company Buildings.

ISAAC N. SELIGMAN.
Of J. & W. Seligman.

This is just one part in the many activities of a private banking house. Perhaps a better idea can be obtained by an examination of the system by which the myriad details are carried on, and effective work made possible.

First of all the policy of the house is shaped generally by the senior partner.

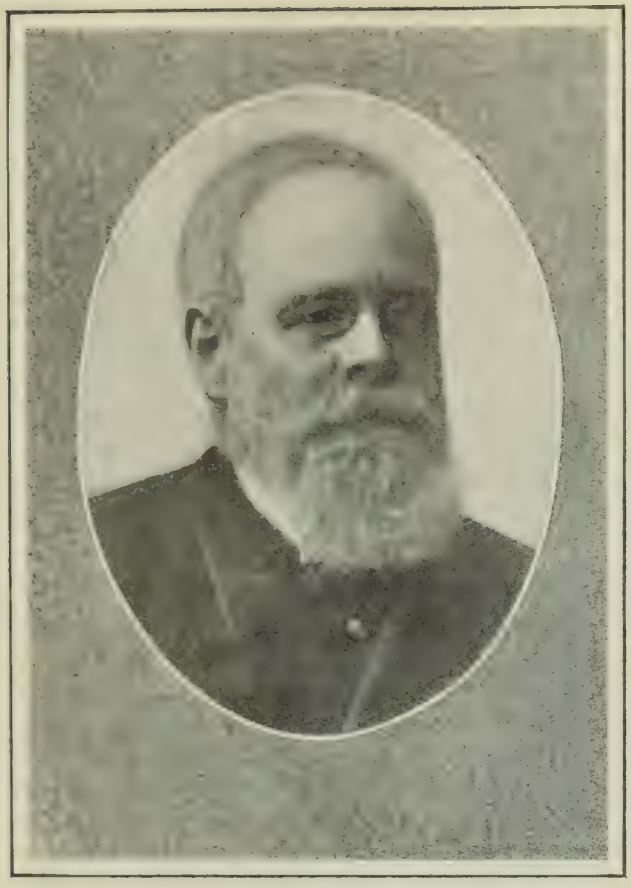
The partners of the house create business. It is they who decide whether it is wise to enter into business deals. Each partner has a special department to which he devotes particular attention. Directly connected with the partner's office is the office of the confidential clerk, to whom is entrusted all private correspondence and documents, and who keeps the partners posted on many matters to which they have not the time to devote particular attention.

This confidential clerk and his assistants have charge of what in some banking houses is called the Archive Department. There are kept the records of the firm, private records and general office records. Statistics are prepared in this department for the use of the partners and for the other departments. Here may may be found also the press bureau, advertising and newspaper clipping departments, which are the necessary adjuncts of a large business.

Each banking house has its own particular divisions of business, but the important departments are substantially similar.

The arbitrage department of a private banking house attends to the stock exchange dealings between New York and the foreign markets. The work of the arbitrageur is immensely interesting, requiring quick wit, nimble mentality, accuracy and expeditious cable work. Transactions of importance to the financial markets are handled thru these arbitrage departments.

A bond salesman is in charge of the bond department. This department keeps in touch with the clients of the firm and with banking and brokerage houses with which the firm does business. It prepares also, under direction of the partners, the prospectuses for bond issues, etc. A record of clients' investments are kept in this department, and from time to time these clients are advised as to changes in their investments.



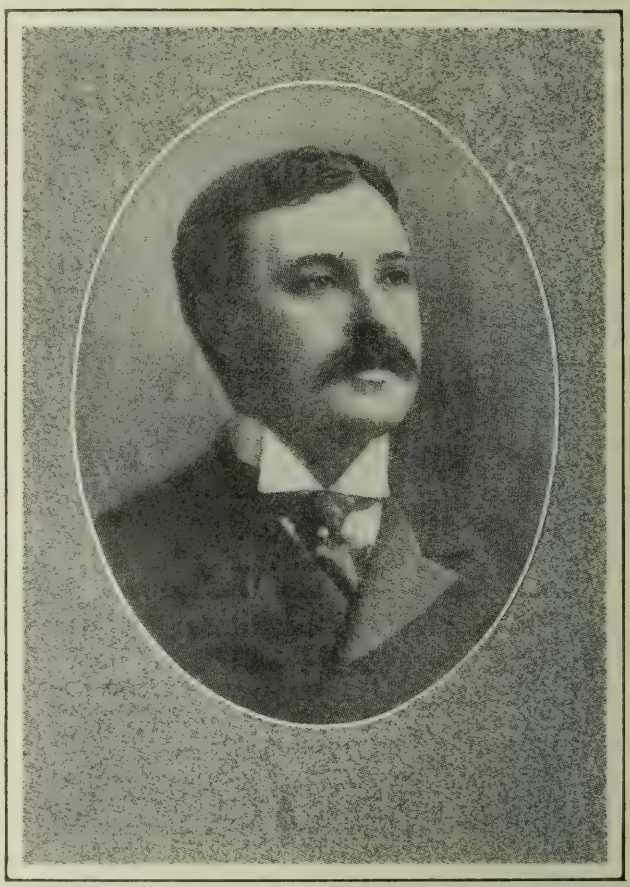
Unless one has an adequate idea of the world's commercial activities, of the extent and mobility of international credit, he cannot fully appreciate the importance of the exchange department of a banking house. One function of these institutions has been described as equalizing the balance of trade, and the application is obvious. The exchange department is in charge of an exchange manager, who has a number of assistants, exchange clerks. The manager attends to all the purchases and sales of foreign exchange. The clerks do the routine work, such as writing drafts, issuing letters of credit and the like. To the uninitiated, foreign exchange is a fearful and wonderful science, and a glib explanation by an expert of the meaning of circular letters of credit, letters of indication, mercantile letters of credit, travelers' checks, foreign checks, and drafts, foreign postal remittances, bank post money orders, and foreign commercial bills of exchange, is likely to leave the lay recipient of the courtesy a little bit dazed.

It happens very often that the securities department of a banking house is in charge of an old employe, in whom implicit confidence is placed, and who is thoroly familiar with the firm's routine business. He is the custodian of all securities, receives all that come in, and delivers all those needed. Once a month there is a stock taking of all securities on hand, which is conducted under the supervision of one of the partners, and all the securities are checked up with the books of record. This department also attends to transfers of stock and shipment of securities to Europe and to the interior.

All cash transactions and securities of the firm, the collection of drafts, etc., are handled by the cashier's department. In connection with this department in the larger houses there is a loan department, which is in charge of a loan clerk, who takes care of all loans made or given.

All coupons from securities belonging to the firm or its clients are collected thro the coupon department, and where the firm acts as fiscal agent for railroad or industrial companies this department pays the coupons of such companies. The bookkeeping department is usually in charge of a head bookkeeper, who keeps the private ledger and makes monthly and annual balance sheets. He supervises the syndicate and current accounts and all other bookkeeping transactions of the firm and its clients.

You will find, as a general rule, that the head of the correspondence department in the important banking houses is



JOHN CROSBY BROWN.
Of Brown Bros. & Co.

a man of European training, with a knowledge of several languages besides English. This department handles all the correspondence of the firm, except the private correspondence. Let us look at the routine in the matter of correspondence for a moment. The mail, arriving in the morning, is opened by the general manager, who, by the way, is responsible for discipline, organization and the proper keeping of records and correspondence. The mail is classified and distributed among the different departments, attended to and answered. From the letters entries are made in some of the books, and as a counter check other entries are made in original books of entry from vouchers initiated by one responsible in the department in which the entry originated. A house doing a fairly large business will receive from 150,000 to 200,000 letters a year, the aggregate totals in figures for such a house running into hundreds of millions of dollars.

There are, of course, stenographic and telephone departments, and some private banking houses have a private telegraph department, with their own private wires to the large centers of the United States.

Some banking houses have a lawyer as partner, but generally legal work is done by outside firms, and it is given to the firm best qualified to handle specific cases, as there are several branches of banking requiring expert legal knowledge—for example, incorporation, mortgaging, consolidation, reorganization, re-

HENRY S. REDMOND.
Of Redmond & Co.

ceivership, litigation, general commercial law, partnership and syndicate contracts. These in themselves give an idea of the multifarious activities of a private banking house.

In order to relieve the partners from a lot of detail work, the larger firms give power of attorney to men who have been in their employ for a number of years and have shown capacity for executive management, and they practically run the business. Running a banking house has become in these days quite a science, but all modern aids in labor saving are utilized. The successful houses have good organization, absolute discipline and a well-trained and well-paid staff. Houses like Speyer's, Morgan's, etc., have, in addition to their clerical force, railroad, industrial and mining experts

in steady employ or available at a moment's notice.

Investors generally would be greatly and agreeably surprised if they knew what a vast machine is, at all times and at an enormous expense, silently working directly and indirectly for their interests in the big banking houses of international reputation, that issue securities for public subscription.

The theory of profit earned of a large banking house is that its general client and agency business should pay the running expenses and that the large profits must come from syndicate underwritings

N. W. HALSEY.
Of N. W. Halsey & Co.

and investments in securities for its own account. It is generally supposed that large banking houses earn tremendous profits. While it is true that the banking business is profitable, the profits are not so large in comparison to the risks assumed.

It is easy to see a broad difference, even from this necessarily condensed view of private banking house methods, between such banking houses and the public chartered banking institutions. In ordinary times you find the private banking houses the principal factors in the import and export of gold. One or two big banks are exceptions. Gold imports during the recent panic reflected extraordinary conditions, and not the working of the business laws, reflecting trade balances, and ordinary developments of the financial world. The direct and intimate relation between banking houses and commerce is patent to any one who knows anything of the exchange market. The placing of securities in Europe, the handling of securities for European account, even the selling of foreign money, are among the banking houses' activities. Some banking houses have regular deposit accounts, against which they keep a reserve. That reserve is kept in the banks and not in its own vaults. Some banking houses also are important factors in the stock market, altho, of course, their operations are not easily detected, nor is it possible to determine for whom they are acting. As a general rule, private banking houses do not discount commercial paper. Contrary to the general impression, a few banking houses carry securities on margin for clients.

A. S. HEIDELBACH.
Of Heidelbach, Ickelheimer & Co.

ERNST THALMAN.
Of Ladenburg, Thalman & Co.

Many private banking houses, both in this country and in Europe, were in their origin mercantile houses, which gradually developed and finally became banking houses exclusively. It is perfectly easy to see how such developments came about, and it is also possible to understand the connection between these banking houses, and in fact all private banking houses, and the commercial world. Many of our New York private banking houses do a large consignment business today, and act between European and American houses in the interchange of products, in some cases special departments for the reception and forwarding of merchandise of all descriptions being established. Thru their mediation machinery, products, manufactures and all possible forms of exports and imports are attended to in the markets of the world. It is not only in Europe that houses which were originally mercantile establishments exercise tremendous influence. The same is the case here today.

Intensely interesting is the history of many of the houses that are now prominent in the American banking world. Such houses as Morgan & Co., Speyer & Co., Brown Bros. & Co., Kuhn, Loeb & Co., Belmont & Co., Lazard Frères, Seligman, Knauth, Nachod & Kuhne, Heidelbach, Ickelheimer & Co., Blair & Co., Blake Bros., Winslow, Lanier & Co., Kountze Bros., Iselin & Co., Harvey Fisk & Sons, Fisk & Robinson, Ladenburg, Thalman & Co., Goldman Sachs & Co., Kean, Van Cortlandt & Co., Maitland, Coppell & Co., Hollins & Co., the retiring firm of Baring & Co., Redmond & Co., and a dozen others—all have an interesting and extremely honorable history.

One of the oldest firms in the city is Brown Bros. & Co., the first foundations of which house was laid in 1808 by Alexander Brown, who was an Irish linen merchant, and left that country in 1798. He established himself at Baltimore. The New York house was a branch of the Baltimore firm, and was established in New York on January 1st, 1826. The firm at first was in the linen and dry goods business, but very soon after the establishment here that part of the business was sold and the firm confined itself to foreign exchange and banking.

Speyer & Co. was founded in 1837. The present head of the house, James Speyer, was thoroly trained as a banker in Europe and here before he became the head of the house. Morgan & Co., so far as the New York end of it is concerned, had its beginning in July, 1871, when the present head of the house, J. Pierpont Morgan, formed a connection with Drexel & Co. It is unnecessary to recount the work of this particular house in the way of gigantic financial undertakings, promotions, reorganizations, flotation of Government loans, the financing of the transfer of the Panama Canal and the more recent history of its activities during the panic. The Morgans were originally in the dry goods business in Hartford, Conn., and J. S. Morgan, the father of the present head of the house of Morgan & Co., became a partner in the firm of J. N. Beebe & Co., of Boston, the firm becoming J. N. Beebe, Morgan & Co. Subsequently J. S. Morgan went to Lon-

don and became a partner in the firm of Peabody & Co., which eventually became J. S. Morgan & Co. Drexel, Morgan & Co. were the agents in this country of J. S. Morgan & Co., but on the death of J. S. Morgan, J. Pierpont Morgan, thru his inheritance, became the head of both the London and New York houses.

August Belmont & Co. dates to the time when the Rothschilds sent August Belmont, the father of the present August Belmont, over here to succeed Josephs as agent for them in this country. Mr. Belmont went into politics speedily, and was appointed American Minister to The Hague, and occupied that position for four years with the consent of the Rothschilds. The house was continued here and managed by two men who held power of attorney. The house still continues to be the representative of the Rothschild interest in this country. The Seligman firm had its origin in the dry goods business, and gradually drifted, as many other houses have done, into a distinct banking business.

Foreign houses are numerous in New York, and figure frequently in the news of the day. Such houses as Lazard Frères, Knauth, Nachod & Kuhne, Ladenburg, Thalman & Co., Heidelbach, Ickelheimer & Co., and others named before in this article, are factors of great importance in our international relations. The history of these houses is full of interest. The present head of the house of Kuhn, Loeb & Co., Jacob Schiff, was originally a partner in the firm of Budge, Schiff & Co. One of the great dealers in commercial paper years ago, and at the present day, for that matter, altho its activities have been more extended, is Blake Bros. Space does not permit any detailed description of the various houses, but the point must be borne in mind that these banking houses represent tremendous amounts of capital.

New York City.

AUGUST BELMONT, OF AUGUST BELMONT & CO.

Bethlehem and Golgotha

Translated From the German of Friedrich Rückert

BY ZITELLA COCKE

In Bethlehem the Babe was born
  Who came to bring us life and light,—
On Golgotha He did not scorn
  Upon the Cross to break Death's might;
And I have fared from Western strand
To utmost verge of Morning Land,
Yet grander sight I nowhere saw
Than Bethlehem and Golgotha!

The old world's seven wonders great—
  Behold how Time has laid them low!
The pride and pomp of earthly state
  How soon Heaven's power can overthrow!
Where'er my wandering steps might stray,—
I saw but ruin and decay,—
In glory still, without a flaw,
Stand Bethlehem and Golgotha!

The Pyramids of Egypt Land,
  How vainly have their builders wrought!
In darkness of the grave they stand,
  Yet Death's sweet peace to them is naught
The Sphinx colossal could not read
Life's riddle in man's hour of need,
Now solved thro Love and Mercy's Law,
By Bethlehem and Golgotha!

O Thou, Who in a manger poor
  Didst choose a helpless Babe to lie,
Didst shame and pain of Cross endure,
  And took from us our pain thereby;
The manger seems too base to pride,—
The haughty still the Cross deride,—
Thy meekness Heaven beheld with awe
In Bethlehem and Golgotha!

The wise the shepherds' star obeyed,
  And kings in adoration stood,
And many a pilgrimage they made
  To kneel before the Holy Rood,
And such a storm of strife was born,
The world, yet not the Cross, was torn,
As East and West the conflict saw
O'er Bethlehem and Golgotha!

O let us not with warring sword,
  But with the Spirit take the field
And fight for Jesus Christ, our Lord,
  With weapons He Himself did wield;
And with the Apostles as our guide
Send out the Light on every side,
Till all the world its light shall draw
From Bethlehem and Golgotha!

With pilgrim hat and staff I sought
  In farthest Eastern world to roam,
And from my pilgrimage have brought
  This faithful message to your home:—
O fare not forth across the wave
To seek God's cradle or His grave,
But look within; there find with awe
Your Bethlehem and Golgotha!

O heart, what need in foreign land
  His lowly cradle to adore?
Or in rapt wonderment to stand
  By grave which holds thy Lord no more?
That He in thee has had His birth,
And that thou diest unto earth,
And liv'st to Him—this only—ah
Is Bethlehem and Golgotha!

Boston, Mass.

The Land of Manhattan

BY CHESTER F. PARISH

Real Estate Editor of the New York *Evening Post.*

NEW YORK real estate—that is, Manhattan Island real estate—is about the only local investment property which has not receded in value during the last year. Industrial stocks of one sort or another have dropped from 4 to 140 points; New York City bonds have reached the lowest point recorded during a decade, but real estate, including office, mercantile, residential and vacant property, still maintains the high values reached during the great period of speculation and investment in 1905 and 1906. Trading in real property, which fell off during the recent financial crisis, is again on the increase, with good prospects of normal activity during the coming year.

Growth of population, with its resultant demands for all grades of property, is the fundamental cause of high land values in New York. Great local improvements, a limited area and constantly increasing business are secondary causes for growing land values, but all these again return for origin to the never-ending tide of immigrants from every part of the world, who annually pass thru the port of New York to make their homes somewhere within the five boroughs of the city.

It is estimated that 250,000 persons

were added in the last year to the residential population of Greater New York by foreign immigration alone. The presence in the city of this great addition, sufficient to make a city of the size of Newark, Louisville, Minneapolis or Denver, is hardly noticeable to the casual observers. The streets and railroads seem no more crowded and tradespeople detect the presence of larger patronage only in increased returns from business. Those who do feel the pressure of this great growth are the property owners and builders of the city, whose task it is to supply the new residents with homes, places of business, schools, and places of worship and amusement.

This year's increase to the permanent population of the city is no exception. Indeed, the ratio of increase has been growing so constantly that statisticians pre-figure the city's population at almost 10,000,000 in 1920. What such yearly additions to the residents of the municipality mean in permanent investment in real property is worthy of consideration. It means at least 50,000 new habitations annually, be they dwellings, apartments or tenements; at least 40,000 new producers or distributors of the products of trade and commerce; at least 30,000 new pupils in the public schools, making necessary the erection of at least ten new schools each year; and at least $30,000,000 per annum increase in the permanently invested wealth.

Based on these facts is all the real estate investment and speculation in New York, which annually amounts to upward of one billion dollars. By careful study of them many operators and investors have made in the last ten years fortunes, the total of which would relegate to insignificance any single fortune known today. Not only has Manhattan Island been completely exploited, but operations have been carried into the other four city boroughs, into Connecticut, New Jersey and Long Island, for a distance of fifty miles. Many railroad improvements in and about the city, which provide quick and direct communication between the business and shopping districts and various suburban parts are lending their aid toward reducing congestion on Manhattan Island and toward building up suburban towns. In the last part of their problem they are

NO. 1 WALL STREET. THIS PROPERTY SOLD FOR $4 A SQUARE INCH TWO YEARS AGO.

CENTER OF THE GREAT RETAIL DISTRICT. FIFTH AVENUE NORTH OF THIRTY-FOURTH STREET.

succeeding mainly thru the fact that people must go outside of Manhattan to live, for accommodations are not to be had by all those whose business and social standing make residence there advisable.

New York City's growth has always been rapid. During the last ten years it has been spectacular to a degree. Ten years also include the period of greatest real estate activity, the development of vacant parts of the city, and the rebuilding of its older sections. Up to three years ago this growth was mainly along established lines of transit, and largely on Manhattan Island. Brooklyn, then an independent city, took a large part of the overflow when available districts became overcrowded, and the rest was divided between Queens County, Richmond, Westchester and hither New Jersey.

In 1890, the consolidation of Manhattan, the Bronx, Brooklyn, Queens and Richmond gave promise of extensive municipal improvements, which would have a direct bearing on real estate values, and prices of property rose accordingly. Three years later the first subway in the city was put under construction thru districts never before available for improvement, because of lack of transit facilities. The "subway boom" resulted in greatly enhanced values in upper Manhattan and in the Bronx, where in a short time a section was created which can bear comparison with many of the country's large cities. Demand for more such transit lines was created by the successful operation of the subway, and the then Rapid Transit Commission acceding, authorized nineteen more subways to every part of the city except Richmond. The city then bought and started to operate a quick ferry to Staten Island, and independent corporations took up the matter of building railroads to Westchester and Connecticut and tunnels to New Jersey and Long Island.

THE NEW WHOLESALE SECTION. FIFTH AVENUE NORTH FROM EIGHTEENTH STREET.

In two years, it seemed, transit lines for the whole suburban district, embracing several hundred square miles, were authorized, and a work, which, it now appears, should have been started twenty-five years ago, was begun. That was two years ago, and from then dates the great land boom about New York City.

Real estate values on Manhattan Island have derived the leading benefit from all these improvements. While it may seem that the opening of avenues of traffic to the suburbs would have the effect of drawing off the resident population and of cutting down rather than improving land values, the fact is, that, with constantly increasing arrivals, the congestion in residential districts is not at all reduced, and builders are pushed to the utmost to supply new housings for those for whom there is no accommodation.

The highest real estate values in the world are found in the financial district of New York City. The high rate of $4 a square inch was paid for a plot on Wall street two years ago. It is the highest price known to have been paid for property of considerable area, but it, even, is less than probably would be asked for some other plots were they for sale. Values in this neighborhood are based on demand for space in close proximity to the great financial center of the country. Here the Stock Exchange, the leading banks, and the various railroads established years ago, and here those who had business with them sought them. So the demand for space goes on now only to a greater extent.

As the population of the city grew from thousands to millions the district first spread out, and then began to grow up. Now, each passing year sees more high buildings erected on the fringe, so to speak, of the financial district. The limit of hight at the center has about been reached. Henceforth the expansion must be lateral. In this way we see today districts invaded by tall office buildings which formerly were given over to wholesale or retail trade, and the trade is compelled to go elsewhere. On this principle the values in the financial district are constantly ascending.

Just now the tendency of values is to rise rapidly in view of the near completion of sub-river tunnels from the lower part of Manhattan to New Jersey, by which it is expected several hundred thousand persons will daily be landed in one spot, who formerly were set down in Manhattan at a half dozen different points along the water front. The demand for space near this tunnel terminal has already become pronounced. Rentals have advanced sharply and values have followed.

In the last two years the financial district has moved its northern boundary to Vesey street, its west boundary to the North River, and its easterly edge almost to the East River. It seems a matter of only a few years before all the land within these limits shall be brought into demand for sites for tall buildings to accommodate the increasing and expanding offices of the great financial institutions of the country. As each new building decreases the supply of improvable land, that remaining takes on increased value; and as rentals improve on the outskirts of the financial district, proximity to the center again becomes more valuable. So values are constantly going upward, and will go up as long as New York City maintains its growing importance among the centers of trade and industry in the world.

Property of this grade, while the most expensive, is at the same time good as an investment holding. As investments office structures in the financial district pay in the average about 6 per cent. per annum. Transactions in them are few, both because owners are loath to part with such good money makers and because comparatively few individuals are able to handle properties of so great cost.

In expanding, the financial district has encroached on neighborhoods where various wholesale trades formerly held sway. Increased business has caused greater demands for space from them. Old houses have enlarged their plants and new ones have entered the field. Expansion was possible to these in a northerly direction only. They forged ahead, past the boundaries of business houses, established during less busy times, and into one of the city's finest residential districts. Fifth avenue homes gave way to lofts and mercantile structures, the wholesale trades moved up as far as

Twenty-third street, and the district from Fourth to Eighth avenue boomed as never before.

Prices in some cases rose from 200 to 300 per cent. Properties were sold three or four times over, each time at large increases. The building of structures to accommodate the expanding business began actively and is yet going on. Retail dealers who formerly occupied some of the side streets found themselves compelled to move, and so that branch of

LARGEST BUILDING IN THE WORLD IN POINT OF FLOOR AREA.
The total rental exceeds $1,000,000 yearly.

trade went north into Fifth avenue as far as Forty-seventh street, and into other side streets as far as Thirty-ninth street, driving the residential population before it.

While this movement was in its beginning, an event occurred to make this central portion of Manhattan one of the most desirable from a real estate point of view. The Pennsylvania Railroad began the work of constructing a set of tunnels under the North River to Thirty-third street, and announced its further purpose of erecting a great station for its trains on Seventh avenue, from Thirty-first to Thirty-third street. At the same time, another corporation announced its intention to build more tunnels from New Jersey to a point near Christopher street in Manhattan, these to be continued into a subway up Sixth avenue, thru the retail dry goods district, to a terminal at Thirty-third street.

All these proposed improvements precipitated a movement which would probably have been quite gradual under ordinary conditions. To catch the trade of the thousands who are expected to be dropt daily in Manhattan by these roads, shopkeepers offered fancy prices for properties, and to a large extent made the values which prevail there today. In the course of business expansion prices in the older sections have been equalled in the new, and, with the prospect good for added patronage to shops from those who arrive by the new lines of transit, property in the entire central district is expected to go higher than such business property has ever gone.

Owners of land in this section, which is popularly termed the "uptown business district," show great reluctance to sell now at any price. While some of them could realize three or four times as much as they paid for their properties ten years ago, most seem anxious to await the completion of improvements, hoping that even better values may be established.

Manhattan Island is not so large that any branch of trade can expand without restraint. For that reason, the uptown retail center seems destined to eventually become a district of very high land values. The finest retail stores in the world are to be found right there, and the richest trade in the world passes daily from door to door. The city has seen the transformation of Fifth avenue from a residence to a business street, but that seems to be but the first step toward a change which will include all property right up to Fifty-ninth street and from the west side of Park avenue to the east side of Seventh avenue. There is to be the finest retail section and that is why land values are high.

Increased population, it may be noted again, was the cause of the business expansion, and the result of the gradual elimination of residences south of Fifty-ninth street. What business has done in the better class neighborhoods, public improvement by both the city and private corporations is doing in tenement sections. Terminals, bridge approaches, parks, playgrounds, and public buildings have taken many acres of homes, and in the migration which ensued the northward transit lines were followed, and the upper reaches of Manhattan and the Bronx benefited. Land values went up by bounds; so far, in fact, as to place individual dwellings beyond the reach of any but the well-to-do.

Values on Fifth avenue, in the wealthy residential district above Fifty-ninth street, have been materially increased in recent years by the removal of many leading business men of other cities to New York. Residence on Fifth avenue seeming the easiest road to them to attain whatever social ambitions they had, they were willing to pay good prices. Fabulous amounts have been paid for such properties, and because of the limited supply such prices have been put down as actual values.

New York's dwelling area is confined to a comparatively small space. What remains of it below Central Park seems destined to be swallowed up by advancing business houses. The rest is east and west of Central Park, thru the Sixties, Seventies, Eighties and Nineties. Here competition is so keen that prices are steadily advancing. Owners who bought homes twenty years ago are able to obtain four and five times what they paid for them. Few are inclined to sell, for to part with their holdings means to go either into apartments or into the suburbs.

Recently many owners of private

dwellings have found that they can make their properties work well for them. Because of the short supply of such housings, rentals are higher than ever before. A well located modern house brings from $4,000 to $7,500 a year. On this basis, owners who have no dislike for apartment houses have rented their homes, and for from $2,000 to $3,000 have obtained apartments. In this way they make their properties pay both the rental of an apartment and an income besides.

The expense and care of private dwellings, coupled with their scarcity, have driven many families to the apartment houses. In fact, whatever increase there may be in the future to the population of Manhattan will have to seek shelter in this grade of dwelling and in tenements.

In elevator apartments values are largely determined by location. Houses convenient to transit lines and near the social center bring the best incomes, and therefore have the best values. But in this class of property, as in all others in Manhattan, increased worth is being made by increased demand.

From the standpoint of an investment, apartment house property leads all other. Twelve to fifteen per cent. is not above the average return from a high grade house of this sort. It is sometimes stated that rentals in apartment houses in Manhattan are too high and that there must be a fall soon. Such a view is not true to fact. The area of apartment house districts is constantly being narrowed by the same process that is eliminating dwellings, while the demand for apartments is increasing. These houses include the only grade of dwellings to which the multitude can go, and while the necessity or wish remains for persons to live in Manhattan, high rentals will probably be maintained. The cost of such houses, too, is becom-

THE FINANCIAL DISTRICT.
This picture shows the new buildings in process of construction.

ing not cheaper, but more expensive, and the houses more lucrative. The average apartment house of today is as fine in most ways as some of the very expensive dwellings. Higher rents and better incomes can be derived from this grade of house than from a cheaper one, and builders know that income is what investors seek.

There are undoubtedly many families which have found themselves unable to longer meet the demands of landlords and have removed to the suburbs, where living is less expensive. Their leaving is not noticeable in the vacancies they cause, for others appear who fill their places.

Just so it is in the city tenements. Laws governing the construction of these houses have made them so expensive that rentals in them have almost doubled in a few years. So many tenements are being destroyed constantly for one reason or another that demand for room increases and landlords are able to obtain higher rates. Many persons have thus been driven to the suburbs, but the tenements are fairly filled.

There was talk last year of overbuilding in some tenement sections. It is true that many houses were almost without tenants for a time last fall and winter. Immigration has remedied that, and with very little building of tenements this year, there is likely to be more congestion next spring and further increases in rents.

Tenement house property in Manhattan is largely held by foreigners, who are of the people who inhabit the houses and who, by their knowledge of their tenants, are able to properly manage their holdings. Some owners have bought their houses subject to three or four mortgages. By economy and constant attention these are, after years, reduced to one or two. Except to one who has ability to handle tenement dwellers, the income is not worth the care of ownership, and so tenements are passed over by those who can afford to buy better grades of property.

Vacant land on Manhattan Island takes its value from its scarcity. For a year or two, except in some favored sections, there has been but slight advance, due to little demand. Builders have been unable to negotiate loans to a great extent, and have taken on few commitments. Prices on such property were established three years ago on the opening of the subway, and so high did they go that there is small hope for advancement until the northern end of the island is brought into demand for home sites.

Profits made in suburban real estate during the last few years probably amount to millions of dollars. Practically every section within fifty miles of the City Hall has had a land boom fostered by promises of future transit improvements and by skilful newspaper advertising. Almost all of this business was speculative, and in only a few cases were legitimate values established. Buyers took over properties in the hope of reselling while the suburban land boom was at its hight. Some resold, but more still have their properties.

The Bronx, Brooklyn, certain parts of Queens Borough, and the nearby New Jersey settlements have been developed on legitimate lines, and have not only furnished homes to thousands of persons who could not find suitable accommodations in Manhattan, but they have done so much in the way of local improvements as to have assisted in the material enhancement of the newly developed tracts.

This has been done with work on interborough and interstate transit connections going on. It was the experience of Manhattan to have its greatest land boom after the completion of the subway. Whether the outlying districts are to have another period of land booming is for the future to tell.

New York City.

Literature

Greece and the Aegean Islands

PHILIP MARDEN has added another to our already numerous books of travel in Greece,* and he has done well. He appears to have gathered his material in one somewhat extended visit. He has certainly kept his eyes open, and he ranks high with those who, having seen and loved Greece, cannot hold their peace. He must be a clever man, of cheerful and genial disposition, with whom one might wish to travel. "May his tribe increase." He disclaims being an expert, leaving that to the "archeologists," whom he sometimes beats on their own ground, getting at the gist of the matter quickly and directly. Many a book-maker may well envy him his felicitous phrases, full of common sense and *bonhomie*.

The illustrations, forty-seven in number, are excellent. The vignettes give a flavor of old Greek life. A map of Greece is also appended.

LANDING PLACE AT THE VOLCANIC ISLAND OF THERA, FROM MARDEN'S "GREECE."

After a few remarks on traveling in Greece, the itinerary begins at Crete, now unveiling its wonders at Knossos and Phæstos. Then comes Piræus and a great circuit thru Attica, Delphi, Argolis, Arcadia, past Brassae to Olympia. An excursion among the islands and coasts of Asia Minor follows, and the tour winds up at Corfu. In the last seven

* GREECE AND THE AEGEAN ISLANDS. *By Philip Sanford Marden.* Pp. lxiv, 1-386. Boston: Houghton, Mifflin & Co. $3.00.

chapters, mostly short, the author is at his best, partly because the theme is not hackneyed.

But with all the world he revels in Athens. His enthusiasm over the view from the Bema just before sunset is common to us all. The thrill cannot be kept down. Then, to the south, lies Ægina—glorious Ægina—that deserved a better fate. "The sunshine is a glorious birth," but it is the eventide that thrills.

The description of Delphi is in some respects the finest of all. There religion took the first place, and religion always claims the first place. Olympia called forth strenuous action and joy over a faded garland, but those who came to Delphi sought relief for their burdened souls.

The correction of errors is an ungracious task. To Schliemann's first fanciful interpretations how many errors are still to be traced! The great circle of graves we here still find spoken of as an "agora" and a "market place." What Schliemann found at Mycenæ was a cemetery, probably a mound originally outside the wall. The idea that the elders sat on the ring, four feet high, is a touch of comedy. The large "fourth grave" was a burial vault, as was shown by the cover, certainly removable; and the five persons in it were buried at considerable intervals. It is clear from the nineteen bodies, that this cemetery had nothing to do with Agamemnon, and those who came back with him from Troy. In the great beehive tomb, commonly called "the treasury of Agamemnon," it is well known that the triangular space over the lintel was filled with a slab or slabs of red porphyry, of which fragments remain.

The theater at Epidaurus is called "an immense "amphitheater," whereas a Greek theater is as different from an amphitheater as chalk from cheese. "The surviving multitude of statues of Athena found on the Acropolis" are for the most part certainly not statues of the goddess.

The great medallion portrait at Eleusis has nothing to do with the propylæa of Claudius Pulcher, nor does the Sacred Way "continue toward Corinth." The Nike temple never stood in the way of the Turkish tower. The Turk had no hand in the destruction of the central group of the east gable of the Parthenon. It disappeared a thousand years or so before the Turk appeared in Athens. The famous temple on Ægina belongs neither to Zeus nor Athena, but to a little known goddess, Aphæa. The temple at Sunion has recently been proved by an inscription to belong to Poseidon and not to Athena. It is, however, odious to weigh mint and anise and cumin in the presence of a really fine work. The description of the grand and awful Thera outweighs a whole book. Let the author speak:

"Considering her beauty as an island Thera is surprisingly little known. Historically she had small celebrity compared with her neighbors, but in every other way she surpassed them all. For beauty of every kind, from the pastoral to the sublimely awful, Thera has no fellow in the Ægean; and for extraordinary natural history and characteristics it is doubtful if it has a fellow in the world, for it is a sunken volcano with a bottomless harbor, where once was the center of fiery activity, a harbor rimmed about with miles of encircling precipices, on the top of one of which lies the town of Thera, a thousand feet straight up above the sea.

"At some prehistoric time the original volcano subsided, with a blaze of glory that can hardly be imagined, into the waters of the Ægean. Thru two enormous crevices torn in the northern and southern slopes the irresistible ocean poured into the vast central cavity, cooling, to a large extent, the fiery ardor of the mountain, and leaving a circle of frowning cliffs nearly a thousand feet in hight, eighteen miles in periphery, inclosing a placid and practically bottomless harbor in what was once the volcano's heart. Into this curious harbor we glided thru walls of forbidding stone towering high above in cliffs of that black, scarred appearance peculiar to volcanic formation, marred by the ravages of ancient fires, yet none the less relieved from utter sullenness by strata of rich red stone or by patches of grayish white tufa. High above, perched on what looked like a most precarious position along the summit of the cliff, ran the white line of the city. No cable could fathom the depth of the basin a few rods off the shore."

Seneca's Tragedies*

LITERARY conditions and knowledge are very different today from what they were in Queen Elizabeth's time and the

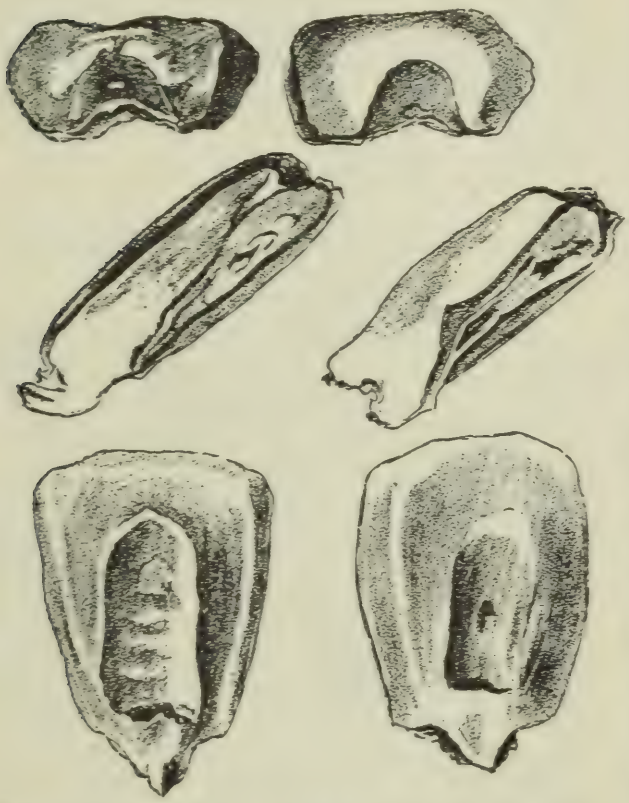
*THE TRAGEDIES OF SENECA. Translated into English verse, to which have been appended Comparative Analyses of the corresponding Greek and Roman plays and a Mythological Index. *By Frank Justus Miller.* Introduced by an essay on the influence of the tragedies of Seneca upon early English drama, by John Matthews Manly. 8vo. Pp. ix, 534. Chicago: The University of Chicago Press. $2.00.

years preceding. Then everybody knew the Latin writers, and almost no one knew the Greek. So Æschylus, Sophocles and Euripides had no influence on the English drama, while the Latin comedians and tragedians were familiar to every writer or scholar. But today who but a classical specialist has ever read one of Seneca's tragedies, or remembers him as anything else than a Stoic philosopher and Nero's tutor and victim? Meanwhile the Greek tragedians are now read in translation in women's clubs.

It is well to have Seneca restored to us as a dramatist, and we are glad that Professor Miller has put his translation in metrical form. This removes the jejune emptiness which cannot be escaped in the English prose rendition of a classical poet. Almost no one but Professor Jowett can put Greek prose even into readable English prose. Professor Miller's translation is not merely scholarly; it is fluent and vigorous. The reader may judge its quality from the closing line of "Œdipus." The Theban king has learnt that he had unwittingly slain his father and wedded his mother, that the pestilence fallen on Thebes was the punishment of his crime, and in remorse he plucks out his eyes, while Jocasta slays herself in his presence:

"With apprehensive feet
Let me go out upon my darkened way,
Planting my footsteps with a faltering tread,
And thru the darkness grope with trembling hands.
Stay not thy flight, speed thy uncertain steps—
But hold! lest on thy mother's corse thou tread.
O Thebans, weak and smitten sore with ills,
Whose hearts are fainting in your breasts, behold,
I flee, I go: Lift up your drooping heads.
A milder sky and sweeter air shall come
When I am gone. Whoever still retains
His feeble life may now inhale the air
In deep, life giving draughts. Go, lend your aid
To those who were to certain death resigned:
For with me in my exile do I bear
All pestilential humors of the land.
Then come, ye blasting Fates and mad Despair,
Thou deadly Pestilence, come, come with me;
With such a company 'tis sweet to flee!"

Seneca's plays, like all Latin literature, follow Greek models and subjects, as might be seen from such titles as "Œdipus," "Phœnissæ," "Phædra" and "Agamemnon," to mention but four of the nine tragedies here translated. We have knowledge of over a hundred plays thus translated or patterned from the Greek, while of plays really original, and based on Roman history, fragments of not a dozen survive, and only one is extant complete, entitled "Octavia," and which would be ascribed to Seneca were it not for the too exact description of Nero's death. Indeed, Seneca is a character in the tragedy, and we are pleased to see it included in the present volume, which is a boon to the lover of classic literature. He will also be pleased to compare, in parallel columns, the plot of Seneca's plays with the Greek originals. For the English reader there is appended a sufficient, but concise mythological index, which will save reference to a classical dictionary.



Bailey's Cyclopedia of American Agriculture

When we consider the immense sums of money that are being spent at Washington and in every State and Territory on experimentation in agriculture, it is distressing to see how slowly the results penetrate to those strata of the farming population where they are most needed. We find in every locality men working according to the formulas inherited from their fathers, and ignorant or disdainful of the help which the experiment stations are willing and able to give them. The chief impediment in this, as in everything else, is mere inertia, or laziness of intellect, but there is another which is removable, and, in fact, is being removed —that is, the confused and incomprehensible form in which the results of research have been published. The scientist and the farmer talked different languages, and, as is the case whenever two parties fail to understand one another, each had a very poor opinion of the other's intelligence. A foreigner always seems something of a fool. Now, however, the farmers—some of them—are extending their vocabularies so they can understand the new learning, and the

*Cyclopedia of American Agriculture. A Popular Survey of Agricultural Conditions, Practices and Ideals in the United States and Canada. *Edited by L. H. Bailey.* With one hundred full page plates and more than two thousand illustrations in the text. 4 vols. Vol. I, Farms. Vol. II, Crops. New York: Macmillan Company. $5.00 each.

scientists—some of them—are learning how to apply their knowledge. We remember the disdain with which old Professor Hilgard received the remark that any farmer could tell more about what a soil could produce by squeezing a handful and smelling of it than an agricultural chemist could by his test tubes and batteries. His retort was that such a man might be a chemist, but how could he lay claim to the title of "agricultural chemist" unless he could tell at least as much by his bare senses as any farmer.

No other science and art has such a mass of recent literature as agriculture, and no other is in so confused and diffused a condition. With sixty or more experiment stations in this country issuing bulletins and reports at irregular intervals in various systems and series, and with bureaus, divisions, offices and departments at Washington adding to the lot, it is hard to tell what real contributions are made to knowledge and what they amount to. A clearing house is needed, and this new *Cyclopedia of American Agriculture* supplies the need. The Cornell Station has always been distinguished by the clear writing and attractive typography of its bulletins, and its director has seen to it that the same qualities prevail in his "Cyclopedia of American Horticulture" and the present work. In spite of the fact that it is packed with technical information, it is almost all of it comprehensible to any person of ordinary education, and much of it is so well written that it could be read aloud in the farmhouse to the whole family; not read perhaps by the flickering light of a pine knot or tallow dip, but, let us say, by the light of a Welsbach mantle heated by denatured alcohol. It will, of course, be in every public and traveling library of the rural districts, but besides that it could be profitably placed in many country schools as a reference book.

THE SELECTION OF CORN KERNELS FOR PEDIGREED SEED.

On the left, high protein kernels (much horny part, little white starch), on the right, low protein kernels (little horny part, much white starch). From Bailey's "Cyclopedia of American Agriculture."

Professor Bailey has called to his aid a hundred or two of the active workers in agricultural science, each to write on what he knows most about. This involves considerable diversity in style and even differences of opinion, but on the whole the contributions are satisfactorily combined and systematically arranged by topics with alphabetical subdivisions. There are to be in the complete work more than two thousand illustrations —real illustrations they are, too, not chromos thrown in to sell the book, but small cuts in the text showing clearly the point to be emphasized.

In its plan the cyclopedia is as orderly as creation. It begins with the inorganic, the two firmaments of soil and sky; the second volume deals with vegetable life, the crops; the third introduces animal husbandry, and the fourth is concerned with human beings, the social and political side of rural life. First the reader is told where to choose his land, the agricultural possibilities and advantages of all parts of the United States being explained, with articles also on Canada and our tropical dependencies in the Atlantic and Pacific. Then comes the laying out of the farm, the planning of buildings and purchase of equipment. The volume on crops begins with a chapter of elementary botany, followed by economic entomology, introducing the detailed description of North American field crops, occupying 500 pages, and

giving the special methods of cultivation, protection, harvesting and marketing of each. The very important and largely unappreciated work done by the Department of Agriculture and the stations in the past few years in the introduction of new and profitable varieties from all parts of the world and in seed selection for the making of plants to order is here carefully explained with abundant illustrations. Evolution has past from the forum to the field. It is no longer a question of acrimonious debate, but an instrument of daily usefulness. Mendel's Law may be for agriculture what Ohm's Law has been for mechanics.

Major Vigoureux. By Quiller-Couch. New York: Charles Scribner's Sons. $1.50.

Quiller-Couch always lays the scene of his story in some remote place, and the first chapters are invariably devoted to quieting the reader's mind, and in winning his spirit away from the noise and confusion of things. For the scene of his last novel he has chosen one of the smaller Channel Isles, which, as the tale progresses, appears to be a bit of solid land that has floated off into mystical waters. And while he lacks that devastating, dramatic power so popular now in fiction, he presents some admirable characters for the reader's consideration. The hero is an English officer who has been left in his empty barracks and orphaned by his Government—a great spirit, winged and helmeted, but whose duty forced him to live in an ignoble relation to society and to concern himself with petty details. Such men are not so rare as some suppose, but the author who can discover and interpret them is almost as rare as a great poet. The interest of the tale does not depend so much upon what happens as upon the contrast between this man of eloquent sensibility and the hard proprietor of the island. The latter's obtuseness renders him unconsciously brutal in his relations to the islanders, who could not be torn up and transplanted without doing violence to their lichen-hearted devotion to the soil. To produce such a character requires more genius than to have created the shrewdest cynic in Bernard Shaw's plays. And Quiller-Couch has it, the same kind which enables a great dramatist to create a fool without making him a clown. But probably no other writer of the day depends more on the right spirit of appreciation in the reader. His genius is shy, reticent, not given to tricks, but gifted with tenderness. He presents men and things with a delicacy, a Hans Andersen touch of fairy fancy. There is no mere cleverness in him, but he shows the harmless, whimsical humor of Charles Lamb. And he retains what many a man has lost since Adam received it—the breath of God, which enables him to come into life with its commonplaces and to change the dull color of it. The clay of all realities is there, but he sheds a radiance upon it and burns it fine and clear with the spirit of immortal fires. Without affectation, Quiller-Couch passes thru the deeper mysteries in the dark of mortal life like a gentle priest bearing candles from the very altars of God. There is a high quality in his work, like the red vigor in old wine, or the minstrel spirit in ancient poetry. It stimulates, it gladdens. There is light in it and the poignant sweetness of vesper hymns.

Literary Notes

....A book of scriptural and other religious quotations for every day in the year is published under the title of *Syllogisms* in handsome typographical form by Paul Elder, New York, at $2.00.

....A timely collection of quotations in prose and verse on the subject of Christmas, preceded by an introduction showing the pagan origin of its festivities, by R. H. Schauffler, is published by Moffat, Yard & Co., under the title of *Christmas*. ($1.)

....The second series of Professor Peabody's *Mornings in the College Chapel* (Houghton, Mifflin, $1.25) might serve as models for such addresses to young men. They are all brief, practical and pointed without being in the least sensational.

....The result of much patient questioning on the deficiencies of the American churches and how they can be remedied is embodied in *An Efficient Church*, by Carl Gregg Doney, Ph. D. (Fleming H. Revell Co. $1.25.) Dr. Doney employed a questionaire somewhat more elaborate than is usual in such inquiries and pursued his investigations with much diligence.

....The publishing house of John Wiley & Sons, this city, whose advertisement appeared in the first issue of THE INDEPENDENT in 1848, celebrated this year the one hundredth anniversary of its existence. But three times as old as John Wiley & Sons is the Oxford

University Press of England, which has been in the printing and publishing business for three hundred years. The United States Branch of the Oxford University Press is at 93 Fifth avenue, this city, and John Armstrong is the resident manager.

....The Rev. Dr. Wilbur F. Crafts may never have learned the truth of the motto that "It is better to fight for the good than to rail at the ill," but his *Practical Christian Sociology* contains a very large number of facts and bibliographical references which those interested in moral reforms would find highly useful. The book appears in a fourth revised edition, with "twentieth century statistics" and references to the most recent literature. Review questions follow each chapter, and courses of reading on sociological subjects are suggested (New York: Funk & Wagnalls Company. $1.50).

....INDEPENDENT readers are familiar with *The Modern Reader's Bible,* which has been appearing in parts consisting of single books for the past twelve years. The work is now complete, and aside from the convenient small volumes, which will continue to be issued, the entire Bible, with three of the Apocryphal books, is now printed together, with introductions and notes, making a book of over 1700 pages, yet not inconvenient or expensive. (The Macmillan Co. $2.00.) For literary study of the Bible, Professor Moulton's work is excellent; it is not intended for critical or historical study, and questions of authorship, date, and religious conceptions are not considered.

....Whatever may be the future of Esperanto, it is certainly making more progress than any previous attempt at an international language. On March 16th, 1905, the American Esperanto Association was duly founded by the two Esperanto societies then existing in the United States. Today forty-four local societies and four State associations are affiliated with the A. E. A., and the assistant secretary of the association at Boston is in touch with thirty-eight other societies moving in the same direction, and with over eight thousand earnest students and advocates of Esperanto, and has handled within two years over forty thousand letters and post-cards concerning Esperanto.

....*Practical Nursing,* by Anna Caroline Maxwell and Amy Elizabeth Pope (Putnam: $1.75), coming as it does from so conservative an institution as the Presbyterian Hospital, it will be readily understood that it is thoroly practical and well up-to-date. While it is technical to some extent it contains a very large amount of information that would be available for those who are not trained nurses or studying for such a career. We often hear complaints of the trained nurse that we think due to a failure of those who employ her to understand all the significance of her work. We would advise those who are about to engage or are already in the midst of their experience with the trained nurse to look over a volume like this, for it will make them sympathize much more with the many problems that present themselves to her and how much she needs to know to meet them, while at the same time retaining her self-confidence so as to deal with them properly.

Pebbles.

IT'S all right for us to eat chickens and cattle, and it's all right for the worms to eat us.—*Atchison Globe.*

A WRITER in THE INDEPENDENT discusses this question, "Is the Supreme Court Unconstitutional?" Thousands of constitutional questions are taken to the Supreme Court, and now at least one noted judge believes that the Supreme Court itself is unconstitutional.—*Atchison Globe.*

SOME people's genius lies in giving infinite pains.——A soft drink turneth away company. ——All the world shoves a shover.——A policy shop, the Embassy.——Two is company, three is investigation.——Peace that passeth all understanding, the Hague Conference.—— Perhaps it was because Nero played the fiddle they burned Rome.—A counter irritant, the saleslady.——Truth is stranger than diction. ——Everybody hates an early riser.——To the food inspector all things are pure.—*The Quite New Cynic's Calendar.* (Paul Elder & Co.)

JACK AND ROSE.

A DARING theft wrought Jack last night
On darling little Rose;
He stole some things he wanted, right
Beneath her very nose.
—*Philadelphia Press.*

'Tis to be hoped that if fair Rose
Returned the blissful smack,
Jack did not overlook a bet,
But turned and kissed her back.
—*Houston Post.*

That may be as they do this job
Down in the Sunny South;
But if Jack lived here in the North
He'd kiss her on the mouth.
—*The Commoner.*

Why rouse again the bitter strife,
And North and South wax hot?
Let's all agree to compromise—
Jack kissed her on the spot.
—*St. Louis Post-Dispatch.*

Why so much racket o'er a kiss,
Or e'en about the spot? It
Would interest us more if we
Had been the one who got it.
—*Birmingham (Ala.) Age-Herald.*

Yet Jack perhaps had little glee,
Tho on the mouth he kissed her;
We have as yet no proof, you see,
That Rose was not his sister.
—*Chicago Record-Herald.*

That smack smacked not of family ties.
The truth's not far to seek.
If Rose were Jack's dear sister, he'd
Just peck her on the cheek.
—*Portland Oregonian.*

A Weekly Magazine. Entered at the New York Post Office as Second-Class Mail Matter.
Publisher, Clarence W. Bowen
Owner, The Estate of Henry C. Bowen
130 Fulton Street, New York
TERMS OF SUBSCRIPTION, PAYABLE IN ADVANCE
One Year, $2.00 Single Copies, 10 Cents

Single Copies over six months old twenty-five cents. Postage to any Foreign Country in the Postal Union, $1.75 a year extra. To Canada $1.00 extra.
Order for the change of an address should be received one week before change is to take effect; the old as well as the new address should be given.
Persons desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, in that case, hold ourselves responsible for their return. Authors should preserve a copy.

Joy and Peace

THERE has been during the approaching Christmas season not a little discussion as to the propriety of the celebration of Christmas in the public schools. The stricter Jews, who are the great majority, altho not the most influential, have protested that their children, who in sections of our cities make a majority of the scholars—Jews have families—have been required to sing songs at this season in honor of the birth of Jesus Christ; and this they have naturally resented, for they do not accept Jesus as the Christ. We have sympathized with their protest, and have urged that the teaching of religion, of whatever kind, is not the duty of the nation or the State, which includes men of all religions with equal rights, but is the solemn duty of the Church. We see no objection to Christmas songs, or to the reading of the Bible in any version preferred, or an opening prayer, in any school where the people who support the school are religiously homogeneous and desire it so; but where different religions support the school, and Protestant, Catholic and Jewish children attend, we regard it as a serious injustice to compel all to submit to one and the same religious exercises. Yet we observe that some of the more advanced, or the radical Jews, say that they do not object, for they do not think it quite courteous for them, in a country where they are better treated than in any other on the globe, to disturb the custom of the people. But Dr. Felix Adler offers another reason. He says that Christmas is a peculiarly Christian celebration only in its name, that it was observed long before Christianity, and that Christianity took over a pagan festival of the joyful Solstice season, and gave it a Christian significance; that we have too little joy in our lives, and we cannot afford to lose a single one of its festivals.

Beyond question, in the choice of Christmas on the 25th of December, it was meant that it should take the place of such pagan festivals as the Roman Saturnalia and the German Yule, days of joy when the sun ceased to decline and began to rise and promise the spring. In very much the same way the Jewish feast of Purim took the place of Babylonian and Persian feasts of the beginning of the year with spring, and the very name of Mordecai suggests the god Marduk (Jupiter), and that of Esther the goddess Ishtar (Venus) and other names of the story have been similarly identified with less evidence. But Purim has become, in our day, wholly Jewish, as Christmas is wholly Christian; but there can be no objection to Jews making the same season a time of domestic joy, and giving to it any meaning they please. The early Christians selected the date arbitrarily, with no evidence that it was the date of our Lord's birth, capturing it from its pagan associations, and the Jews have the right to do the same now. Indeed, we are glad to see that they can and do so usually join with us, in a measure, thus identifying their Feast of Dedication, *Chanuka,* with Christmas. It is a happy thing to have the two feasts made to coincide, whatever the reason. It brings Christians and Jews nearer together. In Christian schools the children will celebrate our Lord's birth; in Jewish schools they will celebrate the consecration of the home, and with equal joy; and in the public schools, which are for all, it would be a profanation of the day and its meaning to make it the occasion for discord and complaint.

It is the day of peace and joy, the day dedicated to the home, a day for gifts and happy greetings; a day, also, for grateful praise of him who, from a manger in Bethlehem, brought us the simple faith in the All-Father, and good will to men. On this day we will rejoice that Japan has decided to reduce her expenditure

for naval equipment by forty millions a year, and we wish that Christian nations might follow the example.

Christmas giving and receiving, with discretion and discrimination, are beautiful functions, and we should as soon denounce the wayside rose or the song of the lark as decry them. Yet why should we annihilate the joy that they ought to impart by converting them into a bondage or a burden? To give to children a few simple and beautiful things, and to make personal sacrifices in order to buy them, is worth while. It creates innocent happiness in others and warms our own hearts. But to overwhelm children with meaningless, grotesque, cheap and senseless things because everybody else does so, or because we will not make the effort or the sacrifice to select a much smaller number of essentially excellent or desirable things, is to take leave of common sense. To send a helpful gift to a friend lonely or in need is to do one of the most gracious things that the inequalities of fate afford us opportunity for doing; but to send presents that we cannot afford to pay for to acquaintances whom we spend three hundred and sixty-four days of the year in forgetting, is neither gracious nor honest.

It would be a sorry day for us all if we should no longer celebrate Christmas or find happiness in its observance. No other festival of the year means quite so much, no other so links all the past history of the race with the living generation. No other so draws together childhood and age in sympathy and understanding. Why, then, spoil or even mar it? Why not use as not abusing it? Why not seek out and draw forth its beauty, and not make it, as too many of us do, a penance and a bane?

The Death of a Philosopher

ENGLAND buries in Westminster Abbey this week one of her greatest national assets, the brain of Sir William Thomson, Baron Kelvin. For the last sixty-seven years this marvelous instrument of the intellect has been actively and continuously engaged in productive thinking for the benefit of the human race. The actual loss to the world is incalculable, for no one can conjecture what new realms of knowledge might have been disclosed next year or the next if this mental searchlight had continued to sweep the horizon of the unknown. For even in his eighty-fourth year, almost to the day of his death, his mind retained its vigor and power of attacking novel problems.

We speak of Lord Kelvin's death as a material loss because that is the side of scientific research most apt to be overlooked by the public. Here is not a case of apparent loss to the community, such as makes us all feel poorer in time of panic, the wiping out of fictitious values, the evaporation of water in stock, the lack of confidence thru finding that confidence has been misplaced. It may be said of the scientific investigator more truly than of any other man that he is a creator of wealth thru the exercise of his peculiar mental abilities, because he extends the power of man over unknown forces; he unlocks the hidden treasuries of nature.

The most conspicuous example of this is in the field of electricity, where Lord Kelvin has been for so many years preeminent. Our trains are run, our elevators lifted and our houses lighted by a power whose very existence was unsuspected until disclosed by the curiosity of science. The term "applied science" has sometimes been criticised, most forcibly perhaps by Prince Kropotkin, on the ground that science is not first discovered and then "applied," but that after—often a long time after—a fact has become known or an invention in use, the scientist comes along and gives a more or less satisfactory explanation of it for his own intellectual gratification. It is undeniable that the early history of science gives abundant examples of this order of procedure, but in recent times pure science has been the leader and initiator, especially in such branches as physics and chemistry, where the greatest progress has been made in the practical utilization of new principles. A modern shop guide to dynamo construction or power transmission contains more abstract mathematics than was dreamt of in the philosophy of our forefathers.

Generally it is true that the theoretician and practician are men of differ-

ent mental qualities or at least habits, but in Lord Kelvin they were combined. He laid the mathematical foundations of modern theory of heat and also constructed the sensitive and accurate instruments for measuring electricity which have made possible the commercial utilization of this elusive fluid. His mind could turn readily from the consideration of the problem of the running down of the universe thru the inevitable degradation and dissipation of energy, to the invention of a device for getting the ink to flow freely from his siphon recorder, which saved the Atlantic cable from failure. He proved from the principles of thermodynamics that at 273 degrees below zero centigrade must be the absolute zero where no heat exists, so that a thermometric scale starting at this point would measure the true temperature, irrespective of the properties of any particular substance. He also invented the mariner's compass now in general use and showed how it could be compensated for the aberrations due to our modern steel ships. He was, besides, an efficient business man, acting as director of cable companies and telegraph systems.

He applied the same inventive skill that he used in the construction of apparatus to the finding of ways out of the intellectual *impasses* into which our logic leads us. When there seemed to be an incompatibility between our conceptions of the atom and the ether, he devised the vortex ring, which is made of ether yet differs from it because of its mode of motion. The nearest familiar analogies to these are the rings that are puffed out from a locomotive smokestack or the lips of a tobacco smoker. They are in this case both formed and destroyed by friction, but in a frictionless fluid like the ether they could not be made, or, once existing, could never be destroyed, in these respects fulfilling what he believed to be the essential properties of atoms. Then, again, a difficulty arose when his calculations of the rate of cooling of the earth indicated that the earth was in a semi-molten state not much more than 20,000,000 years ago, and yet it was inconceivable to him that life could have originated by spontaneous generation from a fortuitous concourse of atoms. To extricate himself from this dilemma he suggested that the earth might have been seeded by living germs brought to us from some older planet, a theory that later seemed less fantastic when Dewar proved that seeds could retain their vitality when cooled nearly to absolute zero, and Arrheneus showed how minute particles could be propelled thru space. But whether these and similar ingenious ideas of Lord Kelvin are real explanations or merely tricks to save us from intellectual confusion remains for the future to determine. Neither can we now decide whether it was the natural conservatism of age or the proper caution of experience which led him recently to throw cold water upon the enthusiasm of the new school of scientists who found in radium and its emanations the key to the universe. Certainly his attitude was in noticeable contrast to the former meeting of the British Association for the Advancement of Science in 1847, when he, then only twenty-three, stood forth alone among the distinguished men of science and championed the theory of the conservation of energy then set forth for the first time in its complete and logical form by Joule.

An American cannot expect to understand why a man who had made famous a commonplace name like William Thomson should abandon it to become the first and last Baron Kelvin, to accept a title foreign in its connotation to the new civilization that he had furthered, to gain a seat with the degenerate members of a vestigal political deformity like the House of Lords. But this form of "the last infirmity of noble minds" is too common among the inhabitants of the British Isles, even tho born in Belfast, to excite comment or to impair our appreciation of the greatest of recent physicists.

The Discoveries in Egypt and the Higher Criticism

THE recent remarkable discovery of Aramaic papyri in Upper Egypt further strengthens the proof, which has now become irrefragable, that the Old Testament is an honest book. A century ago there were those who seriously suspected that the entire Bible was the invention of medieval monks, who forged fables out of whole cloth and past them off as verit-

able history. Thanks to the work of historical students, and to such discoveries as the Moabite Stone, the Tell-el Amarna tablets, the Code of Hammurabi, and the letters from the island of Elephantinê, it is now established beyond a peradventure that the Old Testament is the serious endeavor of honorable and truthful men to set forth facts. Their records are subject to criticism, which is merely intelligent examination and comparison, as indeed are all ancient documents. Views and opinions which they stated repeatedly and emphatically may be found in need of amendment and correction. But the background of the Hebrew Scriptures is so manifestly the historical conditions as they stand out before us from the letters and inscriptions composed centuries before Christ that the general honesty of the Bible is not open to the slightest question.

While defenders of the faith are entitled to all the comfort and exhilaration which this fact affords them, fairness compels attention to the further fact that the most recent discoveries corroborate in a striking manner the contentions of the higher critics and the liberal school of Biblical historians. It is as clear as day from the letter of the Egyptian Jews translated in our issue of December 5th that in the fifth century B. C. there was a Jewish temple, with an altar for meal offerings and burnt offerings, served by devout and regularly constituted priests, on an island some 600 miles up the Nile. So far from this altar and its sacrifices being in contravention to any known law, these Egyptian Jews wrote to "Jehohanan, the high priest, and his companions the priests in Jerusalem," in the earnest hope that he would help them repair the altar after it been broken down. Because of its destruction these pious men put on sackcloth and fasted and prayed to Jehovah, and their wives became as widows. In no portion of the Old Testament does there breathe a spirit of more loyal attachment to the God of Israel and sincere desire to obey his commandment perfectly than in this recent find of the German excavators.

And yet there is passage after passage in the Pentateuch and in the historical books which would make these servants of Jehovah in the fortress Yeb transgressors of the most explicit commandments of Israel's God. According to Deuteronomy it was Jehovah's prescription thru Moses that there should be but one central sanctuary, and that there alone sacrifices and offerings should be brought. The Priests' Code construes the history according to this theory, and describes a movable sanctuary which served for all Israel thru the wilderness wanderings. Scholars have long contended, on the basis of numerous passages which show that sacrifices were offered at many altars in perfect good faith, that the notion of one exclusive altar was a late imagination, and that the Deuteronomic law did not originate until the time of Josiah. The proof from the Old Testament itself is extremely cogent, but the strength of the argument for the critical position is measurably increased by the papyri just discovered, since they show that as late as 408 B. C. the law of the central sanctuary was not recognized, either by pious Jews outside of Palestine or in Jerusalem itself.

In 1904 similar papyri were dug up, almost on the same site, and have since been edited and translated by Euting, Sayce and Cowley. No less than ten beautifully preserved documents, apparently a family archive, give evidence of a Jewish military colony on this far away island of the Nile, and tell of the property and marriage settlements of a single family for two complete generations. Numerous facts of importance to the historian and antiquarian come to light from these papyri, and in them also there is evidence of an altar to Jehovah, estates being located in reference to it, and on this altar pious sacrifices were offered and before it solemn oaths were recorded. The evidence is so complete, and it so completely bears out the statements which scholars have long been making, that one might almost suspect that some wicked higher critics had faked these old petitions and records in order to support their theories, were not the evidences of antiquity so convincing as to leave no possible room for deception or mistake.

The mere fact that Jewish colonies flourished in Upper Egypt in the Persian period bears in another important particular on views concerning the Bible. The question of emigration to Egypt was

brought before the prophet Jeremiah, and he counseled against it, and declared in the strongest terms that disaster would result:

"So shall it be with all the men that set their faces to go into Egypt to sojourn there: they shall die by the sword, by the famine, and by the pestilence: and none of them shall remain or escape from the evil that I will bring upon them."—Jer. 42:17.

The papyri show that they did not die, but on the contrary that many were living and prospering many years after Jeremiah pronounced their doom. Here again the contention of critics has been sustained, for they have long held that the prophets were not infallible in their warnings of future events.

However it is a small matter that Jeremiah did not foresee accurately the fortunes of a panic-stricken band of his countrymen, or that Deuteronomy announced a law in the name of Moses which was not written until centuries later, compared with the fact that a real history, of exceeding spiritual value, may be read from the pages of the Bible by those who study it critically.

Indian Boarding Schools

We recall that when the Government first established its system of boarding schools to which all Indian parents were required to send their children, and in which only English should be spoken, certain wise and far-seeing missionaries among the Sioux made a loud protest. They said it was cruel to remove the children thus from their parents, and that it was unwise to forbid all instruction in the language of the home. They would have local schools brought to the Indians, in their own reservations and close to their homes, village schools where rudimentary education might be given, and would have only the older children sent to boarding schools. They would have the use of the English language come gradually and surely and not force it on an unwilling people.

What these missionaries said thirty years ago is, in substance, what the best Commissioner of Indian Affairs we have ever had says now in his Annual Report just issued. The question of language is no longer a serious one, as English has made much advance among Indians during a generation; but Commissioner Leupp tells the President and Congress that the system of numerous boarding schools is no longer advisable, if it ever was so. He desires to see twenty-five non-reservation Indian boarding schools closed. He believes that the continued plan of wholly supporting Indian children, supplying all their food and clothing, as well as education, is pauperizing and debilitates moral character. He would replace these with local schools at a quarter of the total expense, and would have the advanced and older children sent to schools attended by white youth. The present boarding schools, many of them not on reservations, he suggests might be given, with their valuable plant, to the counties in which they are situated for school purposes, with the condition that, as is the case with Dartmouth College, which was originally an Indian school, Indians shall never be charged any tuition.

The present boarding school system, says Mr. Leupp, is "an anomaly in our American scheme of popular instruction," "they are simply educational almshouses." He continues:

"The rudiments of education, such as can be given his children in the better day school, should remain within the reach of the Indians just as they are within the reach of the white children who must be neighbors and competitors of the Indian children in their joint competition for a livelihood."

The reservation boarding schools, of which there are 91, with a total enrollment of 11,019 pupils, must stay for a while, until they can be replaced by day schools; but nearly all the 25 non-reservation schools, with their 9,485 enrolled pupils, and a cost of $2,000,000 a year, taken bodily out of the United States Treasury, should be discontinued as Indian schools as soon as it can properly be done.

The cost of educating a child in these non-reservation schools is $250 per pupil, as against an average of $50 per pupil in a day school. These large non-reservation schools have an army of employes, for they are hotel as well as school. There are superintendent, clerks, teachers, matrons, housekeeper, nurse, seamstress, laundress, farmer, engineers, physicians, dairyman, baker, cooks, carpenter, blacksmith, shoemaker, tailor,

and perhaps a dozen other sorts of employes besides, not needed in the day school, where the children are clothed and fed at home, and the Government simply gives tuition and a hot lunch at noon. The expense will be less than half, even retaining several needed boarding schools. But the chief advantage is that which the missionaries insisted on thirty years ago, in the old American system, under which the children grow up with their parents, and the parents learn not a little with their children. It is better, says Mr. Leupp, to carry civilization to a people than to carry them to civilization.

The Southern Farmer

THE Southern manufacturer has for some time made himself felt in the Northern field. The largest cotton mills have branched over into Georgia and Alabama, and these branches have been doing profitable work. The farmer of the South held on to his old ways much longer, steadily exhausting the soil, and then going down in his scale of living with the degeneracy he created about himself. A change, however, has begun, and progressive farming has been increasing in such a ratio as to be revolutionary. In the corn contest of two or three years ago South Carolina took first prize, and another Southern State took second. It is found that the most unprofitable soils, when handled scientifically, can not only be renovated, but placed in the very first class of productivity. This is peculiarly true of those lighter soils which had been given up as unfit for cultivation.

Legume is a word in every Southern farmer's mouth. In the Northern States the clovers and vetches, including alfalfa, are about all the legumes available for creating humus and rapidly adding nitrogen to the soil; but in the Middle South there can be added cow-peas and crimson clover; while the lower South has beggar-weed and velvet-bean. These are supplemented by a crowd of lesser leguminous plants, every one a nitrogen gatherer, and therefore important as a fertilizer. This natural advantage must be considered in connection with the fact that some of the Southern States are still without a stock law, while open lands are burnt over once a year. The loss of humus as well as nitrogen has been enormous. Florida alone has to count the cost of such folly by the tens, if not the hundreds of millions. The advantage has been strictly limited to stock growers, mostly Western dealers, who turn the State into a vast pasture ground, for fattening the cattle which they sell in the Northern markets.

A Southern farmer has the advantage of no winter to exhaust his accumulations. He never sees a coal bill, and his taxes are at a minimum. His outfit for clothing is always light, while most of the luxuries of an advanced culture have not yet reached him. There is but one costly item in his repertoire—that is fire insurance; and he is learning to build houses that deserve insurance. However, concrete is not far away, and in all the towns he is turning to that material for his house and barn. He can furnish his own sand and has only to furnish cement, so that this material makes the cheapest as well as best house in the world. He simply has to dig his cellar, using the sand which he throws out to make the concrete. He has nothing to remove when his house is done, and little if any grading.

The model country home, which is growing up all over the South, is first of all surrounded by fruit gardens and vegetable gardens. The farmer grows his own chickens, eggs, meat and fuel. His horses and mules are not shod, for iron shoes are not required in the soft soil. There is a stand of bees, enough at least to furnish honey for the household and pollination for the fruit. Peaches and oranges perfume the air in Florida, and in the cotton belt there are plums and pears and cherries in addition. Better than even this is the fact that the Southern farmer has taken to growing seedlings, and so new sorts multiply, because a seedling, once started, is not likely to get frozen out. It need not be supposed that the change which is going on is confined strictly, or even largely, to Northern migration. Many of the Crackers are wide awake, and show that they are capable of enterprise, thrift and energy. The negro element, where it is decently treated and allowed natural

evolution, is by no means either indolent or shiftless. The worst negro element of the South is in the larger cities or engaged in turpentine camps.

The Southern farmer is now just about where the New York and Ohio farmers were sixty years ago—that is, in the forties of the last century. But it will be a mistake to suppose that he is going to be sixty years in catching up. Not only has he cotton, in the belt that takes in Georgia, Alabama, Louisiana and Texas, but he has found out that he can grow superb apples in the North Carolina mountains, peaches all over six or seven States, and pears almost everywhere that would make Colonel Wilder envious. He can grow Irish potatoes fully as good as those of the Northwest, right alongside his sweet potatoes and cassava, and can land them in the New York or Boston market while the New Englander is still putting in his seed. Meanwhile the Government is doing all that it can to widen the zone of orange growing, together with figs, loquats and other fruits likely to be affected by frost.

In fact, the change which we have noted is due, in very great degree, to the Agricultural Department at Washington and to the growth of agricultural colleges and experiment stations. Bulletins are everywhere. Beggar-weed was a nuisance to the cotton grower ten years ago; now it is one of the chief fodder plants of the South. In Florida the velvet-bean was introduced as a flowering vine; now it is the one most important plant in the State—the legume of all legumes for enriching the soil. Bulletins on these plants give exhaustive information to every farmer. You hear some keynote everywhere from these important documents. They start experiment and investigation, which is all that is needed to make over the South and the Southern farmer. Yet, after all, the chief resource of the South is the black man. The farmer is going to solve this negro problem. He needs the colored man and he cannot get along without him. This he has so thoroly found out that he is adapting himself to the situation. Decent negroes are constantly getting better treatment and better wages. The rank abuse which they have suffered is fading out, at least among the land tillers. He is looked upon as an asset, not to be spared.

There is plenty of hard work in keeping up a country home in the South, and this work continues all the year round. There is something to be done every month. The primitive custom of cooperation, indoors and out, is quite common. Women do not object to work in the gardens, or in the orange and peach orchards; while men see nothing out of the way in housework. The new farmer of the South is learning never to be idle. He has an occasional picnic, but the traditional loafing is rapidly passing away. Traditionalism as to methods is more hard to shake off, but that, too, is giving away. Newspapers and magazines are coming in, and individualism is showing itself in what is thought and believed as well as in what is done. The climate, except in marshy sections, is no more debilitating in Florida than in Massachusetts.

Postmaster General Meyer's Argument

PRESIDENT ROOSEVELT did well to endorse the position of Postmaster-General Meyer, and Mr. Meyer has comprehended the wish of the American people.

The need of a system of postal savings banks has been long apparent; it was fully demonstrated by the financial disaster of October. We are always, while under our present monetary system, in danger of a pressure. A pressure is sure to cause a panic, and the withdrawal of the people's deposits from our banks, as at present constituted. No matter how sound the bank, it is dependent on the confidence of its depositors. What we want is absolute trust in the social mechanism; and this can come only from absolute safety. With the nation behind the banking system, there can be no question of security. Not a dollar would be withdrawn from postal savings banks were all other banks suspended. The people would rest quiet and confident as to their savings, while the flurry or the tempest passed over. This is the logic of events, the testimony of Canada as well as of European countries, and it is the argument of Mr. Meyers.

Thruout the Postmaster's report there is, we are glad to see, something more than business clearheadedness; there is a tone of beneficence and sympathy with the people. It is not simply a question of safety for our banks and of stability for our business, but it is a question of safety for the millions of depositors who have trusted their savings to earn an additional increment against old age. In this country we have, so far, left every man to pension his own old age. In all conscience we cannot accuse him of lack of public spirit and good citizenship if he pulls out his deposit as soon as he doubts its safety. In spite of such precautions thousands are left every year stranded by the breaking of trust companies and banks. This lowers the average tone of our social life, and tends to individual degeneration. As a measure of general safety, we must provide against making paupers or increasing the number of the discouraged. It needs short argument to show that our common and united welfare depends on the security of the poor against deeper poverty, and the tumbling down of the well-to-do into the ranks of the helpless. In other words, business is also a question of character. It should run, not for itself, but for all who constitute the community. Mr. Meyer is right; this question of postal savings banks is a question of social evolution.

But, taken purely as a business question, why should we allow, or rather compel, our newer citizens to send across the Atlantic, every year, nearly seventy-five millions of dollars in the form of money orders—without the least advantage to ourselves? This money, while accumulating, should have been placed in our postal savings banks, and kept in circulation. A large sum is said to be annually sent abroad, to France and England and other parts of the Continent, to be deposited in postal savings banks. Why shall we not afford to these newcomers the privileges which they enjoyed in their own lands?

On deposits in postal savings banks it is proposed to pay 2 per cent—each person's deposit being limited to $500. Most of these deposits will be in small sums and will be made by day laborers. Children will be encouraged to save their first earnings, and, if we are to judge by school savings banks, it will be a successful as well as a beneficial effort. Many of the presidents of national banks have already expressed a willingness to receive these postal deposits and allow upon them 2½ per cent. interest, leaving a ½ per cent. gain to the Government. In many instances the gain will be considerably greater. The postal departments of England and of France report a good margin of profit. Mr. Meyer, after careful examination, assures us that the cost of establishing and running such a system of banks will be practically nothing, as the present line of clerks can, in nearly every instance, make all required entries and reports.

There is considerable force to the argument that postal savings banks would identify the people more closely with the Government. The foreigner, coming at the rate of one million a year, needs this identifying of sentiment and interest with the institutions of his adopted country. With his earnings in a postal savings bank, the fact that he has an interest in the Government, and something at stake in its stability, would make him abhor anarchy and turbulence. We see no reason why our public institutions should not thus involve a certain measure of the educational spirit, and add their influence to the creation of a sound citizenship.

Concerning the establishment of a rational parcels post, little new need be said. The absurdity of our present regulations has been long apparent to every well-informed citizen. Mr. Meyer shows how any one, entering any post office in the United States, with two parcels, each weighing four pounds, while paying 64 cents on the one to New York City, would pay but 48 cents on the other, going, thru New York City, to Liverpool or Berlin. Should the package for New York weigh one ounce over four pounds, he would be obliged to take it away from the post office and send it by express, while the other package, at a much lower rate, could go right on in the mails, thru New York and across the ocean. In other words, we are paying 4 cents a pound more for the privilege of sending packages to each other a distance of twenty miles than for sending them to a foreign land. Our Christmas presents are a costly affair. It is only common sense and

good business which our Postmaster-General urges, when he asks us to be as generous to ourselves as we are to our neighbors.

He especially recommends the establishment of a parcels post in connection with rural delivery routes. He would place the charge at 5 cents for the first pound, and 2 cents for each additional pound, up to a limit of eleven pounds. He thinks that this would facilitate trade, but more particularly would aid the farmers in obtaining the necessaries of life. It certainly would be an immeasurable accommodation and saving to the small farmer, who cannot afford to drive to town, three or four miles possibly, for a trifling but absolutely needed item. His difficulty in securing help and the consequent evils would be at least moderated. The necessary machinery for handling such a parcels post over a large part of the country is already in operation. On the other hand runs the argument that the Government should not undertake business affairs—an argument greatly modified by the fact that the parcels post has already been in operation long enough to make it a familiar factor of the post office system. Either abolish it altogether or make it of value to the people.

❧

The Oppression of Poland

In pursuance of the policy of the German Government to Germanize the Poles and other minor races, two important measures have been introduced respectively into the Imperial Reichstag and the Prussian Diet. The former is a clause of the Government bill for regulating the rights of association and public meetings, and provides that the proceedings at meetings must be conducted in the German language. In the case of international gatherings, where there can be no suspicion of agitation hostile to the Empire, an exception may be made by permission of the authorities. Prince von Bülow as Minister-President of Prussia introduced into the Diet at the opening of the session a bill authorizing the Government to use $100,000,000 in purchasing Polish real estate and selling it to German settlers. The efforts of the Government to purchase land in the open market for this purpose have not been successful, altho enormous sums have been expended, because the Poles either refused to sell except at abnormal prices or secured possession of the land afterward from the German settlers. The new measure would empower the Government to make compulsory purchases at its own valuation. But the opposition in the Diet was too strong, and the Government has been forced to compromise by reducing the appropriation to $66,000,000 and confining the expropriation to certain districts to be determined by the Diet. The Poles of Russia are coming to the defense of their brethren on the other side of the frontier by starting a boycott against German goods. Henryk Sienkiewicz, the author of "With Fire and Sword" and "Quo Vadis," has issued an appeal to the men prominent in literature, science and art all over the world to protest against the extinction of the Polish language and race. In Russian Poland 1,600 Polish schools have been closed by order of General Skallon, which suspends the Polish School Association. Its funds have been sent abroad to avoid confiscation.

❧

Peace

We congratulate the Central American Peace Delegates, and especially Secretary Root and Ambassador Creel, of Mexico, who stood sponsor for their labors, on the remarkable results of the Conference concluded last week in Washington. With the exception of the Chile-Argentina treaty of 1903, which actually resulted in disarmament by both nations, this is the highest achievement yet reached in the world's progress toward the substitution of law for war. Indeed, it is only another proof that at the present moment Latin America leads the world in Peace. But the Peace movement is at last becoming active thruout the whole world, and, as a result of the two Hague Conferences, every nation has to some extent been affected by the spirit of broader internationalism. Denmark, for instance, has just appropriated $2,000 to be divided between the Arbitration Bureau at The Hague, the Berne Peace Bureau and the Danish Group of the Interparliamentary Union. This idea of a peace budget, now for the first time carried out by Denmark, has been one of Mr. Stead's pet ideas for some time, and the last meeting of the Interparliamentary Union at London in 1906 recommended it to the favorable

consideration of all the governments of the world. Now if only the United States Senate would cordially support the President in negotiating an arbitration treaty with Japan in which each nation would agree to respect each other's present territorial integrity and submit all other questions at issue to arbitration, the farthest step in advance yet taken in the unification of the world will have been made, and all this infamous war talk in prose and verse would cease. Is there a greater opportunity before President Roosevelt and the Senate?

A Brawl in the Capitol

There was a difference between Representatives Williams, of Mississippi, and De Armond, of Missouri, both Democrats, as to the assignment of a member from Missouri to a committee. Mr. Williams, who is Democratic leader, and had the right to make assignments, declared that he did not remember that Mr. De Armond had requested a certain assignment for a Missouri colleague; and, after some discussion between them, Mr. De Armond said he believed that Mr. Williams lied, and he said it twice. Then Mr. Williams shot out his fist, and De Armond struck back, and both lost a little bad blood. Mr. De Armond had been a rival candidate for Democratic leader, and the two were on coldly courteous terms before this affair. Fortunately the House had adjourned, but the room was full of members and the galleries of visitors. As to Mr. De Armond it is only to be said that his language was rude, ungentlemanly and wholly discreditable to him, and he must have known it was liable to provoke just what happened. As to Mr. Williams, it is to be said that he comes from a State where it is supposed that to give a man the lie, whether he has lied or not, is an insult which requires at least a blow and justifies murder. This prevailing unwritten law is, of course, wrong, uncivilized and unchristian; but it exists, and Mr. Williams has been brought up in it, and knows that it would ruin his reputation for courage if, in such a case, he should act like a Christian. Fortunately the progress of civilization thereabouts has reached thus far that a duel will hardly follow, but it would have followed before the Civil War. Such a fracas as this, in the Hall of Congress, is a disgrace to both concerned, and they ought to apologize to the country in whose sight they were guilty.

To Solve the Race Problem

Athens, Ga., accredits its name by the fact that it is the seat of the University of Georgia, of the State Normal School and of the Lucy Cobb Seminary for girls. The latter was long under the charge of Mrs. M. A. Lipscomb, and Dr. Lipscomb was president of the University of Georgia. Mrs. Lipscomb is president of the Georgia State Federation of Women's Clubs, and it is a letter of her's to the Athens *Banner,* which is the occasion of this introduction. She tells the story of a new and simple and beautiful effort on the part of the white and colored women of Athens to join in an act of sweet charity, which, we learn, is unique in the knowledge of intelligent Southerners, but which is in line with the effort of which ex-Governor Northen is the head, following the Atlanta riot, to bring the two races into closer sympathy. A colored seamstress, Martha Holsey, was troubled because she could find no home where three colored orphans could be placed. There was not a charity that would undertake their care. She wanted a home for them in Athens, a place, also, where mothers, compelled to work out all day could leave their children protected and kept from the evil of the street. She talked it over with her own people, and then, timidly, she asked the counsel of several white women for whom she had sewed. Mrs. Lipscomb asked her if there was not a colored woman's club that could undertake to establish such a home. There was such a club, but they were too poor. She was told to go to the president of the Athens Woman's Club and present the case. She did so and made a good plea, and was told to look up a house for the purpose. The Woman's Club met and agreed to help. It is now provided for by their subscriptions, and the club is responsible. A nice, clean cottage is rented for a home, and a competent colored woman is put in charge. Mothers will leave their children there all day, and they will be given two good meals, kept from the streets, taught

to "do things," and at night they will be taken to their homes. The mothers will pay a small sum monthly, and this will be supplemented by the Athens Woman's Club. Martha Holsey was happy, and a request came that some of the club women would speak at a mass meeting of the colored women interested in the work. So they went to the colored Baptist Church Sunday afternoon, told the story of the plan, promised their sympathy and help; and then the two colored ministers and Martha Holsey assured their co-operation and thanks. It is a simple story and touchingly sweet and Christian. How much better as a solution of the so-called race problem than grandfather clauses and disfranchisement, which only stir race hatred on both sides. May the movement grow!

Kansas Crops

The value of the agricultural products of Kansas in 1907 would give $280 to each man, woman and child in the State if divided equally among the inhabitants. And the fine thing about it is that in Kansas wealth is pretty equally distributed. Paupers are as rare as millionaires, and the jails are as empty as the poorhouses. Multiply $280 by the number in the home—not so small a number in Kansas as elsewhere—and you have a very respectable family income. The population has increased 20 per cent. in the last ten years, the value of the products of the State has increased 90 per cent. This year the crops and live stock foot up to $463,648,606, which is $39,313,739 more than in any previous year. This is wealth that will not shrink 50 per cent. at the threat of a Presidential prosecution of illegal financiering. Kansas can get along without Wall Street at least as well as Wall Street can get along without Kansas. If the people of the State cannot sell their wheat they can eat it, and if they cannot buy anthracite coal they can burn corn, which is a much better fuel.

The Bones of Thomas a'Becket

They hoped they had found in the crypt of Canterbury Cathedral the skeleton of the famous Archbishop and Saint Thomas a'Becket, but the authorities of the Society of Antiquaries doubt it, partly because the skeleton measured only five feet eleven and a half inches, while the records say that the Archbishop was nearly seven feet tall. But a man whose bones show that he was over six feet tall would have been regarded a giant in those days, and there was a sword cut in the skull such as we know that Becket died from in 1170, slain at the altar by four knights. It was to his shrine that Chaucer's Canterbury pilgrims journeyed. The tale is told that when his body was preparing for burial they questioned if it would be necessary to wash the body of so holy a man. First they were surprised to find that he wore a hair shirt next his skin, and still more to find hair drawers; but when they went to remove them they found them so infested with vermin that they knew he was so great a saint that his body did not need to be washed. The Pope made short work of canonizing him less than two years after his death, thus protesting against the independence of Henry II, whose expressed wish that he might get rid of that pestilent priest was the occasion of his murder.

Excommunicated and Impenitent

Father Tyrrell, the rebellious Jesuit, is stiffly recalcitrant. He has written a letter to the Bishop of Southwark who had informed him of the papal interdict resting upon him, saying that he submits to the decision which forbids him to say mass, for he is still a good Catholic, but if the Bishop asks "submission" of him, he wants to know the canonical offense. If there was any lack of courtesy in his letters to *The Times*, any improper sarcasm or lack of reverence, he is ready to apologize if it is pointed out to him; but he concludes:

"If, however, my offense lies in having protested publicly in the name of Catholicism against a document destructive of the only possible defense of Catholicism and of every reason for submitting, within due limits, to ecclesiastical authority—a document which constitutes the greatest scandal for thousands who, like myself, have been brought into, and kept in, the Church by the influence of Cardinal Newman, and of the mystical theology of the Fathers and the Saints—for such a protest I am absolutely and finally impenitent. I may not lie, and for me, in all the circumstances, silence would have been the basest of lies and a cow-

ardly betrayal of the Church whose service has been the sole aim of my life."

That is vigorous and positive and final. He will not go out of the Church which he loves, and he will remain an excommunicated Catholic priest.

Is It Infallible?

A very serious question now before the Catholic Church is whether the late condemnation of Modernism by the Pope is infallible. In order that a decision may be infallible it is essential (1) that the Pope speak as supreme teacher and pastor, and give to his doctrinal authority the highest measure of intensity; (2) that the matter of the doctrine be one concerning faith or morals; (3) that the Holy Father should make plain his formal intention of binding the whole Church; and (4) that there should be a definition of doctrine. Beyond question the Syllabus, the Encyclical and the *Motu Proprio* would seem to make it clear to the world that every one of these conditions is fully met. Modernism is elaborated and defined as the "synthesis of all the heresies" and the destruction of religion. While there can thus be no reasonable question as to the intention of the Holy Father to define the heresy and to condemn it *ex cathedra*, even to the extent of declaring those guilty of it excommunicated *ipso facto*, doubtless those who come under its condemnation, but yet would remain in the Church, will declare that in some way it lacks the form as well as the content which marks infallibility, altho it will be difficult to see any way in which the form could be any more regular and positive. Probably the best way to test one infected with the heresy of Modernism will be to observe whether he doubts the *ex cathedra* quality of the condemnation.

Mr. Stoiloff, one of the early Prime Ministers of Bulgaria, once remarked that if it had not been for the graduates of Robert College, in Constantinople, Bulgaria would, when it acquired its independence, have been obliged to turn to Russia for competent officials. That this admirable American college is still doing service appears from the fact that both the Bulgarian delegates to The Hague Peace Conference, Major-General Vinaroff and Attorney-General Karadjuloff are among its older graduates. The new Mayor of Sofia is a graduate; another, who negotiated the treaty of commerce with Egypt has been sent to do the same service in a treaty with Turkey, while yet another has been appointed Diplomatic Agent at Constantinople.

It was cold comfort which Secretary Root was able to give the Italian Ambassador who came to complain of the killing of Italian laborers at a lumber camp in Louisiana, and the destruction of tobacco belonging to Italians in Kentucky. All he could say was that he would call the attention of the Governors of the various States to the duty of protecting foreign residents. But why does not Congress allow him to do more? The United States Government should be allowed by law to punish those who injure aliens, in which case the Federal Government would not be compelled to pay damages for these too frequent outrages on Italians and Chinese.

They had a hot time the other day in the new Persian Parliament, which is really a school of debate. Some one read an article in a daily paper which favored civil law for civil affairs and the religious law of Islam solely for religious observances. It also proposed equal suffrage for people of all religions. The Clericals, for there are Moslem Clericals, made a big howl over it, and, altho they are in a minority, they just carried their point that the paper be suppressed. But the next day it appeared as usual, and again the Clericals raised bedlam. There is progress in Islam, and Persia may be its leader.

The Association of Prussian officials may be supposed to be asking for an increase of salaries, to match the largely increased cost of living. They have compiled statistics which show that all prices have risen in ten years, and mostly as much as 25 per cent. Even physicians' fees and church fees have advanced. If the German Government can afford an enormous increase in naval expenditure we should think it might add something to salaries of officials. The chief causes are worldwide, and one of the chief is the cheapening of gold thru its increased production.

The most important influence
on the health of the entire family
is the sanitary equipment of
"Standard" Porcelain Enameled Ware
in the bathroom, bedroom, kitchen and laundry

Our book, "MODERN BATHROOMS," tells you how to plan and arrange your bathroom, and illustrates many beautiful and inexpensive as well as luxurious rooms, showing the cost of each fixture in detail, together with hints on decoration, tiling, etc. It is the most complete and beautiful booklet ever issued on the subject. **FREE** for six cents postage and the name of your plumber and architect (if selected).

CAUTION: Every piece of "Standard" Ware bears our "Standard" "GREEN and GOLD" guarantee label, and has our trade-mark "Standard" cast on the outside. Unless the label and trade-mark are on the fixture it is not "Standard" Ware. Refuse substitutes—they are all inferior and will cost you more in the end. The word "Standard" is stamped on all our nickled brass fittings; specify them and see that you get the genuine trimmings with your bath and lavatory, etc.

Address **Standard Sanitary Mfg. Co** Dept. M, Pittsburgh, Pa., U. S. A.

KAHN SYSTEM

of Reinforced Concrete

Every Building built by the Kahn System is fire-proof, enduring, and accumulates strength with age.

The **Kahn System** is a method of building based on organized engineering skill, experience and facilities for meeting every requirement of reinforced concrete construction in the most efficient and economical way.

By the **Kahn System** construction work of any magnitude is handled complete from start to finish within the shortest possible time limit. It brings brains, engineering skill and experience, inventive genius, capital and manufacturing facilities to bear in the solution of your construction problems.

It relieves owners of all care and trouble and co-operates fully with architects and contractors in the execution of work.

We insure quality and prompt delivery by manufacturing our own reinforcing material, including the patented Kahn Trussed Bar, Kahn Rib Metal, Cup-Bar, and Kahn Metal Lath.

If request is made on your letter head, a copy of "The Typical Factory" will be sent free. Write for copy of "Mills and Factories" and Bulletin No. 5, "What Reinforced Concrete Is."
